nbma: Specifies the network type as NBMA.

p2mp: Specifies the network type as P2MP.

unicast: Specifies the P2MP interface to unicast OSPFv3 packets. By default, a P2MP interface multicasts OSPFv3 packets.

p2p: Specifies the network type as P2P.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

If a router on a broadcast network does not support multicast, configure the network type for the connected interfaces as NBMA.

When the network type of an interface is NBMA or P2MP unicast, you must use the **peer** command to specify the neighbor.

When the network type of an interface is P2MP unicast, all OSPFv3 packets are unicast by the interface.

Examples

Specify the OSPFv3 network type for VLAN-interface 20 as NBMA.

```
<Switch> system-view
[Switch] interface vlan-interface 20
[Switch-Vlan-interface20] ospfv3 network-type nbma
```

Related commands

ospfv3 dr-priority

9.1.39. ospfv3 peer

Use **ospfv3 peer** to specify a neighbor and the DR priority of the neighbor.

Use **undo ospfv3 peer** to remove the configuration.

Syntax

ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

undo ospfv3 peer *ipv6-address* [**instance** *instance-id*]

Default

No link-local address is specified for the neighbor interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the link-local IPv6 address of the neighbor.

cost *cost-value*: Specifies the cost of the neighbor, in the range of 1 to 65535.

dr-priority *priority*: Specifies the DR priority of the neighbor, in the range of 0 to 255. The default is 1.

instance *instance-id:* Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

For NBMA and P2MP interfaces (only when in unicast mode), you must specify the link-local IPv6 addresses of their neighbors because these interfaces cannot find neighbors through broadcasting hello packets. For NBMA interfaces, you can also specify DR priorities for their neighbors.

Examples

On VLAN-interface 10, specify the link-local address of its neighbor as FE80::1111.

```
<Switch> system-view
[Switch] interface vlan-interface 10
```

```
[Switch-Vlan-interface10] ospfv3 peer fe80::1111
```

9.1.40. ospfv3 timer dead

Use **ospfv3 timer dead** to set the OSPFv3 neighbor dead time.

Use **undo ospfv3 timer dead** to remove the configuration.

Syntax

ospfv3 timer dead *seconds* [**instance** *instance-id*]

undo ospfv3 timer dead [**instance** *instance-id*]

Default

The OSPFv3 neighbor dead time is 40 seconds for P2P and broadcast interfaces, and is 120 seconds for P2MP and NBMA interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the dead time in the range of 1 to 65535 seconds.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

If an interface receives no hello packet from a neighbor within the dead time, the interface determines that the neighbor is down.

The dead time must be a minimum of four times the hello time and must be identical on interfaces attached to the same network segment.

Examples

Set the OSPFv3 neighbor dead time to 60 seconds for VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 timer dead 60
```

Related commands

ospfv3 timer hello

9.1.41. ospfv3 timer hello

Use **ospfv3 timer hello** to set the hello interval for an interface.

Use **undo ospfv3 timer hello** to remove the configuration.

Syntax

ospfv3 timer hello *seconds* [**instance** *instance-id*]

undo ospfv3 timer hello [**instance** *instance-id*]

Default

The hello interval is 10 seconds for P2P and broadcast interfaces, and is 30 seconds for P2MP or NBMA interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the hello interval in the range of 1 to 65535 seconds.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

The shorter the hello interval is, the faster the topology converges and the more resources are consumed. Make sure the hello interval on two neighboring interfaces is the same.

Examples

Set the hello interval to 20 seconds for VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 timer hello 20
```

Related commands

ospfv3 timer dead

9.1.42. ospfv3 timer poll

Use **ospfv3 timer poll** to set the poll interval on an NBMA interface.

Use **undo ospfv3 timer poll** to remove the configuration.

Syntax

ospfv3 timer poll *seconds* [**instance** *instance-id*]

undo ospfv3 timer poll [**instance** *instance-id*]

Default

The poll interval is 120 seconds on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the poll interval in the range of 1 to 65535 seconds.

instance *instance-id*: Specifies an interface instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

When an NBMA interface finds its neighbor is down, it sends hello packets at the poll interval.

The poll interval must be a minimum of four times the hello interval.

Examples

Set the poll interval on VLAN-interface 10 to 120 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 timer poll 120
```

Related commands

ospfv3 timer hello

9.1.43. ospfv3 timer retransmit

Use **ospfv3 timer retransmit** to set the LSA retransmission interval for an interface.

Use **undo ospfv3 timer retransmit** to remove the configuration.

Syntax

ospfv3 timer retransmit *seconds* [**instance** *instance-id*]

undo ospfv3 timer retransmit [**instance** *instance-id*]

Default

The interval is 5 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the LSA retransmission interval in the range of 1 to 3600 seconds.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

After the device sends an LSA to its neighbor, it waits for an acknowledgment. If the device receives no acknowledgment after the LSA retransmission interval elapses, it will retransmit the LSA.

To avoid unnecessary retransmissions, set an appropriate retransmission interval. For example, you can set a large retransmission interval value on a low-speed link.

Examples

Set the LSA retransmission interval to 12 seconds on VLAN-interface10 in instance 1.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 timer retransmit 12 instance 1
```

9.1.44. ospfv3 trans-delay

Use **ospfv3 trans-delay** to set the transmission delay for an interface.

Use **undo ospfv3 trans-delay** to remove the configuration.

Syntax

ospfv3 trans-delay *seconds* [**instance** *instance-id*]

undo ospfv3 trans-delay [**instance** *instance-id*]

Default

The transmission delay is 1 second.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the transmission delay in the range of 1 to 3600 seconds.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

Each LSA in the LSDB has an age that is incremented by 1 every second, but the age does not change during transmission. Adding a transmission delay into the age time is important in low speed networks.

Examples

Set the transmission delay to 3 seconds for VLAN-interface 10 in instance 1.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 trans-delay 3 instance 1
```

9.1.45. preference

Use **preference** to set a preference for OSPFv3 routes.

Use **undo preference** to remove the configuration.

Syntax

preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

undo preference [**ase**]

Default

The preference is 10 for OSPFv3 internal routes and 150 for OSPFv3 external routes.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

ase: Specifies a preference for OSPFv3 external routes. If you do not specify this keyword, the command sets a preference for OSPFv3 internal routes.

preference: Specifies the preference value in the range of 1 to 255. A smaller value represents a higher preference.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to set a preference for matching routes.

Usage guidelines

If multiple routing protocols find multiple routes to the same destination, the router uses the route found by the protocol with the highest preference.

Examples

Set a preference of 150 for OSPFv3 routes.

```
<Switch> system-view
[Switch] OSPFv3
[Switch-OSPFv3-1] preference 150
```

9.1.46. reset ospfv3 process

Use **reset ospfv3 process** to restart OSPFv3 processes.

Syntax

reset ospfv3 [*process-id*] **process** [**graceful-restart**]

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command restarts all OSPFv3 processes.

graceful-restart: Restarts the OSPFv3 process by using GR.

Usage guidelines

The **reset ospfv3 process** command performs the following actions:

- Clears all invalid LSAs without waiting for their timeouts.
- Starts a new DR/BDR election.
- Keeps previous OSPFv3 configurations.

The system prompts you to select whether to restart OSPFv3 process upon execution of this command.

Examples

Restart all OSPFv3 processes.

```
<Switch> reset ospfv3 process
Reset OSPFv3 process? [Y/N]:y
```

9.1.47. reset ospfv3 redistribution

Use **reset ospfv3 redistribution** to restart route redistribution.

Syntax

reset ospfv3 [*process-id*] **redistribution**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command restarts route redistribution for all OSPFv3 processes.

Examples

Restart route redistribution.

```
<Switch> reset ospfv3 redistribution
```

9.1.48. reset ospfv3 statistics

Use **reset ospfv3 statistics** to clear OSPFv3 statistics.

Syntax

reset ospfv3 [*process-id*] **statistics**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command clears statistics for all OSPFv3 processes.

Examples

Clear statistics for all OSPFv3 processes.

```
<Switch> reset ospfv3 statistics
```

9.1.49. router-id

Use **router-id** to configure a router ID.

Use **undo router-id** to restore the default.

Syntax

router-id *router-id*

undo router-id

Default

No router ID is configured.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

router-id: Specifies a router ID in IPv4 address format.

Usage guidelines

The router ID is the unique identifier for the device to run OSPFv3 in the AS. An OSPFv3 process cannot run without a router ID.

You must specify a unique router ID for each OSPFv3 process in an AS and on a router.

Examples

Configure the router ID 10.1.1.3 for OSPFv3 process 1.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] router-id 10.1.1.3
```

Related commands

ospfv3

9.1.50. silent-interface(OSPFv3 view)

Use **silent-interface** to disable the specified interface from receiving and sending OSPFv3 packets.

Use **undo silent-interface** to remove the configuration.

Syntax

silent-interface { *interface-type interface-number* | **all** }

undo silent-interface { *interface-type interface-number* | **all** }

Default

An interface can receive and send OSPFv3 packets.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all interfaces.

Usage guidelines

Multiple processes can disable the same interface from receiving and sending OSPFv3 packets. However, the **silent-interface** command takes effect only on interfaces enabled with the current process.

Examples

Disable VLAN-interface 10 from receiving and sending OSPFv3 packets in OSPFv3 processes 100 and 200.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] router-id 10.100.1.9
[Switch-ospfv3-100] silent-interface vlan-interface 10
[Switch-ospfv3-100] quit
[Switch] ospfv3 200
[Switch-ospfv3-200] router-id 20.100.1.9
[Switch-ospfv3-200] silent-interface vlan-interface 10
```

9.1.51. snmp-agent trap enable ospfv3

Use **snmp-agent trap enable ospfv3** to enable SNMP notifications for OSPFv3.

Use **undo snmp-agent trap enable ospfv3** to disable SNMP notifications for OSPFv3.

Syntax

snmp-agent trap enable ospfv3 [**grrestarter-status-change** | **grhelper-status-change** | **if-state-change** | **if-cfg-error** | **if-bad-pkt** | **neighbor-state-change** | **nssatranslator-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtgrhelper-status-change** | **virtneighbor-state-change**] *

undo snmp-agent trap enable ospfv3 [**grrestarter-status-change** | **grhelper-status-change** | **if-state-change** | **if-cfg-error** | **if-bad-pkt** | **neighbor-state-change** | **nssatranslator-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtgrhelper-status-change** | **virtneighbor-state-change**] *

Default

SNMP notifications for OSPFv3 are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

grrestarter-status-change: Specifies notifications about GR restarter state changes.

grhelper-status-change: Specifies notifications about GR helper state changes.

if-state-change: Specifies notifications about interface state changes.

if-cfg-error: Specifies notifications about error configuration of an interface.

if-bad-pkt: Specifies notifications about error messages received on an interface.

neighbor-state-change: Specifies notifications about neighbor state changes.

nssatranslator-status-change: Specifies notifications about NSSA translator state changes.

virtif-bad-pkt: Specifies notifications about error messages received on a virtual interface.

virtif-cfg-error: Specifies notifications about error configuration of a virtual interface.

virtif-state-change: Specifies notifications about virtual interface state changes.

virtgrhelper-status-change: Specifies notifications about neighbor GR helper state changes of a virtual interface.

virtneighbor-state-change: Specifies notifications about the neighbor state changes of a virtual interface.

Examples

Disable SNMP notifications for OSPFv3.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable ospfv3
```

9.1.52. spf-schedule-interval

Use **spf-schedule-interval** to set the OSPFv3 SPF calculation interval.

Use **undo spf-schedule-interval** to restore the default.

Syntax

spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo spf-schedule-interval

Default

The maximum SPF calculation interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

maximum-interval: Specifies the maximum OSPFv3 route calculation interval in the range of 1 to 60 seconds.

minimum-interval: Specifies the minimum OSPFv3 route calculation interval in the range of 10 to 60000 milliseconds.

incremental-interval: Specifies the incremental OSPFv3 route calculation interval in the range of 10 to 60000 milliseconds.

Usage guidelines

Based on the LSDB, an OSPFv3 router uses SPF to calculate a shortest path tree with itself being the root. OSPFv3 uses the shortest path tree to determine the next hop to a destination. By adjusting the SPF calculation interval, you can prevent overconsumption of bandwidth and router resources due to frequent topology changes.

For a stable network, the minimum interval is used. If network changes become frequent, the SPF calculation interval is incremented by the incremental interval × 2^{n-2} for each calculation until the maximum interval is reached. The value *n* is the number of calculation times.

The minimum interval and the incremental interval cannot be greater than the maximum interval.

Examples

Set the maximum SPF calculation interval to 10 seconds, minimum interval to 500 milliseconds, and incremental interval to 300 milliseconds.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] spf-schedule-interval 10 500 300
```

9.1.53. stub (OSPFv3 area view)

Use **stub** to configure an area as a stub area.

Use **undo stub** to restore the default.

Syntax

stub [**default-route-advertise-always** | **no-summary**] *

undo stub

Default

No area is configured as a stub area.

Views

OSPFv3 area view

Predefined user roles

network-admin

Parameters

default-route-advertise-always: Enables the ABR to always advertise a default route into the stub area.

no-summary: Enables the ABR to advertise only a default route in an Inter-Area-Prefix-LSA into the stub area. No AS-external-LSA, Inter-Area-Prefix-LSA, or other Inter-Area-Router-LSA is advertised in the area. The area is a totally stub area.

Usage guidelines

To remove the **no-summary** configuration on an ABR, execute the **stub** command again to overwrite it.

To configure an area as a stub area, execute the **stub** command on all routers attached to the area.

Examples

Configure OSPFv3 area 1 as a stub area.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 1
[Switch-ospfv3-1-area-0.0.0.1] stub
```

Related commands

default-cost (OSPFv3 area view)

9.1.54. vlink-peer (OSPFv3 area view)

Use **vlink-peer** to configure a virtual link.

Use **undo vlink-peer** to remove a virtual link.

Syntax

vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **retransmit** *seconds* | **trans-delay** *seconds*] *

undo vlink-peer *router-id* [**dead** | **hello** | **retransmit** | **trans-delay**] *

Default

No virtual links exist.

Views

OSPFv3 area view

Predefined user roles

network-admin

Parameters

router-id: Specifies the router ID of the neighbor on the virtual link.

dead *seconds*: Specifies the dead interval in the range of 1 to 32768 seconds. The default is 40. The dead interval must be identical with that on the virtual link neighbor, and must be a minimum of four times the hello interval.

hello *seconds*: Specifies the hello interval in the range of 1 to 8192 seconds. The default is 10. It must be identical with the hello interval on the virtual link neighbor.

instance *instance-id*: Specifies the instance ID of a virtual link, in the range of 0 to 255. The default is 0.

retransmit *seconds*: Specifies the retransmission interval in the range of 1 to 3600 seconds. The default is 5.

trans-delay *seconds*: Specifies the transmission delay interval in the range of 1 to 3600 seconds. The default is 1.

Usage guidelines

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or maintain connectivity within the backbone. A virtual link is similar to an interface with OSPFv3 enabled. You can configure parameters such as **hello**, **dead**, **retransmit** and **trans-delay** for the virtual link.

Both ends of a virtual link must be ABRs that are configured with the **vlink-peer** command.

The following guidelines apply to parameters:

- The smaller the hello interval is, the faster the network converges, and the more network resources are consumed.
- For a low speed link, set a large retransmission interval to avoid unnecessary retransmissions.
- Specify a transmission delay with the **trans-delay** keyword depending on the interface delay.

OSPFv3 supports only the HMAC-SHA-256 authentication algorithm.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Examples

Configure a virtual link to 10.10.0.3.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 1
[Switch-ospfv3-1-area-0.0.0.1] vlink-peer 10.10.0.3
```

Related commands

display ospfv3 vlink

10. IPv6 policy-based routing commands

10.1. IPv6 policy-based routing commands

10.1.1. apply next-hop

Use **apply next-hop** to set next hops.

Use **undo apply next-hop** to remove next hops.

Syntax

apply next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-2>

undo apply next-hop [[**vpn-instance** *vpn-instance-name*] *ipv6-address*&<1-2>]

Default

No next hop is set.

Views

IPv6 policy node view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

ipv6-address: Specifies the IPv6 address of the next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option or the **inbound-vpn** keyword, the next hop belongs to the public network.

direct: Specifies that the next hop must be directly connected to take effect.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-2>: Indicates that the argument before it can be entered up to two times.

Usage guidelines

You can specify multiple next hops for backup in one command line or by executing this command multiple times.

With a next hop specified, the **undo apply next-hop** command removes the next hop.

Without any next hop specified, the **undo apply next-hop** command removes all next hops.

Examples

Set a directly-connected next hop of 1::1.

```
<Switch> system-view
[Switch] ipv6 policy-based-route aa permit node 11
[Switch-pbr6-aa-11] apply next-hop 1::1
```

10.1.2. display ipv6 policy-based-route

Use **display ipv6 policy-based-route** to display IPv6 PBR policy information.

Syntax

display ipv6 policy-based-route [**policy** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command displays information for all IPv6 PBR policies.

Examples

Display all IPv6 policy information.

```
<Switch> display ipv6 policy-based-route
Policy name: aaa
  node 1 permit:
    if-match acl 2000
    apply next-hop 1000::1
```

Table 10-1 Command output

Field	Description
node 1 permit	The match mode of Node 1 is **permit**.
if-match acl	Compares IPv6 packets with IPv6 ACL.
apply next-hop	Specifies a next hop for permitted IPv6 packets.

Related commands

ipv6 policy-based-route (system view)

10.1.3. display ipv6 policy-based-route interface

Use **display ipv6 policy-based-route interface** to display IPv6 interface PBR configuration and statistics.

Syntax

display ipv6 policy-based-route interface *interface-type interface-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Examples

Display IPv6 PBR configuration and statistics on VLAN-interface 2.

```
<Switch> display ipv6 policy-based-route interface vlan-interface 2
Policy based routing information for interface Vlan-inerface2(failed):
Policy name: aaa
  node 0 deny:
  Matched: 0
  node 1 permit:
    if-match acl 3999
  Matched: 0
  node 2 permit:
    if-match acl 2000
    apply next-hop 1000::1
  Matched: 0
  node 5 permit:
    if-match acl 3101
    apply next-hop 1000::1
  Matched: 0
Total matched: 0
<Switch> display ipv6 policy-based-route interface Vlan-inerface2
Policy based routing information for interface Vlan-inerface2:
Policy name: aaa
  node 0 deny(not support):
  Matched: 0
  node 1 permit:
    if-match acl 3999
  Matched: 0
```

```
  node 2 permit(no resource):
    if-match acl 2000
    apply next-hop 1000::1
  Matched: 0
  node 5 permit:
    if-match acl 3101
    apply next-hop 1000::1
  Matched: 0 (no statistics resource)
Total matched: 0
```

Table 10-2 Command output

Field	Description
Policy based routing information for interface *XXXX*(failed)	IPv6 PBR configuration and statistics on the interface. **failed** indicates the policy (including all its nodes) failed to be assigned to the driver. For a global interface (with only one-dimensional interface number, for example, VLAN-interface 10), **failed** can be displayed only when you specify the slot information for the command.
node 0 deny(not support) node 2 permit(no resource)	Match mode of the node, **permit** or **deny**. **not support** means the device does not support the match criteria configured on the node. **no resource** means the device has insufficient ACL resources, and failed to assign ACL resources to the node. For a global interface (with only one-dimensional interface number, for example, VLAN-interface 10), **not support** and **no resource** can be displayed only when you specify the slot information for the command.
if-match acl	Compares IPv6 packets with the IPv6 ACL.
apply next-hop	Specifies a next hop for permitted IPv6 packets.
Matched: 0 (no statistics resource)	Number of successful matches on the node (**no statistics resource** indicates insufficient statistics resources). For a global interface (with only one-dimensional interface number, for example, VLAN-interface 10), **no statistics resource** can be displayed only when you specify the slot information for the command.
Total matched	Total number of successful matches on all nodes.

Related commands

reset ipv6 policy-based-route statistics

10.1.4. display ipv6 policy-based-route setup

Use **display ipv6 policy-based-route setup** to display IPv6 PBR configuration.

Syntax

display ipv6 policy-based-route setup

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display IPv6 PBR configuration.

```
<Switch> display ipv6 policy-based-route setup
Policy name              Type              Interface
pr01                     Forward           Vlan-interface 2
pr02                     Local             N/A
```

Table 10-3 Command output

Field	Description
Policy name	Policy name.
Type	Type of the PBR: • **Forward**—Interface PBR. • **Local**—Local PBR.
Interface	Interface where the policy is applied.

Related commands

ipv6 policy-based-route (interface view)

10.1.5. if-match acl

Use **if-match acl** to set an ACL match criterion.

Use **undo if-match acl** to restore the default.

Syntax

if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

undo if-match acl

Default

No ACL match criterion is set.

Views

IPv6 policy node view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999. The value range of a basic ACL is 2000 to 2999 and that of an advanced ACL is 3000 to 3999.

name *ipv6-acl-name*: Specifies an IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters starting with a letter. The ACL name cannot be **all**. For the command to take effect, make sure the specified IPv6 ACL is a basic or advanced ACL.

Examples

Configure Node 10 of policy **aa** to permit the packets matching ACL 2000.

```
<Switch> system-view
[Switch] ipv6 policy-based-route aa permit node 10
[Switch-pbr6-aa-10] if-match acl 2000
```

Configure Node 10 of policy **aa** to permit the packets matching ACL **aaa**.

```
<Switch> system-view
[Switch] ipv6 policy-based-route aa permit node 10
[Switch-pbr6-aa-10] if-match acl name aaa
```

10.1.6. ipv6 policy-based-route (interface view)

Use **ipv6 policy-based-route** to configure IPv6 interface PBR by applying an IPv6 policy to an interface.

Use **undo ipv6 policy-based-route** to restore the default.

Syntax

ipv6 policy-based-route *policy-name*

undo ipv6 policy-based-route

Default

No IPv6 is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Examples

Apply policy **aaa** to VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
```

```
[Switch-Vlan-interface2] ipv6 policy-based-route aaa
```

Related commands

display ipv6 policy-based-route setup

ipv6 policy-based-route (system view)

10.1.7. ipv6 policy-based-route (system view)

Use **ipv6 policy-based-route** to create an IPv6 policy node and enter its view, or enter the view of an existing IPv6 policy node.

Use **undo ipv6 policy-based-route** to delete an IPv6 policy or IPv6 policy node.

Syntax

ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

undo ipv6 policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

Default

No IPv6 policy nodes exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy name, a case-sensitive string of 1 to 19 characters.

deny: Specifies the match mode for the policy node as **deny**.

permit: Specifies the match mode for the policy node as **permit** (default mode).

node *node-number*: Specifies the number of the IPv6 policy node. A smaller number has a higher priority. The value range for the *node-number* argument is 0 to 255.

Usage guidelines

To delete an IPv6 policy that has already applied to an interface, you must delete the policy from the interface first.

If a policy node is specified, the **undo ipv6 policy-based-route** command deletes the specified policy node. If a match mode is specified, the command deletes all nodes configured with the match mode. If no node is specified, the command deletes the whole policy.

Examples

Create permit-mode Node 10 for IPv6 policy **aaa** and enter its view.

```
<Switch> system-view
```

```
[Switch] ipv6 policy-based-route aaa permit node 10
[Switch-pbr6-aaa-10]
```

Related commands

display ipv6 policy-based-route

10.1.8. reset ipv6 policy-based-route statistics

Use **reset ipv6 policy-based-route statistics** to clear IPv6 PBR statistics.

Syntax

reset ipv6 policy-based-route statistics [**policy** *policy-name*]

Views

User view

Predefined user roles

network-admin

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command clears IPv6 PBR statistics for all policies.

Examples

Clear all IPv6 PBR statistics.

```
<Switch> reset ipv6 policy-based-route statistics
```

11. Routing policy commands

11.1. Common routing policy commands

11.1.1. apply as-path

Use **apply as-path** to set the AS_PATH attribute for BGP routes.

Use **undo apply as-path** to restore the default.

Syntax

apply as-path *as-number*&<1-32> [**replace**]

undo apply as-path

Default

No AS_PATH attribute is set.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

as-number&<1-32>: Specifies an AS by its number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 AS numbers.

replace: Replaces the original AS numbers. If you do not specify this keyword, the command adds the specified AS numbers before the original AS_PATH attribute.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to add AS number 200 before the original AS_PATH attribute of BGP routes matching AS path list 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match as-path 1
[Switch-route-policy-policy1-10] apply as-path 200
```

Related commands

display ip as-path

if-match as-path

ip as-path

11.1.2. apply comm-list delete

Use **apply comm-list delete** to delete the COMMUNITY attributes from BGP routes.

Use **undo apply comm-list** to restore the default.

Syntax

apply comm-list { *comm-list-number* | *comm-list-name* } **delete**

undo apply comm-list

Default

No COMMUNITY attributes are deleted from BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

comm-list-number: Specifies a basic community list by its number in the range of 1 to 99 or an advanced community list by its number in the range of 100 to 199.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to delete the COMMUNITY attributes specified in community list 1 from BGP routes.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] apply comm-list 1 delete
```

Related commands

ip community-list

11.1.3. apply community

Use **apply community** to set the COMMUNITY attribute for BGP routes.

Use **undo apply community** to remove the specified COMMUNITY attribute for BGP routes.

Syntax

apply community { **none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**] }

undo apply community [**none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**]]

Default

No COMMUNITY attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

none: Removes the COMMUNITY attributes of BGP routes.

community-number&<1-32>: Specifies a community sequence number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 community sequence numbers.

aa:nn&<1-32>: Specifies a community number. Both *aa* and *nn* are in the range of 0 to 65535. &<1-32> indicates that you can specify a maximum of 32 community numbers.

internet: Sets the INTERNET community attribute for BGP routes. Routes with this attribute can be advertised to all BGP peers. By default, all routes have this attribute.

no-advertise: Sets the NO_ADVERTISE community attribute for BGP routes. Routes with this attribute cannot be advertised to any peers.

no-export: Sets the NO_EXPORT community attribute for BGP routes. Routes with this attribute cannot be advertised out of the AS or confederation, but can be advertised to other sub-ASs in the confederation.

no-export-subconfed: Sets the NO_EXPORT_SUBCONFED community attribute for BGP routes. Routes with this attribute cannot be advertised out of the local AS or to other sub-ASs in the confederation.

additive: Adds the specified COMMUNITY attribute to the original COMMUNITY attribute of BGP routes.

Examples

Configure node 16 in **permit** mode for routing policy **setcommunity** to set the NO_EXPORT community attribute for BGP routes.

```
<Switch> system-view
[Switch] route-policy setcommunity permit node 16
[Switch-route-policy-setcommunity-16] apply community no-export
```

Related commands

if-match community

ip community-list

11.1.4. apply cost

Use **apply cost** to set a cost for routes.

Use **undo apply cost** to restore the default.

Syntax

apply cost [**+** | **-**] *cost-value*

undo apply cost

Default

No cost is set for routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

+: Increases a cost value.

-: Decreases a cost value.

cost-value: Specifies a cost in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a cost of 120 for OSPF external routes.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match route-type external-type1or2
[Switch-route-policy-policy1-10] apply cost 120
```

11.1.5. apply cost-type

Use **apply cost-type** to set a cost type for routes.

Use **undo apply cost-type** to restore the default.

Syntax

apply cost-type { **internal** | **type-1** | **type-2** }

undo apply cost-type

Default

No cost type is set for routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

internal: Sets the MED value for a matching BGP route to the IGP metric of the route's next hop.

type-1: Sets the cost type to OSPF Type-1 external route.

type-2: Sets the cost type to OSPF Type-2 external route.

Usage guidelines

The **apply cost-type internal** command sets the MED for a matching BGP route learned from an IBGP peer to the IGP metric of the route's next hop. The MED is modified when BGP advertises the route to an EBGP peer.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the cost type for routes that have a tag of 8 to OSPF Type-1 external routes.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match tag 8
[Switch-route-policy-policy1-10] apply cost-type type-1
```

11.1.6. apply extcommunity

Use **apply extcommunity** to set the extended community attribute for BGP routes.

Use **undo apply extcommunity** to remove the extended community attribute for BGP routes.

Syntax

apply extcommunity { **rt** *route-target* }&<1-32> [**additive**]

undo apply extcommunity [{ **rt** *route-target* }&<1-32>]

Default

No extended community attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

{ **rt** *route-target* }&<1-32>: Sets the RT extended community attribute, a string of 3 to 21 characters. &<1-32> indicates that you can specify a maximum of 32 RT extended community attributes.

An RT attribute has the following forms:

- *16-bit AS number*:*32-bit self-defined number*. For example, 101:3. The AS number is in the range of 0 to 65535, and the self-defined number is in the range of 0 to 4294967295.
- *32-bit IP address*:*16-bit self-defined number*. For example, 192.168.122.15:1. The self-defined number is in the range of 0 to 65535.
- *32-bit AS number*:*16-bit self-defined number*. For example, 70000:3. The AS number is in the range of 65536 to 4294967295, and the self-defined number is in the range of 0 to 65535.

additive: Adds the specified attribute to the original extended community attribute.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to add the RT extended community attribute 100:2 to BGP routes matching AS path list 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match as-path 1
[Switch-route-policy-policy1-10] apply extcommunity rt 100:2 additive
```

11.1.7. apply local-preference

Use **apply local-preference** to set a local preference for BGP routes.

Use **undo apply local-preference** to restore the default.

Syntax

apply local-preference *preference*

undo apply local-preference

Default

No local preference is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

preference: Specifies a local preference in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a local preference of 130 for BGP routes matching AS path list 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match as-path 1
[Switch-route-policy-policy1-10] apply local-preference 130
```

11.1.8. apply origin

Use **apply origin** to set the ORIGIN attribute for BGP routes.

Use **undo apply origin** to restore the default.

Syntax

apply origin { **egp** *as-number* | **igp** | **incomplete** }

undo apply origin

Default

No ORIGIN attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

egp *as-number*: Sets the ORIGIN attribute to EGP. The *as-number* argument specifies an AS number in the range 1 to 4294967295 for EGP routes.

igp: Sets the ORIGIN attribute to IGP.

incomplete: Sets the ORIGIN attribute to UNKNOWN.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the ORIGIN attribute to IGP for BGP routes matching AS path list 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match as-path 1
[Switch-route-policy-policy1-10] apply origin igp
```

11.1.9. apply preference

Use **apply preference** to set a preference for a routing protocol.

Use **undo apply preference** to restore the default.

Syntax

apply preference *preference*

undo apply preference

Default

No preference is set for a routing protocol.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

preference: Specifies a preference in the range of 1 to 255.

Usage guidelines

If you have set preferences for routing protocols by using the **preference** command, the **apply preference** command sets a new preference for the matching routing protocol. Unmatched routing protocols still use the preferences set by using the **preference** command.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the preference for OSPF external routes to 90.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match route-type external-type1or2
[Switch-route-policy-policy1-10] apply preference 90
```

11.1.10. apply preferred-value

Use **apply preferred-value** to set a preferred value for BGP routes.

Use **undo apply preferred-value** to restore the default.

Syntax

apply preferred-value *preferred-value*

undo apply preferred-value

Default

No preferred value is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

preferred-value: Specifies a preferred value in the range of 0 to 65535.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a preferred value of 66 for BGP routes matching AS path list 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match as-path 1
[Switch-route-policy-policy1-10] apply preferred-value 66
```

11.1.11. apply tag

Use **apply tag** to set a tag for IGP routes.

Use **undo apply tag** to restore the default.

Syntax

apply tag *tag-value*

undo apply tag

Default

No routing tag is set for IGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

tag-value: Specifies the tag value in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a tag of 100 for IGP routes.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] apply tag 100
```

11.1.12. display ip as-path

Use **display ip as-path** to display BGP AS path list information.

Syntax

display ip as-path [*as-path-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

as-path-number: Specifies an AS path list by its number in the range of 1 to 256. If you do not specify this argument, the command displays information about all BGP AS path lists.

Examples

Display information about BGP AS path list 1.

```
<Switch> display ip as-path 1
ListID    Mode      Expression
1         Permit    2
```

Table 11-1 Command output

Field	Description
ListID	AS path list ID.
Mode	Match mode: • **Permit**. • **Deny**.
Expression	Regular expression used to match routes.

11.1.13. display ip community-list

Use **display ip community-list** to display BGP community list information.

Syntax

display ip community-list [*basic-community-list-number* | *adv-community-list-number* | **name** *comm-list-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

name *comm-list-name*: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

Usage guidelines

If no community list is specified, this command displays information about all BGP community lists.

Examples

Display information about all BGP community lists.

```
<Switch> display ip community-list
Community List Basic aaa
        Permit
Community List Advanced bbb
        Permit  3333
```

Table 11-2 Command output

Field	Description
Community List Basic	Basic community list.
Community List Advanced	Advanced community list.
permit	Match mode: • **Permit**. • **Deny**.

11.1.14. display ip extcommunity-list

Use **display ip extcommunity-list** to display BGP extended community list information.

Syntax

display ip extcommunity-list [*ext-comm-list-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ext-comm-list-number: Specifies an extended community list by its number in the range of 1 to 199. If you do not specify this argument, the command displays information about all BGP extended community lists.

Examples

Display information about BGP extended community list 1.

```
<Switch> display ip extcommunity-list 1
Extended Community List Number 1
         Permit rt: 9:6
         Permit soo: 9:6
```

Table 11-3 Command output

Field	Description
Extended Community List Number	Extended community list.
permit	Match mode: • **Permit**. • **Deny**.
rt	Route Target (RT) extended community attribute.
soo	Site of Origin (SoO) extended community attribute.

11.1.15. display route-policy

Use **display route-policy** to display routing policy information.

Syntax

display route-policy [**name** *route-policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all routing policies.

Examples

Display information about routing policy **policy1**.

```
<Switch> display route-policy name policy1
```

```
Route-policy: policy1
  Permit : 1
          if-match cost 10
          continue: next node 11
          apply preference 10
```

Table 11-4 Command output

Field	Description
Route-policy	Routing policy name.
permit	Match mode: • **Permit**. • **Deny**.
if-match	Match criterion.
continue	Specify the next node to be matched.
apply	Action.

11.1.16. if-match as-path

Use **if-match as-path** to match BGP routes whose AS_PATH attribute matches a specified AS path list.

Use **undo if-match as-path** to remove the specified AS path list match criterion.

Syntax

if-match as-path *as-path-number*&<1-32>

undo if-match as-path [*as-path-number*&<1-32>]

Default

No AS path list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

as-path-number&<1-32>: Specifies an AS path list by its number in the range of 1 to 256. &<1-32> indicates that you can specify a maximum of 32 AS path lists.

Examples

Configure AS path list 2 to permit BGP routes containing AS number 200 or 300 to pass. Configure node 10 in **permit** mode for routing policy **test** to match AS path list 2.

```
<Switch> system-view
[Switch] ip as-path 2 permit _*200.*300
```

```
[Switch] route-policy test permit node 10
[Switch-route-policy-policy1-10] if-match as-path 2
```

Related commands

apply as-path

ip as-path

11.1.17. if-match community

Use **if-match community** to match BGP routes whose COMMUNITY attribute matches a specified community list.

Use **undo if-match community** to remove the specified community list match criterion.

Syntax

if-match community { { *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number* }&<1-32>

undo if-match community [{ *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number*]&<1-32>

Default

No community list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

whole-match: Exactly matches the specified community list. All of the communities and only those communities specified must be present.

&<1-32>: Indicates that you can specify a maximum of 32 community lists.

Examples

Configure community list 1 to permit BGP routes with community number 100 or 200. Then configure node 10 in **permit** mode for routing policy **test** to use community list 1 to match BGP routes.

```
<Switch> system-view
[Switch] ip community-list 1 permit 100 200
[Switch] route-policy test permit node 10
[Switch-route-policy-test-10] if-match community 1
```

Related commands

ip community-list

11.1.18. if-match cost

Use **if-match cost** to match routes that have the specified cost.

Use **undo if-match cost** to restore the default.

Syntax

if-match cost *cost-value*

undo if-match cost

Default

No cost match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a cost in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to permit routes with a cost of 8.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match cost 8
```

11.1.19. if-match extcommunity

Use **if-match extcommunity** to match BGP routes whose extended community attribute matches a specified extended community list.

Use **undo if-match extcommunity** to remove the specified extended community list match criterion.

Syntax

if-match extcommunity *ext-comm-list-number*&<1-32>

undo if-match extcommunity [*ext-comm-list-number*&<1-32>]

Default

No extended community list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

ext-comm-list-number&<1-32>: Specifies an extended community list by its number in the range of 1 to 199. &<1-32> indicates that you can specify a maximum of 32 extended community lists.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to match BGP routes whose extended community attribute matches extended community lists 100 and 150.

```
<Switch> system-view
[Switch] ip extcommunity-list 100 permit rt 100:100
[Switch] ip extcommunity-list 150 permit rt 150:150
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match extcommunity 100 150
```

Related commands

apply extcommunity

ip extcommunity-list

11.1.20. if-match interface

Use **if-match interface** to match routes that have the specified output interfaces.

Use **undo if-match interface** to remove the specified output interface match criterion.

Syntax

if-match interface { *interface-type interface-number* }&<1-16>

undo if-match interface [*interface-type interface-number*]&<1-16>

Default

No output interface match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

&<1-16>: Indicates that you can specify a maximum of 16 interfaces.

Usage guidelines

BGP does not support criteria for matching the output interfaces of routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to permit routes with the output interface VLAN-interface 1.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match interface vlan-interface 1
```

11.1.21. if-match route-type

Use **if-match route-type** to set a route-type match criterion.

Use **undo if-match route-type** to remove the specified route-type match criterion.

Syntax

if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *

undo if-match route-type [**external-type1** | **external-type1or2** | **external-type2** | **internal** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2**] *

Default

No route-type match criterion is set.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

external-type1: Matches OSPF Type 1 external routes.

external-type1or2: Matches OSPF Type 1 and Type 2 external routes.

external-type2: Matches OSPF Type 2 external routes.

internal: Matches OSPF internal routes (including OSPF intra-area and inter-area routes).

nssa-external-type1: Matches OSPF NSSA Type 1 external routes.

nssa-external-type1or2: Matches OSPF NSSA Type 1 and 2 external routes.

nssa-external-type2: Matches OSPF NSSA Type 2 external routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to match OSPF internal routes.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match route-type internal
```

11.1.22. if-match tag

Use **if-match tag** to match IGP routes that have the specified tag.

Use **undo if-match tag** to restore the default.

Syntax

if-match tag *tag-value*

undo if-match tag

Default

No tag match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

tag-value: Specifies a tag in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to match IGP routes that have a tag of 8.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match tag 8
```

11.1.23. ip as-path

Use **ip as-path** to configure an AS path list.

Use **undo ip as-path** to remove an AS path list.

Syntax

ip as-path *as-path-number* { **deny** | **permit** } *regular-expression*

undo ip as-path *as-path-number* [*regular-expression* | **deny** | **permit**]

Default

No AS path lists exist.

Views

System view

Predefined user roles

network-admin

Parameters

as-path-number: Specifies an AS path list number in the range of 1 to 256.

deny: Specifies the match mode for the AS path list as **deny**.

permit: Specifies the match mode for the AS path list as **permit**.

regular-expression: Specifies an AS path regular expression, a string of 1 to 63 characters.

Usage guidelines

BGP routing updates contain an AS_PATH attribute field that identifies the ASs through which the routes have passed. An AS path regular expression, for example, ^200.*100$, matches the AS_PATH attribute that starts with AS 200 and ends with AS 100. For more information about regular expressions, see *Fundamentals Configuration Guide*.

Examples

Configure AS path list 1 to permit routes whose AS_PATH attribute starts with 10.

```
<Switch> system-view
[Switch] ip as-path 1 permit ^10
```

Related commands

apply as-path

display ip as-path

if-match as-path

11.1.24. ip community-list

Use **ip community-list** to configure a community list.

Use **undo ip community-list** to remove a community list.

Syntax

ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } { **deny** | **permit** } [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

undo ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } [**deny** | **permit**] [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } { **deny** | **permit** } *regular-expression*

undo ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } [**deny** | **permit**] [*regular-expression*]

Default

No community lists exist.

Views

System view

Predefined user roles

network-admin

Parameters

basic-comm-list-num: Specifies a basic community list number in the range of 1 to 99.

basic *basic-comm-list-name*: Specifies a basic community list name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

advanced *adv-comm-list-name*: Specifies an advanced community list name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

adv-comm-list-num: Specifies an advanced community list number in the range of 100 to 199.

regular-expression: Specifies a regular expression for the advanced community list, a string of 1 to 63 characters. For more information about regular expressions, see *Fundamentals Configuration Guide*.

deny: Specifies the match mode for the community list as **deny**.

permit: Specifies the match mode for the community list as **permit**.

community-number&<1-32>: Specifies a community sequence number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 community sequence numbers.

aa:nn&<1-32>: Specifies a community number. Both *aa* and *nn* are in the range of 0 to 65535. &<1-32> indicates that you can specify a maximum of 32 community numbers.

internet: Specifies the INTERNET community attribute. Routes with this attribute can be advertised to all BGP peers. By default, all routes have this attribute.

no-advertise: Specifies the NO_ADVERTISE community attribute. Routes with this attribute cannot be advertised to other BGP peers.

no-export: Specifies the NO_EXPORT community attribute. Routes with this attribute cannot be advertised out of the local AS or the local confederation but can be advertised to other ASs in the confederation.

no-export-subconfed: Specifies the NO_EXPORT_SUBCONFED community attribute. Routes with this attribute cannot be advertised out of the local AS, or to other sub-ASs in the local confederation.

Examples

Configure basic community list 1 to permit routes with the INTERNET community attribute.

```
<Switch> system-view
[Switch] ip community-list 1 permit internet
```

Configure advanced community list 100 to permit routes with the COMMUNITY attribute starting with 10.

```
<Switch> system-view
[Switch] ip community-list 100 permit ^10
```

Related commands

apply comm-list delete

apply community

display ip community-list

if-match community

11.1.25. ip extcommunity-list

Use **ip extcommunity-list** to configure an extended community list.

Use **undo ip extcommunity-list** to remove an extended community list.

Syntax

ip extcommunity-list *ext-comm-list-number* { **deny** | **permit** } { **rt** *route-target* }&<1-32>

undo ip extcommunity-list *ext-comm-list-number* [{ **deny** | **permit** } [**rt** *route-target*]&<1-32>]

Default

No extended community lists exist.

Views

System view

Predefined user roles

network-admin

Parameters

ext-comm-list-number: Specifies an extended community list number in the range of 1 to 199.

deny: Specifies the match mode for the extended community list as **deny**.

permit: Specifies the match mode for the extended community list as **permit**.

rt *route-target*: Specifies a space-separated list of up to 32 RT extended community attribute items. Each item is a string of 3 to 21 characters.

An RT attribute has the following forms:

- *16-bit AS number*:*32-bit self-defined number*. For example, 101:3. The AS number is in the range of 0 to 65535, and the self-defined number is in the range of 0 to 4294967295.
- *32-bit IP address*:*16-bit self-defined number*. For example, 192.168.122.15:1. The self-defined number is in the range of 0 to 65535.
- *32-bit AS number*:*16-bit self-defined number*. For example, 70000:3. The AS number is in the range of 65536 to 4294967295, and the self-defined number is in the range of 0 to 65535.

Examples

Configure extended community list 1 to permit routes with RT 200:200 to pass.

```
<Switch> system-view
[Switch] ip extcommunity-list 1 permit rt 200:200
```

Related commands

apply extcommunity

display ip extcommunity-list

if-match extcommunity

11.1.26. route-policy

Use **route-policy** to create a routing policy and a node and enter routing policy node view, or enter the view of an existing routing policy node.

Use **undo route-policy** to remove a routing policy or a node of it.

Syntax

route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

undo route-policy *route-policy-name* [**deny** | **permit**] [**node** *node-number*]

Default

No routing policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

route-policy-name: Specifies a routing policy name, a case-sensitive string of 1 to 63 characters.

deny: Specifies the deny match mode for the routing policy node. If a route matches all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not match any **if-match** clauses of the node, the route is compared with the next node.

permit: Specifies the permit match mode for the routing policy node. If a route matches all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. If a route does not match any **if-match** clauses of the node, the route is compared with the next node.

node *node-number*: Specifies a node number in the range of 0 to 65535. A node with a smaller number is matched first.

Usage guidelines

Use a routing policy to filter routing information. A routing policy can contain several nodes and each node contains a set of **if-match** and **apply** clauses. The **if-match** clauses define the match criteria of the node and the **apply** clauses define the actions to be taken on packets matching the criteria. The relation between the **if-match** clauses of a node is logical AND. All the **if-match** clauses must be met. The relation between nodes is logical OR. A packet passing a node passes the routing policy. If a packet does not pass any nodes, the packet does not pass the routing policy.

Examples

Create node 10 in **permit** mode for routing policy **policy1** and enter routing policy node view.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10]
```

Related commands

display route-policy

11.2. IPv4 routing policy commands

11.2.1. apply ip-address next-hop

Use **apply ip-address next-hop** to set a next hop for IPv4 routes.

Use **undo apply ip-address next-hop** to restore the default.

Syntax

apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

undo apply ip-address next-hop

Default

No next hop is set for IPv4 routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the next hop IP address.

public: Specifies the public network.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you use this command to set a next hop for redistributed routes, the configuration does not take effect.

If you do not specify the **public** keyword and the **vpn-instance** *vpn-instance-name* option, the next hop belongs to the public network.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set next hop 193.1.1.8 for routes matching prefix list 100.

```
<Switch> system-view
[Switch] ip prefix-list 100 permit 192.168.10.1 24
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match ip address prefix-list 100
[Switch-route-policy-policy1-10] apply ip-address next-hop 193.1.1.8
```

11.2.2. display ip prefix-list

Use **display ip prefix-list** to display IPv4 prefix list statistics.

Syntax

display ip prefix-list [**name** *prefix-list-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all IPv4 prefix lists.

Examples

Display the statistics for IPv4 prefix list **abc**.

```
<Switch> display ip prefix-list name abc
Prefix-list: abc
 Permitted 0
 Denied 0
        index: 10        Deny   6.6.6.0/24              ge  26  le  28
```

Table 11-5 Command output

Field	Description
Prefix-list	Name of the IPv4 prefix list.
Permitted	Number of routes matching the criterion.
Denied	Number of routes not matching the criterion.
index	Index of an item.
deny	Match mode of the item: • **Permit**. • **Deny**.
6.6.6.0/24	IP address and mask.
ge	Greater-equal, the lower mask length limit.
le	Less-equal, the upper mask length limit.

Related commands

ip prefix-list

reset ip prefix-list

11.2.3. if-match ip

Use **if-match ip** to match IPv4 routes whose destination, next hop, or source address matches an ACL or IPv4 prefix list.

Use **undo if-match ip** to remove the specified ACL or IPv4 prefix list match criterion.

Syntax

if-match ip { **address** | **next-hop** | **route-source** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

undo if-match ip { **address** | **next-hop** | **route-source** } [**acl** | **prefix-list**]

Default

No ACL or IPv4 prefix list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

address: Matches the destination address of IPv4 routes.

next-hop: Matches the next hop of IPv4 routes.

route-source: Matches the source address of BGP routes. This keyword corresponds to the **Neighbor** field in the output from the **display ip routing-table verbose** command.

acl *ipv4-acl-number*: Specifies an ACL by its number. The value range for the *ipv4-acl-number* argument is 2000 to 3999 for the **address** keyword, and 2000 to 2999 for the **next-hop** keyword and **route-source** keyword.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters.

Examples

Configure node 10 of routing policy **policy1** to match IPv4 routes whose next hop matches IP prefix list **p1**.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match ip next-hop prefix-list p1
```

11.2.4. ip prefix-list

Use **ip prefix-list** to configure an IPv4 prefix list or an item for the list.

Use **undo ip prefix-list** to remove an IPv4 prefix list or an item of it.

Syntax

ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

undo ip prefix-list *prefix-list-name* [**index** *index-number*]

Default

No IPv4 prefix lists exist.

Views

System view

Predefined user roles

network-admin

Parameters

prefix-list-name: Specifies an IPv4 prefix list name, a case-sensitive string of 1 to 63 characters.

index *index-number*: Specifies an index number for an IPv4 prefix list item, in the range of 1 to 65535. An item with a smaller index number is matched first. If you do not specify this option, the index number starts from 10 and increments by 10 for each of the consecutive prefix list items.

deny: Specifies the deny mode. If a route matches the item, the route is denied without being compared with the next item. If a route does not match the item, the route is compared with the next item.

permit: Specifies the permit mode. If a route matches the item, it passes the IPv4 prefix list. If a route does not match the item, the route is compared with the next item.

ip-address mask-length: Specifies an IPv4 prefix and mask length. The value range for the *mask-length* argument is 0 to 32.

greater-equal *min-mask-length*, **less-equal** *max-mask-length*: Specifies a prefix length range. The **greater-equal** keyword means "greater than or equal to" and the **less-equal** keyword means "less than or equal to." The prefix length range relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 32.

- If only the *min-mask-length* argument is specified, the prefix length range is [*min-mask-length*, 32].
- If only the *max-mask-length* argument is specified, the prefix length range is [*mask-length*, *max-mask-length*].
- If both the *min-mask-length* and *max-mask-length* arguments are specified, the prefix length range is [*min-mask-length*, *max-mask-length*].

Usage guidelines

An IPv4 prefix list is used to filter IPv4 addresses. It can contain multiple items, each of which specifies a range of IPv4 prefixes. The relation between the items is logical OR. If an item is passed, the IPv4 prefix list is passed. If no item is passed, the IP prefix list cannot be passed.

If both the *ip-address* and *mask-length* arguments are specified as 0.0.0.0 0, only the default route will be matched.

To match all routes, use 0.0.0.0 0 **less-equal** 32.

Examples

Configure IP prefix list **p1** to permit routes destined for network 10.0.0.0/8 and with mask length 17 or 18.

```
<Switch> system-view
[Switch] ip prefix-list p1 permit 10.0.0.0 8 greater-equal 17 less-equal 18
```

Related commands

display ip prefix-list

reset ip prefix-list

11.2.5. reset ip prefix-list

Use **reset ip prefix-list** to clear IPv4 prefix list statistics.

Syntax

reset ip prefix-list [*prefix-list-name*]

Views

User view

Predefined user roles

network-admin

Parameters

prefix-list-name: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics for all IPv4 prefix lists.

Examples

Clear the statistics for IPv4 prefix list **abc**.

```
<Switch> reset ip prefix-list abc
```

Related commands

display ip prefix-list

11.3. IPv6 routing policy commands

11.3.1. apply ipv6 next-hop

Use **apply ipv6 next-hop** to set a next hop for IPv6 routes.

Use **undo apply ipv6 next-hop** to restore the default.

Syntax

apply ipv6 next-hop *ipv6-address*

undo apply ipv6 next-hop

Default

No next hop is set for IPv6 routes.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the next hop IPv6 address.

Usage guidelines

If you use this command to set a next hop for redistributed routes, the configuration does not take effect.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set next hop 3ffe:506::1 for IPv6 routes matching prefix list 100.

```
<Switch> system-view
[Switch] ipv6 prefix-list 100 permit 2::2 64
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match ipv6 address prefix-list 100
[Switch-route-policy-policy1-10] apply ipv6 next-hop 3ffe:506::1
```

11.3.2. display ipv6 prefix-list

Use **display ipv6 prefix-list** to display IPv6 prefix list statistics.

Syntax

display ipv6 prefix-list [**name** *prefix-list-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all IPv6 prefix lists.

Examples

Display the statistics for all IPv6 prefix lists.

```
<Switch> display ipv6 prefix-list
Prefix-list6: 666
 Permitted 0
 Denied 0
        index: 10        Permit 6::/64                  ge  66  le  88
```

Table 11-6 Command output

Field	Description
Prefix-list6	Name of the IPv6 prefix list.
Permitted	Number of routes matching the criterion.
Denied	Number of routes not matching the criterion.
index	Index number of an item.
permit	Match mode of the item: • **Permit**. • **Deny**.
6::/64	IPv6 address and prefix length for matching.
ge	Greater-equal, the lower prefix length limit.
le	Less-equal, the upper prefix length limit.

Related commands

ipv6 prefix-list

reset ipv6 prefix-list

11.3.3. if-match ipv6

Use **if-match ipv6** to match IPv6 routes whose destination, next hop, or source address matches an ACL or IPv6 prefix list.

Use **undo if-match ipv6** to remove the specified ACL or IPv6 prefix list match criterion.

Syntax

if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name*

undo if-match ipv6 { **address** | **next-hop** | **route-source** } [**acl** | **prefix-list**]

Default

No ACL or IPv6 prefix list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

Parameters

address: Matches the destination address of IPv6 routes.

next-hop: Matches the next hop of IPv6 routes.

route-source: Matches the source address of IPv6 routes.

acl *ipv6-acl-number*: Specifies an IPv6 ACL by its number. The value range for the *ipv6-acl-number* argument is 2000 to 3999 for the **address** keyword, and 2000 to 2999 for the **next-hop** and **route-source** keywords.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

Examples

Configure node 10 of routing policy **policy1** to permit routes whose next hop matches IPv6 prefix list **p1**.

```
<Switch> system-view
[Switch] route-policy policy1 permit node 10
[Switch-route-policy-policy1-10] if-match ipv6 next-hop prefix-list p1
```

11.3.4. ipv6 prefix-list

Use **ipv6 prefix-list** to configure an IPv6 prefix list or an item for it.

Use **undo ipv6 prefix-list** to remove an IPv6 prefix list or an item.

Syntax

ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] | **inverse** *inverse-prefix-length* }

undo ipv6 prefix-list *prefix-list-name* [**index** *index-number*]

Default

No IPv6 prefix lists exist.

Views

System view

Predefined user roles

network-admin

Parameters

prefix-list-name: Specifies an IPv6 prefix list name, a case-sensitive string of 1 to 63 characters.

index *index-number*: Specifies an index number for an IPv6 prefix list item, in the range of 1 to 65535. An item with a smaller index number is matched first. If you do not specify this option, the index number starts from 10 and increments by 10 for each of the consecutive IPv6 prefix list items.

deny: Specifies the deny mode. If a route matches the item, the route is denied without being compared with the next item. If a route does not match the item, the route is compared with the next item.

permit: Specifies the permit mode. If a route matches the item, it passes the IPv6 prefix list. If a route does not match the item, the route is compared with the next item.

ipv6-address: Specifies an IPv6 address.

prefix-length: Specifies the IPv6 prefix length. The value range for the *prefix-length* argument is 0 to 128.

greater-equal *min-mask-length*, **less-equal** *max-mask-length*: Specifies a prefix length range. The **greater-equal** keyword means "greater than or equal to" and the **less-equal** keyword means "less than or equal to."

The prefix length range relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 128.

- If only the *min-prefix-length* argument is specified, the prefix length range is [*min-prefix-length*, 128].
- If only the *max-prefix-length* argument is specified, the prefix length range is [*prefix-length*, *max-prefix-length*].
- If both the *min-prefix-length* and *max-prefix-length* arguments are specified, the prefix length range is [*min-prefix-length*, *max-prefix-length*].

inverse *inverse-prefix-length*: Matches IPv6 addresses from the least significant bit to the specified length. The value range for the *inverse-prefix-length* argument is 1 to 128.

Usage guidelines

An IPv6 prefix list is used to filter IPv6 addresses. An IPv6 prefix list can have multiple items, and each of them specifies a range of IPv6 prefixes. The relation between the items is logical OR. A route passing an item passes the IPv6 prefix list. A route passing no item does not pass the IPv6 prefix list.

If the *ipv6-address prefix-length* argument is specified as :: 0, only the default route matches.

To match all routes, configure :: 0 **less-equal** 128.

Examples

Permit IPv6 addresses with a mask length between 32 bits and 64 bits.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc permit :: 0 greater-equal 32 less-equal 64
```

Deny IPv6 addresses with a prefix 3FFE:D00::/32 and a prefix length greater than or equal to 32 bits.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc deny 3FFE:D00:: 32 less-equal 128
```

Related commands

display ipv6 prefix-list

reset ipv6 prefix-list

11.3.5. reset ipv6 prefix-list

Use **reset ipv6 prefix-list** to clear IPv6 prefix list statistics.

Syntax

reset ipv6 prefix-list [*prefix-list-name*]

Views

User view

Predefined user roles

network-admin

Parameters

prefix-list-name: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics for all IPv6 prefix lists.

Examples

Clear the statistics for IPv6 prefix list **abc**.

```
<Switch> reset ipv6 prefix-list abc
```

1. IGMP snooping commands

1.1. IGMP snooping commands

1.1.1. display igmp-snooping

Use **display igmp-snooping** to display IGMP snooping status.

Syntax

display igmp-snooping [**global** | **vlan** *vlan-id* | **vsi** *vsi-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global IGMP snooping status.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify any parameters, this command displays the global IGMP snooping status and the IGMP snooping status in all VLANs and VSIs.

Examples

MEMO:

Do not care about the contents of Global-enable. Even if Global-enable is Disabled, IGMP snooping is globally enabled. If it is globally disabled, "IGMP snooping is not configured." will be displayed.

Display the global IGMP snooping status and the IGMP snooping status for all VLANs and VSIs.

```
<Switch> display igmp-snooping
IGMP snooping information: Global
 Global-enable: Disabled
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-member-query-interval: 1s
 Report-aggregation: Enabled
 Host-tracking: Disabled
 Dot1p-priority: --

IGMP snooping information: VLAN 1
 IGMP snooping: Enabled
```

```
 Drop-unknown: Disabled
 Version: 2
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-member-query-interval: 1s
 Querier: Enabled (IP: 1.1.1.1, Expires: 00:02:05)
 Querier-election: Enabled
 Query-interval: 125s
 General-query source IP: 1.1.1.1
 Special-query source IP: 2.2.2.2
 Report source IP: 3.0.0.3
 Leave source IP: 1.0.0.1
 Host-tracking: Disabled
 Dot1p-priority: 2
 Proxy: Disabled

IGMP snooping information: VLAN 10
 IGMP snooping: Enabled
 Drop-unknown: Enabled
 Version: 3
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-member-query-interval: 1s
 Querier: Enabled (IP: 1.1.1.1, Expires: 00:02:05)
 Querier-election: Enabled
 Query-interval: 125s
 General-query source IP: 1.1.1.1
 Special-query source IP: 2.2.2.2
 Report source IP: 3.0.0.3
 Leave source IP: 1.0.0.1
 Host-tracking: Disabled
 Dot1p-priority: --
 Proxy: Disabled

IGMP snooping information: VSI aaa
 IGMP snooping: Enabled
 Drop-unknown: Enabled
 Version: 2
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-member-query-interval: 1s
 Querier: Disabled
 Querier-election: Disabled
 Query-interval: 125s
 General-query source IP: 1.1.1.1
```

```
Special-query source IP: 2.2.2.2
```

Table 1-1 Command output

Field	Description
Global-enable	Do not care about the contents of Global-enable. Even if Global-enable is Disabled, IGMP snooping is globally enabled.
IGMP snooping	IGMP snooping status in a VLAN or VSI: • **Enabled**. • **Disabled**.
Drop-unknown	Status of dropping unknown multicast data: • Enabled. • Disabled.
Version	IGMP snooping version.
Host-aging-time	Aging timer for the dynamic member port.
Router-aging-time	Aging timer for the dynamic router port.
Max-response-time	Maximum response time for IGMP general queries.
Last-member-query-interval	Interval for sending IGMP group-specific queries.
Report-aggregation	Status of IGMP report suppression: • Enabled. • Disabled.
Dot1p-priority	802.1p priority for IGMP messages. If the priority is not configured, this field displays two hyphens (--).
Querier	Status of IGMP snooping querier: • Enabled. • Disabled.
(IP: 1.1.1.1, Expires: 00:02:05)	IGMP snooping querier information: • **IP**—IP address of the IGMP snooping querier. • **Expire**—Remaining aging time for the IGMP snooping querier. This field is not displayed if IGMP snooping querier election is disabled.
Querier-election	Status of IGMP snooping querier election: • Enabled. • Disabled.
Query-interval	Interval for sending IGMP general queries.
General-query source IP	Source IP address of IGMP general queries.
Special-query source IP	Source IP address of IGMP group-specific queries.
Report source IP	Source IP address of IGMP reports.
Leave source IP	Source IP address of IGMP leave messages.
Host-tracking	Status of host tracking: • Enabled • Disabled.
Proxy	Status of IGMP snooping proxying:

Field	Description
	• Enabled. • Disabled.

1.1.2. display igmp-snooping group

Use **display igmp-snooping group** to display information about dynamic IGMP snooping group entries.

Syntax

display igmp-snooping group [*group-address* | *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about dynamic IGMP snooping group entries for all multicast groups.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about dynamic IGMP snooping group entries for all multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about dynamic IGMP snooping group entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about dynamic IGMP snooping group entries for all VSIs.

verbose: Displays detailed information about dynamic IGMP snooping group entries. If you do not specify this keyword, the command displays brief information about dynamic IGMP snooping group entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about dynamic IGMP snooping group entries for the master device.

Examples

Display detailed information about dynamic IGMP snooping group entries for VLAN 2.

```
<Switch> display igmp-snooping group vlan 2 verbose
Total 1 entries.

VLAN 2: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: local port
    FSM information: dummy
```

```
    Host slots (0 in total):
    Host ports (1 in total):
      GE1/0/2                          (00:03:23)
```

Display brief information about dynamic IGMP snooping group entries for VSI **aaa**.

```
<Switch> display igmp-snooping group vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (3 in total):
      GE1/0/3 (Link ID 0)              (00:03:35)
      NPW (Link ID 8)                  (00:02:35)
      UPW (Link ID 9)                  (00:01:35)
```

Display detailed information about dynamic IGMP snooping group entries for VSI **bbb**.

```
<Switch> display igmp-snooping group vsi bbb verbose
Total 1 entries.
VSI bbb: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: global port
    FSM information: dummy
    Host slots (0 in total):
    Host ports (2 in total):
      GE1/0/3 (Link ID 0)                        (00:03:35)
        VLAN pairs (1 in total):
          Outer VLAN 5     Inner VLAN 2          (00:03:35)
      Tun0 (VXLAN ID 0)                          (00:03:35)
        VLAN pairs (1 in total):
          Outer VLAN 5     Inner VLAN 2          (00:03:35)
```

Table 1-2 Command output

Field	Description
Total 1 entries	Total number of dynamic IGMP snooping group entries.
VLAN 2: Total 1 entries	Total number of dynamic IGMP snooping group entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of dynamic IGMP snooping group entries in VSI **aaa**.
(0.0.0.0, 224.1.1.1)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Attribute	Entry attribute: • **global port**—The entry has a global port. • **local port**—The entry has a port that resides on the member device for which the information is displayed. • **slot**—The entry has ports that reside on other member devices except the member device for which the information is displayed.
FSM information	Finite state machine information of the entry: • **delete**—The entry attributes have been deleted.

Field	Description
	• **dummy**—The entry is a new temporary entry. • **no info**—No entry exists.
Host slots (0 in total)	Member IDs and total number of the member devices that have member ports, except for the specified member device or the master device when no member device is specified.
Host ports (1 in total)	Member ports, and the total number of member ports.
(00:03:23)	Remaining aging time for the dynamic member port. For a global port (such as Layer 2 aggregate interfaces, ACs, N-PWs, and U-PWs), this field is always displayed. For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
GE1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.
VLAN pairs (1 in total)	VLAN pairs and total number of the VLAN pairs.
Outer VLAN 5 Inner VLAN 2	Outer VLAN ID and inner VLAN ID.

Related commands

reset igmp-snooping group

1.1.3. display igmp-snooping router-port

Use **display igmp-snooping router-port** to display dynamic router port information.

Syntax

display igmp-snooping router-port [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays dynamic router port information for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays dynamic router port information for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays dynamic router port information for the master device.

Examples

Display brief information about dynamic router ports for VLAN 2.

```
<Switch> display igmp-snooping router-port vlan 2
VLAN 2:
  Router ports (2 in total):
    GE1/0/1                                 (00:01:30)
    GE1/0/2                                 (00:00:23)
```

Table 1-3 Command output

Field	Description
VLAN 2	VLAN ID.
VSI aaa	VSI name.
Router slots (0 in total)	Member IDs and total number of the member devices that have dynamic router ports, except for the specified member device or the master device when no member device is specified.
Router ports (2 in total)	Dynamic router ports and total number of dynamic router ports.
(00:01:30)	Remaining aging time for the dynamic router port. For a global port, this field is always displayed. For a global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
GE1/0/3 (Link ID 1)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.
VLAN pairs (1 in total)	VLAN pairs and total number of VLAN pairs.
Outer VLAN 5 Inner VLAN 2	Outer VLAN ID and inner VLAN ID.

Related commands

reset igmp-snooping router-port

1.1.4. display igmp-snooping static-group

Use **display igmp-snooping static-group** to display information about static IGMP snooping group entries.

Syntax

display igmp-snooping static-group [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about static IGMP snooping group entries for all multicast groups.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about static IGMP snooping group entries for all multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about static IGMP snooping group entries for all VLANs.

verbose: Displays detailed information about static IGMP snooping group entries. If you do not specify the keyword, this command displays brief information about static IGMP snooping group entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about static IGMP snooping group entries for the master device.

Examples

Display detailed information about static IGMP snooping group entries for VLAN 2.

```
<Switch> display igmp-snooping static-group vlan 2 verbose
Total 1 entries.

VLAN 2: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: local port
    FSM information: dummy
    Host slots (0 in total):
    Host ports (1 in total):
      GE1/0/2
```

Table 1-4 Command output

Field	Description
Total 1 entries	Total number of static IGMP snooping group entries.
VLAN 2: Total 1 entries	Total number of static IGMP snooping group entries in VLAN 2.
(0.0.0.0, 224.1.1.1)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Attribute	Entry attribute: • **global port**—The entry has a global port. • **local port**—The entry has a port that resides on the member device for which the information is displayed. • **slot**—The entry has ports that reside on other member devices except the member device for which the information is displayed.
FSM information	Finite state machine information of the entry:

Field	Description
	• **delete**—The entry attributes have been deleted. • **dummy**—The entry is a new temporary entry. • **no info**—No entry exists.
Host slots (0 in total)	Member IDs and total number of the member devices that have member ports, except for the specified member device or the master device when no member device is specified.
Host ports (1 in total)	Member ports and total number of member ports.

1.1.5. display igmp-snooping static-router-port

Use **display igmp-snooping static-router-port** to display static router port information.

Syntax

display igmp-snooping static-router-port [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

verbose: Displays detailed information about static router ports. If you do not specify this keyword, the command displays brief information about static router ports.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays static router port information for the master device.

Examples

Display brief information about static router ports for VLAN 2.

```
<Switch> display igmp-snooping static-router-port vlan 2
VLAN 2:
  Router ports (2 in total):
    GE1/0/1
    GE1/0/2
```

Display detailed information about static router ports for VLAN 2.

```
<Switch> display igmp-snooping static-router-port vlan 2 verbose
VLAN 2:
  Router slots (0 in total):
  Router ports (2 in total):
    GE1/0/1
    GE1/0/2
```

Table 1-5 Command output

Field	Description
VLAN 2	VLAN ID.
Router slots (0 in total)	Member IDs and total number of the member devices that have static router ports, except for the specified member device or the master device when no member device is specified.
Router ports (2 in total)	Static router ports and total number of static router ports.

1.1.6. display igmp-snooping statistics

Use **display igmp-snooping statistics** to display statistics for the IGMP messages and PIMv2 hello messages learned through IGMP snooping.

Syntax

display igmp-snooping statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display statistics for the IGMP messages and PIMv2 hello messages learned through IGMP snooping.

```
<Switch> display igmp-snooping statistics
Received IGMP general queries:  0
Received IGMPv1 reports:  0
Received IGMPv2 reports:  19
Received IGMP leaves:  0
Received IGMPv2 specific queries:  0
Sent     IGMPv2 specific queries:  0
Received IGMPv3 reports:  1
Received IGMPv3 reports with right and wrong records:  0
Received IGMPv3 specific queries:  0
Received IGMPv3 specific sg queries:  0
Sent     IGMPv3 specific queries:  0
Sent     IGMPv3 specific sg queries:  0
Received PIMv2 hello:  0
Received error IGMP messages:  19
```

Table 1-6 Command output

Field	Description
general queries	Number of IGMP general queries.
specific queries	Number of IGMP group-specific queries.
reports	Number of IGMP reports.

Field	Description
leaves	Number of IGMP leave messages.
reports with right and wrong records	Number of IGMP reports with correct and incorrect records.
specific sg queries	Number of IGMP group-and-source-specific queries.
PIMv2 hello	Number of PIMv2 hello messages.
error IGMP messages	Number of IGMP messages with errors.

Related commands

reset igmp-snooping statistics

1.1.7. display l2-multicast ip

Use **display l2-multicast ip** to display information about Layer 2 IP multicast groups.

Syntax

display l2-multicast ip [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

network-admin

network-operator

Parameters

group *group-address*: Specifies a multicast group by its IP address. If you do not specify a multicast group, this command displays information about all Layer 2 IP multicast groups.

source *source-address*: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about Layer 2 IP multicast groups for all multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about Layer 2 IP multicast groups for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about Layer 2 IP multicast groups for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about Layer 2 IP multicast groups for the master device.

Examples

Display information about Layer 2 IP multicast groups for VLAN 2.

```
<Switch> display l2-multicast ip vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: static, success
```

```
    Host ports (1 in total):
      GE1/0/1                                 (S, SUC)
```

Display information about Layer 2 IP multicast groups for VSI **aaa**.

```
<Switch> display l2-multicast ip vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: dynamic, success
    Host ports (3 in total):
      GE1/0/1 (Link ID 1)                 (D, SUC)
      NPW (Link ID 8)                     (D, SUC)
      UPW (Link ID 9)                     (D, SUC)
```

Display information about Layer 2 IP multicast groups for VSI **bbb**.

```
<Switch> display l2-multicast ip vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Attribute: dynamic, success
    Host ports (2 in total):
      GE1/0/1 (Link ID 1)                 (D, SUC)
      Tun0 (VXLAN ID 0)                   (D, SUC)
```

Table 1-7 Command output

Field	Description
Total 1 entries	Total number of Layer 2 IP multicast groups.
VLAN 2: Total 1 entries	Total number of Layer 2 IP multicast groups in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 IP multicast groups in VSI **aaa**.
(0.0.0.0, 224.1.1.1)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Attribute	Entry attribute: • **dynamic**—The entry is created by a dynamic protocol. • **static**—The entry is created by a static protocol. • **pim**—The entry is created by PIM. • **kernel**—The entry is obtained from the kernel. • **success**—Processing has succeeded. • **fail**—Processing has failed.
Host ports (1 in total)	Member ports and total number of member ports.
(S, SUC)	Port attribute: • **D**—Dynamic port. • **S**—Static port. • **P**—PIM port. • **K**—Port obtained from the kernel. • **R**—Port learned from (*, *) entries. • **W**—Port learned from (*, G) entries.

Field	Description
	• **SUC**—Processing has succeeded. • **F**—Processing has failed.
GE1/0/1 (Link ID 1)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

1.1.8. display l2-multicast ip forwarding

Use **display l2-multicast ip forwarding** to display Layer 2 multicast IP forwarding entries.

Syntax

display l2-multicast ip forwarding [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Parameters

group *group-address*: Specifies a multicast group by its IP address. If you do not specify a multicast group, this command displays Layer 2 multicast IP forwarding entries for all multicast groups.

source *source-address*: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays Layer 2 multicast IP forwarding entries for all multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays Layer 2 multicast IP forwarding entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays Layer 2 multicast IP forwarding entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays Layer 2 multicast IP forwarding entries for the master device.

Examples

Display Layer 2 multicast IP forwarding entries for VLAN 2.

```
<Switch> display l2-multicast ip forwarding vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (3 in total):
      GigabitEthernet1/0/1
```

```
      GigabitEthernet1/0/2
      GigabitEthernet1/0/3
```

Display Layer 2 IP multicast group entries for VSI **aaa**.

```
<Switch> display l2-multicast ip forwarding vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (3 in total):
      GigabitEthernet1/0/3(Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display information about Layer 2 multicast IP forwarding entries for VSI **bbb**.

```
<Switch> display l2-multicast ip forwarding vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GigabitEthernet1/0/3(Link ID 0)
      Tunnel0 (VXLAN ID 0)
```

Table 1-8 Command output

Field	Description
Total 1 entries	Total number of Layer 2 multicast IP forwarding entries.
VLAN 2: Total 1 entries	Total number of Layer 2 multicast IP forwarding entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 multicast IP forwarding entries in VSI **aaa**.
(0.0.0.0, 224.1.1.1)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Host ports (3 in total)	Member ports and total number of member ports.
GigabitEthernet1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tunnel0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

1.1.9. display l2-multicast mac

Use **display l2-multicast mac** to display information about Layer 2 MAC multicast groups.

Syntax

display l2-multicast mac [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies a MAC multicast group by its multicast MAC address. If you do not specify a MAC multicast group, this command displays information about all Layer 2 MAC multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about Layer 2 MAC multicast groups for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about Layer 2 MAC multicast groups for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about Layer 2 MAC multicast groups for the master device.

Examples

Display information about Layer 2 MAC multicast groups for VLAN 2.

```
<Switch> display l2-multicast mac vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Attribute: success
    Host ports (1 in total):
      GE1/0/1
```

Display information about Layer 2 MAC multicast groups for VSI **aaa**.

```
<Switch> display l2-multicast mac vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Attribute: success
    Host ports (3 in total):
      GE1/0/3 (Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display information about Layer 2 MAC multicast groups for VSI **bbb**.

```
<Switch> display l2-multicast mac vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Attribute: success
    Host ports (2 in total):
```

```
GE1/0/3 (Link ID 0)
Tun0 (VXLAN ID 0)
```

Table 1-9 Command output

Field	Description
Total 1 entries	Total number of Layer 2 MAC multicast groups.
VLAN 2: Total 1 entries	Total number of Layer 2 MAC multicast groups in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 MAC multicast groups in VSI **aaa**.
MAC group address	Address of the MAC multicast group.
Attribute	Entry attribute: • **success**—Processing has succeeded. • **fail**—Processing has failed.
Host ports (1 in total)	Member ports and total number of member ports.
GE1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

1.1.10. display l2-multicast mac forwarding

Use **display l2-multicast mac forwarding** to display Layer 2 multicast MAC forwarding entries.

Syntax

display l2-multicast mac forwarding [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies a MAC multicast group by its MAC address. If you do not specify a MAC multicast group, this command displays Layer 2 multicast MAC forwarding entries for all MAC multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays Layer 2 multicast MAC forwarding entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays Layer 2 MAC forwarding entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays Layer 2 multicast MAC group entries for the master device.

Examples

Display Layer 2 multicast MAC forwarding entries for VLAN 2.

```
<Switch> display l2-multicast mac forwarding vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Host ports (3 in total):
      GigabitEthernet1/0/1
      GigabitEthernet1/0/2
      GigabitEthernet1/0/3
```

Display Layer 2 multicast MAC forwarding entries for VSI **aaa**.

```
<Switch> display l2-multicast mac forwarding vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Host slots (0 in total):
    Host ports (3 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display Layer 2 multicast MAC forwarding entries for VSI **bbb**.

```
<Switch> display l2-multicast mac forwarding vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Host ports (2 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      Tunnel0 (VXLAN ID 0)
```

Table 1-10 Command output

Field	Description
Total 1 entries	Total number of Layer 2 multicast MAC forwarding entries.
VLAN 2: Total 1 entries	Total number of Layer 2 multicast MAC forwarding entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 multicast MAC multicast group entries in VSI **aaa**.
MAC group address	Address of the MAC multicast group.
Host ports (3 in total)	Member ports and total number of member ports.
GigabitEthernet1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tunnel0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

1.1.11. display mac-address [multicast]

Use **display mac-address** [**multicast**] to display static multicast MAC address entries.

Syntax

display mac-address [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies a multicast MAC address. The MAC address can be any legal multicast MAC address except 0100-5Exx-xxxx and 3333-xxxx-xxxx, where "x" represents a hexadecimal number in the range of 0 to F.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays MAC address entries for all VLANs.

multicast: Specifies static multicast MAC address entries.

count: Specifies the number of MAC address entries. If you specify this keyword, the command displays the number of matching MAC address entries. If you do not specify this keyword, the command displays the contents of the matching entries rather than the entry count.

Usage guidelines

If you do not specify any parameters, this command displays all MAC address table entries, including unicast MAC address entries and static multicast MAC address entries.

Examples

Display static multicast MAC address entries for VLAN 2.

```
<Switch> display mac-address multicast vlan 2
MAC Address      VLAN ID    State            Port/NickName            Aging
0100-0001-0001   2          Multicast        GE1/0/1                  N
```

Display the number of static multicast MAC address entries.

```
<Switch> display mac-address multicast count
1 mac address(es) found.
```

Table 1-11 Command output

Field	Description
MAC address	MAC address of a multicast group.
VLAN ID	ID of the VLAN to which the network device identified by the MAC address belongs.
State	Status of the MAC address. If the multicast MAC address entry is static, this field displays **Multicast**.
Port/NickName	Outgoing ports or nickname of the Egress RB in a TRILL network for the packet that is sent to the MAC address in this MAC address entry. For more information about the nickname, TRILL, and RB, see *TRILL Configuration Guide*.

Field	Description
	TRILL is not supported in the current software version.
Aging	Aging timer state. If this entry never expires, this field displays **N**.
1 mac address(es) found	One static multicast MAC address entry is found.

Related commands

mac-address multicast

1.1.12. dot1p-priority (IGMP-snooping view)

Use **dot1p-priority** to set the 802.1p priority for IGMP messages globally.

Use **undo dot1p-priority** to restore the default.

Syntax

dot1p-priority *priority*

undo dot1p-priority

Default

The 802.1p priority for IGMP messages is not configured. For IGMP messages created by the device, the 802.1p priority is 0. For IGMP messages to be forwarded, the device does not change the 802.1p priority.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

priority: Specifies an 802.1p priority for IGMP messages, in the range of 0 to 7. The greater the value, the higher the priority.

Usage guidelines

You can set the 802.1p priority globally for all VLANs and VSIs in IGMP-snooping view or for a VLAN in VLAN view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

Examples

Set the 802.1p priority for IGMP messages to 3 globally.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] dot1p-priority 3
```

Related commands

igmp-snooping dot1p-priority

1.1.13. dscp

Use **dscp** to set the DSCP value for outgoing IGMP snooping protocol packets.

Use **undo dscp** to restore the default.

Syntax

dscp *dscp-value*

undo dscp

Default

The DSCP value is 48 for outgoing IGMP snooping protocol packets.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the ToS field of an IP packet to determine the transmission priority of the packet. A greater DSCP value represents a higher priority.

Examples

Set the DSCP value to 63 for outgoing IGMP snooping protocol packets.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] dscp 63
```

1.1.14. entry-limit (IGMP-snooping view)

Use **entry-limit** to globally set the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries.

Use **undo entry-limit** to restore the default.

Syntax

entry-limit *limit*

undo entry-limit

Default

The maximum number of IGMP snooping forwarding entries is 4294967295.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of IGMP snooping forwarding entries, in the range of 0 to 4294967295.

Examples

Set the global maximum number of IGMP snooping forwarding entries to 512.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] entry-limit 512
```

1.1.15. fast-leave (IGMP-snooping view)

Use **fast-leave** to enable fast-leave processing globally.

Use **undo fast-leave** to disable fast-leave processing globally.

Syntax

fast-leave [**vlan** *vlan-list*]

undo fast-leave [**vlan** *vlan-list*]

Default

Fast-leave processing is disabled.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs and VSIs.

Usage guidelines

The fast-leave processing feature enables the device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave message.

You can enable fast-leave processing globally for all ports in IGMP-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Globally enable fast-leave processing for VLAN 2.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] fast-leave vlan 2
```

Related commands

igmp-snooping fast-leave

1.1.16. group-policy (IGMP-snooping view)

Use **group-policy** to globally configure a multicast group policy to control the multicast groups that hosts can join.

Use **undo group-policy** to globally delete multicast group policies.

Syntax

group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

undo group-policy [**vlan** *vlan-list*]

Default

No multicast group policies exist. Hosts can join any multicast groups.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL by its number in the range of 2000 to 3999. Hosts can join only the multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join multicast groups.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs and VSIs.

Usage guidelines

A multicast group policy filters IGMP reports to control the multicast groups that hosts can join.

This command does not take effect on static member ports, because static member ports do not send IGMP reports.

You can configure a multicast group policy globally for all ports in IGMP-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a multicast group address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a multicast source address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.

  To match the following IGMP reports, set the **source** *source-address source-wildcard* option to 0.0.0.0:

  - IGMPv1 and IGMPv2 reports.
  - IGMPv3 IS_EX and IGMPv3 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

You can configure different ACLs for all ports in different VLANs. If you configure multiple ACLs for all ports in the same VLAN, the most recent configuration takes effect.

Examples

Configure a multicast group policy for VLAN 2 so that hosts in VLAN 2 can join only multicast group 225.1.1.1.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 225.1.1.1 0
[Switch-acl-ipv4-basic-2000] quit
[Switch] igmp-snooping
```

```
[Switch-igmp-snooping] group-policy 2000 vlan 2
```

Related commands

igmp-snooping group-policy

1.1.17. host-aging-time (IGMP-snooping view)

Use **host-aging-time** to set the aging timer for dynamic member ports globally.

Use **undo host-aging-time** to restore the default.

Syntax

host-aging-time *seconds*

undo host-aging-time

Default

The aging timer for dynamic member ports is 260 seconds.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic member ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You can set the timer globally for all VLANs and VSIs in IGMP-snooping view, for a VSI in VSI view, or for a VLAN in VLAN view. For a VSI, the VSI-specific configuration takes priority over the global configuration. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting multicast group members, set the aging timer for dynamic member ports to be greater than the value calculated by using the following formula:

[IGMP general query interval] + [maximum response time for IGMP general queries]

As a best practice, set the aging timer of dynamic member ports to the value calculated by using the following formula:

[IGMP general query interval] × 2 + [maximum response time for IGMP general queries]

Examples

Set the global aging timer for dynamic member ports to 300 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] host-aging-time 300
```

Related commands

igmp-snooping host-aging-time

1.1.18. igmp-snooping

Use **igmp-snooping** to enable the IGMP snooping feature and enter IGMP-snooping view.

Use **undo igmp-snooping** to disable the IGMP snooping feature.

Syntax

igmp-snooping

undo igmp-snooping

After enabling IGMP snooping globally, enable IGMP snooping on the VLANs you use. For IGMP snooping settings, see Section 6 *IP Multicast "IGMP Snooping"* in the Configuration Guides.

Default

The IGMP snooping feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If you disable the IGMP snooping feature, IGMP snooping is disabled in all VLANs and VSIs.

Examples

Enable the IGMP snooping feature and enter IGMP-snooping view.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping]
```

Related commands

igmp-snooping enable

1.1.19. igmp-snooping dot1p-priority

Use **igmp-snooping dot1p-priority** to set the 802.1p priority for IGMP messages in a VLAN.

Use **undo igmp-snooping dot1p-priority** to restore the default.

Syntax

igmp-snooping dot1p-priority *priority*

undo igmp-snooping dot1p-priority

Default

The 802.1p priority for IGMP messages is not configured. For IGMP messages created by the device, the 802.1p priority is 0. For IGMP messages to be forwarded, the device does not change the 802.1p priority.

Views

VLAN view

Predefined user roles

network-admin

Parameters

priority: Specifies an 802.1p priority for IGMP messages, in the range of 0 to 7. The greater the value, the higher the priority.

Usage guidelines

You must enable IGMP snooping for a VLAN before you execute this command.

You can set the 802.1p priority for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Examples

In VLAN 2, enable IGMP snooping, and set the 802.1p priority for IGMP messages to 3.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping dot1p-priority 3
```

Related commands

dot1p-priority (IGMP-snooping view)

igmp-snooping enable

1.1.20. igmp-snooping drop-unknown

Use **igmp-snooping drop-unknown** to enable dropping unknown multicast data packets for a VLAN or VSI.

Use **undo igmp-snooping drop-unknown** to disable dropping unknown multicast data packets for a VLAN or VSI.

Syntax

igmp-snooping drop-unknown

undo igmp-snooping drop-unknown

Default

Dropping unknown multicast data packets is disabled. Unknown multicast data packets are flooded.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

Examples

In VLAN 2, enable IGMP snooping, and enable dropping unknown multicast data packets.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
```

```
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping drop-unknown
```

In VSI **aaa**, enable IGMP snooping, and enable dropping unknown multicast data packets.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping drop-unknown
```

Related commands

igmp-snooping enable

1.1.21. igmp-snooping enable

Use **igmp-snooping enable** to enable IGMP snooping for a VLAN or VSI.

Use **undo igmp-snooping** to disable IGMP snooping for a VLAN or VSI.

Syntax

igmp-snooping enable

undo igmp-snooping

After enabling IGMP snooping globally, enable IGMP snooping on the VLANs you use. For IGMP snooping settings, see Section 6 *IP Multicast "IGMP Snooping"* in the Configuration Guides.

Default

IGMP snooping is disabled for a VLAN or VSI.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Usage guidelines

You must enable the IGMP snooping feature by using the **igmp-snooping** command before you enable IGMP snooping for a VLAN or VSI.

You can enable IGMP snooping for a VLAN by using this command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view, and the most recent configuration takes effect.

Examples

Enable the IGMP snooping feature, and then enable IGMP snooping for VLAN 2.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
```

Enable the IGMP snooping feature, and then enable IGMP snooping for VSI **aaa**.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
```

Related commands

igmp-snooping

1.1.22. igmp-snooping fast-leave

Use **igmp-snooping fast-leave** to enable fast-leave processing on a port.

Use **undo igmp-snooping fast-leave** to disable fast-leave processing on a port.

Syntax

igmp-snooping fast-leave [**vlan** *vlan-list*]

undo igmp-snooping fast-leave [**vlan** *vlan-list*]

Default

Fast-leave processing is disabled on a port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

The fast-leave processing feature enables the device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave message.

You can enable fast-leave processing for a port in interface view or globally for all ports in IGMP-snooping view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Enable fast-leave processing for VLAN 2 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping fast-leave vlan 2
```

Related commands

fast-leave (IGMP-snooping view)

1.1.23. igmp-snooping general-query source-ip

Use **igmp-snooping general-query source-ip** to configure the source IP address for IGMP general queries.

Use **undo igmp-snooping general-query source-ip** to restore the default.

Syntax

igmp-snooping general-query source-ip *ip-address*

undo igmp-snooping general-query source-ip

Default

In a VLAN, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

In a VSI, the source IP address of IGMP general queries is the IP address of the gateway interface for the VSI. If the gateway interface does not have an interface, the source IP address is 0.0.0.0.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address for IGMP general queries.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

Examples

In VLAN 2, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP general queries.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping general-query source-ip 10.1.1.1
```

In VSI **aaa**, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP general queries.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping general-query source-ip 10.1.1.1
```

Related commands

igmp-snooping enable

1.1.24. igmp-snooping group-limit

Use **igmp-snooping group-limit** to set the maximum number of multicast groups that a port can join.

Use **undo igmp-snooping group-limit** to remove the limit on the maximum number of multicast groups that a port can join.

Syntax

igmp-snooping group-limit *limit* [**vlan** *vlan-list*]

undo igmp-snooping group-limit [**vlan** *vlan-list*]

Default

No limit is placed on the maximum number of multicast groups that a port can join.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of multicast groups that a port can join, in the range of 0 to 4294967295.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

This command takes effect only on the multicast groups that a port joins dynamically.

Examples

On GigabitEthernet 1/0/1, set the maximum number of multicast groups the port can join in VLAN 2 to 10.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping group-limit 10 vlan 2
```

1.1.25. igmp-snooping group-policy

Use **igmp-snooping group-policy** to configure a multicast group policy on a port to control the multicast groups that hosts attached to the port can join.

Use **undo igmp-snooping group-policy** to delete multicast group policies on a port.

Syntax

igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

undo igmp-snooping group-policy [**vlan** *vlan-list*]

Default

No multicast group polices exist on a port. Hosts attached to the port can join any multicast groups.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL by its number in the range of 2000 to 3999. Hosts can join only the multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join multicast groups.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

A multicast group policy filters IGMP reports to control the multicast groups that hosts can join.

This command does not take effect on static member ports, because static member ports do not send IGMP reports.

You can configure a multicast group policy for a port in interface view or globally for all ports in IGMP-snooping view. For a port, the port-specific configuration takes priority over the global configuration.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a multicast group address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a multicast source address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.

  To match the following IGMP reports, set the **source** *source-address source-wildcard* option to 0.0.0.0:

  - IGMPv1 and IGMPv2 reports.
  - IGMPv3 IS_EX and IGMPv3 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

You can configure different ACLs on a port for different VLANs. If you configure multiple ACLs on a port for the same VLAN, the most recent configuration takes effect.

Examples

On GigabitEthernet 1/0/1, configure a multicast group policy for VLAN 2 so that hosts in VLAN 2 can join only multicast group 225.1.1.1.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 225.1.1.1 0
[Switch-acl-ipv4-basic-2000] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping group-policy 2000 vlan 2
```

Related commands

group-policy (IGMP-snooping view)

1.1.26. igmp-snooping host-aging-time

Use **igmp-snooping host-aging-time** to set the aging timer for dynamic member ports in a VLAN or VSI.

Use **undo igmp-snooping host-aging-time** to restore the default.

Syntax

igmp-snooping host-aging-time *seconds*

undo igmp-snooping host-aging-time

Default

The aging timer for dynamic member ports is 260 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic member ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

You can set the timer for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting multicast group members, set the aging timer for dynamic member ports to be greater than the value calculated by using the following formula:

[IGMP general query interval] + [maximum response time for IGMP general queries]

As a best practice, set the aging timer of dynamic member ports to the value calculated by using the following formula:

[IGMP general query interval] × 2 + [maximum response time for IGMP general queries]

Examples

In VLAN 2, enable IGMP snooping, and set the aging timer for dynamic member ports to 300 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping host-aging-time 300
```

In VSI **aaa**, enable IGMP snooping, and set the aging timer for dynamic member ports to 300 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping host-aging-time 300
```

Related commands

host-aging-time (IGMP-snooping view)

igmp-snooping enable

1.1.27. igmp-snooping host-join

Use **igmp-snooping host-join** to configure a port as a simulated member host for a multicast group.

Use **undo igmp-snooping host-join** to remove the configuration of a simulated member host for a multicast group.

Syntax

igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

undo igmp-snooping host-join { *group-address* [**source-ip** *source-address*] **vlan** *vlan-id* | **all** }

Default

A port is not configured as a simulated member host for multicast groups.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group in the range of 224.0.1.0 to 239.255.255.255.

source-ip *source-address*: Specifies a multicast source by its IP address. If you specify a multicast source, this command configures the port as a simulated member host for a multicast source and group. If you do not specify a multicast source, this command configures the port as a simulated member host for a multicast group. This option takes effect on IGMPv3 snooping devices.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

all: Specifies all multicast groups.

Usage guidelines

The version of IGMP running on a simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Examples

Configure GigabitEthernet 1/0/1 as a simulated member host of the multicast source and group (1.1.1.1, 232.1.1.1) in VLAN 2.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping version 3
[Switch-vlan2] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping host-join 232.1.1.1 source-ip 1.1.1.1 vlan
2
```

1.1.28. igmp-snooping last-member-query-interval

Use **igmp-snooping last-member-query-interval** to set the IGMP last member query interval for a VLAN or VSI.

Use **undo igmp-snooping last-member-query-interval** to restore the default.

Syntax

igmp-snooping last-member-query-interval *interval*

undo igmp-snooping last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

You can set the interval for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

Examples

In VLAN 2, enable IGMP snooping, and set the IGMP last member query interval to 3 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
```

```
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping last-member-query-interval 3
```

In VSI **aaa**, enable IGMP snooping, and set the IGMP last member query interval to 3 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping last-member-query-interval 3
```

Related commands

1.1.29. igmp-snooping leave source-ip

Use **igmp-snooping leave source-ip** to configure the source IP address for IGMP leave messages.

Use **undo igmp-snooping leave source-ip** to restore the default.

Syntax

igmp-snooping leave source-ip *ip-address*

undo igmp-snooping leave source-ip

Default

In a VLAN, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

In a VSI, the source IP address of IGMP leave messages is the IP address of the gateway interface for the VSI. If the gateway interface does not have an IP address, the source IP address is 0.0.0.0.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address for IGMP leave messages.

Usage guidelines

You must enable IGMP snooping for a VLAN before you execute this command.

Examples

In VLAN 2, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP leave messages.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
```

```
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping leave source-ip 10.1.1.1
```

In VSI **aaa**, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP leave messages.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit

1.1.30. igmp-snooping max-response-time

Use **igmp-snooping max-response-time** to set the maximum response time for IGMP general queries in a VLAN or VSI.

Use **undo igmp-snooping max-response-time** to restore the default.

Syntax

igmp-snooping max-response-time *seconds*

undo igmp-snooping max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

seconds: Specifies the maximum response time for IGMP general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

You can set the time for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting multicast group members, set the maximum response time for IGMP general queries to be less than the IGMP general query interval.

Examples

In VLAN 2, enable IGMP snooping, and set the maximum response time for IGMP general queries to 5 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping max-response-time 5
```

In VSI **aaa**, enable IGMP snooping, and set the maximum response time for IGMP general queries to 5 seconds.

```
<Switch> system-view

1.1.36. igmp-snooping router-aging-time

Use **igmp-snooping router-aging-time** to set the aging timer for dynamic router ports in a VLAN or VSI.

Use **undo igmp-snooping router-aging-time** to restore the default.

Syntax

igmp-snooping router-aging-time *seconds*

undo igmp-snooping router-aging-time

Default

The aging timer for dynamic router ports is 260 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic router ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

You can set the timer for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

Examples

In VLAN 2, enable IGMP snooping, and set the aging timer for dynamic router ports to 100 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping router-aging-time 100
```

In VSI **aaa**, enable IGMP snooping, and set the aging timer for dynamic router ports to 100 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping router-aging-time 100
```

Related commands

1.1.37. igmp-snooping source-deny

Use **igmp-snooping source-deny** to enable multicast source port filtering on a port to discard all multicast data packets.

Use **undo igmp-snooping source-deny** to disable multicast source port filtering on a port.

Syntax

igmp-snooping source-deny

undo igmp-snooping source-deny

Default

Multicast source port filtering is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

You can enable this feature for a port in interface view or for the specified ports in IGMP-snooping view. For a port, the configuration in interface view has the same priority as the configuration in IGMP-snooping view, and the most recent configuration takes effect.

Examples

Enable source port filtering for multicast data on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping source-deny
```

Related commands

source-deny (IGMP-snooping view)

1.1.38. igmp-snooping special-query source-ip

Use **igmp-snooping special-query source-ip** to configure the source IP address for IGMP group-specific queries.

Use **undo igmp-snooping special-query source-ip** to restore the default.

Syntax

igmp-snooping special-query source-ip *ip-address*

undo igmp-snooping special-query source-ip

Default

In a VLAN, the source IP address of IGMP group-specific queries is one of the following:

- The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
- The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
- 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

In a VSI, the source IP address of IGMP group-specific queries is one of the following:

- The source IP address of IGMP general queries if the IGMP snooping querier of the VSI has received IGMP general queries.
- The IP address of the gateway interface for the VSI if the IGMP snooping querier does not receive an IGMP general query.
- 0.0.0.0 if the gateway interface for the VSI does not have an IP address.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address for IGMP group-specific queries.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

Examples

In VLAN 2, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP group-specific queries.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping special-query source-ip 10.1.1.1
```

In VSI **aaa**, enable IGMP snooping, and specify 10.1.1.1 as the source IP address of IGMP group-specific queries.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping special-query source-ip 10.1.1.1
```

Related commands

igmp-snooping enable

1.1.39. igmp-snooping static-group

Use **igmp-snooping static-group** to configure a port as a static member port of a multicast group.

Use **undo igmp-snooping static-group** to remove the configuration of static member ports.

Syntax

igmp-snooping static-group *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

undo igmp-snooping static-group { *group-address* [**source-ip** *source-address*] **vlan** *vlan-id* | **all** }

Default

A port is not a static member port of a multicast group.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

source-ip *source-address*: Specifies a multicast source by its IP address. If you specify a multicast source, this command configures the port as a static member port for a multicast source and group. If you do not specify a multicast source, this command configures the port as a static member port for a multicast group. This option takes effect on IGMPv3 snooping devices.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

all: Specifies all multicast groups.

Examples

Configure GigabitEthernet 1/0/1 as a static member port of the multicast source and group (1.1.1.1, 225.0.0.1) in VLAN 2.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping version 3
[Switch-vlan2] quit
[Switch] interface GigabitEthernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping static-group 225.0.0.1 source-ip 1.1.1.1
vlan 2
```

1.1.40. igmp-snooping static-router-port

Use **igmp-snooping static-router-port** to configure a port as a static router port.

Use **undo igmp-snooping static-router-port** to remove the configuration of static router ports.

Syntax

igmp-snooping static-router-port vlan *vlan-id*

undo igmp-snooping static-router-port { **all** | **vlan** *vlan-id* }

Default

A port is not a static router port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

all: Specifies all VLANs.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

Examples

Configure GigabitEthernet 1/0/1 as a static router port in VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] igmp-snooping static-router-port vlan 2
```

1.1.41. igmp-snooping version

Use **igmp-snooping version** to specify an IGMP snooping version for a VLAN or VSI.

Use **undo igmp-snooping version** to restore the default.

Syntax

igmp-snooping version *version-number*

undo igmp-snooping version

Default

The IGMP snooping version in a VLAN or VSI is 2.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

version-number: Specifies an IGMP snooping version, 2 or 3.

Usage guidelines

You must enable IGMP snooping for a VLAN or VSI before you execute this command.

You can specify the version for a VLAN in VLAN view or for the specified VLANs in IGMP-snooping view. The VLAN-specific configuration has the same priority as the configuration in IGMP-snooping view, and the most recent configuration takes effect.

Examples

In VLAN 2, enable IGMP snooping, and specify IGMP snooping version 3.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 2
[Switch-vlan2] igmp-snooping enable
[Switch-vlan2] igmp-snooping version 3
```

In VSI **aaa**, enable IGMP snooping, and specify IGMP snooping version 3.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] igmp-snooping enable
[Switch-vsi-aaa] igmp-snooping version 3
```

Related commands

igmp-snooping enable

1.1.42. last-member-query-interval (IGMP-snooping view)

Use **last-member-query-interval** to set the IGMP last member query interval globally.

Use **undo last-member-query-interval** to restore the default.

Syntax

last-member-query-interval *interval*

undo last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the interval for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP last member query interval to 3 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] last-member-query-interval 3
```

Related commands

igmp-snooping last-member-query-interval

1.1.43. mac-address multicast

Use **mac-address multicast** to configure a static multicast MAC address entry.

Use **undo mac-address multicast** to delete a static multicast MAC address entry.

Syntax

In system view:

mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

undo mac-address [**multicast**] [[*mac-address* [**interface** *interface-list*]] **vlan** *vlan-id*]

In Layer 2 aggregate interface view or Layer 2 Ethernet interface view:

mac-address multicast *mac-address* **vlan** *vlan-id*

undo mac-address [**multicast**] *mac-address* **vlan** *vlan-id*

Default

No static multicast MAC address entries exist.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a static multicast MAC address, in the format of H-H-H. You must specify an unused multicast MAC address. A multicast MAC address is a MAC address in which the least significant bit of the most significant octet is 1.

interface *interface-list*: Specifies a space-separated list of up to four interface items. Each item specifies an interface or an interface list in the format of *start-interface-type interface-number* **to** *end-interface-type interface-number*. The *interface-type interface-number* argument specifies an interface by its type and number. The available interface types include Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces.

vlan *vlan-id*: Specifies an existing VLAN by its VLAN ID in the range of 1 to 4094. The system gives a prompt if the specified interface does not belong to the VLAN.

Usage guidelines

You do not need to enable IP multicast routing before you execute this command.

You can configure static multicast MAC address entries for the specified interfaces in system view or for the current interface in interface view.

If you do not specify the **multicast** keyword in the **undo mac-address** command, all static unicast MAC address entries and static multicast MAC entries are deleted.

Examples

Configure a static multicast MAC address entry. In the entry, the multicast MAC address is 0100-0001-0001 and the outgoing ports are GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 in VLAN 2.

```
<Switch> system-view
[Switch] mac-address multicast 0100-0001-0001 interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/5 vlan 2
```

Configure a static multicast MAC address entry on GigabitEthernet 1/0/1. In the entry, the multicast MAC address is 0100-0001-0001 and the outgoing port is GigabitEthernet 1/0/1, which belongs to VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address multicast 0100-0001-0001 vlan 2
```

Related commands

display mac-address multicast

1.1.44. max-response-time (IGMP-snooping view)

Use **max-response-time** to set the maximum response time for IGMP general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *seconds*

undo max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies the maximum response time for IGMP general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You can set the time for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in IGMP-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting multicast group members, set the maximum response time for IGMP general queries to be less than the IGMP general query interval.

Examples

Set the global maximum response time for IGMP general queries to 5 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] max-response-time 5
```

Related commands

igmp-snooping max-response-time

igmp-snooping query-interval

1.1.45. overflow-replace (IGMP-snooping view)

Use **overflow-replace** to enable the multicast group replacement feature globally.

Use **undo overflow-replace** to disable the multicast group replacement feature globally.

Syntax

overflow-replace [**vlan** *vlan-list*]

undo overflow-replace [**vlan** *vlan-list*]

Default

The multicast group replacement feature is disabled.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

This command takes effect only on the multicast groups that a port joins dynamically.

You can enable the multicast group replacement feature globally for all ports in IGMP-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Globally enable the multicast group replacement feature for VLAN 2.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] overflow-replace vlan 2
```

Related commands

igmp-snooping overflow-replace

1.1.46. report-aggregation (IGMP-snooping view)

Use **report-aggregation** to enable IGMP report suppression.

Use **undo report-aggregation** to disable IGMP report suppression.

Syntax

report-aggregation

undo report-aggregation

Default

IGMP report suppression is enabled.

Views

IGMP-snooping view

Predefined user roles

network-admin

Examples

Disable IGMP report suppression.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] undo report-aggregation
```

1.1.47. reset igmp-snooping group

Use **reset igmp-snooping group** to clear information about dynamic IGMP snooping group entries.

Syntax

reset igmp-snooping group { *group-address* [*source-address*] | **all** } [**vlan** *vlan-id* | **vsi** *vsi-name*]

Views

User view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

source-address: Specifies a multicast source address. If you do not specify a multicast source, this command clears information about dynamic IGMP snooping group entries for all multicast sources.

all: Specifies all multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command clears information about dynamic IGMP snooping group entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears information about dynamic IGMP snooping group entries for all VSIs.

Examples

Clear information about all dynamic IGMP snooping group entries.

```
<Switch> reset igmp-snooping group all
```

Related commands

display igmp-snooping group

1.1.48. reset igmp-snooping router-port

Use **reset igmp-snooping router-port** to clear dynamic router port information.

Syntax

1.1.50. router-aging-time (IGMP-snooping view)

Use **router-aging-time** to set the aging timer for dynamic router ports globally.

Use **undo router-aging-time** to restore the default.

Syntax

router-aging-time *seconds*

undo router-aging-time

Default

The aging timer for dynamic router ports is 260 seconds.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic router ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You can set the timer globally for all VLANs and VSIs in IGMP-snooping view, for a VSI in VSI view, or for a VLAN in VLAN view. For a VSI, the VSI-specific configuration takes priority over the global configuration. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

Examples

Set the global aging timer for dynamic router ports to 100 seconds.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] router-aging-time 100
```

Related commands

igmp-snooping router-aging-time

1.1.51. source-deny (IGMP-snooping view)

Use **source-deny** to enable multicast source port filtering on ports to discard all multicast data packets.

Use **undo source-deny** to disable multicast source port filtering on ports.

Syntax

source-deny port *interface-list*

undo source-deny port *interface-list*

Default

Multicast source port filtering is disabled.

Views

IGMP-snooping view

Predefined user roles

network-admin

Parameters

port *interface-list*: Specifies a space-separated list of port items. Each item specifies a port by its port type and number or a range of ports in the form of *start-interface-type interface-number* **to** *end-interface-type interface-number*.

Usage guidelines

You can enable this feature for the specified ports in IGMP-snooping view or for a port in interface view. For a port, the configuration in IGMP-snooping view has the same priority as the configuration in interface view, and the most recent configuration takes effect.

Examples

Enable multicast source port filtering on ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] source-deny port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

2.1.1. display multicast-vlan

Use **display multicast-vlan** to display information about multicast VLANs.

Syntax

display multicast-vlan [*vlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id: Specifies a multicast VLAN ID in the range of 1 to 4094. If you do not specify a multicast VLAN ID, this command displays information about all multicast VLANs.

Examples

Display information about all multicast VLANs.

```
<Switch> display multicast-vlan
Total 2 multicast VLANs.

Multicast VLAN 100:
  Sub-VLAN list(3 in total):
    2-3, 6
  Port list(3 in total):
    GE1/0/1
    GE1/0/2
    GE1/0/3

Multicast VLAN 200:
  Sub-VLAN list(0 in total):
  Port list(0 in total):
```

Table 2-1 Command output

Field	Description
Total 2 multicast VLANs	Total number of multicast VLANs.
Sub-VLAN list(3 in total)	Sub-VLAN list of the multicast VLAN, and the total number of the sub-VLANs.
Port list(3 in total)	Port list of the multicast VLAN, and the total number of the ports.

2.1.2. display multicast-vlan forwarding-table

Use **display multicast-vlan forwarding-table** to display multicast VLAN forwarding entries.

Syntax

display multicast-vlan forwarding-table [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command displays multicast VLAN forwarding entries for all multicast groups.

mask { *mask-length* | *mask* }: Specifies a mask length or subnet mask for the multicast group address. The value range for the *mask-length* argument is 4 to 32 (default), and the default value for the *mask* argument is 255.255.255.255.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays multicast VLAN forwarding entries for all multicast sources.

mask { *mask-length* | *mask* }: Specifies a mask length or subnet mask for the multicast source address. The value range for the *mask-length* argument is 0 to 32 (default), and the default value for the *mask* argument is 255.255.255.255.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays multicast VLAN forwarding entries for the master device.

subvlan *vlan-id*: Specifies a sub-VLAN by its VLAN ID. If you do not specify a sub-VLAN, this command displays multicast VLAN forwarding entries for all sub-VLANs.

vlan *vlan-id*: Specifies a multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a multicast VLAN, this command displays multicast VLAN forwarding entries for all multicast VLANs.

Examples

Display all multicast VLAN forwarding entries.

```
<Switch> display multicast-vlan forwarding-table
Multicast VLAN 100 Forwarding Table
Total 1 entries, 1 matched

00001. (1.1.1.1, 225.0.0.1)
     Flags: 0x10000
     Multicast VLAN: 100
     List of sub-VLANs (3 in total):
       1: VLAN 10
       2: VLAN 20
```

```
3: VLAN 30
```

Table 2-2 Command output

Field	Description
Multicast VLAN 100 Forwarding Table	Forwarding entries for multicast VLAN 100.
Total 1 entries, 1 matched	Total number of (S, G) entries, and the number of matching entries.
00001	Sequence number of the (S, G) entry.
(1.1.1.1, 255.0.0.1)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x10000 means that the entry has only one flag 0x10000. The following flags are available for an entry: • **0x1**—The entry is in inactive state. • **0x4**—The entry fails to update. • **0x8**—The sub-VLAN information fails to update for the entry. • **0x200**—The entry is in GR state. • **0x10000**—The entry is a multicast VLAN forwarding entry.
List of sub-VLANs (3 in total)	Sub-VLAN list of the multicast VLAN, and the total number of the sub-VLANs.

2.1.3. display multicast-vlan group

Use **display multicast-vlan group** to display information about multicast groups in multicast VLANs.

Syntax

display multicast-vlan group [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about multicast groups for all multicast sources in multicast VLANs.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information for all multicast groups in multicast VLANs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about multicast groups in multicast VLANs for the master device.

verbose: Displays detailed information.

vlan *vlan-id*: Specifies a multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a multicast VLAN, this command displays information about multicast groups for all multicast VLANs.

Examples

Display detailed information about all multicast groups in multicast VLANs.

```
<Switch> display multicast-vlan group verbose
Total 6 entries.

Multicast VLAN 10: Total 3 entries.
  (2.2.2.2, 225.1.1.2)
    Flags: 0x70000020
    Sub-VLANs (1 in total):
      VLAN 40
  (111.112.113.115, 225.1.1.4)
    Flags: 0x70000030
    Sub-VLANs (1 in total):
      VLAN 40
  (0.0.0.0, 226.1.1.6)
    Flags: 0x60000020
    Sub-VLANs (1 in total):
      VLAN 40

Multicast VLAN 20: Total 3 entries.
  (2.2.2.2, 225.1.1.2)
    Flags: 0x70000010
    Sub-VLANs (0 in total):
  (111.112.113.115, 225.1.1.4)
    Flags: 0x70000010
    Sub-VLANs (0 in total):
  (0.0.0.0, 226.1.1.6)
    Flags: 0x50000010
    Sub-VLANs (0 in total):
```

Table 2-3 Command output

Field	Description
Total 6 entries	Total number of (S, G) entries.
Multicast VLAN 10: Total 3 entries	Total number of (S, G) entries in multicast VLAN 10.
(0.0.0.0, 226.1.1.6)	(S, G) entry, where **0.0.0.0** in the S position means all multicast sources.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. For example, the value 0x70000020 means that the entry has flags 0x20, 0x10000000, 0x20000000, and

Field	Description
	0x40000000. The following flags are available for an entry: • **0x10**—The entry is created by the multicast VLAN. • **0x20**—The entry is created by the sub-VLAN of the multicast VLAN. • **0x40**—The entry is to be deleted. • **0x10000000**—This value represents one of the following situations: ○ The entry is newly created. ○ The device receives an IGMP query that matches the (S, G) entry but does not receive any matching IGMPv1 reports within an IGMP general query interval. • **0x20000000**—The device does not receive IGMPv2 or IGMPv3 reports that match the (S, G) entry within an IGMP general query interval. • **0x40000000**—The device does not receive IGMPv3 IS_EX (NULL) reports that match the (S, G) entry within an IGMP general query interval.
Sub-VLANs (1 in total)	Sub-VLAN list of the multicast VLAN, and the total number of the sub-VLANs.

Related commands

reset multicast-vlan group

2.1.4. multicast-vlan

Use **multicast-vlan** to configure a multicast VLAN and enter its view, or enter the view of an existing multicast VLAN.

Use **undo multicast-vlan** to remove the configuration of multicast VLANs.

Syntax

multicast-vlan *vlan-id*

undo multicast-vlan { **all** | *vlan-id* }

Default

No multicast VLANs exist.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies an existing VLAN by its ID in the range of 1 to 4094.

all: Specifies all multicast VLANs.

Usage guidelines

The total number of multicast VLANs on a device cannot exceed the system upper limit.

You must enable IGMP snooping for the VLAN to be configured as a multicast VLAN.

As a best practice, do not configure a multicast VLAN on a device that is enabled with IP multicast routing.

Examples

Enable IGMP snooping for VLAN 100. Configure VLAN 100 as a multicast VLAN and enter its view.

```
<Switch> system-view
[Switch] igmp-snooping
[Switch-igmp-snooping] quit
[Switch] vlan 100
[Switch-vlan100] igmp-snooping enable
[Switch-vlan100] quit
[Switch] multicast-vlan 100
[Switch-mvlan-100]
```

Related commands

igmp-snooping enable

multicast routing

2.1.5. multicast-vlan entry-limit

Use **multicast-vlan entry-limit** to set the maximum number of multicast VLAN forwarding entries.

Use **undo multicast-vlan entry-limit** to restore the default.

Syntax

multicast-vlan entry-limit *limit*

undo multicast-vlan entry-limit

Default

The maximum number of multicast VLAN forwarding entries is 4000.

Views

System view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of multicast VLAN forwarding entries, in the range of 0 to 4000.

Examples

Set the maximum number of multicast VLAN forwarding entries to 128.

```
<Switch> system-view
[Switch] multicast-vlan entry-limit 128
```

Related commands

entry-limit (IGMP-snooping view)

2.1.6. port (multicast-VLAN view)

Use **port** to assign user ports to a multicast VLAN.

Use **undo port** to delete user ports from a multicast VLAN.

Syntax

port *interface-list*

undo port { **all** | *interface-list* }

Default

A multicast VLAN does not have user ports.

Views

Multicast VLAN view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a port in the form of *interface-type interface-number*, or a port range in the form of *interface-type interface-number* to *interface-type interface-number*.

all: Specifies all user ports in the current multicast VLAN.

Usage guidelines

You can assign only Layer 2 Ethernet ports or Layer 2 aggregate interfaces to multicast VLANs. Additionally, you can assign a port to only one multicast VLAN.

For ports to be assigned to a multicast VLAN, you must enable IGMP snooping for the VLANs to which the ports belong.

Examples

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 as user ports to multicast VLAN 100.

```
<Switch> system-view
[Switch] multicast-vlan 100
[Switch-mvlan-100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

2.1.7. port multicast-vlan

Use **port multicast-vlan** to assign a user port to a multicast VLAN.

Use **undo port multicast-vlan** to restore the default.

Syntax

port multicast-vlan *vlan-id*

undo port multicast-vlan

Default

A port does not belong to a multicast VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a multicast VLAN by its VLAN ID in the range of 1 to 4094.

Usage guidelines

You can assign a port to only one multicast VLAN.

For a port to be assigned to a multicast VLAN, you must enable IGMP snooping for the VLAN to which the port belongs.

Examples

Assign GigabitEthernet 1/0/1 as a user port to multicast VLAN 100.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port multicast-vlan 100
```

2.1.8. reset multicast-vlan group

Use **reset multicast-vlan group** to clear multicast groups in multicast VLANs.

Syntax

reset multicast-vlan group [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Views

User view

Predefined user roles

network-admin

Parameters

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command clears multicast groups for all multicast sources in multicast VLANs.

mask { *mask-length* | *mask* }: Specifies a mask length or subnet mask for the multicast source address. The value range for the *mask-length* argument is 0 to 32 (default), and the default value for the *mask* argument is 255.255.255.255.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command clears all multicast groups in multicast VLANs.

mask { *mask-length* | *mask* }: Specifies a mask length or subnet mask for the multicast group address. The value range for the *mask-length* argument is 4 to 32 (default), and the default value for the *mask* argument is 255.255.255.255.

vlan *vlan-id*: Specifies a multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a multicast VLAN, this command clears multicast groups for all multicast VLANs.

Examples

Clear multicast groups for all multicast VLANs.

```
<Switch> reset multicast-vlan group
```

Related commands

display multicast-vlan group

2.1.9. subvlan (multicast-VLAN view)

Use **subvlan** to assign VLANs as sub-VLANs to a multicast VLAN.

Use **undo subvlan** to delete sub-VLANs from a multicast VLAN.

Syntax

subvlan *vlan-list*

undo subvlan { **all** | *vlan-list* }

Default

A multicast VLAN does not have sub-VLANs.

Views

Multicast VLAN view

Predefined user roles

network-admin

Parameters

vlan-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The value range for the VLAN ID is 1 to 4094. The specified VLANs must exist and cannot be multicast VLANs or sub-VLANs of other multicast VLANs.

all: Specifies all sub-VLANs of the current multicast VLAN.

Usage guidelines

You must enable IGMP snooping for VLANs to be configured as sub-VLANs.

Examples

Assign VLAN 10 through VLAN 15 as sub-VLANs to multicast VLAN 100.

```
<Switch> system-view
[Switch] multicast-vlan 100
[Switch-mvlan-100] subvlan 10 to 15
```

MEMO:

The **vpn-instance** *vpn-instance-name* option for each command is supported by V7.2.18 and later software.

3.1. Multicast routing and forwarding commands

3.1.1. delete ip rpf-route-static

Use **delete ip rpf-route-static** to delete all static multicast routes.

Syntax

delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Usage guidelines

This command deletes all static multicast routes. To delete a specified static multicast route, use the **undo ip rpf-route-static** command.

Examples

Delete all static multicast routes.

```
<Switch> system-view
[Switch] delete ip rpf-route-static
This will erase all multicast static routes and their configurations, you must reconfigure all static routes.
Are you sure?[Y/N]:y
```

Related commands

ip rpf-route-static

3.1.2. display multicast boundary

Use **display multicast boundary** to display multicast boundary information.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command displays multicast boundary information for all multicast groups.

mask-length: Specifies an address mask length in the range of 4 to 32. The default is 32.

mask: Specifies an address mask. The default is 255.255.255.255.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays multicast boundary information for all interfaces.

Examples

Display information about all multicast boundaries.

```
<Switch> display multicast boundary
 Boundary            Interface
 224.1.1.0/24        Vlan1
 239.2.2.0/24        Vlan2
```

Table 3-1 Command output

Field	Description
Boundary	Multicast group associated with the multicast boundary.
Interface	Boundary interface associated with the multicast boundary.

Related commands

multicast boundary

3.1.3. display multicast forwarding-table

Use **display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** to display multicast forwarding entries.

Syntax

display multicast forwarding-table [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include**

| **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default value is 255.255.255.255.

incoming-interface: Specifies the multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an incoming interface by its type and number.

outgoing-interface: Specifies the multicast forwarding entries that contain the specified outgoing interface.

exclude: Specifies the multicast forwarding entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the multicast forwarding entries that contain the specified interface in the outgoing interface list.

match: Specifies the forwarding entries that contain only the specified interface in the outgoing interface list.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays multicast forwarding entries for the master device.

statistics: Displays statistics for the multicast forwarding table.

Examples

Display multicast forwarding entries.

```
<Switch> display multicast forwarding-table
Total 1 entries, 1 matched

00001. (172.168.0.2, 227.0.0.1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Vlan-interface10
          Incoming sub-VLAN: VLAN 11
          Outgoing sub-VLAN: VLAN 12
```

```
                          VLAN 13
List of 1 outgoing interfaces:
  1: Vlan-interface20
     Sub-VLAN: VLAN 21
               VLAN 22
Matched 19648 packets(20512512 bytes), Wrong If 0 packet
Forwarded 19648 packets(20512512 bytes)
```

Table 3-2 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries, and the total number of matching (S, G) entries.
00001	Sequence number of the (S, G) entry.
(172.168.0.2,227.0.0.1)	(S, G) entry.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has only one flag 0x0. The following entries are available for an entry: • **0x0**—The entry is in correct state. • **0x1**—The entry is in inactive state. • **0x2**—The entry is null. • **0x4**—The entry fails to update. • **0x8**—Outgoing interface information fails to update for the entry. • **0x10**—Data-group information fails to update for the entry. • **0x20**—A register outgoing interface is available. • **0x40**—The entry is to be deleted. • **0x80**—The entry is in registration suppression state. • **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state. • **0x400**—The entry has the VLAN interface of the super VLAN. • **0x800**—The entry has the associated ARP entry for the multicast source address. • **0x400000**—The entry is created by the IGMP proxy.
Uptime	Length of time for which the (S, G) entry has been up.
Timeout in	Length of time in which the (S, G) entry will expire.
Incoming interface	Incoming interface of the (S, G) entry.
Incoming sub-VLAN	Incoming sub-VLAN of the super VLAN when the incoming interface of the (S, G) entry is the VLAN interface of this super VLAN.
Outgoing sub-VLAN	Outgoing sub-VLAN of the super VLAN when the incoming interface of the (S, G) entry is the VLAN interface of this super VLAN.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.
Sub-VLAN	Outgoing sub-VLAN of the super VLAN when the outgoing interface of the (S, G) entry is the VLAN interface of this

Field	Description
	super VLAN.
Matched 19648 packets(20512512 bytes), Wrong If 0 packet	Number of packets (bytes) that match the (S, G) entry, and number of packets with incoming interface errors. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.
Forwarded 19648 packets(20512512 bytes)	Number of packets (bytes) that have been forwarded. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.

Related commands

reset multicast forwarding-table

3.1.4. display multicast routing-table

Use **display multicast routing-table** to display multicast routing entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default is 255.255.255.255.

incoming-interface: Specifies the multicast routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Specifies the multicast routing entries that contain the specified outgoing interface.

exclude: Specifies the multicast routing entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the multicast routing entries that contain the specified interface in the outgoing interface list.

match: Specifies the multicast routing entries that contain only the specified interface in the outgoing interface list.

Usage guidelines

Multicast routing entries are the basis of multicast forwarding. You can use this command to view the establishment state of (S, G) entries.

Examples

Display multicast routing entries.

```
<Switch> display multicast routing-table
 Total 1 entries

 00001. (172.168.0.2, 227.0.0.1)
       Uptime: 00:00:28
       Upstream Interface: Vlan-interface1
       List of 2 downstream interfaces
           1:  Vlan-interface2
           2:  Vlan-interface3
```

Table 3-3 Command output

Field	Description
Total 1 entries	Total number of (S, G) entries.
00001	Sequence number of the (S, G) entry.
(172.168.0.2, 227.0.0.1)	(S, G) entry.
Uptime	Length of time for which the (S, G) entry has been up.
Upstream Interface	Upstream interface at which (S, G) packets should arrive.
List of 2 downstream interfaces	List of downstream interfaces that need to forward (S, G) packets.

Related commands

reset multicast routing-table

3.1.5. display multicast routing-table static

Use **display multicast routing-table static** to display static multicast routing entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

mask-length: Specifies an address mask length in the range of 0 to 32.

mask: Specifies an address mask.

Usage guidelines

This command displays only valid static multicast routing entries.

Examples

Display static multicast routing entries.

```
<Switch> display multicast routing-table static
Destinations: 3        Routes: 4

Destination/Mask    Pre  RPF neighbor    Interface
1.1.0.0/16          10   7.12.0.1        Vlan12
                         7.11.0.1        Vlan11
2.2.2.0/24          20   7.11.0.1        Vlan11
3.3.3.3/32          50   7.12.0.1        Vlan12
```

Table 3-4 Command output

Field	Description
Destinations	Number of the multicast destination addresses.
Routes	Number of routes.
Destination/Mask	Destination address and its mask length.
Pre	Route preference.
RPF neighbor	IP address of the RPF neighbor to the reachable destination.
Interface	Outgoing interface to the reachable destination.

3.1.6. display multicast rpf-info

Use **display multicast rpf-info** to display RPF information for a multicast source.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

Examples

Display RPF information for multicast source 192.168.1.55.

```
<Switch> display multicast rpf-info 192.168.1.55
 RPF information about source 192.168.1.55:
     RPF interface:Vlan-interface1, RPF neighbor: 10.1.1.1
     Referenced route/mask: 192.168.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
```

Table 3-5 Command output

Field	Description
RPF neighbor	IP address of the RPF neighbor.
Referenced route/mask	Referenced route and its mask length.
Referenced route type	Type of the referenced route: • **igp**—IGP unicast route. • **egp**—EGP unicast route. • **unicast (direct)**—Directly connected unicast route. • **unicast**—Other unicast routes, such as static unicast route. • **multicast static**—Static multicast route. • **mbgp**—MBGP route.
Route selection rule	Rule for RPF route selection: • Route preference. • Longest prefix match.
Load splitting rule	Status of the load splitting rule: enable or disable.

Related commands

display multicast forwarding-table

display multicast routing-table

3.1.7. ip rpf-route-static

Use **ip rpf-route-static** to configure a static multicast route.

Use **undo ip rpf-route-static** to delete a static multicast route.

Syntax

ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]

undo ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* }

Default

No static multicast routes exist.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

mask-length: Specifies an address mask length in the range of 0 to 32.

mask: Specifies an address mask.

rpf-nbr-address: Specifies an RPF neighbor by its IP address.

interface-type interface-number: Specifies an interface by its type and number. The interface connects the RPF neighbor.

preference: Sets a route preference in the range of 1 to 255. The default value is 1.

Usage guidelines

If the interface connected to an RPF neighbor is a point-to-point interface, you must specify the interface by its type and number.

If the interface connected to an RPF neighbor is not a point-to-point interface, you must specify the interface by its IP address. This type of interfaces includes Layer 3 Ethernet, Loopback, and VLAN interfaces.

The configured static multicast route might not take effect when one of the following conditions exists:

- The outgoing interface iteration fails.
- The specified interface is not a point-to-point interface.
- The specified interface is down.

If multiple static multicast routes within the same multicast source address range are available, only the one with the highest route preference can become active. You can use the **display multicast routing-table static** command to verify that the configured static multicast route has taken effect.

The **undo ip rpf-route-static** command deletes the specified static multicast route, but the **delete ip rpf-route-static** command deletes all static multicast routes.

Examples

Configure a static multicast route to multicast source 10.1.1.0/24 and specify the interface with IP address 192.168.1.23 as the RPF neighbor.

```
<Switch> system-view
[Switch] ip rpf-route-static 10.1.1.0 24 192.168.1.23
```

Related commands

delete ip rpf-route-static

display multicast routing-table static

3.1.8. load-splitting (MRIB view)

Use **load-splitting** to enable multicast load splitting.

Use **undo load-splitting** to restore the default.

Syntax

load-splitting { **source** | **source-group** }

undo load-splitting

Default

Multicast load splitting is disabled.

Views

MRIB view

Predefined user roles

network-admin

Parameters

source: Enables multicast load splitting based on multicast source.

source-group: Enables multicast load splitting based on multicast source and group.

Examples

Enable multicast load splitting based on multicast source.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] load-splitting source
```

3.1.9. longest-match (MRIB view)

Use **longest-match** to specify the longest prefix match principle for RPF route.

Use **undo longest-match** to restore the default.

Syntax

longest-match

undo longest-match

Default

Route preference is used for RPF route selection. The route with the highest preference is used as the RPF route.

Views

MRIB view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to use the matching route with the longest prefix as the RPF route.

Examples

Specify the longest prefix match principle for RPF route selection.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] multicast longest-match
```

3.1.10. multicast boundary

Use **multicast boundary** to configure a multicast forwarding boundary.

Use **undo multicast boundary** to delete a multicast forwarding boundary.

Syntax

multicast boundary *group-address* { *mask-length* | *mask* }

undo multicast boundary { *group-address* { *mask-length* | *mask* } | **all** }

Default

No multicast forwarding boundaries are configured on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length in the range of 4 to 32.

mask: Specifies an address mask.

all: Specifies all forwarding boundaries configured on the interface.

Usage guidelines

A multicast forwarding boundary sets the boundary condition for the multicast groups in the specified address range. If the destination address of a multicast packet matches the set boundary condition, the packet is not forwarded.

You can configure an interface as a multicast forwarding boundary for different multicast group ranges by executing this command multiple times on the interface.

You do not need to enable IP multicast routing before you execute this command.

Assume that Set A and Set B are multicast forwarding boundary sets with different address ranges, and B is a subset of A. A takes effect on the interface no matter whether A is configured earlier or later than B.

Examples

Configure VLAN-interface 100 as the forwarding boundary of multicast groups in the range of 239.2.0.0/16.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] multicast boundary 239.2.0.0 16
```

Related commands

display multicast boundary

3.1.11. multicast routing

Use **multicast routing** to enable IP multicast routing and enter MRIB view.

Use **undo multicast routing** to disable IP multicast routing.

Syntax

multicast routing [**vpn-instance** *vpn-instance-name*]

undo multicast routing [**vpn-instance** *vpn-instance-name*]

Default

IP multicast routing is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Usage guidelines

Other Layer 3 multicast commands take effect only when IP multicast routing is enabled.

The device does not forward multicast packets before IP multicast routing is enabled.

Examples

Enable IP multicast routing and enter MRIB view.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib]
```

3.1.12. reset multicast forwarding-table

Use **reset multicast forwarding-table** to clear multicast forwarding entries.

Syntax

reset multicast [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** { *interface-type interface-number* } } * | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default is 255.255.255.255.

incoming-interface: Specifies the multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an incoming interface by its type and number.

all: Specifies all multicast forwarding entries.

Usage guidelines

When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Examples

Clear multicast forwarding entries for multicast group 225.5.4.3.

```
<Switch> reset multicast forwarding-table 225.5.4.3
```

Related commands

display multicast forwarding-table

3.1.13. reset multicast routing-table

Use **reset multicast routing-table** to clear multicast routing entries.

Syntax

reset multicast [**vpn-instance** *vpn-instance-name*] **routing-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask* | *mask-length* }] | **incoming-interface** *interface-type interface-number* } * | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default is 255.255.255.255.

incoming-interface: Specifies the routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an incoming interface by its type and number.

all: Specifies all multicast routing entries.

Usage guidelines

When you clear a multicast routing entry, the associated multicast forwarding entry is also cleared.

Examples

Clear multicast routing entries for multicast group 225.5.4.3.

```
<Switch> reset multicast routing-table 225.5.4.3
```

4.1. IGMP commands

4.1.1. display igmp group

Use **display igmp group** to display information about IGMP multicast groups (multicast groups that hosts have joined through IGMP).

Syntax

display igmp group [**vpn-instance** *vpn-instance-name*] [*group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about all IGMP multicast groups.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about IGMP multicast groups for all interfaces.

static: Specifies IGMP multicast groups that hosts have joined statically. If you do not specify this keyword, the command displays information about IGMP multicast groups that hosts have joined dynamically.

verbose: Displays detailed information.

Examples

Display information about IGMP multicast groups that hosts have dynamically joined.

```
<Switch> display igmp group
IGMP groups in total: 3
 Vlan-interface1(10.10.1.20):
```

```
IGMP groups reported in total: 3
 Group address   Last reporter   Uptime      Expires
 225.1.1.1       10.10.1.10      00:02:04    00:01:15
 225.1.1.2       10.10.1.10      00:02:04    00:01:15
 225.1.1.3       10.10.1.10      00:02:04    00:01:15
```

Table 4-1 Command output

Field	Description
IGMP groups in total	Total number of IGMP multicast groups.
IGMP groups reported in total	Total number of IGMP multicast groups that hosts attached to the interface have joined dynamically.
Group address	Multicast group address.
Last reporter	Address of the last host that reported its membership to the multicast group.
Uptime	Length of time since the multicast group was reported.
Expire	Remaining lifetime for the multicast group. This field displays **Off** if the timer is disabled.

Display detailed information about IGMP multicast group 232.1.1.1 that hosts have dynamically joined. In this example, the switch is configured with IGMP SSM mappings.

```
<Switch> display igmp group 232.1.1.1 verbose
 Vlan-interface1(10.10.1.20):
  IGMP groups reported in total: 3
   Group: 232.1.1.1
     Uptime: 00:00:34
     Exclude expires: 00:04:16
     Mapping expires: 00:02:16
     Last reporter: 10.10.1.10
     Last-member-query-counter: 0
     Last-member-query-timer-expiry: Off
     Mapping last-member-query-counter: 0
     Mapping last-member-query-timer-expiry: Off
     Group mode: Exclude
     Version1-host-present-timer-expiry: Off
     Version2-host-present-timer-expiry: 00:02:11
     Mapping version1-host-present-timer-expiry: Off
     Source list (sources in total: 1):
       Source: 10.1.1.1
          Uptime: 00:00:03
          V3 expires: 00:04:16
          Mapping expires: 00:02:16
          Last-member-query-counter: 0
          Last-member-query-timer-expiry: Off
```

Table 4-2 Command output

Field	Description
IGMP groups reported in total	Total number of IGMP multicast groups that hosts

Field	Description
	attached to the interface have joined dynamically.
Group	Multicast group address.
Uptime	Length of time since the multicast group was reported.
Exclude expires	Remaining lifetime for the multicast group in Exclude mode. This field displays **Off** if the timer is disabled.
Mapping expires	Remaining time for the multicast group specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Last reporter	Address of the last host that reported its membership to this multicast group.
Last-member-query-counter	Number of IGMP group-specific queries or IGMP source-and-group-specific queries sent for the multicast group.
Last-member-query-timer-expiry	Remaining time for the last member query timer for the multicast group. This field displays **Off** if the timer is disabled.
Mapping last-member-query-counter	Number of IGMP group-specific queries or IGMP source-and-group-specific queries sent for the multicast group specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Mapping last-member-query-timer-expiry	Remaining time for the last member query timer of the multicast group specified in IGMP SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured with IGMP SSM mappings.
Group mode	Multicast source filtering mode: • **Include**—Include mode. • **Exclude**—Exclude mode. For a device that runs IGMPv1 or IGMPv2: • If IGMP SSM mappings are not configured, this field displays **Exclude**. • If IGMP SSM mappings are configured, this field displays **Include** or **Exclude** depending on the SSM mappings and the multicast groups that the host joins.
Version1-host-present-timer-expiry	Remaining time for the IGMPv1 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv2 or IGMPv3.
Version2-host-present-timer-expiry	Remaining time for the IGMPv2 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv3.
Mapping version1-host-present-timer-expiry	Remaining time for the IGMPv1 host present timer when the device is configured with IGMP SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured

Field	Description
	with IGMP SSM mappings.
Source list (sources in total)	List of multicast sources and total number of multicast sources. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Source	Multicast source address. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Uptime	Length of time since the multicast source was reported. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
V3 expires	Remaining time for the multicast source when the device runs IGMPv3. This field displays **Off** if the timer is disabled and displays three hyphens (---) if the multicast source is specified in IGMP SSM mappings. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Mapping expires	Remaining time for the multicast source specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Last-member-query-counter	Number of IGMP group-specific queries or IGMP group-and-source-specific queries sent for the multicast source and group. This field is displayed only when the device runs IGMPv3 or is configured with IGMP SSM mappings.
Last-member-query-timer-expiry	Remaining time for the last member query timer for the multicast source and group. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv3 or is configured with IGMP SSM mappings.

Display information about IGMP multicast groups that hosts have statically joined.

```
<Switch> display igmp group static
 Entries in total: 2
   Group address   Source address  Interface           Expires
   225.1.1.1       0.0.0.0         Vlan1               Never
   225.2.2.2       1.1.1.1         Vlan1               Never
```

Table 4-3 Command output

Field	Description
Entries in total	Total number of the multicast groups that hosts have joined statically.
Group address	Multicast group address.

Field	Description
Source address	Multicast source address.
Interface	Interface name.
Expires	Remaining lifetime for the multicast group. This field always displays **Never** because the multicast group never expires.

Related commands

reset igmp group

4.1.2. display igmp interface

Use **display igmp interface** to display IGMP information for interfaces.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**host**] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays IGMP information for all IGMP-enabled interfaces.

host: Displays information about the interfaces enabled with the IGMP host feature. If you do not specify this keyword, the command displays IGMP information for interfaces enabled with IGMP and those enabled with the IGMP host feature. For more information about the IGMP host feature, see *VXLAN Configuration Guide*.

verbose: Displays detailed IGMP information.

Examples

Display detailed IGMP information for VLAN-interface 1 (non-proxy interface).

```
<Switch> display igmp interface vlan-interface 1 verbose
 Vlan-interface1(10.10.1.20):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
   Maximum query response time for IGMP: 10s
   Last member query interval: 1s
   Last member query count: 2
   Startup query interval: 31s
```

```
  Startup query count: 2
  General query timer expiry (hh:mm:ss): 00:00:54
  Querier for IGMP: 10.10.1.20 (This router)
  IGMP activity: 1 join(s), 0 leave(s)
  Multicast routing on this interface: Enabled
  Robustness: 2
  Require-router-alert: Disabled
  Fast-leave: Disabled
  Startup-query: Off
  Other-querier-present-timer-expiry (hh:mm:ss): Off
  IGMP groups reported in total: 1
```

Display detailed IGMP information for all interfaces enabled with the IGMP host feature.

```
<Switch> display igmp interface host verbose
 Vlan-interface3(30.10.1.20):
   IGMP host is enabled.
   IGMP version: 2
   Multicast routing on this interface: Enabled
   Require-router-alert: Disabled
   Version1-querier-present-timer-expiry (hh:mm:ss): Off
```

Table 4-4 Command output

Field	Description
Vlan-interface1(10.10.1.20)	Interface and its IP address.
IGMP is enabled	IGMP is enabled on the interface.
IGMP version	Version of IGMP that the interface runs.
Query interval for IGMP	IGMP general query interval, in seconds.
Other querier present time for IGMP	IGMP other querier present interval, in seconds.
Maximum query response time for IGMP	Maximum response time for IGMP general queries, in seconds.
Last member query interval	Interval for sending IGMP group-specific queries or IGMP group-and-source-specific queries, in seconds.
Last member query count	Number of IGMP group-specific queries or IGMP group-and-source-specific queries sent for the multicast group.
Startup query interval	Interval for sending IGMP general queries on startup, in seconds.
Startup query count	Number of IGMP general queries that the device sends on startup.
General query timer expiry	Remaining time for the IGMP general query timer. This field displays **Off** if the timer is disabled.
Querier for IGMP	IP address of the IGMP querier. This field is not displayed when the device runs IGMPv1 and the device is not the IGMP querier. NOTE: In IGMPv1, the PIM DR acts as the IGMP querier. You can use the **display pim interface**

Field	Description
	command to display PIM information.
No querier elected	No IGMP querier election is performed. This field is displayed when the device runs IGMPv1 and is not the IGMP querier. NOTE: In IGMPv1, the PIM DR acts as the IGMP querier. You can use the **display pim interface** command to display PIM information.
IGMP activity: 1 join(s), 0 leave(s)	Statistics of IGMP activities: • **join(s)**—Total number of multicast groups that this interface has joined. • **leave(s)**—Total number of multicast groups that this interface has left.
Multicast routing on this interface	Whether IP multicast routing is enabled: Enabled or Disabled.
Robustness	Robustness variable of the IGMP querier.
Require-router-alert	Whether the feature of dropping IGMP messages without Router-Alert is enabled: Enabled or Disabled,
Fast-leave	Whether the fast-leave processing feature is enabled: Enabled or Disabled.
Startup-query	Whether the IGMP querier sends IGMP general queries at the startup query interval on startup: • **On**—The IGMP querier performs the above action. • **Off**—The IGMP querier does not perform the above action.
Other-querier-present-timer-expiry	Remaining time for the other querier present timer. This field displays **Off** if the timer is disabled.
IGMP groups reported in total	Total number of multicast groups that the interface has joined dynamically. This field is not displayed if the interface does not join multicast groups.
IGMP proxy is enabled	IGMP proxying is enabled on the interface.
IGMP host is enabled	The IGMP host feature is enabled on the interface.
Version1-querier-present-timer-expiry	Remaining time for the IGMPv1 querier present timer. This field displays **Off** if the timer is disabled.

4.1.3. display igmp ssm-mapping

Use **display igmp ssm-mapping** to display IGMP SSM mappings.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

Examples

Display IGMP SSM mappings for multicast group 232.1.1.1.

```
<Switch> display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        1.2.3.4
        5.5.5.5
        10.1.1.1
        100.1.1.10
```

Table 4-5 Command output

Field	Description
Group	Multicast group address.
Source list	List of multicast source addresses.

4.1.4. igmp

Use **igmp** to enter IGMP view.

Use **undo igmp** to delete the configurations in IGMP view.

Syntax

igmp [**vpn-instance** *vpn-instance-name*]

undo igmp [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

Examples

Enter IGMP view.

```
<Switch> system-view
```

```
[Switch] igmp
[Switch-igmp]
```

4.1.5. igmp enable

Use **igmp enable** to enable IGMP on an interface.

Use **undo igmp enable** to disable IGMP on an interface.

Syntax

igmp enable

undo igmp enable

Default

IGMP is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled.

Other IGMP configurations on the interface take effects only when IGMP is enabled on the interface.

Examples

Enable IP multicast routing, and enable IGMP on VLAN-interface 100.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp enable
```

Related commands

multicast routing

4.1.6. igmp group-policy

Use **igmp group-policy** to configure a multicast group policy on an interface to control the multicast groups that hosts attached to the interface can join.

Use **undo igmp group-policy** to delete the multicast group policy on an interface.

Syntax

igmp group-policy *ipv4-acl-number* [*version-number*]

undo igmp group-policy

Default

No multicast group policy exists on an interface. Hosts attached to the interface can join any multicast groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL by its number in the range of 2000 to 3999. Hosts can join only the multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join any multicast groups.

version-number: Specifies an IGMP version in the range of 1 to 3. By default, this command takes effect on IGMP reports of all versions.

Usage guidelines

A multicast group policy filters IGMP reports to control the multicast groups that the hosts can join.

This command does not take effect on static member interfaces because static member interfaces do not send IGMP reports.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a multicast group address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a multicast source address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.

  To match the following IGMP reports, set the **source** *source-address source-wildcard* option to 0.0.0.0:

  - IGMPv1 and IGMPv2 reports.
  - IGMPv3 IS_EX and IGMPv3 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a multicast group policy on VLAN-interface 100 so that hosts attached to the interface can join only multicast group 225.1.1.1.

```
<Switch> system-view
[Switch] acl basic 2005
[Switch-acl-ipv4-basic-2005] rule permit source 225.1.1.1 0
[Switch-acl-ipv4-basic-2005] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp group-policy 2005
```

4.1.7. igmp last-member-query-interval

Use **igmp last-member-query-interval** to set the IGMP last member query interval on an interface.

Use **undo igmp last-member-query-interval** to restore the default.

Syntax

igmp last-member-query-interval *interval*

undo igmp last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the IGMP last member query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP last member query interval to 6 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp last-member-query-interval 6
```

Related commands

last-member-query-interval (IGMP view)

4.1.8. igmp max-response-time

Use **igmp max-response-time** to set the maximum response time for IGMP general queries on an interface.

Use **undo igmp max-response-time** to restore the default.

Syntax

igmp max-response-time *time*

undo igmp max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the maximum response time for IGMP general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the maximum response time for IGMP general queries to 25 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp max-response-time 25
```

Related commands

max-response-time (IGMP view)

4.1.9. igmp other-querier-present-interval

Use **igmp other-querier-present-interval** to set the IGMP other querier present timer on an interface.

Use **undo igmp other-querier-present-interval** to restore the default.

Syntax

igmp other-querier-present-interval *interval*

undo igmp other-querier-present-interval

Default

The IGMP other querier present timer is calculated by using the following formula:

[IGMP general query interval] × [IGMP querier's robustness variable] + [maximum response time for IGMP general queries] / 2.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP other querier present timer for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP other querier present timer to 125 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp other-querier-present-interval 125
```

Related commands

other-querier-present-interval (IGMP view)

4.1.10. igmp query-interval

Use **igmp query-interval** to set the IGMP general query interval on an interface.

Use **undo igmp query-interval** to restore the default.

Syntax

igmp query-interval *interval*

undo igmp query-interval

Default

The IGMP general query interval is 125 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP general query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP general query interval to 60 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp query-interval 60
```

Related commands

query-interval (IGMP view)

4.1.11. igmp robust-count

Use **igmp robust-count** to set the IGMP querier's robustness variable on an interface.

Use **undo igmp robust-count** to restore the default.

Syntax

igmp robust-count *count*

undo igmp robust-count

Default

The IGMP querier's robustness variable is 2.

Views

Interface view

Predefined user roles

network-admin

Parameters

count: Specifies an IGMP querier's robustness variable in the range of 1 to 255.

Usage guidelines

The IGMP querier's robustness variable defines the number of times to retransmit queries if packet loss occurs. A higher robustness variable makes the IGMP querier more robust, but it increases timeout time for multicast groups.

You can set the IGMP querier's robustness variable for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP querier's robustness variable to 5 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp robust-count 5
```

Related commands

robust-count (IGMP view)

4.1.12. igmp startup-query-count

Use **igmp startup-query-count** to set the IGMP startup query count on an interface.

Use **undo igmp startup-query-count** to restore the default.

Syntax

igmp startup-query-count *count*

undo igmp startup-query-count

Default

The IGMP startup query count equals the IGMP querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

Parameters

count: Specifies an IGMP startup query count in the range of 1 to 255.

Usage guidelines

You can set the IGMP startup query count for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP startup query count to 5 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp startup-query-count 5
```

Related commands

startup-query-count (IGMP view)

4.1.13. igmp startup-query-interval

Use **igmp startup-query-interval** to set the IGMP startup query interval on an interface.

Use **undo igmp startup-query-interval** to restore the default.

Syntax

igmp startup-query-interval *interval*

undo igmp startup-query-interval

Default

The IGMP startup query interval equals one quarter of the IGMP general query interval.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP startup query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP startup query interval to 100 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp startup-query-interval 100
```

Related commands

startup-query-interval (IGMP view)

4.1.14. igmp static-group

Use **igmp static-group** to configure an interface as a static group member of a multicast group.

Use **undo igmp static-group** to restore the default.

Syntax

igmp static-group *group-address* [**source** *source-address*]

undo igmp static-group { **all** | *group-address* [**source** *source-address*]

Default

An interface is not a static group member of multicast groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

source *source-address*: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command configures an interface as a static member of the multicast groups with all multicast source addresses.

all: Specifies all multicast groups that the interface has statically joined.

Usage guidelines

For multicast routing entries to be created, you must specify a multicast source if the specified multicast group is in the SSM group range.

Examples

Configure VLAN-interface 100 as a static group member of multicast group 224.1.1.1.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp static-group 224.1.1.1
```

Configure VLAN-interface 100 as a static group member of multicast source and group (192.168.1.1, 232.1.1.1).

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp static-group 232.1.1.1 source 192.168.1.1
```

4.1.15. igmp version

Use **igmp version** to specify an IGMP version on an interface.

Use **undo igmp version** to restore the default.

Syntax

igmp version *version-number*

undo igmp version

Default

The IGMP version on an interface is 2.

Views

Interface view

Predefined user roles

network-admin

Parameters

version-number: Specifies an IGMP version in the range of 1 to 3.

Examples

Specify IGMP version 1 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] igmp version 1
```

4.1.16. last-member-query-interval (IGMP view)

Use **last-member-query-interval** to set the IGMP last member query interval globally.

Use **undo last-member-query-interval** to restore the default.

Syntax

last-member-query-interval *interval*

undo last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

IGMP view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the IGMP last member query interval globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP last member query interval to 6 seconds.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] last-member-query-interval 6
```

Related commands

igmp last-member-query-interval

4.1.17. max-response-time (IGMP view)

Use **max-response-time** to set the maximum response time for IGMP general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *time*

undo max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

IGMP view

Predefined user roles

network-admin

Parameters

time: Specifies the maximum response time for IGMP general queries in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

#Set the global maximum response time for IGMP general queries to 25 seconds.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] max-response-time 25
```

Related commands

igmp max-response-time

4.1.18. other-querier-present-interval (IGMP view)

Use **other-querier-present-interval** to set the IGMP other querier present timer globally.

Use **undo other-querier-present-interval** to restore the default.

Syntax

other-querier-present-interval *interval*

undo other-querier-present-interval

Default

The IGMP other querier present timer is calculated by using the following formula:

[IGMP general query interval] × [IGMP querier's robustness variable] + [maximum response time for IGMP general queries] / 2.

Views

IGMP view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP other querier present timer globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP other querier present timer to 125 seconds.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] other-querier-present-interval 125
```

Related commands

igmp other-querier-present-interval

4.1.19. query-interval (IGMP view)

Use **query-interval** to set the IGMP general query interval globally.

Use **undo query-interval** to restore the default.

Syntax

query-interval *interval*

undo query-interval

Default

The IGMP general query interval is 125 seconds.

Views

IGMP view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP general query interval globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP general query interval to 60 seconds.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] query-interval 60
```

Related commands

igmp query-interval

4.1.20. reset igmp group

Use **reset igmp group** to clear dynamic IGMP multicast group entries.

Syntax

reset igmp [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

all: Specifies all interfaces (the first **all**), or all IGMP multicast groups (the second **all**).

interface-type interface-number: Specifies an interface by its type and number.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255.

source-address: Specifies a multicast source address. If you do not specify a multicast source, this command clears dynamic IGMP multicast group entries for all multicast source addresses.

mask: Specifies an address mask. The default is 255.255.255.255.

mask-length: Specifies an address mask length. The default is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

Usage guidelines

This command might interrupt the multicast information transmission.

Examples

Clear dynamic IGMP multicast group entries for all interfaces.

```
<Switch> reset igmp group all
```

Clear all dynamic IGMP multicast group entries for VLAN-interface 100.

```
<Switch> reset igmp group interface vlan-interface 100 all
```

Clear the dynamic IGMP multicast group entry of group 225.0.0.1 for VLAN-interface 100.

```
<Switch> reset igmp group interface vlan-interface 100 225.0.0.1
```

Related commands

display igmp group

4.1.21. robust-count (IGMP view)

Use **robust-count** to set the IGMP querier's robustness variable globally.

Use **undo robust-count** to restore the default.

Syntax

robust-count *count*

undo robust-count

Default

The IGMP querier's robustness variable is 2.

Views

IGMP view

Predefined user roles

network-admin

Parameters

count: Specifies an IGMP querier's robustness variable in the range of 1 to 255.

Usage guidelines

The IGMP querier's robustness variable defines the number of times to retransmit queries if packet loss occurs. A higher robustness variable makes the IGMP querier more robust, but it increases the timeout time for multicast groups.

You can set the IGMP querier's robustness variable globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP querier's robustness variable to 5.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] robust-count 5
```

Related commands

igmp robust-count

4.1.22. ssm-mapping (IGMP view)

Use **ssm-mapping** to configure an IGMP SSM mapping.

Use **undo ssm-mapping** to delete IGMP SSM mappings.

Syntax

ssm-mapping *source-address ipv4-acl-number*

undo ssm-mapping { *source-address* | **all** }

Default

No IGMP SSM mappings exist.

Views

IGMP view

Predefined user roles

network-admin

Parameters

source-address: Specifies a multicast source by its IP address.

ipv4-acl-number: Specifies a basic ACL number in the range of 2000 to 2999. Multicast groups in IGMP reports permitted by the ACL are associated with the IPv6 multicast source. If the ACL does

not exist or does not have valid rules, no multicast groups are associated with the IPv6 multicast source.

all: Specifies all IGMP SSM mappings.

Usage guidelines

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Configure an IGMP SSM mapping with multicast source 125.1.1.1 and multicast group range 232.1.1.0/24.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 232.1.1.1 0.0.0.255
[Switch-acl-ipv4-basic-2001] quit
[Switch] igmp
[Switch-igmp] ssm-mapping 125.1.1.1 2001
```

Related commands

display igmp ssm-mapping

4.1.23. startup-query-count (IGMP view)

Use **startup-query-count** to set the IGMP startup query count globally.

Use **undo startup-query-count** to restore the default.

Syntax

startup-query-count *count*

undo startup-query-count

Default

The IGMP startup query count equals the IGMP querier's robustness variable.

Views

IGMP view

Predefined user roles

network-admin

Parameters

count: Specifies an IGMP startup query count in the range of 1 to 255.

Usage guidelines

You can set the IGMP startup query count globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP startup query count to 5.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] startup-query-count 5
```

Related commands

igmp startup-query-count

4.1.24. startup-query-interval (IGMP view)

Use **startup-query-interval** to set the IGMP startup query interval globally.

Use **undo startup-query-interval** to restore the default.

Syntax

startup-query-interval *interval*

undo startup-query-interval

Default

The IGMP startup query interval equals one quarter of the IGMP general query interval.

Views

IGMP view

Predefined user roles

network-admin

Parameters

interval: Specifies an IGMP startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP startup query interval globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP startup query interval to 100 seconds.

```
<Switch> system-view
[Switch] igmp
[Switch-igmp] startup-query-interval 100
```

5. PIM commands

MEMO:

The **vpn-instance** *vpn-instance-name* option for each command is supported by V7.2.18 and later software.

5.1. PIM commands

5.1.1. bsm-reflection enable (PIM view)

Use **bsm-reflection enable** to enable the device to forward BSMs out of their incoming interfaces.

Use **undo bsm-reflection enable** to disable the device from forwarding BSMs out of their incoming interfaces.

Syntax

bsm-reflection enable

undo bsm-reflection enable

Default

The device forwards BSMs out of their incoming interfaces.

Views

PIM view

Predefined user roles

network-admin

Usage guidelines

Disable this feature if all the devices in the PIM-SM domain have consistent routing information.

Examples

Disable the device from forwarding BSMs out of their incoming interfaces.

```
<Switch> system-view
[Switch] pim
[Switch-pim] undo bsm-reflection enable
```

5.1.2. bsr-policy (PIM view)

Use **bsr-policy** to configure a BSR policy.

Use **undo bsr-policy** to restore the default.

Syntax

bsr-policy *ipv4-acl-number*

undo bsr-policy

Default

No BSR policy exists, and all bootstrap messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999.

Usage guidelines

A BSR policy filters bootstrap messages to guard against BSR spoofing.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a BSR address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a BSR policy so that only the devices on subnet 10.1.1.0/24 can act as the BSR.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 10.1.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] pim
[Switch-pim] bsr-policy 2000
```

Related commands

c-bsr (PIM view)

5.1.3. c-bsr (PIM view)

Use **c-bsr** to configure a candidate-BSR (C-BSR).

Use **undo c-bsr** to remove the configuration of a C-BSR.

Syntax

c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

undo c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }]

Default

No C-BSRs exist.

Views

PIM view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a C-BSR. You must specify the IP address of a local PIM interface.

scope *group-address*: Specifies a multicast group by its IP address in the range of 239.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command designates the C-BSR to the global-scoped zone.

mask-length: Specifies an address mask length in the range of 8 to 32.

mask: Specifies an address mask.

hash-length *hash-length*: Specifies a hash mask length in the range of 0 to 32. The default setting is 30.

priority *priority*: Specifies a C-BSR priority in the range of 0 to 255. The default setting is 64. The greater the value, the higher the priority.

Usage guidelines

If you execute this command for a zone multiple times, the most recent configuration takes effect.

You can configure the same C-BSR for different zones.

Examples

Configure the interface with IP address 1.1.1.1 as a C-BSR for the global-scoped zone.

```
<Switch> system-view
[Switch] pim
[Switch-pim] c-bsr 1.1.1.1
```

5.1.4. c-rp (PIM view)

Use **c-rp** to configure a candidate-RP (C-RP).

Use **undo c-rp** to remove the configuration of a C-RP.

Syntax

c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** *ipv4-acl-number* | **holdtime** *hold-time* | **priority** *priority*] *

undo c-rp *ip-address*

Default

No C-RPs exist.

Views

PIM view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a C-RP. You must specify the IP address of a local PIM interface.

advertisement-interval *adv-interval*: Specifies a C-RP advertisement interval in the range of 1 to 65535 seconds. The default value is 60 seconds.

group-policy *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. If you specify an ACL, this command designates the C-RP to IPv4 multicast groups in C-RP advertisement messages that the ACL permits. The C-RP is designated to all IPv4 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

holdtime *hold-time*: Specifies a C-RP lifetime in the range of 1 to 65535 seconds. The default value is 150 seconds.

priority *priority*: Specifies a C-RP priority in the range of 0 to 255. The default setting is 192. The greater the value, the lower the priority.

Usage guidelines

To designate a C-RP to multiple multicast group ranges, create multiple rules that specify different multicast group ranges in the ACL.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command by using the same C-RP address multiple times, the most recent configuration takes effect.

Examples

Configure the interface with IP address 1.1.1.1 as a C-RP for multicast group ranges 225.1.0.0/16 and 226.2.0.0/16 and set its priority to 10.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 225.1.0.0 0.0.255.255
[Switch-acl-ipv4-basic-2000] rule permit source 226.2.0.0 0.0.255.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] pim
[Switch-pim] c-rp 1.1.1.1 group-policy 2000 priority 10
```

5.1.5. crp-policy (PIM view)

Use **crp-policy** to configure a C-RP policy.

Use **undo crp-policy** to restore the default.

Syntax

crp-policy *ipv4-acl-number*

undo crp-policy

Default

No C-RP policy exists, and all C-RP messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

A C-RP policy filters C-RP advertisement messages to guard against C-RP spoofing.

The device uses only the prefixes of the multicast group ranges in advertisement messages to match the destination field in ACL rules. For example, the multicast group range in an advertisement message is 224.1.0.0/16. If the prefix 224.1.0.0 is in the range specified by the destination field of an ACL rule, the specified C-RPs are designated to this multicast group range.

When you configure a rule in the IPv4 advanced ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies an RP address.
- The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a C-RP policy so that only devices in the range of 1.1.1.1/24 can be C-RPs for the groups in the range of 225.1.1.0/24.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip source 1.1.1.1 0.0.0.255 destination 225.1.1.0
0.0.0.255
[Switch-acl-ipv4-adv-3000] quit
[Switch] pim
[Switch-pim] crp-policy 3000
```

5.1.6. display pim bsr-info

Use **display pim bsr-info** to display BSR information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **bsr-info**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

Examples

Display BSR information.

```
<Switch> display pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 12.12.12.1
       Priority: 64
       Hash mask length: 30
       Uptime: 00:21:56

 Scope: 239.4.0.0/16
     State: Accept Any
     Scope-zone expiry timer: 00:21:12

 Scope: 239.1.0.0/16
     State: Elected
     Bootstrap timer: 00:00:26
     Elected BSR address: 17.1.11.1
       Priority: 64
       Hash mask length: 30
       Uptime: 02:53:37
     Candidate BSR address: 17.1.11.1
       Priority: 64
       Hash mask length: 30

 Scope: 239.2.2.0/24
     State: Candidate
     Bootstrap timer: 00:01:56
     Elected BSR address: 61.2.37.1
       Priority: 64
       Hash mask length: 30
       Uptime: 02:53:32
     Candidate BSR address: 17.1.12.1
       Priority: 64
       Hash mask length: 30

 Scope: 239.3.3.0/24
     State: Pending
     Bootstrap timer: 00:00:07
     Candidate BSR address: 17.1.13.1
       Priority: 64
```

```
Hash mask length: 30
```

Table 5-1 Command output

Field	Description
Bootstrap timer	Aging timer for the BSR.
Scope-zone expiry timer	Aging timer for the scoped zone.
Elected BSR address	Address of the elected BSR.
Candidate BSR address	Address of the C-BSR.
Priority	BSR priority.
Uptime	Length of time the BSR has been up.

5.1.7. display pim claimed-route

Use **display pim claimed-route** to display information about all routes that PIM uses.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **claimed-route** [*source-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about all routes that PIM uses.

Examples

Display information about all routes that PIM uses.

```
<Switch> display pim claimed-route
 RPF-route selecting rule: longest-match

 Route/mask: 7.11.0.0/16 (unicast (direct))
     RPF interface: Vlan-interface2, RPF neighbor: 8.0.0.2
     Total number of (S,G) or (*,G) dependent on this route entry: 4
     (7.11.0.10, 225.1.1.1)
     (7.11.0.10, 226.1.1.1)
     (7.11.0.10, 227.1.1.1)
     (*, 228.1.1.1)
 Route/mask: 7.12.0.0/16 (multicast static)
     RPF interface: Vlan-interface2, RPF neighbor: 8.0.0.3,
     Config NextHop: 8.0.0.5
```

```
Total number of (S,G) or (*,G) dependent on this route entry: 2
(7.12.0.10, 226.1.1.1)
(7.12.0.10, 225.1.1.1)
```

Table 5-2 Command output

Field	Description
Route/mask	Route entry. Route types in parentheses include: • **igp**—IGP unicast route. • **egp**—EGP unicast route. • **unicast (direct)**—Direct unicast route. • **unicast**—Other unicast route, such as static unicast route. • **mbgp**—MBGP route. • **multicast static**—Static multicast route.
RPF interface	Name of the RPF interface.
RPF neighbor	IP address of the RPF neighbor.
Config NextHop	Address of the configured next hop. This field is displayed only when the static multicast route is configured with a next hop.
Total number of (S,G) or (*,G) dependent on this route entry	Total number of (S, G) or (*, G) entries associated with the RPF route and the entry list.

5.1.8. display pim c-rp

Use **display pim c-rp** to display C-RP information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

local: Specifies local C-RPs. If you do not specify this keyword, the command displays information about all C-RPs.

Usage guidelines

You can view information about learned C-RPs only on the BSR. On other devices, you can view information about the locally configured C-RPs.

Examples

Display information about learned C-RPs.

```
<Switch> display pim c-rp
```

```
Scope: non-scoped
    Group/MaskLen: 224.0.0.0/4
      C-RP address             Priority  HoldTime  Uptime    Expires
      1.1.1.1 (local)          192       150       03:01:36  00:02:29
      2.2.2.2                  192       150       1d:13h    00:02:02
    Group/MaskLen: 226.1.1.0/24 [B] Expires: 00:00:33
    Group/MaskLen: 225.1.0.0/16 [B]
      C-RP Address             Priority  HoldTime  Uptime    Expires
      3.3.3.3                  192       150       12w:5d    00:02:05
```

Display information about the locally configured C-RPs.

```
<Switch> display pim c-rp local
 Candidate RP: 12.12.12.9(Loop1)
    Priority: 192
    HoldTime: 150
    Advertisement interval: 60
    Next advertisement scheduled at: 00:00:48
```

Table 5-3 Command output

Field	Description
Group/MaskLen	Multicast group to which the C-RP is designated.
[B]	This field is not supported in the current software version. BIDIR-PIM C-RP. This field is not displayed if the C-RP is a PIM-SM C-RP.
C-RP address	IP address of the C-RP. If the C-RP resides on the device where the command is executed, this field displays **(local)** after the address.
Priority	Priority of the C-RP.
HoldTime	Lifetime of the C-RP.
Uptime	Length of time the C-RP has been up: • **w**—Weeks. • **d**—Days. • **h**—Hours.
Expires	Remaining lifetime for the C-RP and the multicast group.
Candidate RP	IP address of the locally configured C-RP.
Advertisement interval	Interval between two advertisement messages sent by the locally configured C-RP.
Next advertisement scheduled at	Remaining time for the locally configured C-RP to send the next advertisement message.

5.1.9. display pim interface

Use **display pim interface** to display PIM information for interfaces.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays PIM information for all interfaces.

verbose: Displays detailed PIM information. If you do not specify this keyword, the command displays brief PIM information.

Examples

Display brief PIM information for all interfaces.

```
<Switch> display pim interface
 Interface          NbrCnt  HelloInt  DR-Pri     DR-Address
 Vlan1              1       30        1          10.1.1.2
 Vlan2              0       30        1          172.168.0.2     (local)
 Vlan3              1       30        1          20.1.1.2
```

Table 5-4 Command output

Field	Description
NbrCnt	Number of PIM neighbors.
HelloInt	Interval for sending hello messages.
DR-Pri	Priority for DR election.
DR-Address	IP address of the DR. If the DR resides on the device where the command is executed, this field displays **(local)** after the address.

Display detailed PIM information for VLAN-interface 1.

```
<Switch> display pim interface vlan-interface 1 verbose
 Interface: Vlan-interface1, 10.1.1.1
     PIM version: 2
     PIM mode: Sparse
     PIM DR: 10.1.1.2
     PIM DR Priority (configured): 1
     PIM neighbors count: 1
     PIM hello interval: 30 s
     PIM LAN delay (negotiated): 500 ms
     PIM LAN delay (configured): 500 ms
     PIM override interval (negotiated): 2500 ms
     PIM override interval (configured): 2500 ms
     PIM neighbor tracking (negotiated): disabled
     PIM neighbor tracking (configured): disabled
```

```
PIM generation ID: 0xF5712241
PIM require generation ID: disabled
PIM hello hold interval: 105 s
PIM assert hold interval: 180 s
PIM triggered hello delay: 5 s
PIM J/P interval: 60 s
PIM J/P hold interval: 210 s
PIM BSR domain border: disabled
PIM BFD: disabled
PIM passive: disabled
Number of routers on network not using DR priority: 0
Number of routers on network not using LAN delay: 0
Number of routers on network not using neighbor tracking: 2
```

Table 5-5 Command output

Field	Description
PIM version	Version of the PIM protocol.
PIM mode	PIM mode: dense or sparse.
PIM DR	IP address of the DR.
PIM DR Priority (configured)	Configured priority for DR election.
PIM neighbors count	Total number of PIM neighbors.
PIM hello interval	Interval between two hello messages.
PIM LAN delay (negotiated)	Negotiated PIM message propagation delay.
PIM LAN delay (configured)	Configured PIM message propagation delay.
PIM override interval (negotiated)	Negotiated interval for overriding prune messages.
PIM override interval (configured)	Configured interval for overriding prune messages.
PIM neighbor tracking (negotiated)	Negotiated neighbor tracking status: enabled or disabled.
PIM neighbor tracking (configured)	Configured neighbor tracking status: enabled or disabled.
PIM require generation ID	Whether the feature of discarding hello messages without Generation_ID is enabled.
PIM hello hold interval	PIM neighbor lifetime.
PIM assert hold interval	Assert holdtime timer.
PIM triggered hello delay	Maximum delay for sending hello messages.
PIM J/P interval	Interval between two join/prune messages.
PIM J/P hold interval	Joined/pruned state holdtime timer.
PIM BSR domain border	Whether a PIM domain border is configured.
PIM BFD	Whether PIM is enabled to work with BFD.
PIM passive	Whether PIM passive mode is enabled on the interface.
Number of routers on network not using DR priority	Number of routers that do not use the DR priority field on the subnet where the interface resides.

Field	Description
Number of routers on network not using LAN delay	Number of routers that do not use the LAN delay field on the subnet where the interface resides.
Number of routers on network not using neighbor tracking	Number of routers that are not enabled with neighbor tracking on the subnet where the interface resides.

5.1.10. display pim neighbor

Use **display pim neighbor** to display PIM neighbor information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **neighbor** [*neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

neighbor-address: Specifies a PIM neighbor by its IP address. If you do not specify a PIM neighbor, this command displays information about all PIM neighbors.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays PIM neighbor information on all interfaces.

verbose: Displays detailed PIM neighbor information. If you do not specify this keyword, the command displays brief PIM neighbor information.

Examples

Display brief information about all PIM neighbors.

```
<Switch> display pim neighbor
 Total Number of Neighbors = 2

 Neighbor        Interface           Uptime   Expires  DR-Priority Mode
 10.1.1.2        Vlan1               02:50:49 00:01:31 1           B
 20.1.1.2        Vlan2               02:49:39 00:01:42 1
```

Display detailed information about the PIM neighbor with IP address 11.110.0.20.

```
<Switch> display pim neighbor 11.110.0.20 verbose
 Neighbor: 11.110.0.20
     Interface: Vlan-interface3
     Uptime: 00:00:10
     Expiry time: 00:00:30
     DR Priority: 1
```

```
Generation ID: 0x2ACEFE15
Holdtime: 105 s
LAN delay: 500 ms
Override interval: 2500 ms
State refresh interval: 60 s
Neighbor tracking: Disabled
Bidirectional PIM: Disabled
RPF proxy vector: Disabled
Secondary address(es):
22.1.1.2
22.1.1.3
22.1.1.4
22.1.1.5
22.1.1.6
22.1.1.7
22.1.1.8
```

Table 5-6 Command output

Field	Description
Total Number of Neighbors	Total number of PIM neighbors.
Neighbor	IP address of the PIM neighbor.
Interface	Interface that connects to the PIM neighbor.
Uptime	Length of time the PIM neighbor has been up.
Expires/Expiry time	Remaining lifetime for the PIM neighbor. If the PIM neighbor is always up and reachable, this field displays **never**.
DR-Priority/DR Priority	Priority of the PIM neighbor.
Mode	PIM mode. **B**—The PIM mode is BIDIR-PIM. This mode is not supported in the current software version. This field is empty if the PIM mode is not BIDIR-PIM and the RPF vector is disabled.
Generation ID	Generation ID of the PIM neighbor. (A random value represents a status change of the PIM neighbor.)
Holdtime	Lifetime of the PIM neighbor. If the PIM neighbor is always up and reachable, this field displays **forever**.
LAN delay	PIM message propagation delay on a shared-media LAN.
Override interval	Interval for overriding prune messages.
State refresh interval	Interval for refreshing state. This field is displayed only when the PIM neighbor operates in the PIM-DM mode and the state refresh capability is enabled.
Neighbor tracking	Neighbor tracking status: enabled or disabled.
Bidirectional PIM	This field is not supported in the current software version. Whether BIDIR-PIM is enabled.
RPF proxy vector	Whether the RPF vector feature is enabled.
Secondary address(es)	Secondary addresses of the PIM neighbor.

5.1.11. display pim routing-table

Use **display pim routing-table** to display PIM routing entries.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **routing-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command displays PIM routing entries for all multicast groups.

source-address: Specifies a multicast source by its IP address.

mask-length: Specifies an address mask length in the range of 0 to 32. The default value is 32.

mask: Specifies an address mask. The default value is 255.255.255.255.

flags *flag-value*: Specifies a flag. If you do not specify a flag, this command displays PIM routing entries that contain all flags. The following lists the values for the *flag-value* argument and their meanings:

- **2msdp**: Specifies PIM routing entries to be contained in the next SA message to notify an MSDP peer.
- **act**: Specifies PIM routing entries that have been used for routing data.
- **del**: Specifies PIM routing entries to be deleted.
- **exprune**: Specifies PIM routing entries containing outgoing interfaces pruned by other multicast routing protocols.
- **ext**: Specifies PIM routing entries containing outgoing interfaces provided by other multicast routing protocols.
- **loc**: Specifies PIM routing entries on the devices that reside on the same subnet as the multicast source.
- **msdp**: Specifies PIM routing entries learned from MSDP SA messages.
- **niif**: Specifies PIM routing entries containing unknown incoming interfaces.
- **nonbr**: Specifies PIM routing entries with PIM neighbor lookup failure.
- **rpt**: Specifies PIM routing entries on the RPT branches where (S, G) prunes have been sent to the RP.

- **rq**: Specifies PIM routing entries of the receiving side of the data-MDT switchover.
- **spt**: Specifies PIM routing entries on the SPT.
- **sq**: Specifies PIM routing entries of the originator side of data-MDT switchover.
- **swt**: Specifies PIM routing entries in the process of RPT-to-SPT switchover.
- **vxlan**: Specifies VXLAN overlay entries maintained by PIM.
- **wc**: Specifies PIM routing entries with wildcards.

fsm: Displays detailed information about the finite state machine.

incoming-interface *interface-type interface-number*: Specifies an incoming interface. If you do not specify an incoming interface, this command displays PIM routing entries that contain all incoming interfaces.

mode *mode-type*: Specifies a PIM mode. If you do not specify a PIM mode, this command displays PIM routing entries in all PIM modes. The available PIM modes include:

- **sm**: Specifies PIM-SM.
- **ssm**: Specifies PIM-SSM.

outgoing-interface { **exclude** | **include** | **match** } *interface-type interface-number*: Specifies an outgoing interface. If you do not specify an outgoing interface, this command displays PIM routing entries that contain all outgoing interfaces. Whether an outgoing interface is contained in the PIM routing table depends on the following conditions:

- If you specify an excluded interface, this command displays PIM routing entries that do not contain the specified outgoing interface.
- If you specify an included interface, this command displays PIM routing entries that contain the specified outgoing interface.
- If you specify a matching interface, this command displays PIM routing entries that contain only the specified outgoing interface.

Examples

Display PIM routing entries.

```
<Switch> display pim routing-table
 Total 0 (*, G) entries; 1 (S, G) entries

 (172.168.0.12, 227.0.0.1)
     RP: 2.2.2.2
     Protocol: pim-sm, Flag: SPT LOC ACT
     UpTime: 02:54:43
     Upstream interface: Vlan-interface1
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface2
             Protocol: pim-sm, UpTime: 02:54:43, Expires: 00:02:47
```

Table 5-7 Command output

Field	Description
Total 0 (*, G) entries; 1 (S, G) entries	Total number of (*, G) entries, and the total number of (S, G) entries.

Field	Description
(172.168.0.12, 227.0.0.1)	(S, G) entry.
Protocol	PIM mode.
Flag	Flag of the (S, G) entry or (*, G) entry: • **2MSDP**—The entry is to be advertised by the MSDP module in the next (S, A) message. • **ACT**—The entry has been used for routing data. • **DEL**—The entry is to be removed. • **EXPRUNE**—Some outgoing interfaces are pruned by other multicast routing protocols. • **EXT**—The entry contains outgoing interfaces provided by other multicast routing protocols. • **LOC**—The entry is on a router directly connected to the same subnet with the multicast source. • **MSDP**—The entry is learned from an MSDP (S, A) message. • **NIIF**—The entry contains unknown incoming interfaces. • **NONBR**—The entry has a PIM neighbor lookup failure. • **RPT**—The entry is on an RPT branch where (S, G) prunes have been sent to the RP. • **SPT**—The entry is on the SPT. • **SQ**—The entry triggers the default-MDT to data-MDT switchover. • **SWT**—The entry is in the process of RPT-to-SPT switchover. • **VXLAN**—The entry is a VXLAN overlay entry. • **WC**—The entry contains a wildcard.
Uptime	Length of time for which the (S, G) entry or (*, G) entry has been up.
Upstream interface	Upstream (incoming) interface of the (S, G) entry or (*, G) entry.
Upstream neighbor	Upstream neighbor of the (S, G) entry or (*, G) entry.
RPF prime neighbor	RPF neighbor of the (S, G) or (*, G) entry: • For a (*, G) entry, if the RPF neighbor is the RP, the field displays **NULL**. • For an (S, G) entry, if the RPF neighbor is a router that directly connects to the multicast source, this field displays **NULL**.
Downstream interface information	Information about the downstream interfaces: • Total number of downstream interfaces. • Names of the downstream interfaces. • Protocol type on the downstream interfaces. • Uptime of the downstream interfaces. • Expiration time of the downstream interfaces.

5.1.12. display pim rp-info

Use **`display pim rp-info`** to display PIM RP information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **rp-info** [*group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays RP information for all multicast groups.

Examples

Display RP information for multicast group 224.0.1.1.

```
<Switch> display pim rp-info 224.0.1.1
 BSR RP address is: 2.2.2.2
     Priority: 192
     HoldTime: 180
     Uptime: 03:01:10
     Expires: 00:02:30

 Static RP address is: 3.3.3.5
     Preferred: Yes
     Configured ACL: 2003

 RP mapping for this group is: 3.3.3.5

 Anycast-RP 3.3.3.5 members:
     Member address           State
     1.1.0.1                  Active
     1.2.0.2                  Local
     1.2.0.1                  Remote
```

Display RP information for all multicast groups.

```
<Switch> display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
       1.1.1.1 (local)          192       180       03:01:36  00:02:29
       2.2.2.2                  192       180       1d:13h    00:02:02

 Static RP information:
       RP address               ACL   Mode    Preferred
```

```
      3.3.3.1                 2000  pim-sm  No
      3.3.3.2                 2001  bidir   Yes
      3.3.3.3                 2002  pim-sm  No
      3.3.3.4                       pim-sm  No
      3.3.3.5                 2002  pim-sm  Yes

Anycast-RP information:
      RP address              Member address          State
      3.3.3.5                 1.1.0.1                 Active
      3.3.3.5                 1.1.0.2                 Local
      3.3.3.5                 1.2.0.1                 Remote
```

Table 5-8 Command output

Field	Description
BSR RP address is	IP address of the RP.
BSR RP information	Information about the RP.
Group/MaskLen	Multicast group to which the RP is designated.
[B]	This field is not supported in the current software version. The RP is a BIDIR-PIM RP. This field is not displayed if the RP is a PIM-SM RP.
RP address	IP address of the RP. If the RP resides on the device where the command is executed, this field displays **(local)** after the address.
Priority	Priority of the RP.
HoldTime	RP lifetime.
Uptime	Length of time the RP has been up.
Expires	Remaining lifetime for the RP.
Preferred	Whether the static RP is preferred.
Configured ACL/ACL	ACL defining the multicast groups to which the static RP is designated.
Mode	RP service mode: PIM-SM or BIDIR-PIM. BIDIR-PIM is not supported in the current software version.
RP mapping for this group	IP address of the RP that provides services for the multicast group.
Anycast-RP 3.3.3.5 members	Members of Anycast RP 3.3.3.5.
Member address	IP address of the Anycast RP member.
State	State of the interface from which the member address originates: • **Active**—Activated local interface. • **Local**—Inactivated local interface. • **Remote**—Remote interface.

5.1.13. hello-option dr-priority (PIM view)

Use **hello-option dr-priority** to set the DR priority globally.

Use **undo hello-option dr-priority** to restore the default.

Syntax

hello-option dr-priority *priority*

undo hello-option dr-priority

Default

The DR priority is 1.

Views

PIM view

Predefined user roles

network-admin

Parameters

priority: Specifies a DR priority in the range of 0 to 4294967295. The greater the value, the higher the priority.

Usage guidelines

You can set the DR priority globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global DR priority to 3.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option dr-priority 3
```

Related commands

pim hello-option dr-priority

5.1.14. hello-option holdtime (PIM view)

Use **hello-option holdtime** to set the PIM neighbor lifetime globally.

Use **undo hello-option holdtime** to restore the default.

Syntax

hello-option holdtime *time*

undo hello-option holdtime

Default

The PIM neighbor lifetime is 105 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

time: Specifies a PIM neighbor lifetime in the range of 1 to 65535 seconds. If you set the value to 65535 seconds, PIM neighbors are always reachable.

Usage guidelines

You can set the PIM neighbor lifetime globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global PIM neighbor lifetime to 120 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option holdtime 120
```

Related commands

pim hello-option holdtime

5.1.15. hello-option lan-delay (PIM view)

Use **hello-option lan-delay** to set the PIM message propagation delay on a shared-media LAN globally.

Use **undo hello-option lan-delay** to restore the default.

Syntax

hello-option lan-delay *delay*

undo hello-option lan-delay

Default

The PIM message propagation delay on a shared-media LAN is 500 milliseconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

delay: Specifies a PIM message propagation delay on a shared-media LAN, in the range of 1 to 32767 milliseconds.

Usage guidelines

You can set the PIM message propagation delay globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global PIM message propagation delay on a shared-media LAN to 200 milliseconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option lan-delay 200
```

Related commands

hello-option override-interval (PIM view)

pim hello-option lan-delay

pim hello-option override-interval

5.1.16. hello-option neighbor-tracking (PIM view)

Use **hello-option neighbor-tracking** to enable neighbor tracking globally.

Use **undo hello-option neighbor-tracking** to disable neighbor tracking globally.

Syntax

hello-option neighbor-tracking

undo hello-option neighbor-tracking

Default

Neighbor tracking is disabled.

Views

PIM view

Predefined user roles

network-admin

Usage guidelines

You can enable neighbor tracking globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Enable neighbor tracking globally.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option neighbor-tracking
```

Related commands

pim hello-option neighbor-tracking

5.1.17. hello-option override-interval (PIM view)

Use **hello-option override-interval** to set the override interval globally.

Use **undo hello-option override-interval** to restore the default.

Syntax

hello-option override-interval *interval*

undo hello-option override-interval

Default

The override interval is 2500 milliseconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies an override interval in the range of 1 to 65535 milliseconds.

Usage guidelines

You can set the override interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global override interval to 2000 milliseconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option override-interval 2000
```

Related commands

hello-option lan-delay (PIM view)

pim hello-option lan-delay

pim hello-option override-interval

5.1.18. holdtime join-prune (PIM view)

Use **holdtime join-prune** to set the joined/pruned state holdtime globally.

Use **undo holdtime join-prune** to restore the default.

Syntax

holdtime join-prune *time*

undo holdtime join-prune

Default

The joined/pruned state holdtime is 210 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

time: Specifies a joined/pruned state holdtime in the range of 1 to 65535 seconds.

Usage guidelines

You can set the joined/pruned state holdtime globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

To prevent the upstream neighbors from aging out, you must set the join/prune interval to be less than the joined/pruned state holdtime.

Examples

Set the global joined/pruned state holdtime to 280 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] holdtime join-prune 280
```

Related commands

pim holdtime join-prune

timer join-prune (PIM view)

5.1.19. jp-pkt-size (PIM view)

Use **jp-pkt-size** to set the maximum size of a join/prune message.

Use **undo jp-pkt-size** to restore the default.

Syntax

jp-pkt-size *size*

undo jp-pkt-size

Default

The maximum size of a join/prune message is 8100 bytes.

Views

PIM view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum size of a join/prune message, in the range of 100 to 8100 bytes.

Examples

Set the maximum size of a join/prune message to 1500 bytes.

```
<Switch> system-view
[Switch] pim
[Switch-pim] jp-pkt-size 1500
```

5.1.20. pim

Use **pim** to enter PIM view.

Use **undo pim** to remove all configurations in PIM view.

Syntax

pim [**vpn-instance** *vpn-instance-name*]

undo pim [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

Examples

Enable IP multicast routing and enter PIM view.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] quit
[Switch] pim
[Switch-pim]
```

Related commands

multicast routing-enable

5.1.21. pim bsr-boundary

Use **pim bsr-boundary** to configure a PIM-SM domain border (a bootstrap message boundary).

Use **undo pim bsr-boundary** to restore the default.

Syntax

pim bsr-boundary

undo pim bsr-boundary

Default

An interface is not a PIM-SM domain border.

Views

Interface view

Predefined user roles

network-admin

Examples

Configure VLAN-interface 100 as a PIM-SM domain border.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim bsr-boundary
```

Related commands

multicast boundary

5.1.22. pim hello-option dr-priority

Use **pim hello-option dr-priority** to set the DR priority on an interface.

Use **undo pim hello-option dr-priority** to restore the default.

Syntax

pim hello-option dr-priority *priority*

undo pim hello-option dr-priority

Default

The DR priority is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

priority: Specifies a DR priority in the range of 0 to 4294967295. The greater the value, the higher the priority.

Usage guidelines

You can set the DR priority for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the DR priority to 3 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim hello-option dr-priority 3
```

Related commands

5.1.25. pim hello-option neighbor-tracking

Use **pim hello-option neighbor-tracking** to enable neighbor tracking on an interface.

Use **pim hello-option neighbor-tracking disable** to disable neighbor tracking on an interface when neighbor tracking is enabled globally.

Use **undo pim hello-option neighbor-tracking** to restore neighbor tracking setting on an interface to be consistent with the global setting.

Syntax

pim hello-option neighbor-tracking

pim hello-option neighbor-tracking disable

undo pim hello-option neighbor-tracking

Default

Neighbor tracking is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

You can enable neighbor tracking for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Enable neighbor tracking on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim hello-option neighbor-tracking
```

Disable neighbor tracking on VLAN-interface 100 when neighbor tracking is enabled globally.

```
<Switch> system-view
[Switch] pim
[Switch-pim] hello-option neighbor-tracking
[Switch-pim] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim hello-option neighbor-tracking disable
```

Related commands

hello-option neighbor-tracking (PIM view)

5.1.26. pim hello-option override-interval

Use **pim hello-option override-interval** to set the override interval on an interface.

Use **undo pim hello-option override-interval** to restore the default.

Syntax

pim hello-option override-interval *interval*

undo pim hello-option override-interval

Default

The override interval is 2500 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an override interval in the range of 1 to 65535 milliseconds.

Usage guidelines

You can set the override interval for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the override interval to 2000 milliseconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim hello-option override-interval 2000
```

hello-option override-interval (PIM view)

pim hello-option lan-delay

5.1.27. pim holdtime join-prune

Use **pim holdtime join-prune** to set the joined/pruned state holdtime on an interface.

Use **undo pim holdtime join-prune** to restore the default.

Syntax

pim holdtime join-prune *time*

undo pim holdtime join-prune

Default

The joined/pruned state holdtime is 210 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies a joined/pruned state holdtime in the range of 1 to 65535 seconds.

Usage guidelines

You can set the joined/pruned state holdtime for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

To prevent the upstream neighbors from aging out, you must configure the join/prune interval to be less than the joined/pruned state holdtime.

Examples

Set the joined/pruned state holdtime to 280 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim holdtime join-prune 280
```

Related commands

holdtime join-prune (PIM view)

pim timer join-prune

5.1.28. pim neighbor-policy

Use **pim neighbor-policy** to configure a PIM hello policy.

Use **undo pim neighbor-policy** to restore the default.

Syntax

pim neighbor-policy *ipv4-acl-number*

undo pim neighbor-policy

Default

No PIM hello policy exists on an interface, and all PIM hello messages are regarded as legal.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

Usage guidelines

A PIM hello policy filters PIM hello messages to guard against hello message spoofing.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a source IP address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a PIM hello policy on VLAN-interface 100 so that only the devices on subnet 10.1.1.0/24 can become PIM neighbors of this switch.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 10.1.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim neighbor-policy 2000
```

5.1.29. pim passive

Use **pim passive** to enable PIM passive mode on an interface.

Use **undo pim passive** to disable PIM passive mode on an interface.

Syntax

pim passive

undo pim passive

Default

PIM passive mode is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when PIM-SM is enabled on the interface.

Examples

Enable IP multicast routing. Then, enable PIM-SM and PIM passive mode on VLAN-interface 100.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim sm
[Switch-Vlan-interface100] pim passive
```

5.1.30. pim require-genid

Use **pim require-genid** to enable dropping hello messages without the generation ID options.

Use **undo pim require-genid** to restore the default.

Syntax

pim require-genid

undo pim require-genid

Default

Hello messages without the generation ID options are accepted.

Views

Interface view

Predefined user roles

network-admin

Examples

Enable VLAN-interface 100 to drop hello messages without the generation ID options.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim require-genid
```

5.1.31. pim sm

Use **pim sm** to enable PIM-SM.

Use **undo pim sm** to disable PIM-SM.

Syntax

pim sm

undo pim sm

Default

PIM-SM is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled.

Examples

Enable IP multicast routing, and enable PIM-SM on VLAN-interface 100.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim sm
```

Related commands

multicast routing

5.1.32. pim state-refresh-capable

Use **pim state-refresh-capable** to enable the state refresh feature on an interface.

Use **undo pim state-refresh-capable** to disable the state refresh feature.

Syntax

pim state-refresh-capable

undo pim state-refresh-capable

Default

The state refresh feature is enabled.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable the state refresh feature on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] undo pim state-refresh-capable
```

5.1.33. pim timer hello

Use **pim timer hello** to set the hello interval on an interface.

Use **undo pim timer hello** to restore the default.

Syntax

pim timer hello *interval*

undo pim timer hello

Default

The hello interval is 30 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies a hello interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the interface does not send hello messages.

Usage guidelines

You can set the hello interval for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the hello interval to 40 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim timer hello 40
```

Related commands

timer hello (PIM view)

5.1.34. pim timer join-prune

Use **pim timer join-prune** to set the join/prune interval on an interface.

Use **undo pim timer join-prune** to restore the default.

Syntax

pim timer join-prune *interval*

undo pim timer join-prune

Default

The join/prune interval is 60 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies a join/prune interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the interface does not send join or prune messages.

Usage guidelines

You can set the join/prune interval for an interface in interface view or globally for all interfaces in PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

The configuration takes effect after the current interval ends.

To prevent the upstream neighbors from aging out, you must set the join/prune interval to be less than the joined/pruned state holdtime.

Examples

Set the join/prune interval to 80 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim timer join-prune 80
```

Related commands

pim holdtime join-prune

5.1.35. pim triggered-hello-delay

Use **pim triggered-hello-delay** to set the triggered hello delay (maximum delay for sending a hello message).

Use **undo pim triggered-hello-delay** to restore the default.

Syntax

pim triggered-hello-delay *delay*

undo pim triggered-hello-delay

Default

The triggered hello delay is 5 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay: Specifies a triggered hello delay in the range of 1 to 60 seconds.

Examples

Set the triggered hello delay to 3 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] pim triggered-hello-delay 3
```

5.1.36. register-policy (PIM view)

Use **register-policy** to configure a PIM register policy.

Use **undo register-policy** to restore the default.

Syntax

register-policy *ipv4-acl-number*

undo register-policy

Default

No PIM register policy exists, and all PIM register messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

A PIM register policy enables an RP to filter PIM register messages so that the RP is designated only to multicast groups permitted by the ACL.

When you configure a rule in the IPv4 advanced ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast source address.
- The **destination** *dest-address dest-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a PIM register policy. Then, the device accepts only register messages from the sources on the subnet 10.10.0.0/16 to the groups on the subnet 225.1.0.0/16.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip source 10.10.0.0 0.0.255.255 destination
225.1.0.0 0.0.255.255
[Switch-acl-ipv4-adv-3000] quit
[Switch] pim
[Switch-pim] register-policy 3000
```

5.1.37. register-whole-checksum (PIM view)

Use **register-whole-checksum** to configure the device to calculate the checksum based on an entire register message.

Use **undo register-whole-checksum** to restore the default.

Syntax

register-whole-checksum

undo register-whole-checksum

Default

The device calculates the checksum based on the register message header.

Views

PIM view

Predefined user roles

network-admin

Examples

Configure the device to calculate the checksum based on an entire register message.

```
<Switch> system-view
[Switch] pim
[Switch-pim] register-whole-checksum
```

5.1.38. snmp-agent trap enable pim

Use **snmp-agent trap enable pim** to enable SNMP notifications for PIM.

Use **undo snmp-agent trap enable pim** to disable SNMP notifications for PIM.

Syntax

snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

undo snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

Default

SNMP notifications for PIM are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

candidate-bsr-win-election: Specifies notifications about winning the BSR election.

elected-bsr-lost-election: Specifies notifications about losing the BSR election.

neighbor-loss: Specifies notifications about losing neighbors.

Usage guidelines

If you do not specify an optional keyword, this command enables or disables PIM to generate SNMP notifications.

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Examples

Disable SNMP notifications for PIM.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable pim
```

5.1.39. source-lifetime (PIM view)

Use **source-lifetime** to set the multicast source lifetime.

Use **undo source-lifetime** to restore the default.

Syntax

source-lifetime *time*

undo source-lifetime

Default

The multicast source lifetime is 210 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

time: Specifies a multicast source lifetime in the range of 0 to 31536000 seconds. If you set the value to 0 seconds, multicast sources never age out.

Examples

Set the multicast source lifetime to 200 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] source-lifetime 200
```

5.1.40. source-policy (PIM view)

Use **source-policy** to configure a multicast source policy.

Use **undo source-policy** to restore the default.

Syntax

source-policy *ipv4-acl-number*

undo source-policy

Default

No multicast source policy exists. The device does not filter multicast data packets.

Views

PIM view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL number in the range of 2000 to 3999.

Usage guidelines

A multicast source policy filters multicast data packets to control information available to downstream receivers.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a source IP address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a source IP address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a multicast source policy to accept multicast data from source 10.10.1.2 and to deny multicast data from source 10.10.1.1.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 10.10.1.2 0
[Switch-acl-ipv4-basic-2000] rule deny source 10.10.1.1 0
[Switch-acl-ipv4-basic-2000] quit
[Switch] pim
[Switch-pim] source-policy 2000
```

5.1.41. spt-switch-threshold (PIM view)

Use **spt-switch-threshold** to configure a criterion for an RPT-to-SPT switchover.

Use **undo spt-switch-threshold** to remove criteria for RPT-to-SPT switchovers.

Syntax

spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

undo spt-switch-threshold [**immediacy** | **infinity**] [**group-policy** *ipv4-acl-number*]

Default

The first multicast packet triggers an RPT-to-STP switchover.

Views

PIM view

Predefined user roles

network-admin

Parameters

immediacy: Triggers an RPT-to-STP switchover immediately.

infinity: Disables RPT-to-STP switchover.

group-policy *ipv4-acl-number*: Specifies an IPv4 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the configuration applies to the multicast groups that the ACL permits. The configuration applies to all multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

CAUTION:
If the device is an RP, disabling RPT-to-STP switchover might cause multicast traffic forwarding failures on the source-side DR. When disabling RPT-to-SPT switchover, make sure you fully understand its impact on your network.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Disable RPT-to-STP switchover on a receiver-side DR.

```
<Switch> system-view
[Switch] pim
[Switch-pim] spt-switch-threshold infinity
```

5.1.42. ssm-policy (PIM view)

Use **ssm-policy** to configure the SSM group range.

Use **undo ssm-policy** to restore the default.

Syntax

ssm-policy *ipv4-acl-number*

undo ssm-policy

Default

The SSM group range is 232.0.0.0/8.

Views

PIM view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

Usage guidelines

This command defines a multicast group range that is used by PIM-SSM. For multicast packets that are permitted by the ACL, the PIM-SSM mode is used. For multicast packets that are not permitted by the ACL, the PIM-SM mode is used.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the SSM group range as 232.1.0.0/16.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 232.1.0.0 0.0.255.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] pim
[Switch-pim] ssm-policy 2000
```

5.1.43. state-refresh-interval (PIM view)

Use **state-refresh-interval** to set the state refresh interval.

Use **undo state-refresh-interval** to restore the default.

Syntax

state-refresh-interval *interval*

undo state-refresh-interval

Default

The state refresh interval is 60 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a state refresh interval in the range of 1 to 255 seconds.

Examples

Set the state refresh interval to 70 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] state-refresh-interval 70
```

Related commands

pim state-refresh-capable

state-refresh-rate-limit (PIM view)

state-refresh-ttl (PIM view)

5.1.44. state-refresh-rate-limit (PIM view)

Use **state-refresh-rate-limit** to set the waiting time to accept a new state refresh message.

Use **undo state-refresh-rate-limit** to restore the default.

Syntax

state-refresh-rate-limit *time*

undo state-refresh-rate-limit

Default

The device waits 30 seconds before it accepts a new state refresh message.

Views

PIM view

Predefined user roles

network-admin

Parameters

time: Specifies the waiting time to accept a new refresh message, in the range of 1 to 65535 seconds.

Examples

Set the waiting time to 45 seconds to accept a new state refresh message.

```
<Switch> system-view
[Switch] pim
```

```
[Switch-pim] state-refresh-rate-limit 45
```

Related commands

pim state-refresh-capable

state-refresh-interval (PIM view)

state-refresh-ttl (PIM view)

5.1.45. state-refresh-ttl (PIM view)

Use **state-refresh-ttl** to set the TTL value for state refresh messages.

Use **undo state-refresh-ttl** to restore the default.

Syntax

state-refresh-ttl *ttl-value*

undo state-refresh-ttl

Default

The TTL value for state refresh messages is 255.

Views

PIM view

Predefined user roles

network-admin

Parameters

ttl-value: Specifies the TTL value for state refresh messages, in the range of 1 to 255.

Examples

Set the TTL value to 45 for state refresh messages.

```
<Switch> system-view
[Switch] pim
[Switch-pim] state-refresh-ttl 45
```

Related commands

pim state-refresh-capable (PIM view)

state-refresh-interval (PIM view)

state-refresh-rate-limit (PIM view)

5.1.46. static-rp (PIM view)

Use **static-rp** to configure a static RP.

Use **undo static-rp** to delete a static RP.

Syntax

static-rp *rp-address* [*ipv4-acl-number* | **preferred**] *

undo static-rp *rp-address*

Default

No static RPs exist.

Views

PIM view

Predefined user roles

network-admin

Parameters

rp-address: Specifies the IP address of the static RP. The IP address must be valid and cannot be on the subnet 127.0.0.0/8. For a static PIM-SM RP, you must specify a used IP address.

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the static RP is designated only to multicast groups that the ACL permits. The static RP is designated to all multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

preferred: Gives priority to the static RP if a dynamic RP also exists on the network. The dynamic RP takes effect only when the static RP fails. If you do not specify this keyword, the dynamic RP has priority, and the static RP takes effect only when the dynamic RP fails.

Usage guidelines

You do not need to enable PIM on an interface that acts as a static RP.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

When rules in the ACL used by a static RP change, new RPs are dynamically elected for all multicast groups.

You can configure multiple static RPs by using this command multiple times. However, if you specify the same static RP address or use the same ACL in the command, the most recent configuration takes effect. If you configure multiple static RPs for the same multicast group, the static RP with the highest IP address is used.

Examples

Configure the interface with IP address 11.110.0.6 as a static RP for multicast group range 225.1.1.0/24 and give priority to this static RP.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 225.1.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2001] quit
[Switch] pim
[Switch-pim] static-rp 11.110.0.6 2001 preferred
```

Related commands

display pim rp-info

5.1.47. timer hello (PIM view)

Use **timer hello** to set the hello interval globally.

Use **undo timer hello** to restore the default.

Syntax

timer hello *interval*

undo timer hello

Default

The hello interval is 30 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a hello interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send hello messages.

Usage guidelines

You can set the hello interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global hello interval to 40 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] timer hello 40
```

Related commands

pim timer hello

5.1.48. timer join-prune (PIM view)

Use **timer join-prune** to set the join/prune interval globally.

Use **undo timer join-prune** to restore the default.

Syntax

timer join-prune *interval*

undo timer join-prune

Default

The join/prune interval is 60 seconds.

Views

PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a join/prune interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send join or prune messages.

Usage guidelines

You can set the join/prune interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

The configuration takes effect after the current interval ends.

To prevent the upstream neighbors from expiring, you must set the join/prune interval to be less than the joined/pruned state holdtime.

Examples

Set the global join/prune interval to 80 seconds.

```
<Switch> system-view
[Switch] pim
[Switch-pim] timer join-prune 80
```

6. MSDP commands

6.1. MSDP commands

6.1.1. cache-sa-enable

Use **cache-sa-enable** to enable the SA message cache mechanism to cache the (S, G) entries contained in SA messages.

Use **undo cache-sa-enable** to disable the SA message cache mechanism.

Syntax

cache-sa-enable

undo cache-sa-enable

Default

The SA message cache mechanism is enabled, and the device caches the (S, G) entries contained in received SA messages.

Views

MSDP view

Predefined user roles

network-admin

Examples

Enable the SA message cache mechanism, so that the device caches the (S, G) entries contained in the received SA messages.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] cache-sa-enable
```

Related commands

display msdp sa-cache

display msdp sa-count

6.1.2. display msdp brief

Use **display msdp brief** to display brief information about MSDP peers.

Syntax

display msdp brief [**state** { **connect** | **disabled** | **established** | **listen** | **shutdown** }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

state: Specifies a state. If you do not specify this keyword, the command displays brief information about MSDP peers in all states.

connect: Specifies the connecting state.

disabled: Specifies the connection failure state.

established: Specifies the session state.

listen: Specifies the listening state.

shutdown: Specifies the shutdown state.

Examples

Display brief information about MSDP peers in all states.

```
<Switch> display msdp brief
Configured    Established  Listen       Connect      Shutdown     Disabled
1             1            0            0            0            0

Peer address     State       Up/Down time    AS          SA count    Reset count
20.20.20.20      Established 00:00:13        100         0           0
```

Table 6-1 Command output

Field	Description
Configured	Number of MSDP peers that have been configured.
Established	Number of MSDP peers in established state.
Listen	Number of MSDP peers in listening state.
Connect	Number of MSDP peers in connecting state.
Shutdown	Number of MSDP peers in shutdown state.
Disabled	Number of MSDP peers in connection failure state.
Peer address	MSDP peer address.
State	MSDP peer status: • **Established**—A session has been established and the MSDP peer is in session. • **Listen**—A session has been established and the local device acts as the server in listening state. • **Connect**—A session is not established and the local device acts as a client in connecting state. • **Shutdown**—The session has been torn down. • **Down**—The connection failed.
Up/Down time	Length of time since the MSDP peering connection was established or torn down.
AS	Number of the AS where the MSDP peer is located. If the system could not obtain the AS number, this field displays a question mark (?).
SA count	Number of (S, G) entries in the SA cache.
Reset count	MSDP peering connection reset times.

6.1.3. display msdp peer-status

Use **display msdp peer-status** to display detailed status information for MSDP peers.

Syntax

display msdp peer-status [*peer-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

peer-address: Specifies an MSDP peer by its address. If you do not specify an MSDP peer, this command displays detailed status information for all MSDP peers.

Examples

Display detailed status information for MSDP peer 20.20.20.20.

```
<Switch> display msdp peer-status 20.20.20.20
MSDP peer 20.20.20.20; AS 100
 Description:
 Information about connection status:
   State: Disabled
   Up/down time: 14:41:08
   Resets: 0
   Connection interface: LoopBack0 (20.20.20.30)
   Received/sent messages: 867/867
   Discarded input messages: 0
   Discarded output messages: 0
   Elapsed time since last connection or counters clear: 14:42:40
   Mesh group peer joined: momo
   Last disconnect reason: Hold timer expired with truncated message
   Truncated packet: 5 bytes in buffer, type: 1, length: 20, without packet time: 75s
 Information about (Source, Group)-based SA filtering policy:
   Import policy: None
   Export policy: None
 Information about SA-Requests:
   Policy to accept SA-Requests: None
   Sending SA-Requests status: Disable
 Minimum TTL to forward SA with encapsulated data: 0
 SAs learned from this peer: 0, SA cache maximum for the peer: 4294967295
 Input queue size: 0, Output queue size: 0
 Counters for MSDP messages:
   RPF check failure: 0
   Incoming/outgoing SA: 0/0
   Incoming/outgoing SA-Request: 0/0
   Incoming/outgoing SA-Response: 0/0
```

```
Incoming/outgoing Keepalive: 867/867
Incoming/outgoing Notification: 0/0
Incoming/outgoing Traceroutes in progress: 0/0
Incoming/outgoing Traceroute reply: 0/0
Incoming/outgoing Unknown: 0/0
Incoming/outgoing data packet: 0/0
```

Table 6-2 Command output

Field	Description
MSDP peer	MSDP peer address.
AS	Number of the AS where the MSDP peer is located. If the system could not obtain the AS number, this field displays a question mark (?).
State	MSDP peer status: • **Established**—A session has been established and the MSDP peer is in session. • **Listen**—A session has been established and the local device acts as the server in listening state. • **Connect**—A session is not established and the local device acts as a client in connecting state. • **Shutdown**—The session has been torn down. • **Disabled**—The connection failed.
Up/Down time	Length of time since the MSDP peering connection was established or torn down.
Resets	MSDP peering connection reset times.
Connection interface	Interface and IP address used for setting up a TCP connection with the remote MSDP peer.
Received/sent messages	Number of SA messages sent and received through this connection.
Discarded input messages	Number of discarded incoming messages.
Discarded output messages	Number of discarded outgoing messages.
Elapsed time since last connection or counters clear	Elapsed time since the MSDP peer information was last cleared.
Mesh group peer joined	Mesh group that the MSDP peer has joined. This field is not displayed if the MSDP peer does not join a mesh group.
Last disconnect reason	Reason why last MSDP peering connection was torn down. If the connection is not terminated, this field does not display a value. • **Hold timer expired without message**—Hold timer expires and the receiving cache has no messages. • **Hold timer expired with truncated message**—Hold timer expires and messages in the receiving buffer are not intact. ○ **bytes in buffer**—Size of data in the receiving buffer when the connection was terminated. ○ **type**—Type of packets in the receiving buffer when the connection was terminated. ○ **length**—Length of packets in the receiving buffer when the connection was terminated. If the packet is too small in size, this field cannot be resolved and

Field	Description
	is not displayed. ○ **without packet time**—Length of time since packets were last processed. • **Remote peer has been closed**—The MSDP peering connection has been torn down. • **TCP ERROR/HUP event received**—Error/hup event received by the TCP socket when the MSDP peer sent messages. • **Illegal message received**—The MSDP peer received illegal messages. • **Notification received**—The MSDP peer received notification messages. • **Reset command executed**—The user executed the **reset msdp peer** command. • **Shutdown command executed**—The user executed the **shutdown** command. • **Interface downed**—The MSDP peer received the interface down event when connecting to the remote MSDP peer.
Information about (Source, Group)-based SA filtering policy	SA message filtering list information: • **Import policy**—Filter list for receiving SA messages from the specified MSDP peer. • **Export policy**—Filter list for forwarding SA messages from the specified MSDP peer.
Information about SA-Requests	SA request information: • **Policy to accept SA request messages**—Filtering rule for receiving or forwarding SA request messages from the specified MSDP peer. If SA request messages are not filtered, this field displays **None**. • **Sending SA requests status**—Whether the MSDP peer is enabled to send an SA request message to the designated MSDP peer after receiving a new join message.
Minimum TTL to forward SA with encapsulated data	Lower TTL threshold for the multicast packets encapsulated in SA messages.
SAs learned from this peer	Number of cached (S, G) entries learned from the specified MSDP peer.
SA-cache maximum for the peer	Maximum number of (S, G) entries learned from the specified MSDP peer that the device can cache.
Input queue size	Data size cached in the input queue.
Output queue size	Data size cached in the output queue.
Counters for MSDP message	MSDP peer statistics: • **RPF check failure**—Number of SA messages discarded because of RPF check failure. • **Incoming/outgoing SA**—Number of received and sent SA messages. • **Incoming/outgoing SA-Request**—Number of received and sent SA requests. • **Incoming/outgoing SA-Response**—Number of received and sent SA responses. • **Incoming/outgoing Keepalive**—Number of received and sent keepalive messages.

Field	Description
	• **Incoming/outgoing Notification**—Number of received and sent notification messages. • **Incoming/outgoing Traceroutes in progress**—Number of received and sent traceroute-in-progress messages. • **Incoming/outgoing Traceroute reply**—Number of received and sent traceroute replies. • **Incoming/outgoing Unknown**—Number of received and sent unknown messages. • **Incoming/outgoing data packet**—Number of received and sent SA messages encapsulated with multicast data.

6.1.4. display msdp sa-cache

Use **display msdp sa-cache** to display (S, G) entries in the SA cache.

Syntax

display msdp sa-cache [*group-address* | *source-address* | *as-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays (S, G) entries in the SA cache for all multicast groups.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays (S, G) entries in the SA cache for all sources.

as-number: Specifies an AS number in the range of 1 to 4294967295. If you do not specify an AS number, this command displays (S, G) entries in the SA cache for all ASs.

Usage guidelines

For this command to display output, you must first execute the **cache-sa-enable** command before you execute this command.

Examples

Display (S, G) entries in the SA cache.

```
<Switch> display msdp sa-cache
Total Source-Active Cache - 5 entries
Matched 5 entries

Source          Group           Origin RP       Pro  AS         Uptime   Expires
10.10.1.2       225.0.0.1       10.10.10.10     BGP  100        00:00:11 00:05:49
10.10.1.2       225.0.0.2       10.10.10.10     BGP  100        00:00:11 00:05:49
10.10.1.2       225.0.0.3       10.10.10.10     BGP  100        00:00:11 00:05:49
```

```
10.10.1.2       225.0.0.4       10.10.10.10     BGP  100        00:00:11 00:05:49
10.10.1.2       225.0.0.5       10.10.10.10     BGP  100        00:00:11 00:05:49
```

Table 6-3 Command output

Field	Description
Total Source-Active Cache	Total number of multicast sources in the SA cache.
Matched	Total number of (S, G) entries that match a multicast sources.
Source	Multicast source address.
Group	Multicast group address.
Origin RP	Address of the RP that generated the (S, G) entry.
Pro	Type of protocol from which the AS number of the origin RP originates. If the system could not obtain the AS number, this field displays a question mark (?).
AS	AS number of the origin RP. If the system could not obtain the AS number, this field displays a question mark (?).
Uptime	Length of time for which the cached (S, G) entry has existed.
Expires	Length of time in which the cached (S, G) entry will expire.

Related commands

cache-sa-enable

6.1.5. display msdp sa-count

Use **display msdp sa-count** to display the number of (S, G) entries in the SA cache.

Syntax

display msdp sa-count [*as-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

as-number: Specifies an AS number in the range of 1 to 4294967295. If you do not specify an AS number, this command displays the number of (S, G) entries in the SA cache for all ASs.

Usage guidelines

For this command to display output, you must first execute the **cache-sa-enable** command before you execute this command.

Examples

Display the number of (S, G) entries in the SA cache.

```
<Switch> display msdp sa-count
(S, G) entries statistics, counted by peer
  Peer address       SA count
  10.10.10.10        5

(S, G) entries statistics, counted by AS
  AS          Source count        Group count
  ?           3                   3

5 (S, G) entries in total
```

Table 6-4 Command output

Field	Description
(S, G) entries statistics, counted by peer	Number of (S, G) entries on an MSDP peer basis.
Peer address	Address of the MSDP peer that sent SA messages.
SA count	Number of (S, G) entries from the MSDP peer.
(S, G) entries statistics, counted by AS	Number of cached (S, G) entries on an AS basis.
AS	AS number. If the system could not obtain the AS number, this field displays a question mark (?).
Source count	Number of multicast sources in the AS.
Group count	Number of multicast groups in the AS.
(S, G) entries in total	Total number of (S, G) entries.

Related commands

cache-sa-enable

6.1.6. encap-data-enable

Use **encap-data-enable** to enable multicast data encapsulation in SA messages.

Use **undo encap-data-enable** to restore the default.

Syntax

encap-data-enable

undo encap-data-enable

Default

An SA message contains only (S, G) entries. Multicast data is not encapsulated in an SA message.

Views

MSDP view

Predefined user roles

network-admin

Examples

Enable multicast data encapsulation in SA messages.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] encap-data-enable
```

6.1.7. import-source

Use **import-source** to configure an SA message creation policy.

Use **undo import-source** to restore the default.

Syntax

import-source [**acl** *ipv4-acl-number*]

undo import-source

Default

When an SA message is created, all the (S, G) entries within the domain are advertised in the SA message.

Views

MSDP view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL number in the range of 2000 to 3999. If you specify an ACL, this command advertises only the (S, G) entries that the ACL permits. This command does not advertise (S, G) entries when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

This command controls the creation of SA messages. To control forwarding or acceptance of SA messages, use the **peer sa-policy** command.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a multicast group address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a multicast source address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you configure this command multiple times, the most recent configuration takes effect.

Examples

Configure an SA creation policy to advertise only (10.10.0.0/16, 225.1.0.0/16) entries in SA messages.

```
<Switch> system-view
```

```
[Switch] acl advanced 3101
[Switch-acl-ipv4-adv-3101] rule permit ip source 10.10.0.0 0.0.255.255 destination
225.1.0.0 0.0.255.255
[Switch-acl-ipv4-adv-3101] quit
[Switch] msdp
[Switch-msdp] import-source acl 3101
```

Related commands

peer sa-policy

6.1.8. msdp

Use **msdp** to enable MSDP and enter MSDP view.

Use **undo msdp** to disable MSDP and delete the configurations in MSDP view.

Syntax

msdp

undo msdp

Default

MSDP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled.

Examples

Enable IP multicast routing. Then, enable MSDP and enter MSDP view.

```
<Switch> system-view
[Switch] multicast routing
[Switch-mrib] quit
[Switch] msdp
[Switch-msdp]
```

Related commands

multicast routing

6.1.9. originating-rp

Use **originating-rp** to configure the originating RP of SA messages.

Use **undo originating-rp** to restore the default.

Syntax

originating-rp *interface-type interface-number*

undo originating-rp

Default

SA messages are originated by real RPs.

Views

MSDP view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Examples

Configure VLAN-interface 100 as the originating RP of SA messages.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] originating-rp vlan-interface 100
```

6.1.10. peer

Use **peer** to specify an MSDP peer.

Use **undo peer** to remove an MSDP peer.

Syntax

peer *peer-address* **connect-interface** *interface-type interface-number*

undo peer *peer-address*

Default

No MSDP peers exist.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

connect-interface *interface-type interface-number*: Specifies an interface by its type and number. The local device uses the primary IP address of the specified interface to establish a TCP connection with the remote MSDP peer.

Usage guidelines

You must execute this command before you use any other **peer** commands.

Examples

Specify the router with IP address 125.10.7.6 as an MSDP peer and VLAN-interface 100 as the local connection port.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] peer 125.10.7.6 connect-interface vlan-interface 100
```

6.1.11. peer description

Use **peer description** to configure a description for an MSDP peer.

Use **undo peer description** to delete the description for an MSDP peer.

Syntax

peer *peer-address* **description** *text*

undo peer *peer-address* **description**

Default

No description exists.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Examples

Configure the description **CustomerA** for the MSDP peer with IP address 125.10.7.6.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] peer 125.10.7.6 description CustomerA
```

6.1.12. peer mesh-group

Use **peer mesh-group** to assign an MSDP peer to a mesh group.

Use **undo peer mesh-group** to remove an MSDP peer from a mesh group.

Syntax

peer *peer-address* **mesh-group** *name*

undo peer *peer-address* **mesh-group**

Default

An MSDP peer does not belong to a mesh group.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

name: Specifies a mesh group, a case-sensitive string of 1 to 32 characters. A mesh group name must not contain spaces.

Examples

Assign the MSDP peer with IP address 125.10.7.6 to mesh group **Group1**.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] peer 125.10.7.6 mesh-group Group1
```

6.1.13. peer request-sa-enable

Use **peer request-sa-enable** to enable the device to send an SA request message to an MSDP peer after receiving a new join message.

Use **undo peer request-sa-enable** to disable the device from sending an SA request message to an MSDP peer.

Syntax

peer *peer-address* **request-sa-enable**

undo peer *peer-address* **request-sa-enable**

Default

After receiving a new join message, the device does not send an SA request message to MSDP peers. Instead, it waits for an SA message.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

Usage guidelines

For the device to send out SA request messages, you must disable the SA message cache mechanism before you execute this command.

Examples

Disable the SA message cache mechanism.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] undo cache-sa-enable
```

Enable the device to send an SA request message to MSDP peer 125.10.7.6 after it receives a new join message.

```
[Switch-msdp] peer 125.10.7.6 request-sa-enable
```

Related commands

cache-sa-enable

6.1.14. peer sa-cache-maximum

Use **peer sa-cache-maximum** to set the maximum number of (S, G) entries in the SA cache learned from an MSDP peer.

Use **undo peer sa-cache-maximum** to restore the default.

Syntax

peer *peer-address* **sa-cache-maximum** *sa-limit*

undo peer *peer-address* **sa-cache-maximum**

Default

The device can cache a maximum of 4294967295 (S, G) entries learned from an MSDP peer.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

sa-limit: Specifies the maximum number of (S, G) entries in the SA cache, in the range of 1 to 4294967295.

Examples

Set the maximum number to 100 for (S, G) entries in the SA cache learned from MSDP peer 125.10.7.6.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] peer 125.10.7.6 sa-cache-maximum 100
```

Related commands

display msdp brief

display msdp peer-status

6.1.15. peer sa-policy

Use **peer sa-policy** to configure an SA incoming or outgoing policy for an MSDP peer.

Use **undo peer sa-policy** to delete the SA incoming or outgoing policy for an MSDP peer.

Syntax

peer *peer-address* **sa-policy** { **export** | **import** } [**acl** *ipv4-acl-number*]

undo peer *peer-address* **sa-policy** { **export** | **import** }

Default

No SA incoming or outgoing policy exists, and all SA messages from an MSDP peer are accepted or forwarded.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

export: Specifies the outgoing direction.

import: Specifies the incoming direction.

ipv4-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999. If you specify an ACL, the device accepts and forwards only SA messages that the ACL permits. The device discards all SA messages when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

This command filters SA messages from a specified MSDP peer to control the acceptance or forwarding of SA messages. To control the creation of SA messages, use the **import-source** command.

When you configure a rule in the IPv4 advanced ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast source address.
- The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you configure this command multiple times, the most recent configuration takes effect.

Examples

Configure an SA outgoing policy to forward only SA messages that ACL 3100 permits to MSDP peer 125.10.7.6.

```
<Switch> system-view
[Switch] acl advanced 3100
[Switch-acl-ipv4-adv-3100] rule permit ip source 170.15.0.0 0.0.255.255 destination
225.1.0.0 0.0.255.255
[Switch-acl-ipv4-adv-3100] quit
[Switch] msdp
[Switch-msdp] peer 125.10.7.6 connect-interface vlan-interface 100
[Switch-msdp] peer 125.10.7.6 sa-policy export acl 3100
```

Related commands

6.1.16. peer sa-request-policy

Use **peer sa-request-policy** to configure an SA request policy for an MSDP peer.

Use **undo peer sa-request-policy** to delete the SA request policy for an MSDP peer.

Syntax

peer *peer-address* **sa-request-policy** [**acl** *ipv4-acl-number*]

undo peer *peer-address* **sa-request-policy**

Default

No SA request policy exists, and all SA request messages from an MSDP peer are accepted.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the device accepts only SA requests that the ACL permits. The device discards all SA requests when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you configure this command multiple times, the most recent configuration takes effect.

Examples

Configure an SA request policy. Then, the device accepts only SA requests that are from MSDP peer 175.58.6.5 and for multicast groups in the range 225.1.1.0/24.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 225.1.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2001] quit
[Switch] msdp
[Switch-msdp] peer 175.58.6.5 sa-request-policy acl 2001
```

6.1.17. reset msdp peer

Use **reset msdp peer** to reset the TCP connection with an MSDP peer and clear statistics for the MSDP peer.

Syntax

reset msdp peer [*peer-address*]

Views

User view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address. If you do not specify an MSDP peer, this command resets the TCP connections with all MSDP peers and clears statistics for all MSDP peers.

Examples

Reset the TCP connection with MSDP peer 125.10.7.6 and clear all statistics for the MSDP peer.

```
<Switch> reset msdp peer 125.10.7.6
```

6.1.18. reset msdp sa-cache

Use **reset msdp sa-cache** to clear (S, G) entries in the SA cache.

Syntax

reset msdp sa-cache [*group-address*]

Views

User view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command clears (S, G) entries for all multicast groups in the SA cache.

Examples

Clear (S, G) entries for multicast group 225.5.4.3 in the SA cache.

```
<Switch> reset msdp sa-cache 225.5.4.3
```

Related commands

cache-sa-enable

display msdp sa-cache

6.1.19. reset msdp statistics

Use **reset msdp statistics** to clear statistics for an MSDP peer without resetting the TCP connection with the MSDP peer.

Syntax

reset msdp statistics [*peer-address*]

Views

User view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address. If you do not specify an MSDP peer, this command clears statistics for all MSDP peers without resetting the TCP connection with all MSDP peers.

Examples

Clear statistics for MSDP peer 125.10.7.6 without resetting the TCP connection with the peer.

```
<Switch> reset msdp statistics 125.10.7.6
```

6.1.20. shutdown (MSDP view)

Use **shutdown** to tear down the connection with an MSDP peer.

Use **undo shutdown** to re-establish the connection with an MSDP peer.

Syntax

shutdown *peer-address*

undo shutdown *peer-address*

Default

The connection with an MSDP peer is active.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

Examples

Tear down the connection with the MSDP peer 125.10.7.6.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] shutdown 125.10.7.6
```

display msdp brief

display msdp peer-status

6.1.21. static-rpf-peer

Use **static-rpf-peer** to configure a static RPF peer.

Use **undo static-rpf-peer** to remove a static RPF peer.

Syntax

static-rpf-peer *peer-address* [**rp-policy** *ip-prefix-name*]

undo static-rpf-peer *peer-address*

Default

No static RPF peers exist.

Views

MSDP view

Predefined user roles

network-admin

Parameters

peer-address: Specifies an MSDP peer by its IP address.

rp-policy *ip-prefix-name*: Specifies a filtering policy based on RP addresses in SA messages by its name, a case-sensitive string of 1 to 63 characters. If you specify a filtering policy, the device does not perform RPF checks on SA messages permitted by the policy. If you do not specify a filtering policy, the device performs RPF checks on all SA messages.

Usage guidelines

This feature exempts SA messages forwarded by the static RPF peer from RPF checks.

Examples

Specify 130.10.7.6 as the static RPF peer to exempt SA messages originated by RPs on subnet 130.10.0.0/16 from RPF checks.

```
<Switch> system-view
[Switch] ip prefix-list list1 permit 130.10.0.0 16 greater-equal 16 less-equal 32
[Switch] msdp
[Switch-msdp] peer 130.10.7.6 connect-interface vlan-interface 100
[Switch-msdp] static-rpf-peer 130.10.7.6 rp-policy list1
```

Related commands

display msdp peer-status

ip prefix-list

6.1.22. timer retry

Use **timer retry** to set the MSDP connection retry interval.

Use **undo timer retry** to restore the default.

Syntax

timer retry *interval*

undo timer retry

Default

The MSDP connection retry interval is 30 seconds.

Views

MSDP view

Predefined user roles

network-admin

Parameters

interval: Specifies an MSDP connection retry interval in the range of 1 to 60 seconds.

Examples

Set the MSDP connection retry interval to 60 seconds.

```
<Switch> system-view
[Switch] msdp
[Switch-msdp] timer retry 60
```

7.1. MLD snooping commands

7.1.1. display ipv6 l2-multicast ip

Use **display ipv6 l2-multicast ip** to display information about Layer 2 IPv6 multicast groups.

Syntax

display ipv6 l2-multicast ip [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group *ipv6-group-address*: Specifies an IPv6 multicast group by its IPv6 address. If you do not specify an IPv6 multicast group, this command displays information about all Layer 2 IPv6 multicast groups.

source *ipv6-source-address*: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays information about Layer 2 IPv6 multicast groups for all IPv6 multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about Layer 2 IPv6 multicast groups for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about Layer 2 IPv6 multicast groups for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about Layer 2 IP multicast groups for the master device.

Examples

Display information about Layer 2 IPv6 multicast groups for VLAN 2.

```
<Switch> display ipv6 l2-multicast ip vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
   (::, FF1E::101)
    Attribute: static, success
    Host ports (1 in total):
      GE1/0/1                                 (S, SUC)
```

Display information about Layer 2 IPv6 multicast groups for VSI **aaa**.

```
<Switch> display ipv6 l2-multicast ip vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  (::, FF1E::101)
    Attribute: dynamic, success
    Host ports (3 in total):
      GE1/0/3 (Link ID 0)                  (D, SUC)
      NPW (Link ID 8)                      (D, SUC)
      UPW (Link ID 9)                      (D, SUC)
```

Display information about Layer 2 IPv6 multicast groups for VSI **bbb**.

```
<Switch> display ipv6 l2-multicast ip vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  (::, FF1E::101)
    Attribute: dynamic, success
    Host ports (2 in total):
      GE1/0/3 (Link ID 0)                  (D, SUC)
      Tun0 (VXLAN ID 0)                    (D, SUC)
```

Table 7-1 Command output

Field	Description
Total 1 entries	Total number of Layer 2 IPv6 multicast groups.
VLAN 2: Total 1 entries	Total number of Layer 2 IPv6 multicast groups in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 IPv6 multicast groups in VSI **aaa**.
(::, FF1E::101)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Attribute	Entry attribute: • **dynamic**—The entry is created by a dynamic protocol. • **static**—The entry is created by a static protocol. • **pim**—The entry is created by IPv6 PIM. • **kernel**—The entry is obtained from the kernel. • **success**—Processing has succeeded. • **fail**—Processing has failed.
Host ports (1 in total)	Member ports and total number of member ports.
(S, SUC)	Port attribute: • **D**—Dynamic port. • **S**—Static port. • **P**—IPv6 PIM port. • **K**—Port obtained from the kernel. • **R**—Port learned from (*, *) entries. • **W**—Port learned from (*, G) entries. • **SUC**—Processing has succeeded. • **F**—Processing has failed.
GE1/0/3 (Link ID 0)	AC and its link ID.

Field	Description
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

7.1.2. display ipv6 l2-multicast ip forwarding

Use **display ipv6 l2-multicast ip forwarding** to display Layer 2 IPv6 multicast IP forwarding entries.

Syntax

display ipv6 l2-multicast ip forwarding [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Parameters

group *ipv6-group-address*: Specifies an IPv6 multicast group by its IPv6 address. If you do not specify an IPv6 multicast group, this command displays Layer 2 IPv6 multicast IP forwarding entries for all IPv6 multicast groups.

source *ipv6-source-address*: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays Layer 2 IPv6 multicast IP forwarding entries for all IPv6 multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays Layer 2 IPv6 multicast IP forwarding entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays Layer 2 IPv6 multicast IP forwarding entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays Layer 2 IPv6 multicast IP forwarding entries for the master device.

Examples

Display Layer 2 IPv6 multicast IP forwarding entries for VLAN 2.

```
<Switch> display ipv6 l2-multicast ip forwarding vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
   (::, FF1E::101)
    Host ports (3 in total):
      GigabitEthernet1/0/1
      GigabitEthernet1/0/2
      GigabitEthernet1/0/3
```

Display Layer 2 IPv6 multicast IP forwarding entries for VSI **aaa**.

```
<Switch> display ipv6 l2-multicast ip forwarding vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  (::, FF1E::101)
    Host ports (3 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display Layer 2 IPv6 multicast IP forwarding entries for VSI **bbb**.

```
<Switch> display ipv6 l2-multicast ip forwarding vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      Tunnel0 (VXLAN ID 0)
```

Table 7-2 Command output

Field	Description
Total 1 entries	Total number of Layer 2 IPv6 multicast IP forwarding entries.
VLAN 2: Total 1 entries	Total number of Layer 2 IPv6 multicast IP forwarding entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 IPv6 multicast IP forwarding entries in VSI **aaa**.
(::, FF1E::101)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Host ports (3 in total)	Member ports and total number of member ports.
GigabitEthernet1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tunnel0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

7.1.3. display ipv6 l2-multicast mac

Use **display ipv6 l2-multicast mac** to display information about Layer 2 IPv6 multicast MAC multicast groups.

Syntax

display ipv6 l2-multicast mac [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies an IPv6 multicast MAC address. If you do not specify an IPv6 multicast MAC address, this command displays information about all Layer 2 IPv6 multicast MAC multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about Layer 2 IPv6 multicast MAC multicast groups for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about Layer 2 IPv6 multicast MAC multicast groups for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about Layer 2 IPv6 multicast MAC multicast groups for the master device.

Examples

Display information about Layer 2 IPv6 multicast MAC multicast groups for VLAN 2.

```
<Switch> display ipv6 l2-multicast mac vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  MAC group address: 3333-0000-0101
    Attribute: success
    Host ports (1 in total):
      GE1/0/1
```

Display information about Layer 2 IPv6 MAC multicast groups for VSI **aaa**.

```
<Switch> display ipv6 l2-multicast mac vsi aaa
Total 1 MAC entries.

VSI aaa: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Attribute: success
    Host ports (3 in total):
      GE1/0/3 ( Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display information about Layer 2 IPv6 MAC multicast groups for VSI **bbb**.

```
<Switch> display ipv6 l2-multicast mac vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  MAC group address: 0100-5e01-0101
```

```
Attribute: success
Host ports (2 in total):
  GE1/0/3 ( Link ID 0)
  Tun0 (VXLAN ID 0)
```

Table 7-3 Command output

Field	Description
Total 1 entries	Total number of Layer 2 IPv6 MAC multicast groups.
VLAN 2: Total 1 entries	Total number of Layer 2 IPv6 MAC multicast groups in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 IPv6 MAC multicast groups in VSI **aaa**.
MAC group address	IPv6 address of the Layer 2 IPv6 MAC multicast group.
Attribute	Entry attribute: • **success**—Processing has succeeded. • **fail**—Processing has failed.
Host ports (1 in total)	Member ports and total number of member ports.
GE1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

7.1.4. display ipv6 l2-multicast mac forwarding

Use **display ipv6 l2-multicast mac forwarding** to display Layer 2 IPv6 multicast MAC forwarding entries.

Syntax

display ipv6 l2-multicast mac forwarding [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies an IPv6 MAC multicast group by its IPv6 MAC address. If you do not specify an IPv6 MAC multicast group, this command displays Layer 2 IPv6 multicast MAC forwarding entries for all IPv6 MAC multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays Layer 2 IPv6 multicast MAC forwarding entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays Layer 2 IPv6 multicast MAC forwarding entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays Layer 2 IPv6 multicast MAC forwarding entries for the master device.

Examples

Display Layer 2 IPv6 multicast MAC forwarding entries for VLAN 2.

```
<Switch> display ipv6 l2-multicast mac forwarding vlan 2
Total 1 entries.

VLAN 2: Total 1 entries.
  MAC group address: 3333-0000-0101
    Host ports (3 in total):
      GigabitEthernet1/0/1
      GigabitEthernet1/0/2
      GigabitEthernet1/0/3
```

Display Layer 2 IPv6 multicast MAC forwarding entries for VSI **aaa**.

```
<Switch> display ipv6 l2-multicast mac forwarding vsi aaa
Total 1 entries.

VSI aaa: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Host ports (3 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      NPW (Link ID 8)
      UPW (Link ID 9)
```

Display Layer 2 IPv6 multicast MAC forwarding entries for VSI **bbb**.

```
<Switch> display ipv6 l2-multicast mac forwarding vsi bbb
Total 1 entries.

VSI bbb: Total 1 entries.
  MAC group address: 0100-5e01-0101
    Host ports (2 in total):
      GigabitEthernet1/0/3 (Link ID 0)
      Tunnel0 (VXLAN ID 0)
```

Table 7-4 Command output

Field	Description
Total 1 MAC entries	Total number of Layer 2 IPv6 multicast MAC forwarding entries.
VLAN 2: Total 1 entries	Total number of Layer 2 IPv6 multicast MAC forwarding entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of Layer 2 IPv6 multicast MAC forwarding entries in VSI **aaa**.
MAC group address	Address of the IPv6 MAC multicast group.
Host ports (3 in total)	Member ports, and the total number of member ports.
GigabitEthernet1/0/3 (Link ID 0)	AC and its link ID.

Field	Description
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tunnel0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.

7.1.5. display mld-snooping

Use **display mld-snooping** to display MLD snooping status.

Syntax

display mld-snooping [**global** | **vlan** *vlan-id* | **vsi** *vsi-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global MLD snooping status.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify any parameters, this command displays the global MLD snooping status and the MLD snooping status in all VLANs and VSIs.

Examples

Display the global MLD snooping status and the MLD snooping status for all VLANs and VSIs.

```
<Switch> display mld-snooping
MLD snooping information: Global
  Global-enable: Enabled
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-listener-query-interval: 1s
 Report-aggregation: Enabled
 Host-tracking: Disabled
 Dot1p-priority: --

MLD snooping information: VLAN 1
 MLD snooping: Enabled
 Drop-unknown: Disabled
 Version: 1
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
```

```
 Last-listener-query-interval: 1s
 Querier: Enabled (IP: FE80::2FF:FFFF:FE00:1, Expires: 00:02:05)
 Querier-election: Enabled
 Query-interval: 125s
 General-query source IP: FE80::2FF:FFFF:FE00:1
 Special-query source IP: FE80::2FF:FFFF:FE00:1
 Report source IP: FE80::2FF:FFFF:FE00:2
 Done source IP: FE80::2FF:FFFF:FE00:3
 Host-tracking: Disabled
 Dot1p-priority: 2
 Proxy: Disabled

MLD snooping information: VLAN 10
 MLD snooping: Enabled
 Drop-unknown: Enabled
 Version: 1
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-listener-query-interval: 1s
 Querier: Enabled (IP: FE80::2FF:FFFF:FE00:1, Expires: 00:02:05)
 Querier-election: Enabled
 Query-interval: 125s
 General-query source IP: FE80::2FF:FFFF:FE00:1
 Special-query source IP: FE80::2FF:FFFF:FE00:1
 Report source IP: FE80::2FF:FFFF:FE00:2
 Done source IP: FE80::2FF:FFFF:FE00:3
 Host-tracking: Disabled
 Dot1p-priority: --
 Proxy: Disabled

MLD snooping information: VSI aaa
 MLD snooping: Enabled
 Drop-unknown: Enabled
 Version: 1
 Host-aging-time: 260s
 Router-aging-time: 260s
 Max-response-time: 10s
 Last-listener-query-interval: 1s
 Querier: Disabled
 Querier-election: Disabled
 Query-interval: 125s
 General-query source IP: FE80::2FF:FFFF:FE00:1
 Special-query source IP: FE80::2FF:FFFF:FE00:1
```

Table 7-5 Command output

Field	Description
MLD snooping	MLD snooping status in a VLAN or VSI: • **Enabled**. • **Disabled**.
Drop-unknown	Status of dropping unknown IPv6 multicast data: • Enabled. • Disabled.
Version	MLD snooping version.
Host-aging-time	Aging timer for the dynamic member port.
Router-aging-time	Aging timer for the dynamic router port.
Max-response-time	Maximum time for responding to MLD general queries.
Last-listener-query-interval	Interval for sending MLD multicast-address-specific queries.
Report-aggregation	Status of MLD report suppression: • Enabled. • Disabled.
Dot1p-priority	802.1p priority for MLD messages. This field displays two hyphens (--) if the 802.1p priority is not configured.
Querier	Status of MLD snooping querier: • Enabled. • Disabled.
(IP: FE80::2FF:FFFF:FE00:1, Expires: 00:02:05)	MLD snooping querier information: • **IP**—IP address of the MLD snooping querier. • **Expire**—Remaining aging time for the MLD snooping querier. This field is not displayed if MLD snooping querier election is disabled.
Querier-election	Status of IGMP snooping querier election: • Enabled. • Disabled.
Query-interval	Interval for sending MLD general queries.
General-query source IP	Source IPv6 address of MLD general queries.
Special-query source IP	Source IPv6 address of MLD multicast-address-specific queries.
Report source IP	Source IPv6 address of MLD reports.
Done source IP	Source IPv6 address of MLD done messages.
Host-tracking	Status of host tracking: • Enabled. • Disabled.
Proxy	Status of MLD snooping proxying: • Enabled. • Disabled.

7.1.6. display mld-snooping group

Use **display mld-snooping group** to display information about dynamic MLD snooping group entries.

Syntax

display mld-snooping group [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays information about all dynamic MLD snooping group entries.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays information about dynamic MLD snooping group entries for all IPv6 multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about dynamic MLD snooping group entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about dynamic MLD snooping group entries for all VSIs.

verbose: Displays detailed information about dynamic MLD snooping group entries. If you do not specify this keyword, the command displays brief information about dynamic MLD snooping group entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about dynamic MLD snooping group entries for the master device.

Examples

Display detailed information about dynamic MLD snooping group entries for VLAN 2.

```
<Switch> display mld-snooping group vlan 2 verbose
Total 1 entries.

VLAN 2: Total 1 entries.
  (::,FF1E::101)
    Attribute: local port
    FSM information: dummy
    Host slots (0 in total):
    Host ports (1 in total):
      GE1/0/2                          (00:03:23)
```

Display brief information about dynamic MLD snooping group entries for VSI **aaa**.

```
<Switch> display mld-snooping group vsi aaa
```

```
Total 1 entries.
VSI aaa: Total 1 entries.
  (::,FF1E::101)
    Host ports (1 in total):
      GE1/0/3 (Link ID 1)                (00:03:35)
      NPW (Link ID 8)                    (00:02:35)
      UPW (Link ID 9)                    (00:01:35)
```

Display detailed information about dynamic MLD snooping group entries for VSI **bbb**.

```
<Switch> display mld-snooping group vsi bbb verbose
Total 1 entries.

VSI bbb: Total 1 entries.
  (::,FF1E::101)
    Attribute: global port
    FSM information: dummy
    Host slots (0 in total):
    Host ports (2 in total):
      GE1/0/3 (Link ID 0)                          (00:03:35)
        VLAN pairs (1 in total):
          Outer VLAN 5     Inner VLAN 2            (00:03:35)
      Tun0 (VXLAN ID 0)                            (00:03:35)
        VLAN pairs (1 in total):
          Outer VLAN 5     Inner VLAN 2            (00:03:35)
```

Table 7-6 Command output

Field	Description
Total 1 entries	Total number of dynamic MLD snooping group entries.
VLAN 2: Total 1 entries	Total number of dynamic MLD snooping group entries in VLAN 2.
VSI aaa: Total 1 entries	Total number of dynamic MLD snooping group entries in VSI **aaa**.
(::, FF1E::101)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Attribute	Entry attribute: • **global port**—The entry has a global port. • **local port**—The entry has a port that resides on the member device for which the information is displayed. • **slot**—The entry has ports that reside on other member devices, but not on the member device for which the information is displayed.
FSM information	Finite state machine information of the entry: • **delete**—The entry attributes have been deleted. • **dummy**—The entry is a new temporary entry. • **no info**—The entry does not exist.
Host slots (0 in total)	Member IDs and total number of the member devices that have member ports, except for the specified member device or the master device when no member device is specified.
Host ports (1 in total)	Member ports and total number of member ports.

Field	Description
(00:03:23)	Remaining aging time for the dynamic member port. This field is always displayed for a global port (such as Layer 2 aggregate interfaces, ACs, N-PWs, and U-PWs). For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
GE1/0/3 (Link ID 0)	AC and its link ID.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	VXLAN tunnel and its VXLAN ID.
VLAN pairs (1 in total)	VLAN pairs and total number of VLAN pairs.
Outer VLAN 5 Inner VLAN 2	Outer VLAN ID and inner VLAN ID.

Related commands

reset mld-snooping group

7.1.7. display mld-snooping router-port

Use **display mld-snooping router-port** to display dynamic router port information.

Syntax

display mld-snooping router-port [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed information about dynamic router ports. If you do not specify this keyword, the command displays brief information about dynamic router ports.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays dynamic router port information for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays dynamic router port information for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays dynamic router port information for the master device.

Examples

Display brief information about dynamic router ports for VLAN 2.

```
<Switch> display mld-snooping router-port vlan 2
```

```
VLAN 2:
  Router ports (2 in total):
    GE1/0/1                                (00:01:30)
    GE1/0/2                                (00:00:23)
```

Display detailed information about dynamic router ports for VSI **aaa**.

```
<Switch> display mld-snooping router-port vsi aaa verbose
VSI aaa:
  Router slots (0 in total):
  Router ports (3 in total):
    GE1/0/3 (Link ID 0)                                (00:03:35)
      VLAN pairs (1 in total):
        Outer VLAN 5     Inner VLAN 2                  (00:03:35)

      VLAN pairs (1 in total)
        Outer VLAN 5     Inner VLAN 2                  (00:03:35)
```

Table 7-7 Command output

Field	Description
VLAN 2	VLAN ID.
VSI aaa	VSI name.
Router slots (0 in total)	Member IDs and total number of the member devices that have dynamic router ports, except for the specified member device or the master device when no member device is specified.
Router ports (2 in total)	Dynamic router ports and total number of dynamic router ports.
(00:01:30)	Remaining aging time for the dynamic router port. This field is always displayed for a global port (including Layer 2 aggregate interfaces). For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
GE1/0/3 (Link ID 0)	AC and its link ID.

Field	Description
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.
Tun0 (VXLAN ID 0)	Name of the VXLAN tunnel and the VXLAN ID.
VLAN pairs (1 in total)	VLAN pairs and total number of VLAN pairs.
Outer VLAN 5 Inner VLAN 2	Outer VLAN ID and inner VLAN ID.

7.1.8. display mld-snooping static-group

Use **display mld-snooping static-group** to display information about static MLD snooping group entries.

Syntax

display mld-snooping static-group [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays information about static MLD snooping group entries for all IPv6 multicast groups.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays information about static MLD snooping group entries for all IPv6 multicast sources.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays information about static MLD snooping group entries for all VLANs.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about static MLD snooping group entries for the master device.

Examples

Display detailed information about static MLD snooping group entries for VLAN 2.

```
<Switch> display mld-snooping static-group vlan 2 verbose
Total 1 entries.
```

```
VLAN 2: Total 1 entries.
  (::,FF1E::101)
    Attribute: local port
    FSM information: dummy
    Host slots (0 in total):
    Host ports (1 in total):
      GE1/0/2
```

Table 7-8 Command output

Field	Description
Total 1 entries	Total number of static MLD snooping group entries.
VLAN 2: Total 1 entries	Total number of static MLD snooping group entries in VLAN 2.
(::, FF1E::101)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Attribute	Entry attribute: • **global port**—The entry has a global port. • **local port**—The entry has a port that resides on the member device for which the information is displayed. • **slot**—The entry has ports that reside on other member devices, but not on the member device for which the information is displayed.
FSM information	Finite state machine information of the entry: • **delete**—The entry attributes have been deleted. • **dummy**—The entry is a new temporary entry. • **no info**—The entry does not exist.
Host slots (0 in total)	Member IDs and total number of the member devices that have member ports, except for the specified member device or the master device when no member device is specified.
Host ports (1 in total)	Member ports and total number of member ports.

7.1.9. display mld-snooping static-router-port

Use **display mld-snooping static-router-port** to display static router port information.

Syntax

display mld-snooping static-router-port [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

verbose: Displays detailed information about static router ports. If you do not specify this keyword, the command displays brief information about static router ports.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays static router port information for the master device.

Examples

Display brief information about static router ports for VLAN 2.

```
<Switch> display mld-snooping static-router-port vlan 2
VLAN 2:
  Router ports (2 in total):
    GE1/0/1
    GE1/0/2
```

Display detailed information about static router ports for VLAN 2.

```
<Switch> display mld-snooping static-router-port vlan 2 verbose
VLAN 2:
  Router slots (0 in total):
  Router ports (2 in total):
    GE1/0/1
    GE1/0/2
```

Table 7-9 Command output

Field	Description
VLAN 2	VLAN ID.
Router slots (0 in total)	Member IDs and total number of the member devices that have static router ports, except for the specified member device or the master device when no member device is specified.
Router ports (2 in total)	Static router ports and total number of static router ports.

7.1.10. display mld-snooping statistics

Use **display mld-snooping statistics** to display statistics for the MLD messages and IPv6 PIM hello messages learned through MLD snooping.

Syntax

display mld-snooping statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display statistics for the MLD messages and IPv6 PIM hello messages learned through MLD snooping.

```
<Switch> display mld-snooping statistics
Received MLD general queries:  0
```

```
Received MLDv1 specific queries:  0
Received MLDv1 reports:  0
Received MLD dones:  0
Sent     MLDv1 specific queries:  0
Received MLDv2 reports:  0
Received MLDv2 reports with right and wrong records:  0
Received MLDv2 specific queries:  0
Received MLDv2 specific sg queries:  0
Sent     MLDv2 specific queries:  0
Sent     MLDv2 specific sg queries:  0
Received IPv6 PIM hello:  0
Received error MLD messages:  0
```

Table 7-10 Command output

Field	Description
general queries	Number of MLD general queries.
specific queries	Number of MLD multicast-address-specific queries.
reports	Number of MLD reports.
dones	Number of MLD done messages.
reports with right and wrong records	Number of MLD reports with correct and incorrect records.
specific sg queries	Number of MLD multicast-address-and-source-specific queries.
IPv6 PIM hello	Number of IPv6 PIM hello messages.
error MLD messages	Number of MLD messages with errors.

Related commands

reset mld-snooping statistics

7.1.11. dot1p-priority (MLD-snooping view)

Use **dot1p-priority** to set the 802.1p priority for MLD messages globally.

Use **undo dot1p-priority** to restore the default.

Syntax

dot1p-priority *priority*

undo dot1p-priority

Default

The 802.1p priority for MLD messages is not configured. For MLD messages created by the device, the 802.1p priority is 0. For MLD messages to be forwarded, the device does not change the 802.1p priority.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

priority: Specifies an 802.1p priority for MLD messages, in the range of 0 to 7. The greater the value, the higher the priority.

Usage guidelines

You can set the 802.1p priority globally for all VLANs and VSIs in MLD-snooping view or for a VLAN in VLAN view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

Examples

Set the 802.1p priority for MLD messages to 3 globally.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] dot1p-priority 3
```

Related commands

mld-snooping dot1p-priority

7.1.12. enable (MLD-snooping view)

Use **enable** to enable MLD snooping for VLANs.

Use **undo enable** to disable MLD snooping for VLANs.

Syntax

enable vlan *vlan-list*

undo enable vlan *vlan-list*

Default

MLD snooping is disabled in a VLAN.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094.

Usage guidelines

You must enable the MLD snooping feature by using the **mld-snooping** command before you enable MLD snooping for VLANs.

You can enable MLD snooping for multiple VLANs by using this command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view, and the most recent configuration takes effect.

Examples

Enable the MLD snooping feature, and then enable MLD snooping for VLAN 2 through VLAN 10.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] enable vlan 2 to 10
```

Related commands

mld-snooping

mld-snooping enable

7.1.13. entry-limit (MLD-snooping view)

Use **entry-limit** to globally set the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries.

Use **undo entry-limit** to restore the default.

Syntax

entry-limit *limit*

undo entry-limit

Default

The maximum number of MLD snooping forwarding entries is 4294967295.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of MLD snooping forwarding entries, in the range of 0 to 4294967295.

Examples

Set the global maximum number of MLD snooping forwarding entries to 512.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] entry-limit 512
```

7.1.14. fast-leave (MLD-snooping view)

Use **fast-leave** to enable fast-leave processing globally.

Use **undo fast-leave** to disable fast-leave processing globally.

Syntax

fast-leave [**vlan** *vlan-list*]

undo fast-leave [**vlan** *vlan-list*]

Default

Fast-leave processing is disabled.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect for all VLANs and VSIs.

Usage guidelines

The fast-leave processing feature enables the device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message.

You can enable fast-leave processing globally for all ports in MLD-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Globally enable MLD snooping fast-leave processing for VLAN 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] fast-leave vlan 2
```

Related commands

mld-snooping fast-leave

7.1.15. group-policy (MLD-snooping view)

Use **group-policy** to globally configure an IPv6 multicast group policy to control the IPv6 multicast groups that hosts can join.

Use **undo group-policy** to globally delete IPv6 multicast group policies.

Syntax

group-policy *ipv6-acl-number* [**vlan** *vlan-list*]

undo group-policy [**vlan** *vlan-list*]

Default

No IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic or advanced ACL by its number in the range of 2000 to 3999. Hosts can join only IPv6 multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join IPv6 multicast groups.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN

ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect for all VLANs and VSIs.

Usage guidelines

An IPv6 multicast group policy filters MLD reports to control the IPv6 multicast groups that hosts can join.

This command does not take effect on static member ports, because static member ports do not send MLD reports.

You can configure an IPv6 multicast group policy globally for all ports in MLD-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- In an advanced ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast source address. The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.

  To match MLDv1 reports and MLDv2 IS_EX and MLDv2 TO_EX reports that do not carry IPv6 multicast source addresses, set the **source** *source-address source-prefix* option to 0::0.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

You can configure different ACLs for all ports in different VLANs. If you configure multiple ACLs for all ports in the same VLAN, the most recent configuration takes effect.

Examples

Configure an IPv6 multicast group policy for VLAN 2 so that hosts in VLAN 2 can join only IPv6 multicast group FF03::101.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source ff03::101 128
[Switch-acl-ipv6-basic-2000] quit
[Switch] mld-snooping
[Switch-mld-snooping] group-policy 2000 vlan 2
```

Related commands

mld-snooping group-policy

7.1.16. host-aging-time (MLD-snooping view)

Use **host-aging-time** to set the aging timer for dynamic member ports globally.

Use **undo host-aging-time** to restore the default.

Syntax

host-aging-time *seconds*

undo host-aging-time

Default

The aging timer for dynamic member ports is 260 seconds.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic member ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You can set the timer globally for all VLANs and VSIs in MLD-snooping view, for a VSI in VSI view, or for a VLAN in VLAN view. For a VSI, the VSI-specific configuration takes priority over the global configuration. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting IPv6 multicast group members, set the aging timer for dynamic member ports to be greater than the value calculated by using the following formula:

[MLD general query interval] + [maximum response time for MLD general queries]

As a best practice, set the aging timer of dynamic member ports to the value calculated by using the following formula:

[MLD general query interval] × 2 + [maximum response time for MLD general queries]

Examples

Set the global aging timer for dynamic member ports to 300 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] host-aging-time 300
```

Related commands

mld-snooping host-aging-time

7.1.17. last-listener-query-interval (MLD-snooping view)

Use **last-listener-query-interval** to set the MLD last listener query interval globally.

Use **undo last-listener-query-interval** to restore the default.

Syntax

last-listener-query-interval *interval*

undo last-listener-query-interval

Default

The MLD last listener query interval is 1 second.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD last listener query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the interval for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in MLD-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

Examples

Set the global MLD last listener query interval to 3 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] last-listener-query-interval 3
```

Related commands

mld-snooping last-listener-query-interval

7.1.18. max-response-time (MLD-snooping view)

Use **max-response-time** to set the maximum response time for MLD general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *seconds*

undo max-response-time

Default

The maximum response time for MLD general queries is 10 seconds.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies the maximum response time for MLD general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You can set the time globally for all VLANs and VSIs in MLD-snooping view, for a VSI in VSI view, or for a VLAN in VLAN view. For a VSI, the VSI-specific configuration takes priority over the global configuration. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting IPv6 multicast group members, set the maximum response time for MLD general queries to be less than the MLD general query interval.

Examples

Set the global maximum response time for MLD general queries to 5 seconds.

```
<Switch> system-view
[Switch] mld-snooping
```

```
[Switch-mld-snooping] max-response-time 5
```

Related commands

mld-snooping max-response-time

7.1.19. mld-snooping

Use **mld-snooping** to enable the MLD snooping feature and enter MLD-snooping view.

Use **undo mld-snooping** to disable the MLD snooping feature.

Syntax

mld-snooping

undo mld-snooping

Default

The MLD snooping feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If you disable the MLD snooping feature, MLD snooping is disabled in all VLANs and VSIs.

Examples

Enable the MLD snooping feature and enter MLD-snooping view.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping]
```

Related commands

enable (MLD-snooping view)

mld-snooping enable

7.1.20. mld-snooping done source-ip

Use **mld-snooping done source-ip** to configure the source IPv6 address for MLD done messages.

Use **undo mld-snooping done source-ip** to restore the default.

Syntax

mld-snooping done source-ip *ipv6-address*

undo mld-snooping done source-ip

Default

In a VLAN, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

In a VSI, the source IPv6 address of MLD done messages is the IPv6 link-local address of the gateway interface for the VSI. If the gateway interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address for MLD done messages.

Usage guidelines

You must enable MLD snooping for a VLAN before you execute this command.

Examples

In VLAN 2, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address of MLD done messages.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping done source-ip fe80:0:0:1::1
```

In VSI **aaa**, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address of MLD done messages.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable

7.1.21. mld-snooping dot1p-priority

Use **mld-snooping dot1p-priority** to set the 802.1p priority for MLD messages in a VLAN.

Use **undo mld-snooping dot1p-priority** to restore the default.

Syntax

mld-snooping dot1p-priority *priority*

undo mld-snooping dot1p-priority

Default

The 802.1p priority for MLD messages is not configured. For MLD messages created by the device, the 802.1p priority is 0. For MLD messages to be forwarded, the device does not change the 802.1p priority.

Views

VLAN view

Predefined user roles

network-admin

Parameters

priority: Specifies an 802.1p priority for MLD messages, in the range of 0 to 7. The greater the value, the higher the priority.

Usage guidelines

You must enable MLD snooping for a VLAN before you execute this command.

You can set the 802.1p priority for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

Examples

In VLAN 2, enable MLD snooping, and set the 802.1p priority for MLD messages to 3.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit

mld-snooping

7.1.24. mld-snooping fast-leave

Use **mld-snooping fast-leave** to enable fast-leave processing on a port.

Use **undo mld-snooping fast-leave** to disable fast-leave processing on a port.

Syntax

mld-snooping fast-leave [**vlan** *vlan-list*]

undo mld-snooping fast-leave [**vlan** *vlan-list*]

Default

Fast-leave processing is disabled on a port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

The fast-leave processing feature enables the device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message.

You can enable fast-leave processing for a port in interface view or globally for all ports in MLD-snooping view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Enable fast-leave processing for VLAN 2 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping fast-leave vlan 2
```

Related commands

fast-leave (MLD-snooping view)

7.1.25. mld-snooping general-query source-ip

Use **mld-snooping general-query source-ip** to configure the source IPv6 address for MLD general queries.

Use **undo mld-snooping general-query source-ip** to restore the default.

Syntax

mld-snooping general-query source-ip *ipv6-address*

undo mld-snooping general-query source-ip

Default

In a VLAN, the source IPv6 address for MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

In a VSI, the source IPv6 address for MLD general queries is the IPv6 link-local address of the gateway interface for the VSI. If the gateway interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address for MLD general queries.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command.

Examples

In VLAN 2, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address for MLD general queries.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
```

```
[Switch-vlan2] mld-snooping general-query source-ip fe80:0:0:1::1
```

In VSI **aaa**, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address for MLD general queries.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable
[Switch-vsi-aaa] mld-snooping general-query source-ip fe80:0:0:1::1
```

Related commands

7.1.26. mld-snooping group-limit

Use **mld-snooping group-limit** to set the maximum number of IPv6 multicast groups that a port can join.

Use **undo mld-snooping group-limit** to remove the limit on the maximum number of IPv6 multicast groups that a port can join.

Syntax

mld-snooping group-limit *limit* [**vlan** *vlan-list*]

undo mld-snooping group-limit [**vlan** *vlan-list*]

Default

No limit is placed on the maximum number of IPv6 multicast groups that a port can join.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of multicast groups that a port can join, in the range of 0 to 4294967295.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect for all VLANs.

Usage guidelines

This command takes effect only on the IPv6 multicast groups that a port joins dynamically.

Examples

On GigabitEthernet 1/0/1, set the maximum number to 10 for IPv6 multicast groups that the port can join in VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] mld-snooping group-limit 10 vlan 2
```

7.1.27. mld-snooping group-policy

Use **mld-snooping group-policy** to configure an IPv6 multicast group policy on a port to control the IPv6 multicast groups that hosts attached to the port can join.

Use **undo mld-snooping group-policy** to delete IPv6 multicast group policies on a port.

Syntax

mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]

undo mld-snooping group-policy [**vlan** *vlan-list*]

Default

No IPv6 multicast group policies exist. Hosts attached to the port can join any IPv6 multicast groups.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic or advanced ACL number in the range of 2000 to 3999. Hosts can join only the IPv6 multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join IPv6 multicast groups.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

An IPv6 multicast group policy filters MLD reports to control the IPv6 multicast groups that hosts can join.

This command does not take effect on static member ports, because static member ports do not send MLD reports.

You can configure an IPv6 multicast group policy for a port in interface view or globally for all ports in MLD-snooping view. For a port, the port-specific configuration takes priority over the global configuration.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- In a basic ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- In an advanced ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast source address. The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.

  To match MLDv1 reports and MLD IS_EX and MLDv2 TO_EX reports that do not carry IPv6 multicast source addresses, set the **source** *source-address source-prefix* option to 0::0.
- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

You can configure different ACLs for different VLANs on a port. If you configure multiple ACLs for the same VLANs on a port, the most recent configuration takes effect.

Examples

On GigabitEthernet 1/0/1, configure an IPv6 multicast group policy for VLAN 2 so that hosts attached to the port in VLAN 2 can join only the group FF03::101.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source ff03::101 128
[Switch-acl-ipv6-basic-2000] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping group-policy 2000 vlan 2
```

Related commands

group-policy (MLD-snooping view)

7.1.28. mld-snooping host-aging-time

Use **mld-snooping host-aging-time** to set the aging timer for dynamic member ports in a VLAN or VSI.

Use **undo mld-snooping host-aging-time** to restore the default.

Syntax

mld-snooping host-aging-time *seconds*

undo mld-snooping host-aging-time

Default

The aging timer for dynamic member ports is 260 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic member ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command.

You can set the timer for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in MLD-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting IPv6 multicast group members, set the aging timer for dynamic member ports to be greater than the value calculated by using the following formula:

[MLD general query interval] + [maximum response time for MLD general queries]

As a best practice, set the aging timer of dynamic member ports to the value calculated by using the following formula:

[MLD general query interval] × 2 + [maximum response time for MLD general queries]

Examples

In VLAN 2, enable MLD snooping, and set the aging timer for dynamic member ports in the VLAN to 300 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping host-aging-time 300
```

In VSI **aaa**, enable MLD snooping, and set the aging timer for dynamic member ports in the VSI to 300 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable
[Switch-vsi-aaa] mld-snooping host-aging-time 300
```

Related commands

enable (MLD-snooping view)

mld-snooping enable

7.1.29. mld-snooping host-join

Use **mld-snooping host-join** to configure a port as a simulated member host for an IPv6 multicast group or an IPv6 multicast source and group.

Use **undo mld-snooping host-join** to remove the configuration of a simulated member host for an IPv6 multicast group.

Syntax

mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

undo mld-snooping host-join { *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id* | **all** }

Default

A port is not a simulated member host of any IPv6 multicast groups or any IPv6 multicast sources and groups.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

source-ip *ipv6-source-address*: Specifies an IPv6 multicast source by its IPv6 address. If you specify an IPv6 multicast source, this command configures the port as a simulated member host for an IPv6 multicast source and group. If you do not specify an IPv6 multicast source, this command configures the port as a simulated member host for an IPv6 multicast group. This option takes effect on MLDv2 snooping devices.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

all: Specifies all IPv6 multicast groups and all IPv6 multicast sources and groups.

Usage guidelines

The version of MLD running on a simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same way as a dynamic member port.

Examples

Configure GigabitEthernet 1/0/1 as a simulated member host for the IPv6 multicast group (*, FF3E::101) in VLAN 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping host-join ff3e::101 vlan 2
```

7.1.30. mld-snooping last-listener-query-interval

Use **mld-snooping last-listener-query-interval** to set the MLD last listener query interval for a VLAN or VSI.

Use **undo mld-snooping last-listener-query-interval** to restore the default.

Syntax

mld-snooping last-listener-query-interval *interval*

undo mld-snooping last-listener-query-interval

Default

The MLD last listener query interval is 1 second.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD last listener query interval in the range of 1 to 25 seconds.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command.

You can set the interval for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in MLD-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

Examples

In VLAN 2, enable MLD snooping, and set the MLD last listener query interval to 3 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping last-listener-query-interval 3
```

In VSI **aaa**, enable MLD snooping, and set the MLD last listener query interval to 3 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable
[Switch-vsi-aaa] mld-snooping last-listener-query-interval 3
```

7.1.31. mld-snooping max-response-time

Use **mld-snooping max-response-time** to set the maximum response time for MLD general queries in a VLAN or VSI.

Use **undo mld-snooping max-response-time** to restore the default.

Syntax

mld-snooping max-response-time *seconds*

undo mld-snooping max-response-time

Default

The maximum response time for MLD general queries is 10 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

seconds: Specifies the maximum response time for MLD general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You must enable MLD snooping for a VLAN before you execute this command.

You can set the time for a VLAN in VLAN view, for a VSI in VSI view, or globally for all VLANs and VSIs in MLD-snooping view. For a VLAN, the VLAN-specific configuration takes priority over the global configuration. For a VSI, the VSI-specific configuration takes priority over the global configuration.

To avoid mistakenly deleting IPv6 multicast group members, set the maximum response time for MLD general queries to be less than the MLD general query interval.

Examples

In VLAN 2, enable MLD snooping, and set the maximum response time for MLD general queries to 5 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping max-response-time 5
```

In VSI **aaa**, enable MLD snooping, and set the maximum response time for MLD general queries to 5 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable

7.1.32. mld-snooping overflow-replace

Use **mld-snooping overflow-replace** to enable the IPv6 multicast group replacement feature on a port.

Use **undo mld-snooping overflow-replace** to disable the multicast group replacement feature on a port.

Syntax

mld-snooping overflow-replace [**vlan** *vlan-list*]

undo mld-snooping overflow-replace [**vlan** *vlan-list*]

Default

The IPv6 multicast group replacement feature is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

This command takes effect only on the IPv6 multicast groups that a port joins dynamically.

You can enable the IPv6 multicast group replacement feature for a port in interface view or globally for all ports in MLD-snooping view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

On GigabitEthernet 1/0/1, enable the IPv6 multicast group replacement feature for VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping overflow-replace vlan 2
```

7.1.33. mld-snooping querier

Use **mld-snooping querier** to enable the MLD snooping querier.

Use **undo mld-snooping querier** to disable the MLD snooping querier.

Syntax

mld-snooping querier

undo mld-snooping querier

Default

The MLD snooping querier is disabled.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command.

For a sub-VLAN of an IPv6 multicast VLAN, this command takes effect only after you remove the VLAN from the IPv6 multicast VLAN.

Examples

In VLAN 2, enable MLD snooping, and enable the MLD snooping querier.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping querier
```

In VSI **aaa**, enable MLD snooping, and enable the MLD snooping querier.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa

7.1.34. mld-snooping query-interval

Use **mld-snooping query-interval** to set the MLD general query interval for a VLAN or VSI.

Use **undo mld-snooping query-interval** to restore the default.

Syntax

mld-snooping query-interval *interval*

undo mld-snooping query-interval

Default

The MLD general query interval is 125 seconds.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD general query interval, in the range of 2 to 31744 seconds.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command for the VLAN.

To avoid mistakenly deleting IPv6 multicast group members, set the MLD general query interval to be greater than the maximum response time for MLD general queries.

Examples

In VLAN 2, enable MLD snooping, and set the MLD general query interval to 20 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping query-interval 20
```

In VSI **aaa**, enable MLD snooping, and set the MLD general query interval to 20 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit

7.1.37. mld-snooping source-deny

Use **mld-snooping source-deny** to enable IPv6 multicast source port filtering on a port to discard all IPv6 multicast data packets.

Use **undo mld-snooping source-deny** to disable IPv6 multicast source port filtering on a port.

Syntax

mld-snooping source-deny

undo mld-snooping source-deny

Default

IPv6 multicast source port filtering is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

You can enable this feature for a port in interface view or for the specified ports in MLD-snooping view. For a port, the configuration in interface view has the same priority as the configuration in MLD-snooping view, and the most recent configuration takes effect.

Examples

Enable source port filtering for IPv6 multicast data on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping source-deny
```

Related commands

source-deny (MLD-snooping view)

7.1.38. mld-snooping special-query source-ip

Use **mld-snooping special-query source-ip** to configure the source IPv6 address for MLD multicast-address-specific queries.

Use **undo mld-snooping special-query source-ip** to restore the default.

Syntax

mld-snooping special-query source-ip *ipv6-address*

undo mld-snooping special-query source-ip

Default

In a VLAN, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

- The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.
- The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
- FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.

In a VSI, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

- The source address of MLD general queries if the MLD snooping querier of the VSI has received MLD general queries.
- The IPv6 link-local address of the gateway interface for the VSI if the MLD snooping querier does not receive an MLD general query.
- FE80::02FF:FFFF:FE00:0001 if the gateway interface does not have an IPv6 link-local address.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address for MLD multicast-address-specific queries.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you execute this command.

Examples

In VLAN 2, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address of MLD multicast-address-specific queries.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping special-query source-ip fe80:0:0:1::1
```

In VSI **aaa**, enable MLD snooping, and specify FE80:0:0:1::1 as the source IPv6 address of MLD multicast-address-specific queries.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable
[Switch-vsi-aaa] mld-snooping special-query source-ip fe80:0:0:1::1
```

Related commands

enable (MLD-snooping view)

mld-snooping enable

7.1.39. mld-snooping static-group

Use **mld-snooping static-group** to configure a port as a static member port of an IPv6 multicast group or an IPv6 multicast source and group.

Use **undo mld-snooping static-group** to delete the configuration of static member ports.

Syntax

mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

undo mld-snooping static-group { *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id* | **all** }

Default

A port is not a static member port of IPv6 multicast groups.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

source-ip *ipv6-source-address*: Specifies an IPv6 multicast source by its IPv6 address. If you specify an IPv6 multicast source, this command configures the port as a static member port of an IPv6 multicast source and group. If you do not specify an IPv6 multicast source, this command configures the port as a static member port of an IPv6 multicast group. This option takes effect on MLDv2 snooping devices.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

all: Specifies all IPv6 multicast groups and all IPv6 multicast sources and groups.

Examples

Configure GigabitEthernet 1/0/1 as a static member port for the IPv6 multicast group (*, FF3E::101) in VLAN 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping static-group ff3e::101 vlan 2
```

7.1.40. mld-snooping static-router-port

Use **mld-snooping static-router-port** to configure a port as a static router port.

Use **undo mld-snooping static-router-port** to remove the configuration of static router ports.

Syntax

mld-snooping static-router-port vlan *vlan-id*

undo mld-snooping static-router-port { **all** | **vlan** *vlan-id* }

Default

A port is not a static router port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

all: Specifies all VLANs.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094.

Examples

Configure GigabitEthernet 1/0/1 as a static router port in VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mld-snooping static-router-port vlan 2
```

7.1.41. mld-snooping version

Use **mld-snooping version** to specify an MLD snooping version for a VLAN or VSI.

Use **undo mld-snooping version** to restore the default.

Syntax

mld-snooping version *version-number*

undo mld-snooping version

Default

The MLD snooping version in a VLAN or VSI is 1.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Parameters

version-number: Specifies an MLD snooping version, 1 or 2.

Usage guidelines

You must enable MLD snooping for a VLAN or VSI before you configure this command.

You can specify the version for a VLAN in VLAN view or for the specified VLANs in MLD-snooping view. The VLAN-specific configuration has the same priority as the configuration in MLD-snooping view, and the most recent configuration takes effect.

Examples

In VLAN 2, enable MLD snooping, and specify MLD snooping version 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 2
[Switch-vlan2] mld-snooping enable
[Switch-vlan2] mld-snooping version 2
```

In VSI **aaa**, enable MLD snooping, and specify MLD snooping version 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vsi aaa
[Switch-vsi-aaa] mld-snooping enable
[Switch-vsi-aaa] mld-snooping version 2
```

Related commands

enable (MLD-snooping view)

mld-snooping enable

version (MLD-snooping view)

7.1.42. overflow-replace (MLD-snooping view)

Use **overflow-replace** to enable the IPv6 multicast group replacement feature globally.

Use **undo overflow-replace** to disable the IPv6 multicast group replacement feature globally.

Syntax

overflow-replace [**vlan** *vlan-list*]

undo overflow-replace [**vlan** *vlan-list*]

Default

The IPv6 multicast group replacement feature is disabled.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN, this command takes effect on all VLANs.

Usage guidelines

This command takes effect only on the IPv6 multicast groups that a port joins dynamically.

You can enable IPv6 multicast group replacement globally for all ports in MLD-snooping view or for a port in interface view. For a port, the port-specific configuration takes priority over the global configuration.

Examples

Globally enable the IPv6 multicast group replacement feature for VLAN 2.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] overflow-replace vlan 2
```

Related commands

mld-snooping overflow-replace

7.1.43. report-aggregation (MLD-snooping view)

Use **report-aggregation** to enable MLD report suppression.

Use **undo report-aggregation** to disable MLD report suppression.

Syntax

report-aggregation

undo report-aggregation

Default

MLD report suppression is enabled.

Views

MLD-snooping view

Predefined user roles

network-admin

Examples

Disable MLD report suppression.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] undo report-aggregation
```

7.1.44. reset mld-snooping group

Use **reset mld-snooping group** to clear information about dynamic MLD snooping group entries.

Syntax

reset mld-snooping group { *ipv6-group-address* [*ipv6-source-address*] | **all** } [**vlan** *vlan-id* | **vsi** *vsi-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

ipv6-source-address: Specifies an IPv6 multicast source address. If you do not specify an IPv6 multicast source, this command clears information about dynamic MLD snooping group entries for all IPv6 multicast sources.

all: Specifies all IPv6 multicast groups.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command clears information about dynamic MLD snooping group entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears information about dynamic MLD snooping group entries for all VSIs.

Examples

Clear information about all dynamic MLD snooping group entries.

```
<Switch> reset mld-snooping group all
```

Related commands

display mld-snooping group

7.1.45. reset mld-snooping router-port

Use **reset mld-snooping router-port** to clear dynamic router port information.

Syntax

reset mld-snooping router-port { **all** | **vlan** *vlan-id* | **vsi** *vsi-name* }

Views

User view

Predefined user roles

network-admin

Parameters

all: Specifies all dynamic router ports.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command clears dynamic router port information for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears dynamic router port information for all VSIs.

Examples

Clear information about all dynamic router ports.

```
<Switch> reset mld-snooping router-port all
```

Related commands

display mld-snooping router-port

7.1.46. reset mld-snooping statistics

Use **reset mld-snooping statistics** to clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.

Syntax

reset mld-snooping statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear statistics for all MLD messages and IPv6 PIM hello messages learned through MLD snooping.

```
<Switch> reset mld-snooping statistics
```

Related commands

display mld-snooping statistics

7.1.47. router-aging-time (MLD-snooping view)

Use **router-aging-time** to set the aging timer for dynamic router ports globally.

Use **undo router-aging-time** to restore the default.

Syntax

router-aging-time *seconds*

undo router-aging-time

Default

The aging timer for dynamic router ports is 260 seconds.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

seconds: Specifies an aging timer for dynamic router ports, in the range of 1 to 8097894 seconds.

Usage guidelines

You can set the timer globally for all VLANs and VSIs in MLD-snooping view, for a VSI in VSI view, or for a VLAN in VLAN view. For a VSI, the VSI-specific configuration takes priority over the global configuration. For a VLAN, the VLAN-specific configuration takes priority over the global configuration.

Examples

Set the global aging timer for dynamic router ports to 100 seconds.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] router-aging-time 100
```

Related commands

mld-snooping router-aging-time

7.1.48. source-deny (MLD-snooping view)

Use **source-deny** to enable IPv6 multicast source port filtering on ports to discard all IPv6 multicast data packets.

Use **undo source-deny** to disable IPv6 multicast source port filtering on ports.

Syntax

source-deny port *interface-list*

undo source-deny port *interface-list*

Default

IPv6 multicast source port filtering is disabled.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

port *interface-list*: Specifies a space-separated list of port items. Each item specifies a port by its port type and number or a range of ports in the form of *start-interface-type interface-number* **to** *end-interface-type interface-number*.

Usage guidelines

You can enable this feature for the specified ports in MLD-snooping view or for a port in interface view. For a port, the configuration in MLD-snooping view has the same priority as the configuration in interface view, and the most recent configuration takes effect.

Examples

Enable source port filtering for IPv6 multicast data on ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] source-deny port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Related commands

mld-snooping source-deny

7.1.49. version (MLD-snooping view)

Use **version** to specify an MLD snooping version for VLANs.

Use **undo version** to restore the default.

Syntax

version *version-number* **vlan** *vlan-list*

undo version vlan *vlan-list*

Default

The MLD snooping version in a VLAN is 1.

Views

MLD-snooping view

Predefined user roles

network-admin

Parameters

version-number: Specifies an MLD snooping version, 1 or 2.

vlan *vlan-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The VLAN ID is in the range of 1 to 4094.

Usage guidelines

You must enable MLD snooping for the specified VLANs before you execute this command.

You can specify the version for the specified VLANs in MLD-snooping view or for a VLAN in VLAN view. The VLAN-specific configuration has the same priority as the configuration in MLD-snooping view, and the most recent configuration takes effect.

Examples

Enable MLD snooping for VLAN 2 through VLAN 10, and specify MLD snooping version 2 for these VLANs.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] enable vlan 2 to 10
[Switch-mld-snooping] version 2 vlan 2 to 10
```

8.1.1. display ipv6 multicast-vlan

Use **display ipv6 multicast-vlan** to display information about IPv6 multicast VLANs.

Syntax

display ipv6 multicast-vlan [*vlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id: Specifies an IPv6 multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify an IPv6 multicast VLAN, this command displays information about all IPv6 multicast VLANs.

Examples

Display information about all IPv6 multicast VLANs.

```
<Switch> display ipv6 multicast-vlan
Total 2 IPv6 multicast VLANs.

IPv6 multicast VLAN 100:
  Sub-VLAN list(3 in total):
    2-3, 6
  Port list(3 in total):
    GE1/0/1
    GE1/0/2
    GE1/0/3

IPv6 multicast VLAN 200:
  Sub-VLAN list(0 in total):
  Port list(0 in total):
```

Table 8-1 Command output

Field	Description
Total 2 IPv6 multicast VLANs	Total number of IPv6 multicast VLANs.
Sub-VLAN list(3 in total)	Sub-VLAN list of the IPv6 multicast VLAN, and the total number of the sub-VLANs.
Port list(3 in total)	Port list of the IPv6 multicast VLAN, and the total number of the ports.

8.1.2. display ipv6 multicast-vlan forwarding-table

Use **display ipv6 multicast-vlan forwarding-table** to display IPv6 multicast VLAN forwarding entries.

Syntax

display ipv6 multicast-vlan forwarding-table [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays IPv6 multicast VLAN forwarding entries for all IPv6 multicast sources.

prefix-length: Specifies a prefix length of the IPv6 multicast source address. The value range is 0 to 128 and the default value is 128.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays IPv6 multicast VLAN forwarding entries for all IPv6 multicast groups.

prefix-length: Specifies a prefix length of the IPv6 multicast group address. The value range is 8 to 128 and the default value is 128.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 multicast VLAN forwarding entries for the master device.

subvlan *vlan-id*: Specifies a sub-VLAN by its VLAN ID. If you do not specify a sub-VLAN, this command displays IPv6 multicast VLAN forwarding entries for all sub-VLANs.

vlan *vlan-id*: Specifies an IPv6 multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify an IPv6 multicast VLAN, this command displays IPv6 multicast VLAN forwarding entries for all VLANs.

Examples

Display all IPv6 multicast VLAN forwarding entries.

```
<Switch> display ipv6 multicast-vlan forwarding-table
IPv6 multicast VLAN 100 Forwarding Table
Total 1 entries, 1 matched

00001. (1::1, FF0E::1)
     Flags: 0x10000
     IPv6 multicast VLAN: 100
     List of sub-VLANs (3 in total):
       1: VLAN 10
       2: VLAN 20
```

```
3: VLAN 30
```

Table 8-2 Command output

Field	Description
IPv6 multicast VLAN 100 Forwarding Table	The multicast forwarding table for IPv6 multicast VLAN 100.
Total 1 entries, 1 matched	Total number of (S, G) entries, and the number of matching entries.
00001	Sequence number of the (S, G) entry.
(1::1, FF0E::1)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x10000 means that the entry has only one flag 0x10000. The following flags are available for an entry: • **0x1**—The entry is in inactive state. • **0x4**—The entry fails to update. • **0x8**—The sub-VLAN information fails to update for the entry. • **0x200**—The entry is in GR state. • **0x10000**—The entry is an IPv6 multicast VLAN forwarding entry.
List of sub-VLANs (3 in total)	Sub-VLAN list of the IPv6 multicast VLAN, and the total number of the sub-VLANs.

8.1.3. display ipv6 multicast-vlan group

Use **display ipv6 multicast-vlan group** to display information about IPv6 multicast groups in IPv6 multicast VLANs.

Syntax

display ipv6 multicast-vlan group [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays information about IPv6 multicast groups for all IPv6 multicast sources in IPv6 multicast VLANs.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays information about all IPv6 multicast groups in IPv6 multicast VLANs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about IPv6 multicast groups in IPv6 multicast VLANs for the master device.

verbose: Displays detailed information. If you do not specify the keyword, this command displays brief information.

vlan *vlan-id*: Specifies an IPv6 multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify an IPv6 multicast VLAN, this command displays information about IPv6 multicast groups for all IPv6 multicast VLANs.

Examples

Display detailed information about all IPv6 multicast groups in IPv6 multicast VLANs.

```
<Switch> display ipv6 multicast-vlan group verbose
Total 6 entries.

IPv6 multicast VLAN 10: Total 3 entries.
  (2::2, FF0E::2)
    Flags: 0x70000020
    Sub-VLANs (1 in total):
      VLAN 40
  (22::22, FF0E::4)
    Flags: 0x70000030
    Sub-VLANs (1 in total):
      VLAN 40
  (::, FF0E::10)
    Flags: 0x10000030
    Sub-VLANs (1 in total):
      VLAN 40

IPv6 multicast VLAN 20: Total 3 entries.
  (2::2, FF0E::2)
    Flags: 0x70000010
    Sub-VLANs (0 in total):
  (22::22, FF0E::4)
    Flags: 0x70000010
    Sub-VLANs (0 in total):
  (::, FF0E::10)
    Flags: 0x50000010
    Sub-VLANs (0 in total):
```

Table 8-3 Command output

Field	Description
Total 6 entries	Total number of (S, G) entries.
IPv6 multicast VLAN 10: Total 3 entries	Total number of (S, G) entries in IPv6 multicast VLAN 10.
(::, FF0E::10)	(S, G) entry, where a double colon (::) in the S position means all IPv6 multicast sources.
Flags	Entry flag. This field displays one flag or the sum of multiple flags.

Field	Description
	For example, the value 0x70000020 means that the entry has flags 0x20, 0x10000000, 0x20000000, and 0x40000000. The following flags are available for an entry: • **0x10**—The entry is created by the IPv6 multicast VLAN. • **0x20**—The entry is created by the sub-VLAN of the IPv6 multicast VLAN. • **0x40**—The entry is to be deleted. • **0x10000000**—This value represents one of the following situations: ○ The entry is newly created. ○ The device receives an MLD query within an MLD general query interval. • **0x20000000**—The device does not receive MLDv1 or MLDv2 reports that match the entry within an MLD general query interval. • **0x40000000**—The device does not receive MLDv2 IS_EX (NULL) reports that match the entry within an MLD general query interval.
Sub-VLANs (1 in total)	Sub-VLAN list of the IPv6 multicast VLAN, and the total number of the sub-VLANs.

Related commands

reset ipv6 multicast-vlan group

8.1.4. ipv6 multicast-vlan

Use **ipv6 multicast-vlan** to configure an IPv6 multicast VLAN and enter its view, or enter the view of an existing IPv6 multicast VLAN.

Use **undo ipv6 multicast-vlan** to remove the configuration of IPv6 multicast VLANs.

Syntax

ipv6 multicast-vlan *vlan-id*

undo ipv6 multicast-vlan { **all** | *vlan-id* }

Default

No IPv6 multicast VLANs exist.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies an existing VLAN ID in the range of 1 to 4094.

all: Specifies all IPv6 multicast VLANs.

Usage guidelines

The total number of IPv6 multicast VLANs on a device cannot exceed the system upper limit.

You must enable MLD snooping for the VLAN to be configured as an IPv6 multicast VLAN.

As a best practice, do not configure an IPv6 multicast VLAN on a device that is enabled with IPv6 multicast routing.

Examples

Enable MLD snooping for VLAN 100. Configure VLAN 100 as an IPv6 multicast VLAN and enter its view.

```
<Switch> system-view
[Switch] mld-snooping
[Switch-mld-snooping] quit
[Switch] vlan 100
[Switch-vlan100] mld-snooping enable
[Switch-vlan100] quit
[Switch] ipv6 multicast-vlan 100
[Switch-ipv6-mvlan-100]
```

Related commands

ipv6 multicast routing

mld-snooping enable

8.1.5. ipv6 multicast-vlan entry-limit

Use **ipv6 multicast-vlan entry-limit** to set the maximum number of IPv6 multicast VLAN forwarding entries.

Use **undo ipv6 multicast-vlan entry-limit** to restore the default.

Syntax

ipv6 multicast-vlan entry-limit *limit*

undo ipv6 multicast-vlan entry-limit

Default

The maximum number of IPv6 multicast VLAN forwarding entries is 4000.

Views

System view

Predefined user roles

network-admin

Parameters

limit: Specifies the maximum number of IPv6 multicast VLAN forwarding entries. The value range for this argument is 0 to 4000.

Examples

Set the maximum number of IPv6 multicast VLAN forwarding entries to 120.

```
<Switch> system-view
[Switch] ipv6 multicast-vlan entry-limit 120
```

Related commands

entry-limit (MLD-snooping view)

8.1.6. ipv6 port multicast-vlan

Use **ipv6 port multicast-vlan** to assign a user port to an IPv6 multicast VLAN.

Use **undo ipv6 port multicast-vlan** to restore the default.

Syntax

ipv6 port multicast-vlan *vlan-id*

undo ipv6 port multicast-vlan

Default

A port does not belong to an IPv6 multicast VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies an IPv6 multicast VLAN by its VLAN ID in the range of 1 to 4094.

Usage guidelines

You can assign a port to only one IPv6 multicast VLAN.

For the port to be assigned to an IPv6 multicast VLAN, you must enable MLD snooping for the VLAN to which the port belongs.

Examples

Assign GigabitEthernet 1/0/1 to IPv6 multicast VLAN 100.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ipv6 port multicast-vlan 100
```

8.1.7. port (IPv6 multicast VLAN view)

Use **port** to assign user ports to an IPv6 multicast VLAN.

Use **undo port** to delete user ports from an IPv6 multicast VLAN.

Syntax

port *interface-list*

undo port { **all** | *interface-list* }

Default

An IPv6 multicast VLAN does not have user ports.

Views

IPv6 multicast VLAN view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a port in the form of *interface-type interface-number*, or a port range in the form of *interface-type interface-number* to *interface-type interface-number*.

all: Specifies all user ports in the current IPv6 multicast VLAN.

Usage guidelines

You can assign only Layer 2 Ethernet interfaces or Layer 2 aggregate interfaces as user ports to an IPv6 multicast VLAN. Additionally, you can assign a port to only one IPv6 multicast VLAN.

For ports to be assigned to an IPv6 multicast VLAN, you must enable MLD snooping for the VLANs to which the ports belong.

Examples

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 as user ports to IPv6 multicast VLAN 100.

```
<Switch> system-view
[Switch] ipv6 multicast-vlan 100
[Switch-ipv6-mvlan-100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

8.1.8. reset ipv6 multicast-vlan group

Use **reset ipv6 multicast-vlan group** to clear IPv6 multicast group entries in IPv6 multicast VLANs.

Syntax

reset ipv6 multicast-vlan group [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

Views

User view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command clears all IPv6 multicast group entries in IPv6 multicast VLANs.

prefix-length: Specifies a prefix length of the IPv6 multicast group address. The value range is 8 to 128 and the default value is 128.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command clears IPv6 multicast group entries for all IPv6 multicast sources in IPv6 multicast VLANs.

prefix-length: Specifies a prefix length of the IPv6 multicast source address. The value range is 0 to 128 and the default value is 128.

vlan *vlan-id*: Specifies an IPv6 multicast VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify an IPv6 multicast VLAN, this command clears IPv6 multicast group entries for all IPv6 multicast VLANs.

Examples

Clear all IPv6 multicast group entries for all IPv6 multicast VLANs.

```
<Switch> reset ipv6 multicast-vlan group
```

Related commands

display ipv6 multicast-vlan group

8.1.9. subvlan (IPv6 multicast VLAN view)

Use **subvlan** to assign VLANs as sub-VLANs to an IPv6 multicast VLAN.

Use **undo subvlan** to delete sub-VLANs from an IPv6 multicast VLAN.

Syntax

subvlan *vlan-list*

undo subvlan { **all** | *vlan-list* }

Default

An IPv6 multicast VLAN does not have sub-VLANs.

Views

IPv6 multicast VLAN view

Predefined user roles

network-admin

Parameters

vlan-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN by its ID or a range of VLANs in the form of *start-vlan-id* **to** *end-vlan-id*. The value range for the VLAN ID is 1 to 4094. The specified VLANs must exist and cannot be multicast VLANs or sub-VLANs of other IPv6 multicast VLANs.

all: Specifies all sub-VLANs of the current IPv6 multicast VLAN.

Usage guidelines

You must enable MLD snooping for VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN.

Examples

Assign VLAN 10 through VLAN 15 as sub-VLANs to multicast VLAN 100.

```
<Switch> system-view
[Switch] ipv6 multicast-vlan 100
[Switch-ipv6-mvlan-100] subvlan 10 to 15
```

9. IPv6 multicast routing and forwarding commands

MEMO:

The **vpn-instance** *vpn-instance-name* option for each command is supported by V7.2.18 and later software.

9.1. IPv6 multicast routing and forwarding commands

9.1.1. display ipv6 multicast boundary

Use **display ipv6 multicast boundary** to display IPv6 multicast boundary information.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.**group**: Displays the IPv6 multicast boundary information for the specified groups.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays IPv6 multicast boundary information for all IPv6 multicast groups.

prefix-length: Specifies an address prefix length in the range of 8 to 128. The default is 128.

scope: Displays the IPv6 multicast group boundary information in the admin-scoped zone.

scope-id: Specifies an admin-scope zone by its ID in the range of 3 to 15, which is identified by the scope field in the IPv6 multicast group address. If you do not specify an admin-scoped zone, this command displays IPv6 multicast boundary information for all IPv6 admin-scoped zones.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays IPv6 multicast boundary information for all interfaces.

Examples

Display IPv6 multicast boundary information of all IPv6 multicast groups for all interfaces.

```
<Switch> display ipv6 multicast boundary group
 Boundary                                                Interface
 FF1E::/64                                               Vlan1
```

Display IPv6 multicast boundary information in all IPv6 admin-scope zones for all interfaces.

```
<Switch> display ipv6 multicast boundary scope
 Boundary            Interface
        3            Vlan-interface1
```

Table 9-1 Command output

Field	Description
Boundary	IPv6 multicast group or IPv6 admin-scoped zone associated with the IPv6 multicast boundary.
Interface	Boundary interface associated with the IPv6 multicast boundary.

Related commands

ipv6 multicast boundary

9.1.2. display ipv6 multicast forwarding-table

Use **display ipv6 multicast forwarding-table** to display IPv6 multicast forwarding entries.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.*ipv6-source-address*: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default value is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Specifies the IPv6 forwarding entries that contain the specified outgoing interface.

exclude: Specifies the IPv6 forwarding entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the IPv6 forwarding entries that contain the specified interface in the outgoing interface list.

match: Specifies the IPv6 forwarding entries that contain only the specified interface in the outgoing interface list.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 multicast forwarding entries for the master device.

statistics: Displays statistics for the IPv6 multicast forwarding table.

Examples

Display IPv6 multicast forwarding entries.

```
<Switch> display ipv6 multicast forwarding-table
Total 1 entries, 1 matched

00001. (1::1, ff0e::1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Vlan-interface10
          Incoming sub-VLAN: VLAN 11
          Outgoing sub-VLAN: VLAN 12
                             VLAN 13
     List of 1 outgoing interface:
       1: Vlan-interface20
          Sub-VLAN: VLAN 21
                    VLAN 22
     Matched 19648 packets(20512512 bytes), Wrong If 0 packet
     Forwarded 19648 packets(20512512 bytes)
```

Table 9-2 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries, and the total number of matching (S, G) entries.
00001	Sequence number of the (S, G) entry.
(1::1, ff0e::1)	(S, G) entry.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has

Field	Description
	only one flag 0x0. The following flags are available for an entry: • **0x0**—The entry is in correct state. • **0x1**—The entry is in inactive state. • **0x2**—The entry is null. • **0x4**—The entry fails to update. • **0x8**—The outgoing interface information fails to update for the entry. • **0x20**—A register outgoing interface is available. • **0x40**—The entry is to be deleted. • **0x80**—The entry is in registration suppression state. • **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state. • **0x400**—The entry has the VLAN interface of the super VLAN. • **0x800**—The entry has the associated ND entry for the IPv6 multicast source address. • **0x4000000**—The entry is created by the MLD proxy.
Uptime	Length of time for which the (S, G) entry has been up.
Timeout in	Length of time in which the (S, G) entry will time out.
Incoming interface	Incoming interface of the (S, G) entry.
Incoming sub-VLAN	Incoming sub-VLAN of the super VLAN when the incoming interface of the (S, G) entry is the VLAN interface of this super VLAN.
Outgoing sub-VLAN	Outgoing sub-VLAN of the super VLAN when the incoming interface of the (S, G) entry is the VLAN interface of this super VLAN.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.
Sub-VLAN	Outgoing sub-VLAN of the super VLAN when the outgoing interface of the (S, G) entry is the VLAN interface of this super VLAN.
Matched 19648 packets (20512512 bytes), Wrong If 0 packet	Number of packets (bytes) that match the (S, G) entry, and number of packets with incoming interface errors. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.
Forwarded 19648 packets (20512512 bytes)	Number of packets (bytes) that have been forwarded. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.

Related commands

`reset ipv6 multicast forwarding-table`

9.1.3. display ipv6 multicast routing-table

Use **`display ipv6 multicast routing-table`** to display IPv6 multicast routing entries.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.*ipv6-source-address*: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Displays the IPv6 routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Displays the IPv6 routing entries that contain the specified outgoing interface.

exclude: Displays the IPv6 routing entries that do not contain the specified interface in the outgoing interface list.

include: Displays the IPv6 routing entries that contain the specified interface in the outgoing interface list.

match: Displays the IPv6 routing entries that contain only the specified interface in the outgoing interface list.

Usage guidelines

IPv6 multicast routing entries are the basis of IPv6 multicast forwarding. You can use this command to view the establishment state of (S, G) entries.

Examples

Display IPv6 multicast routing entries.

```
<Switch> display ipv6 multicast routing-table
 Total 1 entries

 00001. (2001::2, FFE3::101)
       Uptime: 00:00:14
       Upstream Interface: Vlan-interface1
       List of 2 downstream interfaces
```

```
1:  Vlan-interface2
2:  Vlan-interface3
```

Table 9-3 Command output

Field	Description
Total 1 entries	Total number of (S, G) entries.
00001	Sequence number of the (S, G) entry.
(2001::2, FFE3::101)	(S, G) entry.
Uptime	Length of time for which the (S, G) entry has been up.
Upstream Interface	Upstream interface at which the (S, G) packets should arrive.
List of 2 downstream interfaces	List of downstream interfaces that forward (S, G) packets.

Related commands

reset ipv6 multicast routing-table

9.1.4. display ipv6 multicast rpf-info

Use **display ipv6 multicast rpf-info** to display RPF information for an IPv6 multicast source.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.*ipv6-source-address*: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

Examples

Display RPF information for IPv6 multicast source 2001::101.

```
<Switch> display ipv6 multicast rpf-info 2001::101
 RPF information about source 2001::101:
     RPF interface: Vlan-interface1, RPF neighbor: FE80::A01:101:1
     Referenced prefix/prefix length: 2001::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
```

```
Load splitting rule: disable
```

Table 9-4 Command output

Field	Description
RPF information about source 2001::101	RPF information of the IPv6 multicast source 2001::101.
RPF interface	Type and number of the RPF interface.
RPF neighbor	IPv6 address (link-local address) of the RPF neighbor.
Referenced prefix/prefix length	Referenced route and its prefix length.
Referenced route type	Type of the referenced route: • **igp**—IPv6 IGP unicast route. • **egp**—IPv6 EGP unicast route. • **unicast (direct)** —IPv6 directly connected unicast route. • **unicast**—Other IPv6 unicast route, such as IPv6 unicast static route. • **mbgp**—IPv6 MBGP route.
Route selection rule	RPF route selection rule: • Route preference. • Longest prefix match.
Load splitting rule	Whether load splitting is enabled.

Related commands

display ipv6 multicast forwarding-table

display ipv6 multicast routing-table

9.1.5. ipv6 multicast boundary

Use **ipv6 multicast boundary** to configure an IPv6 multicast forwarding boundary.

Use **undo ipv6 multicast boundary** to delete an IPv6 multicast forwarding boundary.

Syntax

ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

undo ipv6 multicast boundary { *ipv6-group-address prefix-length*| **all** | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

Default

An interface is not an IPv6 multicast forwarding boundary.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies the address prefix length in the range of 8 to 128.

all: Specifies all IPv6 multicast boundaries configured on the interface.

scope-id: Specifies the ID of an admin-scoped zone, in the range of 3 to 15, which is identified by the scope field in the IPv6 multicast group address.

admin-local: Specifies the scoped zone as admin-local, which has a scope ID of 4.

global: Specifies the scoped zone as global, which has a scope ID of 14.

organization-local: Specifies the scoped zone as organization-local, which has a scope ID of 8.

site-local: Specifies the scoped zone as site-local, which has a scope ID of 5.

Usage guidelines

A multicast forwarding boundary sets the boundary condition for the IPv6 multicast groups in the specified address range. If the destination address of an IPv6 multicast packet matches the set boundary condition, the packet is not forwarded.

An interface can act as a forwarding boundary for multiple IPv6 multicast groups in different address ranges. You can implement this by using this command on the interface for each multicast address range. These multicast groups must be in the same scope. The latest configuration of a scope overwrites the previous one.

You do not need to enable IPv6 multicast routing before you execute this command.

Assume that Set A and Set B are both IPv6 multicast forwarding boundary sets with different address ranges, and that B is a subset of A. A takes effect on the interface no matter whether A is configured earlier or later than B.

Examples

Configure VLAN-interface 100 as the forwarding boundary of IPv6 multicast groups in the range of FF03::/16.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 multicast boundary ff03:: 16
```

Configure VLAN-interface 100 as the forwarding boundary of IPv6 multicast groups in the admin-local scope.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 multicast boundary scope 4
```

Related commands

display ipv6 multicast boundary

9.1.6. ipv6 multicast routing

Use **ipv6 multicast routing** to enable IPv6 multicast routing and enter IPv6 MRIB view.

Use **undo ipv6 multicast routing** to disable IPv6 multicast routing.

Syntax

ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

undo ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

Default

IPv6 multicast routing is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Usage guidelines

Other Layer 3 IPv6 multicast commands take effect only when IPv6 multicast routing is enabled.

The device does not forward any IPv6 multicast packets before IPv6 multicast routing is enabled.

Examples

Enable IPv6 multicast routing and enter IPv6 MRIB view.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6]
```

9.1.7. load-splitting (IPv6 MRIB view)

Use **load-splitting** to enable IPv6 multicast load splitting.

Use **multicast load-splitting** to restore the default.

Syntax

load-splitting { **source** | **source-group** }

undo load-splitting

Default

IPv6 multicast load splitting is disabled.

Views

IPv6 MRIB view

Predefined user roles

network-admin

Parameters

source: Enables IPv6 multicast load splitting based on IPv6 multicast source.

source-group: Enables IPv6 multicast load splitting based on IPv6 multicast source and group.

Examples

Enable IPv6 multicast load splitting based on IPv6 multicast source.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6] load-splitting source
```

9.1.8. longest-match (IPv6 MRIB view)

Use **longest-match** to specify the longest prefix match principle for RPF route selection.

Use **undo longest-match** to restore the default.

Syntax

longest-match

undo longest-match

Default

Route preference is used for RPF route selection. The route with the highest route preference is used as the RPF route.

Views

IPv6 MRIB view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to use the matching route with the longest prefix as the RPF route.

Examples

Specify the longest prefix match principle for RPF route selection.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6] longest-match
```

9.1.9. reset ipv6 multicast forwarding-table

Use **reset ipv6 multicast forwarding-table** to clear IPv6 multicast forwarding entries.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.*ipv6-source-address*: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies the address prefix length. The default value is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all IPv6 multicast forwarding entries.

Usage guidelines

When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

Examples

Clear IPv6 multicast forwarding entries for IPv6 multicast group FF0E::1.

```
<Switch> reset ipv6 multicast forwarding-table ff0e::1
```

Related commands

display ipv6 multicast forwarding-table

9.1.10. reset ipv6 multicast routing-table

Use **reset ipv6 multicast routing-table** to clear IPv6 multicast routing entries.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.*ipv6-source-address*: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 multicast routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all IPv6 multicast routing entries.

Usage guidelines

When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.

Examples

Clear IPv6 multicast routing entries for IPv6 multicast group FF03::101.

```
<Switch> reset ipv6 multicast routing-table ff03::101
```

10. MLD commands

MEMO:

The **vpn-instance** *vpn-instance-name* option for each command is supported by V7.2.18 and later software.

10.1. MLD commands

10.1.1. display mld group

Use **display mld group** to display information about MLD multicast groups (IPv6 multicast groups that hosts have joined through MLD).

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays information about all MLD multicast groups.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about MLD multicast groups for all interfaces.

static: Specifies MLD multicast groups that hosts have joined statically. If you do not specify this keyword, the command displays information about MLD multicast groups that hosts have joined dynamically.

verbose: Displays detailed information about MLD multicast groups.

Examples

Display information about MLD multicast groups that hosts have dynamically joined.

```
<Switch> display mld group
MLD groups in total: 1
 Vlan-interface1(FE80::101):
```

```
MLD groups reported in total: 1
 Group address: FF03::101
  Last reporter: FE80::10
  Uptime: 00:02:04
  Expires: 00:01:15
```

Table 10-1 Command output

Field	Description
MLD groups in total	Total number of MLD multicast groups.
MLD groups reported in total	Total number of MLD multicast groups that the hosts attached to the interface have joined dynamically.
Group address	IPv6 multicast group address.
Last reporter	IPv6 address of the receiver host that last reported membership for the group.
Uptime	Length of time since the IPv6 multicast group was joined.
Expires	Remaining lifetime for the IPv6 multicast group. This field displays **Off** if the timer is disabled.

Display detailed information about MLD multicast group FF3E::101 that hosts have statically joined. In this example, the switch is configured with MLD SSM mappings.

```
<Switch> display mld group ff3e::101 verbose
 Vlan-interface1(FE80::101):
  MLD groups reported in total: 1
   Group: FF3E::101
     Uptime: 00:01:46
     Exclude expires: 00:04:16
     Mapping expires: 00:02:16
     Last reporter: FE80::10
     Last-listener-query-counter: 0
     Last-listener-query-timer-expiry: Off
     Mapping last-listener-query-counter: 0
     Mapping last-listener-query-timer-expiry: Off
     Group mode: Exclude
     Version1-host-present-timer-expiry: Off
     Source list (sources in total: 1):
       Source: 10::10
          Uptime: 00:00:09
          V2 expires: 00:04:11
          Mapping expires: 00:02:16
          Last-listener-query-counter: 0
          Last-listener-query-timer-expiry: Off
```

Table 10-2 Command output

Field	Description
MLD groups reported in total	Total number of MLD multicast groups that the hosts attached to the interface have joined dynamically.

Field	Description
Group	IPv6 multicast group address.
Uptime	Length of time since the IPv6 multicast group was reported.
Exclude expires	Remaining time for the IPv6 multicast group in Exclude mode. This field displays **Off** if the timer is disabled.
Mapping expires	Remaining time for the IPv6 multicast group specified in MLD SSM mappings. This field is displayed only when the device is configured with MLD SSM mappings.
Last reporter	IPv6 address of the receiver host that last reported membership for this group.
Last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the group.
Last-listener-query-timer-expiry	Remaining time for the MLD last listener query timer for the multicast group. This field displays **Off** if the timer is disabled.
Mapping last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the IPv6 multicast group specified in MLD SSM mappings. This field is displayed only when the device is configured with MLD SSM mappings.
Mapping last-listener-query-timer-expiry	Remaining time for the last listener query timer of the IPv6 multicast group specified in MLD SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured with MLD SSM mappings.
Group mode	IPv6 multicast source filtering mode: • **Include**—Include mode. • **Exclude**—Exclude mode. For a device that runs MLDv1: • If MLD SSM mappings are not configured, this field displays **Exclude**. • If MLD SSM mappings are configured, this field displays **Include** or **Exclude** depending on the SSM mappings and the IPv6 multicast groups that the host joins.
Version1-host-present-timer-expiry	Remaining time for the MLDv1 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs MLDv2.
Source list (sources in total 1)	List of IPv6 multicast sources and total number of IPv6 multicast sources. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Source	IPv6 multicast source address. This field is displayed only when the device runs MLDv2 or the device is configured with MLD SSM mappings.

Field	Description
Uptime	Length of time since the IPv6 multicast source was reported. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
V2 expires	Remaining time for the IPv6 multicast source when the device runs MLDv2. This field displays **Off** if the timer is disabled. This field displays three hyphens (---) if the IPv6 multicast source is specified in MLD SSM mappings. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Mapping expires	Remaining time for the IPv6 multicast sources specified in MLD SSM mappings.
Last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the IPv6 multicast source and group. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Last-listener-query-timer-expiry	Remaining time for the last listener query timer for the IPv6 multicast source and group. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.

Display information about the MLD multicast groups that hosts have statically joined.

```
<Switch> display mld group static
 Entries in total: 2
  (*, FF03::101)
   Interface: Vlan1
   Expires: Never

  (2001::101, FF3E::202)
   Interface: Vlan1
   Expires: Never
```

Table 10-3 Command output

Field	Description
Entries in total	Total number of the IPv6 multicast groups that hosts have joined statically.
(*, FF03::101)	(*, G) entry.
(2001::101, FF3E::202)	(S, G) entry.
Expires	Remaining lifetime for the IPv6 multicast group. This field always displays **Never**, which means that the IPv6 multicast group never expires.

Related commands

reset mld group

10.1.2. display mld interface

Use **display mld interface** to display MLD information for interfaces.

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays MLD information for all interfaces.

verbose: Displays detailed MLD information.

Examples

Display detailed MLD information for VLAN-interface 1 (non-proxy interface).

```
<Switch> display mld interface vlan-interface 1 verbose
 Vlan-interface1(FE80::200:AFF:FE01:101):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
   Other querier present time for MLD: 255s
   Maximum query response time for MLD: 10s
   Last listener query interval: 1s
   Last listener query count: 2
   Startup query interval: 31s
   Startup query count: 2
   General query timer expiry (hh:mm:ss): 00:00:23
   Querier for MLD: FE80::200:AFF:FE01:101 (This router)
   MLD activity: 1 join(s), 0 done(s)
   IPv6 multicast routing on this interface: Enabled
   Robustness: 2
   Require-router-alert: Disabled
   Fast-leave: Disabled
   Startup-query: Off
   Other-querier-present-timer-expiry (hh:mm:ss): Off
   MLD groups reported in total: 1
```

Table 10-4 Command output

Field	Description
Vlan-interface1(FE80::200:AFF:FE01:101)	Interface and its IPv6 link-local address.
MLD is enabled	MLD is enabled on the interface.
MLD version	Version of MLD that the interface runs.
Query interval for MLD	MLD query interval, in seconds.
Other querier present time for MLD	MLD other querier present interval, in seconds.
Maximum query response time for MLD	Maximum response time for MLD general query messages, in seconds.
Last listener query interval	Interval for sending MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, in seconds.
Last listener query count	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the group.
Startup query interval	MLD startup query interval, in seconds.
Startup query count	Number of MLD general queries sent on startup.
General query timer expiry	Remaining time for the MLD general query timer. This field displays **Off** if the timer is disabled.
Querier for MLD	IPv6 link-local address of the MLD querier.
MLD activity: 1 join(s), 0 done(s)	MLD activity statistics: • **join(s)**—Total number of IPv6 multicast groups that the interface has joined. • **done(s)**—Total number of IPv6 multicast groups that the interface has left.
IPv6 multicast routing on this interface	Whether IPv6 multicast routing is enabled: Enabled or Disabled.
Robustness	Robustness variable of the MLD querier.
Require-router-alert	Whether the feature of dropping MLD messages without Router-Alert is enabled: Enabled or Disabled.
Fast-leave	Whether fast-leave processing is enabled: Enabled or Disabled.
Startup-query	Whether the MLD querier sends MLD general queries at the startup query interval on startup: • **On**—The MLD querier performs the above action. • **Off**—The MLD querier does not perform the above action.
Other-querier-present-timer-expiry	Remaining time for MLD other querier present timer. This field displays **Off** if the timer is disabled.

Field	Description
MLD groups reported in total	Total number of IPv6 multicast groups that the interface has joined dynamically. This field is not displayed if the interface does not join IPv6 multicast groups.
MLD proxy is enabled	MLD proxying is enabled.
Version1-querier-present-timer-expiry	Remaining time for the MLDv1 querier present timer. This field displays **Off** if the timer is disabled.

10.1.3. display mld ssm-mapping

Use **display mld ssm-mapping** to display MLD SSM mappings.

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

Examples

Display MLD SSM mappings for IPv6 multicast group FF3E::101.

```
<Switch> display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
        1::1
        1::2
        10::1
        100::10
```

Table 10-5 Command output

Field	Description
Group	IPv6 multicast group address.
Source list	List of IPv6 multicast source addresses.

10.1.4. last-listener-query-interval (MLD view)

Use **last-listener-query-interval** to set the MLD last listener query interval globally.

Use **undo last-listener-query-interval** to restore the default.

Syntax

last-listener-query-interval *interval*

undo last-listener-query-interval

Default

The MLD last listener query interval is 1 second.

Views

MLD view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD last listener query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the MLD last listener query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD last listener query interval to 6 seconds.

```
<Switch> system-view
[Switch] mld
[Switch-mld] last-listener-query-interval 6
```

Related commands

mld last-listener-query-interval

10.1.5. max-response-time (MLD view)

Use **max-response-time** to set the maximum response time for MLD general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *time*

undo max-response-time

Default

The maximum response time for MLD general queries is 10 seconds.

Views

MLD view

Predefined user roles

network-admin

Parameters

time: Specifies the maximum response time for MLD general queries in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global maximum response time for MLD general queries to 25 seconds.

```
<Switch> system-view
[Switch] mld
[Switch-mld] max-response-time 25
```

Related commands

mld max-response-time

10.1.6. mld

Use **mld** to enter MLD view.

Use **undo mld** to delete the configurations in MLD view.

Syntax

mld [**vpn-instance** *vpn-instance-name*]

undo mld [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

Examples

Enter MLD view.

```
<Switch> system-view
[Switch] mld
[Switch-mld]
```

10.1.7. mld enable

Use **mld enable** to enable MLD on an interface.

Use **undo mld enable** to disable MLD on an interface.

Syntax

mld enable

undo mld enable

Default

MLD is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IPv6 multicast routing is enabled.

Other MLD configurations on the interface take effect only when MLD is enabled on the interface.

Examples

Enable IPv6 multicast routing, and enable MLD for VLAN-interface 100.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld enable
```

Related commands

ipv6 multicast routing

10.1.8. mld group-policy

Use **mld group-policy** to configure an IPv6 multicast group policy on an interface to control the IPv6 multicast groups that hosts attached to the interface can join.

Use **undo mld group-policy** to delete the IPv6 multicast group policy on an interface.

Syntax

mld group-policy *ipv6-acl-number* [*version-number*]

undo mld group-policy

Default

No IPv6 multicast group policy exists. Hosts attached to the interface can join any IPv6 multicast groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic or advanced ACL by its number in the range of 2000 to 3999. Receiver hosts can join only the IPv6 multicast groups that the ACL permits. If the ACL does not exist or have valid rules, receiver hosts cannot join IPv6 multicast groups.

version-number: Specifies an MLD version number, 1 or 2. By default, this command takes effect on both MLDv1 reports and MLDv2 reports.

Usage guidelines

An IPv6 multicast group policy filters MLD reports to control the IPv6 multicast groups that hosts can join.

This command does not take effect on static member interfaces because static member interfaces do not send MLD reports.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- In an advanced ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast source address. The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.

  To match the following MLD reports, set the **source** *source-address source-prefix* option to 0::0:
  - MLDv1 reports.
  - MLDv2 IS_EX and MLDv2 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure an IPv6 multicast group policy on VLAN-interface 100 so that hosts attached to the interface can join only IPv6 multicast group FF03::101.

```
<Switch> system-view
[Switch] acl ipv6 basic 2005
[Switch-acl-ipv6-basic-2005] rule permit source ff03::101 128
[Switch-acl-ipv6-basic-2005] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld group-policy 2005
```

10.1.9. mld last-listener-query-interval

Use **mld last-listener-query-interval** to set the MLD last listener query interval on an interface.

Use **undo mld last-listener-query-interval** to restore the default.

Syntax

mld last-listener-query-interval *interval*

undo mld last-listener-query-interval

Default

The MLD last listener query interval is 1 second.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD last listener query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the MLD last listener query interval for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD last listener query interval to 6 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld last-listener-query-interval 6
```

Related commands

last-listener-query-interval (MLD view)

10.1.10. mld max-response-time

Use **mld max-response-time** to set the maximum response time for MLD general queries on an interface.

Use **undo mld max-response-time** to restore the default.

Syntax

mld max-response-time *time*

undo mld max-response-time

Default

The maximum response time for MLD general queries is 10 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the maximum response time for MLD general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the maximum response time for MLD general queries to 25 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld max-response-time 25
```

Related commands

max-response-time (MLD view)

10.1.11. mld other-querier-present-timeout

Use **mld other-querier-present-timeout** to set the MLD other querier present timer on an interface.

Use **undo mld other-querier-present-timeout** to restore the default.

Syntax

mld other-querier-present-timeout *time*

undo mld other-querier-present-timeout

Default

The MLD other querier present timer is calculated by using the following formula:

[MLD general query interval] × [MLD querier's robustness variable] + [maximum response time for MLD general queries] / 2.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies an MLD other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD other querier present timer for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD other querier present timer to 125 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld other-querier-present-timeout 125
```

Related commands

other-querier-present-timeout (MLD view)

10.1.12. mld query-interval

Use **mld query-interval** to set the MLD general query interval on an interface.

Use **undo mld query-interval** to restore the default.

Syntax

mld query-interval *interval*

undo mld query-interval

Default

The MLD general query interval is 125 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD general interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD general interval for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD general query interval to 60 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld query-interval 60
```

Related commands

query-interval (MLD view)

10.1.13. mld robust-count

Use **mld robust-count** to set the MLD querier's robustness variable on an interface.

Use **undo mld robust-count** to restore the default.

Syntax

mld robust-count *count*

undo mld robust-count

Default

The MLD querier's robustness variable is 2.

Views

Interface view

Predefined user roles

network-admin

Parameters

count: Specifies an MLD querier's robustness variable in the range of 1 to 255.

Usage guidelines

The MLD querier's robustness variable defines the number of times to retransmit MLD queries if packet loss occurs. A higher robustness variable makes the MLD querier more robust, but it increases the timeout time for IPv6 multicast groups.

You can set the MLD querier's robustness variable for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD querier's robustness variable to 5 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld robust-count 5
```

Related commands

robust-count (MLD view)

10.1.14. mld startup-query-count

Use **mld startup-query-count** to set the MLD startup query count on an interface.

Use **undo mld startup-query-count** to restore the default.

Syntax

mld startup-query-count *count*

undo mld startup-query-count

Default

The MLD startup query count equals the MLD querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

Parameters

count: Specifies an MLD startup query count in the range of 1 to 255.

Usage guidelines

You can set the MLD startup query count for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD startup query count to 5 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld startup-query-count 5
```

Related commands

startup-query-count (MLD view)

10.1.15. mld startup-query-interval

Use **mld startup-query-interval** to set the MLD startup query interval on an interface.

Use **undo mld startup-query-interval** to restore the default.

Syntax

mld startup-query-interval *interval*

undo mld startup-query-interval

Default

The MLD startup query interval equals one quarter of the MLD general query interval.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD startup query interval for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD startup query interval to 100 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld startup-query-interval 100
```

Related commands

startup-query-interval (MLD view)

10.1.16. mld static-group

Use **mld static-group** to configure an interface as a static group member of an IPv6 multicast group.

Use **undo mld static-group** to restore the default.

Syntax

mld static-group *ipv6-group-address* [**source** *ipv6-source-address*]

undo mld static-group { **all** | *ipv6-group-address* [**source** *ipv6-source-address*] }

Default

An interface is not a static member of IPv6 multicast groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command configures an interface as a static group member of the multicast groups with all IPv6 multicast source addresses.

all: Specifies all IPv6 multicast groups that the interface has statically joined.

Usage guidelines

For IPv6 multicast routing entries to be created, specify an IPv6 multicast source address if the specified IPv6 multicast group address is in the SSM group range.

Examples

Configure VLAN-interface 100 as a static group member of IPv6 multicast group FF03::101.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld static-group ff03::101
```

Configure VLAN-interface 100 as a static group member of IPv6 multicast source and group (2001::101, FF3E::202).

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld static-group ff3e::202 source 2001::101
```

10.1.17. mld version

Use **mld version** to specify an MLD version for an interface.

Use **undo mld version** to restore the default.

Syntax

mld version *version-number*

undo mld version

Default

The MLD version is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

version-number: Specifies an MLD version, 1 or 2.

Examples

Specify MLD version 2 for VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] mld version 2
```

10.1.18. other-querier-present-timeout (MLD view)

Use **other-querier-present-timeout** to set the MLD other querier present timer globally.

Use **undo other-querier-present-timeout** to restore the default.

Syntax

other-querier-present-timeout *time*

undo other-querier-present-timeout

Default

The MLD other querier present timer is calculated by using the following formula:

[MLD general query interval] × [MLD querier's robustness variable] + [maximum response time for MLD general queries] / 2.

Views

MLD view

Predefined user roles

network-admin

Parameters

time: Specifies an MLD other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD other querier present timer globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD other querier present timer to 125 seconds.

```
<Switch> system-view
[Switch] mld
[Switch-mld] other-querier-present-timeout 125
```

Related commands

mld other-querier-present-timeout

10.1.19. query-interval (MLD view)

Use **query-interval** to set the MLD general query interval globally.

Use **undo query-interval** to restore the default.

Syntax

query-interval *interval*

undo query-interval

Default

The MLD general query interval is 125 seconds.

Views

MLD view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD general query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD general query interval to 60 seconds.

```
<Switch> system-view
[Switch] mld
[Switch-mld] query-interval 60
```

Related commands

mld query-interval

10.1.20. reset mld group

Use **reset mld group** to clear dynamic MLD multicast group entries.

Syntax

reset mld [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

all: The first **all** specifies all interfaces, and the second **all** specifies all MLD multicast groups.

interface-type interface-number: Specifies an interface by its type and number.

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command clears dynamic MLD multicast group entries for all IPv6 multicast sources.

prefix-length: Specifies an address prefix length. The default is 128. For a multicast source address, the value range for this argument is 0 to 128. For a multicast group address, the value range for this argument is 8 to 128.

Usage guidelines

This command might interrupt the IPv6 multicast information transmission.

Examples

Clear dynamic MLD multicast group entries for all interfaces.

```
<Switch> reset mld group all
```

Clear all dynamic MLD multicast group entries for VLAN-interface 100.

```
<Switch> reset mld group interface vlan-interface 100 all
```

Clear the dynamic entry of MLD multicast group FF03::101:10 for VLAN-interface 100.

```
<Switch> reset mld group interface vlan-interface 100 ff03::101:10
```

Related commands

display mld group

10.1.21. robust-count (MLD view)

Use **robust-count** to set the MLD querier's robustness variable globally.

Use **undo robust-count** to restore the default.

Syntax

robust-count *count*

undo robust-count

Default

The MLD querier's robustness variable is 2.

Views

MLD view

Predefined user roles

network-admin

Parameters

count: Specifies an MLD querier's robustness variable in the range of 1 to 255.

Usage guidelines

The MLD querier's robustness variable defines the number of times to retransmit MLD queries if packet loss occurs. A higher robustness variable makes the MLD querier more robust, but it increases the timeout time for IPv6 multicast groups.

You can set the MLD querier's robustness variable globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD querier's robustness variable to 5.

```
<Switch> system-view
[Switch] mld
[Switch-mld] robust-count 5
```

Related commands

mld robust-count

10.1.22. ssm-mapping (MLD view)

Use **ssm-mapping** to configure an MLD SSM mapping.

Use **undo ssm-mapping** to delete MLD SSM mappings.

Syntax

ssm-mapping *ipv6-source-address ipv6-acl-number*

undo ssm-mapping { *ipv6-source-address* | **all** }

Default

No MLD SSM mappings exist.

Views

MLD view

Predefined user roles

network-admin

Parameters

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address.

ipv6-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999. IPv6 multicast groups in MLD reports permitted by the ACL are associated with the IPv6 multicast source. If the ACL does not exist or does not have valid rules, no IPv6 multicast groups are associated with the IPv6 multicast source.

all: Specifies all MLD SSM mappings.

Usage guidelines

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* **option specifies an** IPv6 multicast group address.
- Among the other optional parameters, only the **fragment keyword and the time-range** *time-range-name* option take effect.

Examples

Configure an MLD SSM mapping with IPv6 multicast source 1::1 and IPv6 multicast group range FF3E::/64.

```
<Switch> system-view
[Switch] acl ipv6 basic 2001
[Switch-acl-ipv6-basic-2001] rule permit source ff3e:: 64
[Switch-acl-ipv6-basic-2001] quit
[Switch] mld
[Switch-mld] ssm-mapping 1::1 2001
```

Related commands

display mld ssm-mapping

10.1.23. startup-query-count (MLD view)

Use **startup-query-count** to set the MLD startup query count globally.

Use **undo startup-query-count** to restore the default.

Syntax

startup-query-count *count*

undo startup-query-count

Default

The MLD startup query count equals the MLD querier's robustness variable.

Views

MLD view

Predefined user roles

network-admin

Parameters

count: Specifies an MLD startup query count in the range of 1 to 255.

Usage guidelines

You can set the MLD startup query count globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD startup query count to 5.

```
<Switch> system-view
[Switch] mld
[Switch-mld] startup-query-count 5
```

Related commands

mld startup-query-count

10.1.24. startup-query-interval (MLD view)

Use **startup-query-interval** to set the MLD startup query interval globally.

Use **undo startup-query-interval** to restore the default.

Syntax

startup-query-interval *interval*

undo startup-query-interval

Default

The MLD startup query interval equals one quarter of the MLD general query interval.

Views

MLD view

Predefined user roles

network-admin

Parameters

interval: Specifies an MLD startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD startup query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD startup query interval to 100 seconds.

```
<Switch> system-view
[Switch] mld
[Switch-mld] startup-query-interval 100
```

Related commands

mld startup-query-interval

11. IPv6 PIM commands

MEMO:

The **vpn-instance** *vpn-instance-name* option for each command is supported by V7.2.18 and later software.

11.1. IPv6 PIM commands

11.1.1. bsm-reflection enable (IPv6 PIM view)

Use **bsm-reflection enable** to enable the device to forward BSMs out of their incoming interfaces.

Use **undo bsm-reflection enable** to disable the device from forwarding BSMs out of their incoming interfaces.

Syntax

bsm-reflection enable

undo bsm-reflection enable

Default

The device forwards BSMs out of their incoming interfaces.

Views

IPv6 PIM view

Predefined user roles

network-admin

Usage guidelines

Disable this feature if all the routers in the IPv6 PIM-SM domain have consistent routing information.

Examples

Disable the device from forwarding BSMs out of their incoming interfaces.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] undo bsm-reflection enable
```

11.1.2. bsr-policy (IPv6 PIM view)

Use **bsr-policy** to configure a BSR policy.

Use **undo bsr-policy** to restore the default.

Syntax

bsr-policy *ipv6-acl-number*

undo bsr-policy

Default

No BSR policy exists, and all bootstrap messages are regarded as legal.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999.

Usage guidelines

A BSR policy filters bootstrap messages to guard against BSR spoofing.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies a BSR address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a BSR policy so that only the devices on subnet 2001::2/64 can act as the BSR.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source 2001::2 64
[Switch-acl-ipv6-basic-2000] quit
[Switch] ipv6 pim
[Switch-pim6] bsr-policy 2000
```

Related commands

c-bsr (IPv6 PIM view)

11.1.3. c-bsr (IPv6 PIM view)

Use **c-bsr** to configure a candidate-BSR (C-BSR).

Use **undo c-bsr** to remove the configuration of a C-BSR.

Syntax

c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *

undo c-bsr *ipv6-address* [**scope** *scope-id*]

Default

No C-BSRs exist.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of a C-BSR. You must specify the IPv6 address of a local IPv6 PIM interface.

scope *scope-id*: Specifies an IPv6 admin-scoped zone by its ID in the range of 3 to 15. If you do not specify an IPv6 admin-scoped zone, this command designates the C-BSR to the global-scoped zone.

hash-length *hash-length*: Specifies a hash mask length in the range of 0 to 128. The default is 126.

priority *priority*: Specifies a C-BSR priority in the range of 0 to 255. The default is 64. The greater the value, the higher the priority.

Usage guidelines

If you execute this command for a zone multiple times, the most recent configuration takes effect.

You can configure the same C-BSR for different zones.

Examples

Configure the interface with IPv6 address 1101::1 as a C-BSR for the global-scoped zone.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] c-bsr 1101::1
```

11.1.4. c-rp (IPv6 PIM view)

Use **c-rp** to configure a candidate-RP (C-RP).

Use **undo c-rp** to remove the configuration of a C-RP.

Syntax

c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** *ipv6-acl-number* | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] *

undo c-rp *ipv6-address*

Default

No C-RPs exist.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of a C-RP. You must specify the IPv6 address of a local IPv6 PIM interface.

advertisement-interval *adv-interval*: Specifies a C-RP advertisement message interval in the range of 1 to 65535 seconds. The default is 60 seconds.

group-policy *ipv6-acl-number*: Specifies an IPv6 basic ACL number by its number in the range of 2000 to 2999. If you specify an ACL, this command designates the C-RP to IPv6 multicast groups in C-RP advertisement messages that the ACL permits. The C-RP is designated to all IPv6 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

scope *scope-id:* Specifies an IPv6 admin-scoped zone by its ID in the range of 3 to 15.

holdtime *hold-time*: Specifies a C-RP lifetime in the range of 1 to 65535 seconds. The default is 150 seconds.

priority *priority*: Specifies a C-RP priority in the range of 0 to 255. The default is 192. The greater the value, the lower the priority.

Usage guidelines

To designate a C-RP to multiple IPv6 multicast group ranges, create multiple rules that specify different IPv6 multicast group ranges in the ACL.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command by using the same IPv6 address of a C-RP multiple times, the most recent configuration takes effect.

Examples

Configure the interface with IPv6 address 2001::1 as the C-RP for IPv6 multicast group range FF0E:0:1391::/96, and set its priority to 10.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source ff0e:0:1391:: 96
[Switch-acl-ipv6-basic-2000] quit
[Switch] ipv6 pim
[Switch-pim6] c-rp 2001::1 group-policy 2000 priority 10
```

11.1.5. crp-policy (IPv6 PIM view)

Use **crp-policy** to configure a C-RP policy.

Use **undo crp-policy** to restore the default.

Syntax

crp-policy *ipv6-acl-number*

undo crp-policy

Default

No C-RP policy exists, and all C-RP messages are regarded as legal.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

A C-RP policy filters C-RP advertisement messages to guard against C-RP spoofing.

The device uses only the prefixes of the multicast group ranges in advertisement messages to match the destination field in ACL rules. For example, the IPv6 multicast group range in a C-RP advertisement message is FF0E:0:1::/96. If the prefix FF0E:0:1:: is in the range specified by the destination field of an ACL rule, the specified C-RPs are designated to this IPv6 multicast group range.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an RP address.
- The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a C-RP policy so that only devices in the address range of 2001::2/64 can be C-RPs for the groups in the range of FF03::101/64.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule permit ipv6 source 2001::2 64 destination ff03::101 64
[Switch-acl-ipv6-adv-3000] quit
[Switch] ipv6 pim
[Switch-pim6] crp-policy 3000
```

Related commands

c-rp (IPv6 PIM view)

11.1.6. display ipv6 pim bsr-info

Use **display ipv6 pim bsr-info** to display IPv6 PIM BSR information.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **bsr-info**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Examples

Display IPv6 PIM BSR information.

```
<Switch> display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 12:12::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:21:56

 Scope: 5
     State: Accept Any
     Scope-zone expiry timer: 00:21:12

 Scope: 6
     State: Elected
     Bootstrap timer: 00:00:26
     Elected BSR address: 17:11::1
       Priority: 64
       Hash mask length: 126
       Uptime: 02:53:37
     Candidate BSR address: 17:11::1
       Priority: 64
       Hash mask length: 126

 Scope: 7
     State: Candidate
     Bootstrap timer: 00:01:56
     Elected BSR address: 61:37::1
       Priority: 64
       Hash mask length: 126
       Uptime: 02:53:32
     Candidate BSR address: 17:12::1
       Priority: 64
       Hash mask length: 126

 Scope: 8
     State: Pending
     Bootstrap timer: 00:00:07
     Candidate BSR address: 17:13::1
       Priority: 64
```

```
Hash mask length: 126
```

Table 11-1 Command output

Field	Description
Bootstrap timer	Aging timer for the BSR.
Scope-zone expiry timer	Aging timer for the scoped zone.
Elected BSR address	Address of the elected BSR.
Candidate BSR address	Address of the C-BSR.
Priority	BSR priority.
Uptime	Length of time the BSR has been up.

11.1.7. display ipv6 pim claimed-route

Use **display ipv6 pim claimed-route** to display information about all routes that IPv6 PIM uses.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **claimed-route** [*ipv6-source-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command displays information about all routes that IPv6 PIM uses.

Examples

Display information about all routes that IPv6 PIM uses.

```
<Switch> display ipv6 pim claimed-route
 RPF-route selecting rule: longest-match

 Route/mask: 7:11::/64 (unicast (direct))
     RPF interface: Vlan-interface2, RPF neighbor: 8::2
     Total number of (S,G) or (*,G) dependent on this route entry: 4
     (7:11::10, ff1e::1)
     (7:11::10, ff1e::2)
     (7:11::10, ff1e::3)
     (*, ff1e::4)
 Route/mask: 7:12::/64 (unicast)
```

```
RPF interface: Vlan-interface2, RPF neighbor: 8::3,
Total number of (S,G) or (*,G) dependent on this route entry: 2
(7:12::10, ff1e::1)
(7:12::10, ff1e::2)
```

Table 11-2 Command output

Field	Description
Route/mask	Route entry. Route types in parentheses include: • **igp**—IGP unicast route. • **egp**—EGP unicast route. • **unicast (direct)**—Directly connected unicast route. • **unicast**—Other unicast route, such as static unicast route. • **mbgp**—IPv6 MBGP route.
RPF interface	Name of the RPF interface.
RPF neighbor	IPv6 address of the RPF neighbor.
Total number of (S,G) or (*,G) dependent on this route entry	Total number (S, G) or (*, G) entries associated with the RPF route and the entry list.

11.1.8. display ipv6 pim c-rp

Use **display ipv6 pim c-rp** to display C-RP information.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

local: Specifies local C-RPs. If you do not specify this keyword, the command displays information about all C-RPs.

Usage guidelines

You can display information about learned C-RPs only on the BSR. On other devices, you can display information about the locally configured C-RPs.

Examples

Display information about learned C-RPs.

```
<Switch> display ipv6 pim c-rp
 Scope: non-scoped
     Group/MaskLen: FF00::/8 [B]
```

```
  C-RP address             Priority  HoldTime  Uptime    Expires
  8:12::2 (local)          192       150       00:27:48  00:01:43
Group/MaskLen: FF23::/92 Expires: 00:02:07
```

Display information about the locally configured C-RPs.

```
<Switch> display ipv6 pim c-rp local
 Candidate RP: 8:12::2(Loop1)
     Priority: 192
     HoldTime: 150
     Advertisement interval: 60
     Next advertisement scheduled at: 00:00:46
```

Table 11-3 Command output

Field	Description
Group/MaskLen	IPv6 multicast group to which the C-RP is designated.
[B]	This field is not supported in the current software version. The C-RP is an IPv6 BIDIR-PIM RP. This field is not displayed if the C-RP is an IPv6 PIM-SM RP.
C-RP address	IPv6 address of the C-RP. If the C-RP resides on the device where the command is executed, this field displays **(local)** after the IPv6 address.
Priority	C-RP priority.
HoldTime	C-RP lifetime.
Uptime	Length of time the C-RP has been up: • **w**—Weeks. • **d**—Days. • **h**—Hours.
Expires	Remaining lifetime for the C-RP and the IPv6 multicast group.
Candidate RP	IPv6 address of the locally configured C-RP.
Advertisement interval	Interval between two advertisement messages sent by the locally configured C-RP.
Next advertisement scheduled at	Remaining time for the locally configured C-RP to send the next advertisement message.

11.1.9. display ipv6 pim interface

Use **display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **interface** to display IPv6 PIM information for interfaces.

Syntax

display ipv6 pim interface [*interface-type interface-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays IPv6 PIM information for all interfaces.

verbose: Displays detailed IPv6 PIM information. If you do not specify this keyword, the command displays brief IPv6 PIM information.

Examples

Display brief IPv6 PIM information for all interfaces.

```
<Switch> display ipv6 pim interface
 Interface          NbrCnt  HelloInt  DR-Pri     DR-Address
 Vlan1              1       30        1          FE80::200:5EFF:FE04:8700
```

Table 11-4 Command output

Field	Description
Interface	Name of the interface.
NbrCnt	Number of IPv6 PIM neighbors.
HelloInt	Interval for sending hello messages.
DR-Pri	DR priority.
DR-Address	IPv6 address (link-local address) of the DR.

Display detailed IPv6 PIM information on VLAN-interface 1.

```
<Switch> display ipv6 pim interface vlan-interface 1 verbose
 Interface: Vlan-interface1, FE80::200:5EFF:FE04:8700
     PIM version: 2
     PIM mode: Sparse
     PIM DR: FE80::200:AFF:FE01:101
     PIM DR Priority (configured): 1
     PIM neighbors count: 1
     PIM hello interval: 30 s
     PIM LAN delay (negotiated): 500 ms
     PIM LAN delay (configured): 500 ms
     PIM override interval (negotiated): 2500 ms
     PIM override interval (configured): 2500 ms
     PIM neighbor tracking (negotiated): disabled
     PIM neighbor tracking (configured): disabled
     PIM generation ID: 0xF5712241
     PIM require generation ID: disabled
     PIM hello hold interval: 105 s
     PIM assert hold interval: 180 s
     PIM triggered hello delay: 5 s
     PIM J/P interval: 60 s
     PIM J/P hold interval: 210 s
     PIM BSR domain border: disabled
     PIM BFD: disabled
```

```
PIM passive: disabled
Number of routers on network not using DR priority: 0
Number of routers on network not using LAN delay: 0
Number of routers on network not using neighbor tracking: 2
```

Table 11-5 Command output

Field	Description
Interface	Interface name and IPv6 address (link-local address).
PIM version	Version of the IPv6 PIM protocol
PIM mode	IPv6 PIM mode: dense or sparse.
PIM DR	IPv6 address (link-local address) of the DR.
PIM DR Priority (configured)	Configured DR priority.
PIM neighbor count	Total number of IPv6 PIM neighbors.
PIM hello interval	Interval for sending hello messages.
PIM LAN delay (negotiated)	Negotiated IPv6 message propagation delay.
PIM LAN delay (configured)	Configured IPv6 message propagation delay.
PIM override interval (negotiated)	Negotiated interval for overriding prune messages.
PIM override interval (configured)	Configured interval for overriding prune messages.
PIM neighbor tracking (negotiated)	Negotiated neighbor tracking status: enabled or disabled.
PIM neighbor tracking (configured)	Configured neighbor tracking status: enabled or disabled.
PIM require generation ID	Whether the feature of dropping hello messages without Generation_ID is enabled.
PIM hello hold interval	IPv6 PIM neighbor lifetime.
PIM assert hold interval	Assert holdtime timer.
PIM triggered hello delay	Maximum delay for sending hello messages.
PIM J/P interval	Interval for sending join/prune messages.
PIM J/P hold interval	Joined/pruned state holdtime timer.
PIM BSR domain border	Whether an IPv6 PIM domain border is configured.
PIM BFD	Whether IPv6 PIM is enabled to work with BFD.
PIM passive	Whether IPv6 PIM passive mode is enabled on the interface.
Number of routers on network not using DR priority	Number of routers that do not use the DR priority field on the subnet where the interface resides.
Number of routers on network not using LAN delay	Number of routers that do not use the LAN delay field on the subnet where the interface resides.
Number of routers on network not using neighbor tracking	Number of routers that are not enabled with neighbor tracking on the subnet where the interface resides.

11.1.10. display ipv6 pim neighbor

Use **display ipv6 pim neighbor** to display IPv6 PIM neighbor information.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **neighbor** [*ipv6-neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

ipv6-neighbor-address: Specifies an IPv6 PIM neighbor by its IPv6 address. If you do not specify an IPv6 PIM neighbor, this command displays information about all IPv6 PIM neighbors.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about IPv6 PIM neighbors on all interfaces.

verbose: Displays detailed IPv6 PIM neighbor information. If you do not specify this keyword, the command displays brief IPv6 PIM neighbor information.

Examples

Display brief information about all IPv6 PIM neighbors.

```
<Switch> display ipv6 pim neighbor
 Total Number of Neighbors = 2

 Neighbor        Interface           Uptime   Expires  DR-Priority Mode
 FE80::A01:101:1  Vlan1              02:50:49 00:01:31 1           B
 FE80::A01:102:1  Vlan2              02:49:39 00:01:42 1
```

Display detailed information about the IPv6 PIM neighbor with IPv6 address FE80::A01:101:1.

```
<Switch> display ipv6 pim neighbor fe80::a01:101:1 verbose
 Neighbor: FE80::A01:101:1
     Interface: Vlan-interface3
     Uptime: 00:00:10
     Expiry time: 00:00:30
     DR Priority: 1
     Generation ID: 0x2ACEFE15
     Holdtime: 105 s
     LAN delay: 500 ms
     Override interval: 2500 ms
     State refresh interval: 60 s
     Neighbor tracking: Disabled
```

```
Bidirectional PIM: Disabled
Secondary address(es):
1::1
```

Table 11-6 Command output

Field	Description
Total Number of Neighbors	Total number of IPv6 PIM neighbors.
Neighbor	Primary IPv6 address (link-local address) of the IPv6 PIM neighbor.
Interface	Interface that connects to the IPv6 PIM neighbor.
Uptime	Length of time the IPv6 PIM neighbor has been up.
Expires/Expiry time	Remaining lifetime for the IPv6 PIM neighbor. If the IPv6 PIM neighbor is always up and reachable, this field displays **never**.
DR-Priority/DR Priority	DR priority of the IPv6 PIM neighbor.
Mode	IPv6 PIM mode. This field displays **B** if the IPv6 PIM mode is BIDIR-PIM.IPv6 BIDIR-PIM is not supported in the current software version. This field is empty if an IPv6 PIM mode other than IPv6 BIDIR-PIM is used.
Generation ID	Generation ID of the IPv6 PIM neighbor. (A random value represents a status change of the IPv6 PIM neighbor.)
Holdtime	Lifetime of the IPv6 PIM neighbor. If the IPv6 PIM neighbor is always up and reachable, this field displays **forever**.
LAN delay	IPv6 PIM message propagation delay on the shared-media LAN.
Override interval	Interval for overriding prune messages.
State refresh interval	Interval for refreshing state. This field is displayed only when the state refresh feature is enabled.
Neighbor tracking	Neighbor tracking status: enabled or disabled.
Bidirectional PIM	This field is not supported in the current software version. Whether IPv6 BIDIR-PIM is enabled.
RPF proxy vector	Whether the RPF proxy vector feature is enabled.
Secondary address(es)	Secondary IPv6 address (non-link-local address) of the IPv6 PIM neighbor.

11.1.11. display ipv6 pim routing-table

Use **display ipv6 pim routing-table** to display IPv6 PIM routing entries.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **flags** *flag-value* | **fsm** | **incoming-interface**

interface-type interface-number | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays IPv6 PIM routing entries for all IPv6 multicast groups.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address.

prefix-length: Specifies a prefix length of the IPv6 multicast group or IPv6 multicast source address. The default is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

flags *flag-value*: Specifies a flag. If you do not specify a flag, this command displays IPv6 PIM routing entries that contain all flags.

The following lists the values for the *flag-value* argument and their meanings:

- **act**: Specifies IPv6 PIM routing entries that have been used for routing data.
- **del**: Specifies IPv6 PIM routing entries to be deleted.
- **exprune**: Specifies IPv6 PIM routing entries that contain outgoing interfaces pruned by other IPv6 multicast routing protocols.
- **ext**: Specifies IPv6 PIM routing entries that contain outgoing interfaces provided by other multicast routing protocols.
- **loc**: Specifies IPv6 PIM routing entries on the devices that reside on the same subnet as the IPv6 multicast source.
- **niif**: Specifies IPv6 PIM routing entries that contain unknown incoming interfaces.
- **nonbr**: Specifies IPv6 PIM routing entries with IPv6 PIM neighbor lookup failure.
- **rpt**: Specifies IPv6 PIM routing entries on the RPT branches where (S, G) prunes have been sent to the RP.
- **rq**: Specifies IPv6 PIM routing entries on the receiving side of the RPT-to-SPT switchover.
- **spt**: Specifies IPv6 PIM routing entries on the SPT.
- **sq**: Specifies IPv6 PIM routing entries on the originating side of the RPT-to-SPT switchover.
- **swt**: Specifies IPv6 PIM routing entries in the process of RPT-to-SPT switchover.
- **wc**: Specifies IPv6 PIM routing entries with wildcards.

fsm: Displays detailed information about the finite state machine.

incoming-interface *interface-type interface-number*: Specifies an incoming interface. If you do not specify an incoming interface, this command displays IPv6 PIM routing entries that contain all incoming interfaces.

interface-type interface-number: Specifies an interface by its type and number.

mode *mode-type*: Specifies an IPv6 PIM mode. If you do not specify an IPv6 PIM mode, this command displays IPv6 PIM routing entries in all modes. The available IPv6 PIM modes include:

- **sm**: Specifies IPv6 PIM-SM.
- **ssm**: Specifies IPv6 PIM-SSM.

outgoing-interface { **exclude** | **include** | **match** } *interface-type interface-number*: Specifies an outgoing interface. If you do not specify an outgoing interface, this command displays IPv6 PIM routing entries that contain all outgoing interfaces. Whether the specified outgoing interface is contained in the IPv6 PIM routing table depends on the following conditions:

- If you specify an excluded interface, this command displays IPv6 PIM routing entries that do not contain the specified outgoing interface.
- If you specify an included interface, this command displays IPv6 PIM routing entries that contain the specified outgoing interface.
- If you specify a matching interface, this command displays IPv6 PIM routing entries that contain only the specified outgoing interface.

Examples

Display IPv6 PIM routing entries.

```
<Switch> display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (2001::2, FFE3::101)
     RP: FE80::A01:100:1
     Protocol: pim-sm, Flag: SPT LOC ACT
     UpTime: 02:54:43
     Upstream interface: Vlan-interface1
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface2
             Protocol: pim-sm, UpTime: 02:54:43, Expires: 00:02:47
```

Display state machine information for the IPv6 PIM routing table.

```
<Switch> display ipv6 pim routing-table fsm
 Total 0 (*, G) entries; 1 (S, G) entries

 Abbreviations for FSM states:
     NI - no info, J - joined, NJ - not joined, P - pruned,
     NP - not pruned, PP - prune pending, W - winner, L - loser,
     F - forwarding, AP - ack pending, DR - designated router,
     NDR - non-designated router, RCV - downstream receivers

 (2001::2, FFE3::101)
     RP: FE80::A01:100:1
     Protocol: pim-sm, Flag: SPT LOC ACT
     UpTime: 02:54:43
     Upstream interface: Vlan-interface1
         Upstream neighbor: NULL
```

```
    RPF prime neighbor: NULL
    Join/Prune FSM: [SPT: J] [RPT: NP]
Downstream interface information:
Total number of downstream interfaces: 1
    1: Vlan-interface2
        Protocol: pim-sm, UpTime: 02:54:43, Expires: 00:02:47
        DR state: [DR]
        Join/Prune FSM: [NI]
        Assert FSM: [NI]

FSM information for non-downstream interfaces: None
```

Table 11-7 Command output

Field	Description
Total 0 (*, G) entries; 1 (S, G) entries	Total number of (*, G) entries, and the total number of (S, G) entries.
(2001::2, FFE3::101)	(S, G) entry.
RP	IPv6 address of the RP.
Protocol	IPv6 PIM mode: IPv6 PIM-SM.
Flag	Flag of the (S, G) entry or (*, G) entry: • **ACT**—The entry has been used for routing data. • **DEL**—The entry will be removed. • **EXPRUNE**—Some outgoing interfaces are pruned by other IPv6 multicast routing protocols. • **EXT**—The entry contains outgoing interfaces provided by other multicast routing protocols. • **LOC**—The entry is on a router directly connected to the same subnet with the IPv6 multicast source. • **NIIF**—The entry contains unknown incoming interfaces. • **NONBR**—The entry has an IPv6 PIM neighbor lookup failure. • **RPT**—The entry is on an RPT branch where (S, G) prunes have been sent to the RP. • **RQ**—The entry is on the receiving side of the RPT-to-SPT switchover. • **SPT**—The entry is on the SPT. • **SQ**—The entry is on the originating side of the RPT-to-SPT switchover. • **SWT**—The entry is in the process of RPT-to-SPT switchover. • **WC**—The entry contains a wildcard.
Uptime	Length of time since the (S, G) entry or (*, G) entry was installed.
Upstream interface	Upstream (incoming) interface of the (S, G) entry or (*, G) entry.
Upstream neighbor	Upstream neighbor of the (S, G) entry or (*, G) entry.
RPF prime neighbor	RPF neighbor of the (S, G) or (*, G) entry: • For a (*, G) entry, if the RPF neighbor is the RP, the field displays **NULL**.

Field	Description
	• For an (S, G) entry, if the RPF neighbor is a router that directly connects to the IPv6 multicast source, this field displays **NULL**.
Downstream interface information	Information about the downstream interfaces: • Total number of downstream interfaces. • Names of the downstream interfaces. • Protocol type on the downstream interfaces. • Uptime of the downstream interfaces. • Expiration time of the downstream interfaces.

11.1.12. display ipv6 pim rp-info

Use **display ipv6 pim rp-info** to display RP information.

Syntax

display ipv6 pim [**vpn-instance** *vpn-instance-name*] **rp-info** [*ipv6-group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays RP information for all IPv6 multicast groups.

Examples

Display information about the RP for IPv6 multicast group FF0E::101.

```
<Switch> display ipv6 pim rp-info ff0e::101
 BSR RP address is: 7:12::1
     Priority: 192
     HoldTime: 180
     Uptime: 03:01:10
     Expires: 00:02:30

 Static RP address is: 7:12::1
     Preferred: No
     Configured ACL: 2003

 RP mapping for this group is: 7:12::1 (local host)

 Anycast-RP 7:12::1 members:
```

```
    Member address          State
    1:1::1                  Active
    1:1::2                  Local
    1:2::1                  Remote
```

Display information about all RPs for all IPv6 multicast groups.

```
<Switch> display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address               Priority  HoldTime  Uptime    Expires
       8:12::2 (local)          192       180       03:01:36  00:02:29
     Group/MaskLen: FF23::/92 [B]
       RP address               Priority  HoldTime  Uptime    Expires
       7:12::1 (local)          192       180       00:00:39  00:02:57

 Static RP information:
       RP address               ACL   Mode    Preferred
       3:3::1                   2000  pim-sm  No
       3:3::2                   2001  bidir   Yes
       3:3::3                   2002  pim-sm  No
       3:3::4                         pim-sm  No
       3:3::5                   2002  pim-sm  Yes

 Anycast-RP information:
       RP address               Member address          State
       3:3::1                   1:1::1                  Active
       3:3::1                   1:1::2                  Local
       3:3::1                   1:2::1                  Remote
```

Table 11-8 Command output

Field	Description
BSR RP address is	IPv6 address of the RP.
BSR RP information	Information about the RP.
Group/MaskLen	IPv6 multicast group to which the RP is designated.
[B]	This field is not supported in the current software version. The RP is an IPv6 BIDIR-PIM RP. This field is not displayed if the RP is an IPv6 PIM-SM RP.
RP address	IPv6 address of the RP. If the RP resides on the device where the command is executed, this field displays **(local)** after the IPv6 address.
Priority	Priority of the RP.
HoldTime	RP lifetime.
Uptime	Length of time the RP has been up.
Expires	Remaining time for the RP lifetime.
Static RP address	IPv6 address of the static RP.

Field	Description
is/RP address	
Preferred	Whether the static RP is preferred.
Configured ACL/ACL	ACL defining the IPv6 multicast groups to which the static RP is designated.
Mode	RP service mode: IPv6 PIM-SM or IPv6 BIDIR-PIM. IPv6 BIDIR-PIM is not supported in the current software version.
RP mapping for this group	IPv6 address of the RP that provides services for the IPv6 multicast group.
Anycast-RP 7:12::1 members	Members of Anycast RP 7:12::1.
Member address	IPv6 address of the Anycast RP member.
State	State of the interface from which the member address originates: • **Active**—Activated local interface. • **Local**—Inactivated local interface. • **Remote**—Remote interface.

11.1.13. hello-option dr-priority (IPv6 PIM view)

Use **hello-option dr-priority** to set the DR priority globally.

Use **undo hello-option dr-priority** to restore the default.

Syntax

hello-option dr-priority *priority*

undo hello-option dr-priority

Default

The DR priority is 1.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

priority: Specifies a DR priority in the range of 0 to 4294967295. The greater the value, the higher the priority.

Usage guidelines

You can set the DR priority globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global DR priority to 3.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] hello-option dr-priority 3
```

Related commands

ipv6 pim hello-option dr-priority

11.1.14. hello-option holdtime (IPv6 PIM view)

Use **hello-option holdtime** to set the IPv6 PIM neighbor lifetime globally.

Use **undo hello-option holdtime** to restore the default.

Syntax

hello-option holdtime *time*

undo hello-option holdtime

Default

The IPv6 PIM neighbor lifetime is 105 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

time: Specifies an IPv6 PIM neighbor lifetime in the range of 1 to 65535 seconds. If you set the value to 65535 seconds, the IPv6 PIM neighbors are always reachable.

Usage guidelines

You can set the IPv6 PIM neighbor lifetime globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IPv6 PIM neighbor lifetime to 120 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] hello-option holdtime 120
```

Related commands

ipv6 pim hello-option holdtime

11.1.15. hello-option lan-delay (IPv6 PIM view)

Use **hello-option lan-delay** to set the IPv6 PIM message propagation delay on a shared-media LAN globally.

Use **undo hello-option lan-delay** to restore the default.

Syntax

hello-option lan-delay *delay*

undo hello-option lan-delay

Default

The IPv6 PIM message propagation delay on a shared-media LAN is 500 milliseconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

delay: Specifies an IPv6 PIM message propagation delay on a shared-media LAN in the range of 1 to 32767 milliseconds.

Usage guidelines

You can set the IPv6 PIM message propagation delay globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IPv6 PIM message propagation delay on a shared-media LAN to 200 milliseconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] hello-option lan-delay 200
```

Related commands

hello-option override-interval (IPv6 PIM view)

ipv6 pim hello-option lan-delay

ipv6 pim hello-option override-interval

11.1.16. hello-option neighbor-tracking (IPv6 PIM view)

Use **hello-option neighbor-tracking** to enable neighbor tracking globally.

Use **undo hello-option neighbor-tracking** to disable neighbor tracking globally.

Syntax

hello-option neighbor-tracking

undo hello-option neighbor-tracking

Default

Neighbor tracking is disabled.

Views

IPv6 PIM view

Predefined user roles

network-admin

Usage guidelines

You can enable neighbor tracking globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Enable neighbor tracking globally.

```
<Switch> system-view
```

```
[Switch] ipv6 pim
[Switch-pim6] hello-option neighbor-tracking
```

Related commands

ipv6 pim hello-option neighbor-tracking

11.1.17. hello-option override-interval (IPv6 PIM view)

Use **hello-option override-interval** to set the override interval globally.

Use **undo hello-option override-interval** to restore the default.

Syntax

hello-option override-interval *interval*

undo hello-option override-interval

Default

The override interval is 2500 milliseconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies an override interval in the range of 1 to 65535 milliseconds.

Usage guidelines

You can set the override interval globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global override interval to 2000 milliseconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] hello-option override-interval 2000
```

Related commands

hello-option lan-delay (IPv6 PIM view)

ipv6 pim hello-option override-interval

11.1.18. holdtime join-prune (IPv6 PIM view)

Use **holdtime join-prune** to set the joined/pruned state holdtime globally.

Use **undo holdtime join-prune** to restore the default.

Syntax

holdtime join-prune *time*

undo holdtime join-prune

Default

The joined/pruned state holdtime is 210 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

time: Specifies a joined/pruned state holdtime in the range of 1 to 65535 seconds.

Usage guidelines

You can set the joined/pruned state holdtime globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

To prevent the upstream neighbors from aging out, you must set the join/prune interval to be less than the joined/pruned state holdtime timer.

Examples

Set the global joined/pruned state holdtime to 280 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] holdtime join-prune 280
```

Related commands

ipv6 pim holdtime join-prune

timer join-prune (IPv6 PIM view)

11.1.19. ipv6 pim

Use **ipv6 pim** to enter IPv6 PIM view.

Use **undo ipv6 pim** to remove all configurations in IPv6 PIM view.

Syntax

ipv6 pim [**vpn-instance** *vpn-instance-name*]

undo ipv6 pim [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Examples

Enable IPv6 multicast routing and enter the IPv6 PIM view.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6] quit
[Switch] ipv6 pim
[Switch-pim6]
```

11.1.20. ipv6 pim bsr-boundary

Use **ipv6 pim bsr-boundary** to configure an IPv6 PIM-SM domain border (a bootstrap message boundary).

Use **ipv6 pim bsr-boundary** to restore the default.

Syntax

ipv6 pim bsr-boundary

undo ipv6 pim bsr-boundary

Default

An interface is not an IPv6 PIM-SM domain border.

Views

Interface view

Predefined user roles

network-admin

Examples

Configure VLAN-interface 100 as an IPv6 PIM-SM domain border.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim bsr-boundary
```

Related commands

c-bsr (IPv6 PIM view)

ipv6 multicast boundary

11.1.21. ipv6 pim hello-option dr-priority

Use **ipv6 pim hello-option dr-priority** to set the DR priority on an interface.

Use **undo ipv6 pim hello-option dr-priority** to restore the default.

Syntax

ipv6 pim hello-option dr-priority *priority*

undo ipv6 pim hello-option dr-priority

Default

The DR priority is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

priority: Specifies a DR priority in the range of 0 to 4294967295. The greater the value, the higher the priority.

Usage guidelines

You can set the DR priority for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the DR priority to 3 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim hello-option dr-priority 3
```

Related commands

hello-option dr-priority (IPv6 PIM view)

11.1.22. ipv6 pim hello-option holdtime

Use **ipv6 pim hello-option holdtime** to set the IPv6 PIM neighbor lifetime on an interface.

Use **undo ipv6 pim hello-option holdtime** to restore the default.

Syntax

ipv6 pim hello-option holdtime *time*

undo ipv6 pim hello-option holdtime

Default

The IPv6 PIM neighbor lifetime is 105 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies an IPv6 PIM neighbor lifetime in the range of 1 to 65535 seconds. If you set the value to 65535 seconds, the IPv6 PIM neighbor is always reachable.

Usage guidelines

You can set the IPv6 PIM neighbor lifetime for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IPv6 PIM neighbor lifetime to 120 seconds on VLAN-interface 100.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim hello-option holdtime 120
```

Related commands

hello-option holdtime (IPv6 PIM view)

11.1.23. ipv6 pim hello-option lan-delay

Use **ipv6 pim hello-option lan-delay** to set the IPv6 PIM message propagation delay on a shared-media LAN for an interface.

Use **undo ipv6 pim hello-option lan-delay** to restore the default.

Syntax

ipv6 pim hello-option lan-delay *delay*

undo ipv6 pim hello-option lan-delay

Default

The IPv6 PIM message propagation delay on a shared-media LAN is 500 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay: Specifies an IPv6 PIM message propagation delay on a shared-media LAN in the range of 1 to 32767 milliseconds.

Usage guidelines

You can set the IPv6 PIM message propagation delay for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IPv6 PIM message propagation delay on a shared-media LAN to 200 milliseconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim hello-option lan-delay 200
```

11.1.24. ipv6 pim hello-option neighbor-tracking

Use **ipv6 pim hello-option neighbor-tracking** to enable neighbor tracking on an interface.

Use **ipv6 pim hello-option neighbor-tracking disable** to disable neighbor tracking on an interface when join message suppression is disabled globally.

Use **undo ipv6 pim hello-option neighbor-tracking** to restore neighbor tracking setting on an interface to be consistent with the global setting.

Syntax

ipv6 pim hello-option neighbor-tracking

ipv6 pim hello-option neighbor-tracking disable

undo ipv6 pim hello-option neighbor-tracking

Default

Neighbor tracking is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

You can enable neighbor tracking for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Enable neighbor tracking on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim hello-option neighbor-tracking
```

Disable neighbor tracking on VLAN-interface 100 when neighbor tracking is enabled globally.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] hello-option neighbor-tracking
[Switch-pim6] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim hello-option neighbor-tracking disable
```

Related commands

hello-option neighbor-tracking (IPv6 PIM view)

11.1.25. ipv6 pim hello-option override-interval

Use **ipv6 pim hello-option override-interval** to set the override interval on an interface.

Use **undo ipv6 pim hello-option override-interval** to restore the default.

Syntax

ipv6 pim hello-option override-interval *interval*

undo ipv6 pim hello-option override-interval

Default

The override interval is 2500 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies an override interval in the range of 1 to 65535 milliseconds.

Usage guidelines

You can set the override interval for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the override interval to 2000 milliseconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100

holdtime join-prune (IPv6 PIM view)

ipv6 pim timer join-prune

11.1.27. ipv6 pim neighbor-policy

Use **ipv6 pim neighbor-policy** to configure an IPv6 PIM hello policy.

Use **undo ipv6 pim neighbor-policy** to restore the default.

Syntax

ipv6 pim neighbor-policy *ipv6-acl-number*

undo ipv6 pim neighbor-policy

Default

No IPv6 PIM hello policy exists on an interface, and all IPv6 PIM hello messages are regarded as legal.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999.

Usage guidelines

An IPv6 PIM hello policy filters IPv6 PIM hello messages to guard against hello message spoofing.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies a source IPv6 address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure an IPv6 PIM hello policy on VLAN-interface 100, so that only the devices on subnet FE80:101::101/64 can become PIM neighbors of this switch.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source fe80:101::101 64
[Switch-acl-ipv6-basic-2000] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim neighbor-policy 2000
```

11.1.28. ipv6 pim require-genid

Use **ipv6 pim require-genid** to drop hello messages without the generation ID options.

Use **undo ipv6 pim require-genid** to restore the default.

Syntax

ipv6 pim require-genid

undo ipv6 pim require-genid

Default

Hello messages without the generation ID options are accepted.

Views

Interface view

Predefined user roles

network-admin

Examples

Enable VLAN-interface 100 to drop hello messages without the generation ID options.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim require-genid
```

11.1.29. ipv6 pim sm

Use **ipv6 pim sm** to enable IPv6 PIM-SM.

Use **undo ipv6 pim sm** to disable IPv6 PIM-SM.

Syntax

ipv6 pim sm

undo ipv6 pim sm

Default

IPv6 PIM-SM is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IPv6 multicast routing is enabled.

Examples

Enable IPv6 multicast routing, and enable IPv6 PIM-SM on VLAN-interface 100.

```
<Switch> system-view
[Switch] ipv6 multicast routing
[Switch-mrib6] quit
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim sm
```

11.1.31. ipv6 pim timer hello

Use **ipv6 pim timer hello** to set the hello interval on an interface.

Use **undo ipv6 pim timer hello** to restore the default.

Syntax

ipv6 pim timer hello *interval*

undo ipv6 pim timer hello

Default

The hello interval is 30 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies a hello interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the interface does not send hello messages.

Usage guidelines

You can set the hello interval for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the hello interval to 40 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim timer hello 40
```

Related commands

timer hello (IPv6 PIM view)

11.1.32. ipv6 pim timer join-prune

Use **ipv6 pim timer join-prune** to set the join/prune interval on an interface.

Use **undo ipv6 pim timer join-prune** to restore the default.

Syntax

ipv6 pim timer join-prune *interval*

undo ipv6 pim timer join-prune

Default

The join/prune interval is 60 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies a join/prune interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the interface does not send join or prune messages.

Usage guidelines

You can set the join/prune interval for an interface in interface view or globally for all interfaces in IPv6 PIM view. For an interface, the interface-specific configuration takes priority over the global configuration.

The configuration takes effect after the current interval ends.

To prevent the upstream neighbors from aging out, you must set the interval for sending join/prune messages to be less than the joined/pruned state holdtime timer.

Examples

Set the join/prune interval to 80 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim timer join-prune 80
```

Related commands

ipv6 pim holdtime join-prune

timer join-prune (IPv6 PIM view)

11.1.33. ipv6 pim triggered-hello-delay

Use **ipv6 pim triggered-hello-delay** to set the triggered hello delay (maximum delay for sending a hello message).

Use **undo ipv6 pim triggered-hello-delay** to restore the default.

Syntax

ipv6 pim triggered-hello-delay *delay*

undo ipv6 pim triggered-hello-delay

Default

The triggered hello delay is 5 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay: Specifies a triggered hello delay in the range of 1 to 60 seconds.

Examples

Set the triggered hello delay to 3 seconds on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 pim triggered-hello-delay 3
```

11.1.34. jp-pkt-size (IPv6 PIM view)

Use **jp-pkt-size** to set the maximum size of a join/prune message.

Use **undo jp-pkt-size** to restore the default.

Syntax

jp-pkt-size *size*

undo jp-pkt-size

Default

The maximum size of a join/prune message is 8100 bytes.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum size of a join/prune message, in the range of 100 to 64000 bytes.

Examples

Set the maximum size of a join/prune message to 1500 bytes.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] jp-pkt-size 1500
```

11.1.35. register-policy (IPv6 PIM view)

Use **register-policy** to configure an IPv6 PIM register policy.

Use **undo register-policy** to restore the default.

Syntax

register-policy *ipv6-acl-number*

undo register-policy

Default

No IPv6 PIM register policy exists, and all IPv6 PIM register messages are regarded as legal.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

An IPv6 PIM register policy enables an RP to filter IPv6 PIM register messages so that the RP is designated only to IPv6 multicast groups permitted by the ACL.

When you configure a rule in the IPv6 advanced ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast source address.

- The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure an IPv6 PIM register policy to accept register messages from sources on subnet 3:1::/64 to groups on the subnet FF0E:13::/64.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule permit ipv6 source 3:1:: 64 destination ff0e:13:: 64
[Switch-acl-ipv6-adv-3000] quit
[Switch] ipv6 pim
[Switch-pim6] register-policy 3000
```

11.1.36. register-whole-checksum (IPv6 PIM view)

Use **register-whole-checksum** to configure the device to calculate the checksum based on an entire register message.

Use **undo register-whole-checksum** to restore the default.

Syntax

register-whole-checksum

undo register-whole-checksum

Default

The device calculates the checksum based on the register message header.

Views

IPv6 PIM view

Predefined user roles

network-admin

Examples

Configure the device to calculate the checksum based on an entire register message.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] register-whole-checksum
```

11.1.37. snmp-agent trap enable pim6

Use **snmp-agent trap enable pim6** to enable SNMP notifications for IPv6 PIM.

Use **undo snmp-agent trap enable pim6** to disable SNMP notifications for IPv6 PIM.

Syntax

snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

undo snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

Default

SNMP notifications for IPv6 PIM are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

candidate-bsr-win-election: Specifies notifications about winning the BSR election.

elected-bsr-lost-election: Specifies notifications about losing the BSR election.

neighbor-loss: Specifies notifications about losing neighbors.

Usage guidelines

If you do not specify an optional keyword, this command enables or disables IPv6 PIM to generate SNMP notifications.

To report critical IPv6 PIM events to an NMS, enable SNMP notifications for IPv6 PIM. For IPv6 PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Examples

Disable SNMP notifications for IPv6 PIM.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable pim6
```

11.1.38. source-lifetime (IPv6 PIM view)

Use **source-lifetime** to set the IPv6 multicast source lifetime.

Use **undo source-lifetime** to restore the default.

Syntax

source-lifetime *time*

undo source-lifetime

Default

The IPv6 multicast source lifetime is 210 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

time: Specifies an IPv6 multicast source lifetime in the range of 0 to 31536000 seconds. If you set the value to 0 seconds, IPv6 multicast sources are never aged out.

Examples

Set the IPv6 multicast source lifetime to 200 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] source-lifetime 200
```

11.1.39. source-policy (IPv6 PIM view)

Use **source-policy** to configure an IPv6 multicast source policy.

Use **undo source-policy** to restore the default.

Syntax

source-policy *ipv6-acl-number*

undo source-policy

Default

No IPv6 multicast source policy exists, The device does not filter IPv6 multicast data packets.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic or advanced ACL number in the range of 2000 to 3999.

Usage guidelines

An IPv6 multicast source policy filters IPv6 multicast data packets to control information available to downstream receivers.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- In a basic ACL, the **source** *source-address source-prefix* option specifies a source IPv6 address.
- In an advanced ACL, the **source** *source-address source-prefix* option specifies a source IPv6 address. The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure an IPv6 multicast source policy to accept IPv6 multicast data from source 3121::1 and to deny the data from source 3121::2.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source 3121::1 128
[Switch-acl-ipv6-basic-2000] rule deny source 3121::2 128
```

```
[Switch-acl-ipv6-basic-2000] quit
[Switch] ipv6 pim
[Switch-pim6] source-policy 2000
[Switch-pim6] quit
```

11.1.40. spt-switch-threshold (IPv6 PIM view)

Use **spt-switch-threshold** to configure a criterion for an RPT-to-SPT switchover.

Use **undo spt-switch-threshold** to remove criteria for RPT-to-SPT switchovers.

Syntax

spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv6-acl-number*]

undo spt-switch-threshold [**immediacy** | **infinity**] [**group-policy** *ipv6-acl-number*]

Default

The first IPv6 multicast data packet triggers an RPT-to-SPT switchover.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

immediacy: Triggers an RPT-to-SPT switchover immediately.

infinity: Disables RPT-to-SPT switchover.

group-policy *ipv6-acl-number*: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. If you specify an ACL, the configuration applies to the IPv6 multicast groups that the ACL permits. The configuration applies to all IPv6 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

CAUTION:
If the device is an RP, disabling RPT-to-SPT switchover might cause multicast traffic forwarding failures on the source-side DR. When disabling RPT-to-SPT switchover, make sure you fully understand its impact on your network.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Disable RPT-to-SPT switchover on receiver-side DR.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] spt-switch-threshold infinity
```

11.1.41. ssm-policy (IPv6 PIM view)

Use **ssm-policy** to configure the IPv6 SSM group range.

Use **undo ssm-policy** to restore the default.

Syntax

ssm-policy *ipv6-acl-number*

undo ssm-policy

Default

The IPv6 SSM group range is FF3x::/32, where x can be any valid scope.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999.

Usage guidelines

This command defines an IPv6 multicast group range that is used by IPv6 PIM-SSM. The IPv6 PIM-SSM mode applies to IPv6 multicast packets that are permitted by the ACL. The IPv6 PIM-SM mode applies to IPv6 multicast packets that are not permitted by the ACL.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the IPv6 SSM group range as FF3E:0:8192::/96.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source ff3e:0:8192:: 96
[Switch-acl-ipv6-basic-2000] quit
[Switch] ipv6 pim
[Switch-pim6] ssm-policy 2000
```

11.1.42. state-refresh-hoplimit (IPv6 PIM view)

Use **state-refresh-hoplimit** to set the hop limit for state refresh messages.

Use **undo state-refresh-hoplimit** to restore the default.

Syntax

state-refresh-hoplimit *hoplimit-value*

undo state-refresh-hoplimit

Default

The hop limit for state refresh messages is 255.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

hoplimit-value: Specifies the hop limit for state refresh messages, in the range of 1 to 255.

Examples

Set the hop limit for state refresh messages to 45.

```
<Switch> system-view

11.1.43. state-refresh-interval (IPv6 PIM view)

Use **state-refresh-interval** to set the state refresh interval.

Use **undo state-refresh-interval** to restore the default.

Syntax

state-refresh-interval *interval*

undo state-refresh-interval

Default

The state refresh interval is 60 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a state refresh interval in the range of 1 to 255 seconds.

Examples

Set the state refresh interval to 70 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] state-refresh-interval 70
```

11.1.44. state-refresh-rate-limit (IPv6 PIM view)

Use **state-refresh-rate-limit** to set the waiting time to accept a new state refresh message.

Use **undo state-refresh-rate-limit** to restore the default.

Syntax

state-refresh-rate-limit *time*

undo state-refresh-rate-limit

Default

The device waits 30 seconds before it accepts a new state refresh message.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

time: Specifies the waiting time to accept a new refresh message, in the range of 1 to 65535 seconds.

Examples

Set the waiting time to 45 seconds to accept a new state refresh message.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] state-refresh-rate-limit 45
```

Related commands

ipv6 pim state-refresh-capable

11.1.45. static-rp (IPv6 PIM view)

Use **static-rp** to configure a static RP.

Use **undo static-rp** to delete a static RP.

Syntax

static-rp *ipv6-rp-address* [*ipv6-acl-number* | **preferred**] *

undo static-rp *ipv6-rp-address*

Default

No static RPs exist.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

ipv6-rp-address: Specifies the IPv6 address of the static RP. This address must be a valid IPv6 global unicast address.

ipv6-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the static RP is designated only to IPv6 multicast groups that the ACL permits. The static RP is designated to all IPv6 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

preferred: Gives priority to the static RP if the static RP and the dynamic RP exist at the same time on the network. The dynamic RP takes effect only when no static RP exists on the network. If you do not specify this keyword, the dynamic RP has priority. The static RP takes effect only when the dynamic RP fails.

Usage guidelines

You do not need to enable IPv6 PIM on an interface that acts as a static RP.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- For the rule to take effect, do not specify the **vpn-instance** *vpn-instance* option.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

When rules in the ACL used by a static RP change, new RPs are dynamically elected for all IPv6 multicast groups.

You can configure multiple static RPs by using this command multiple times. However, if you specify the same static RP address or use the same ACL in the commands, the most recent configuration takes effect. If you configure multiple static RPs for the same IPv6 multicast group, the static RP with the highest IPv6 address is used.

Examples

Configure the interface with IPv6 address 2001::2 as a static RP for IPv6 multicast group range FF03::101/64 and give priority to this static RP.

```
<Switch> system-view
[Switch] acl ipv6 basic 2001
[Switch-acl-ipv6-basic-2001] rule permit source ff03::101 64
[Switch-acl-ipv6-basic-2001] quit
[Switch] ipv6 pim
[Switch-pim6] static-rp 2001::2 2001 preferred
```

Related commands

display ipv6 pim rp-info

11.1.46. timer hello (IPv6 PIM view)

Use **timer hello** to set the hello interval globally.

Use **undo timer hello** to restore the default.

Syntax

timer hello *interval*

undo timer hello

Default

The hello interval is 30 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a hello interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send hello messages.

Usage guidelines

You can set the hello interval globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global hello interval to 40 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] timer hello 40
```

Related commands

ipv6 pim timer hello

11.1.47. timer join-prune (IPv6 PIM view)

Use **timer join-prune** to set the join/prune interval globally.

Use **undo timer join-prune** to restore the default.

Syntax

timer join-prune *interval*

undo timer join-prune

Default

The join/prune interval is 60 seconds.

Views

IPv6 PIM view

Predefined user roles

network-admin

Parameters

interval: Specifies a join/prune interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send join or prune messages.

Usage guidelines

You can set the join/prune interval globally for all interfaces in IPv6 PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

The configuration takes effect after the current interval ends.

To prevent the upstream neighbors from aging out, you must set the join/prune interval to be less than the joined/pruned state holdtime.

Examples

Set the global join/prune interval to 80 seconds.

```
<Switch> system-view
[Switch] ipv6 pim
[Switch-pim6] timer join-prune 80
```

12. PIM snooping commands

NOTE:

PIM snooping commands are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

12.1. PIM snooping commands

12.1.1. display pim-snooping neighbor

Use **display pim-snooping neighbor** to display PIM snooping neighbor information.

Syntax

display pim-snooping neighbor [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays PIM snooping neighbor information for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays PIM snooping neighbor information for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays PIM snooping neighbor information for the master device.

verbose: Displays detailed information about PIM snooping neighbors. If you do not specify this keyword, the command displays brief information about PIM snooping neighbors.

Examples

Display detailed information about PIM snooping neighbors for VLAN 2.

```
<Sysname> display pim-snooping neighbor vlan 2 verbose
Total 2 neighbors.

VLAN 2: Total 2 neighbors.
  10.1.1.2
    Slots (0 in total):
    Ports (1 in total):
      GE1/0/1                              (02:02:23)    LAN Prune Delay(T)
  10.1.1.3
    Slots (0 in total):
    Ports (1 in total):
      GE1/0/2                              (02:02:25)
```

Table 12-1 Command output

Field	Description
Total 2 neighbors	Total number of PIM snooping neighbors.
VLAN 2: Total 2 neighbors	Total number of PIM snooping neighbors in VLAN 2.
10.1.1.2	IP address of the PIM snooping neighbor.
Slots (0 in total)	Member IDs and total number of the member devices that have the neighbor, except for the specified member device or the master device when no member device is specified.
Ports (1 in total)	Ports where the PIM snooping neighbors reside, and the total number of the ports.
(02:02:23)	Remaining aging timer for a PIM snooping neighbor on the port. This field is always displayed for global ports (such as Layer 2 aggregate interfaces, ACs, N-PWs, and U-PWs). For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
LAN Prune Delay	The PIM hello message sent by the PIM snooping neighbor has the LAN_Prune_Delay option.
(T)	The join message suppression feature has been disabled for the PIM snooping neighbor.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.

12.1.2. display pim-snooping router-port

Use **display pim-snooping router-port** to display PIM snooping router port information.

Syntax

display pim-snooping router-port [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays PIM snooping router port information for all VLANs.

verbose: Displays detailed information about PIM snooping router ports. If you do not specify this keyword, the command displays brief information about PIM snooping router ports.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays PIM snooping router port information for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays PIM snooping router port information for the master device.

Examples

Display brief information about PIM snooping router ports for VLAN 2.

```
<Sysname> display pim-snooping router-port vlan 2
VLAN 2:
  Router ports (2 in total):
    GE1/0/1                                 (00:01:30)
    GE1/0/2                                 (00:01:32)
```

Display detailed information about PIM snooping router ports for VLAN 2.

```
<Sysname> display pim-snooping router-port vlan 2 verbose
VLAN 2:
  Router slots (0 in total):
  Router ports (2 in total):
    GE1/0/1                                 (00:01:30)
    GE1/0/2                                 (00:01:32)
```

Table 12-2 Command output

Field	Description
VLAN 2	VLAN ID.
Router slots (0 in total)	Member IDs and total number of the member devices that have router ports, except for the specified member device or the master device when no member device is specified.
Router ports (2 in total)	Router ports and total number of router ports.
(00:01:30)	Remaining aging time for the router port. For a global port, this field is always displayed. For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.

12.1.3. display pim-snooping routing-table

Use **display pim-snooping routing-table** to display PIM snooping routing entries.

Syntax

display pim-snooping routing-table [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Specifies a VLAN by its VLAN ID in the range of 1 to 4094. If you do not specify a VLAN, this command displays PIM snooping routing entries for all VLANs.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays PIM snooping routing entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays PIM snooping routing entries for the master device.

verbose: Displays detailed information about PIM snooping routing entries. If you do not specify the keyword, this command displays brief information about PIM snooping routing entries.

Examples

Display detailed information about PIM snooping routing entries for VLAN 2.

```
<Sysname> display pim-snooping routing-table vlan 2 verbose
Total 1 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 2: Total 1 entries.
  (172.10.10.1, 225.1.1.1)
    FSM information: dummy
    Upstream neighbor: 20.1.1.1
      Upstream Slots (0 in total):
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Slots (0 in total):
      Downstream Ports (2 in total):
        GE1/0/2
          Expires: 00:03:01, FSM: J
          Downstream Neighbors (2 in total):
            7.1.1.1
              Expires: 00:59:19, FSM: J
            7.1.1.11
              Expires: 00:59:20, FSM: J
        GE1/0/3
          Expires: 00:02:21, FSM: PP
```

Table 12-3 Command output

Field	Description
Total 1 entries	Total number of (S, G) entries and (*, G) entries.
FSM Flag: NI-no info, J-join, PP-prune pending	State machine flag of the downstream port: • **NI**—Initial state. • **J**—Join. • **PP**—Prune pending.
VLAN 2: Total 1 entries	Total number of (S, G) entries and (*, G) entries in VLAN 2.

Field	Description
(172.10.10.1, 225.1.1.1)	(S, G) entry.
FSM information	Finite state machine information of the entry: • **delete**—The entry attributes have been deleted. • **dummy**—The entry is a new temporary entry. • **no info**—The entry does not exist.
Upstream neighbor	Upstream neighbor of the (S, G) or (*, G) entry.
Upstream Slots (0 in total)	Member IDs and total number of the member devices that have the upstream neighbor, except for the specified member device or the master device when no member device is specified.
Upstream Ports (1 in total)	Upstream ports, and the total number of upstream ports. This field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
Downstream Slots (0 in total)	Member IDs and total number of the member devices that have downstream ports, except for the specified member device or the master device when no member device is specified.
Downstream Ports (2 in total)	Downstream ports of the upstream neighbor, and the total number of the downstream ports.
Downstream Neighbors (2 in total)	Downstream neighbors of the downstream port, and the total number of the downstream neighbors.
Expires: 00:03:01, FSM: J	Remaining aging time for the downstream port or downstream neighbor, and the finite state machine information. For a global port, this field is always displayed. For a non-global port, this field is displayed when one of the following conditions exists: • The port is on the specified member device. • The port is on the master device and no member device is specified.
NPW (Link ID 8)	N-PW and its link ID.
UPW (Link ID 9)	U-PW and its link ID.

12.1.4. display pim-snooping statistics

Use **display pim-snooping statistics** to display statistics for the PIM messages learned through PIM snooping.

Syntax

display pim-snooping statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display statistics for the PIM messages learned through PIM snooping.

```
<Sysname> display pim-snooping statistics
Received PIMv2 hello:  100
Received PIMv2 join/prune:  100
Received PIMv2 error:  0
Received PIMv2 messages in total:  200
Received PIMv1 messages in total:  0
```

Table 12-4 Command output

Field	Description
Received PIMv2 hello	Number of received PIMv2 hello messages.
Received PIMv2 join/prune	Number of received PIMv2 join/prune messages.
Received PIMv2 error	Number of received PIMv2 messages with errors.
Received PIMv2 messages in total	Total number of received PIMv2 messages.
Received PIMv1 messages in total	Total number of received PIMv1 messages.

Related commands

reset pim-snooping statistics

12.1.5. pim-snooping enable

Use **pim-snooping enable** to enable PIM snooping for a VLAN or VSI.

Use **undo pim-snooping enable** to disable PIM snooping for a VLAN or VSI.

Syntax

pim-snooping enable

undo pim-snooping enable

Default

PIM snooping is disabled for a VLAN or VSI.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Usage guidelines

You must enable the IGMP snooping feature and enable IGMP snooping for a VLAN or VSI before you enable PIM snooping for the VLAN or VSI.

PIM snooping does not take effect on sub-VLANs of a multicast VLAN.

Examples

Enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for VLAN 2.

```
<Sysname> system-view
[Sysname] igmp-snooping
[Sysname-igmp-snooping] quit
[Sysname] vlan 2
[Sysname-vlan2] igmp-snooping enable
[Sysname-vlan2] pim-snooping enable
```

13. IGMP proxy commands

NOTE:

IGMP proxy commands are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

13.1. IGMP proxy commands

13.1.1. display igmp proxy group

Use **display igmp proxy group** to display information about multicast groups maintained by the IGMP proxy.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about multicast groups maintained by the IGMP proxy on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about all multicast groups maintained by the IGMP proxy.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about multicast groups maintained by the IGMP proxy for all interfaces.

verbose: Displays detailed information.

Examples

Display information about multicast groups maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy group
IGMP proxy group records in total: 2
 Vlan-interface1(1.1.1.20):
  IGMP proxy group records in total: 2
   Group address      Member state      Expires
   225.1.1.1          Delay             00:00:02
   225.1.1.2          Idle              Off
```

Display detailed information about multicast group 225.1.1.1 maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy group 225.1.1.1 verbose
 Vlan-interface1(1.1.1.20):
  IGMP proxy group records in total: 2
   Group: 225.1.1.1
     Group mode: Include
     Member state: Delay
     Expires: 00:00:02
     Source list (sources in total: 1):
       1.1.1.1
```

Table 13-1 Command output

Field	Description
IGMP groups records in total	Total number of multicast groups maintained by the IGMP proxy.
Vlan-interface1(1.1.1.20)	IGMP proxy interface and its IP address.
Pending proxy group	Pending multicast groups maintained by the IGMP proxy.
Group address/Group	Multicast group address.
Member state	Member host states: • **Delay**—The member host has joined a group and started a delay timer. • **Idle**—The member host has joined a group, but didn't start a delay timer.
Expires	Remaining delay time for the member host to send a responding report. This field displays **Off** if the timer is disabled.
Group mode	Multicast source filtering mode: Include or Exclude.
Source list	Multicast source list for the multicast group maintained by the IGMP proxy.
sources in total	Total number of multicast sources.

13.1.2. display igmp proxy routing-table

Use **display igmp proxy routing-table** to display multicast routing entries maintained by the IGMP proxy.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast routing entries maintained by the IGMP proxy on the public network.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays multicast routing entries for all multicast sources maintained by the IGMP proxy.

group-address: Specifies a multicast group address by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays multicast routing entries for all multicast groups maintained by the IGMP proxy.

mask-length: Specifies a mask length of the multicast group address or multicast source address. For a multicast source address, the value range for this argument is 0 to 32. For a multicast group address, the value range for this argument is 4 to 32. The default value is 32 in both cases.

mask: Specifies a mask of the multicast group address or multicast source address. The default value is 255.255.255.255.

verbose: Displays detailed information about multicast routing entries maintained by the IGMP proxy.

Examples

Display multicast routing entries maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy routing-table
 Total 1 (*, G) entries, 2 (S, G) entries.

 (172.168.0.12, 227.0.0.1)

```

Table 13-2 Command output

Field	Description
Total 1 (*, G) entries, 2 (S, G) entries	Total number of (*, G) entries, and the total number of (S, G) entries.
(172.168.0.12, 227.0.0.1)	(S, G) entry.
Upstream interface	Incoming interface of the (S, G) entry.
Downstream interfaces (1 in total)	Outgoing interfaces of the (S, G) entry, and the total number of outgoing interfaces.
Non-downstream interfaces (1 in total)	Non-outgoing interfaces of the (S, G) entry, and the total number of non-outgoing interfaces.

Field	Description
1: Vlan-interface2	Index of an interface, and the interface.
Protocol	Protocol type: • **IGMP**—Dynamic IGMP. • **PROXY**—IGMP proxy. • **STATIC**—Static IGMP.
Querier state	Querier state: • Querier. • Non-querier.
Join/Prune state	Joined or pruned state of the interface: • **NI**—Default state. • **Join**—Joined state. • **Prune**—Pruned state.

13.1.3. igmp proxy enable

Use **igmp proxy enable** to enable IGMP proxying on an interface.

Use to **undo igmp proxy enable** to disable IGMP proxying on an interface.

Syntax

igmp proxy enable

undo igmp proxy enable

Default

IGMP proxying is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled on the public network or for the VPN instance to which the interface belongs.

Examples

Enable IP multicast routing on the public network, and enable IGMP proxying on VLAN-interface 100.

```
<Sysname> system-view
[Sysname] multicast routing-enable
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] igmp proxy enable
```

Related commands

multicast routing

1. MCE commands

1.1. MCE commands

1.1.1. address-family ipv4 (VPN instance view)

Use **address-family ipv4** to enter VPN instance IPv4 VPN view.

Use **undo address-family ipv4** to remove all configurations from VPN instance IPv4 VPN view.

Syntax

address-family ipv4

undo address-family ipv4

Views

VPN instance view

Predefined user roles

network-admin

Usage guidelines

In VPN instance IPv4 VPN view, you can configure IPv4 VPN parameters such as inbound and outbound routing policies.

Examples

Enter VPN instance IPv4 VPN view.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] address-family ipv4
[Switch-vpn-ipv4-vpn1]
```

Related commands

address-family ipv6 (VPN instance view)

1.1.2. description (VPN instance view)

Use **description** to configure a description for a VPN instance.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for a VPN instance.

Views

VPN instance view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 79 characters.

Examples

Configure a description of **This is vpn1** for VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] description This is vpn1
```

1.1.3. display ip vpn-instance

Use **display ip vpn-instance** to display information about VPN instances.

Syntax

display ip vpn-instance [**instance-name** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-name *vpn-instance-name*: Displays information about the specified VPN instance. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays brief information about all VPN instances.

Examples

Display brief information about all VPN instances.

```
<Switch> display ip vpn-instance
  Total VPN-Instances configured : 1
  VPN-Instance Name               RD                    Create time
  abc                             1:1                   2011/05/18 10:48:17
```

Table 1-1 Command output

Field	Description
VPN-Instance Name	Name of the VPN instance.
RD	RD of the VPN instance.
Create Time	Time when the VPN instance was created.

Display detailed information about VPN instance **vpn1**.

```
<Switch> display ip vpn-instance instance-name vpn1
  VPN-Instance Name and Index : vpn1, 2
  Route Distinguisher : 100:1
  VPN ID : 1:1
  Description : vpn1
```

```
Interfaces : Vlan-interface2

 Threshold Value(%): 50
Address-family EVPN:
 Export VPN Targets :
     3:3
 Import VPN Targets :
     3:3
```

Table 1-2 Command output

Field	Description
Route Distinguisher	Route distinguisher of the VPN instance.
Interfaces	Interfaces that are associated with the VPN instance.
Address-family IPv4	IPv4 VPN information.
Address-family IPv6	IPv6 VPN information.
Address-family EVPN	EVPN information. For more information about EVPN, see *EVPN Configuration Guide*.
Export VPN Targets	Export route targets.
Import VPN Targets	Import route targets.
Export Route Policy	Routing policy in the outbound direction.
Import Route Policy	Routing policy in the inbound direction.
Tunnel Policy	This field is not supported in the current software version. Tunnel policy associated with the VPN instance.
Maximum Routes Limit	Maximum number of routes.
Threshold Value(%)	Alarm threshold for number of active routes.

1.1.4. export route-policy

Use **export route-policy** to apply an export routing policy to a VPN instance.

Use **undo export route-policy** to restore the default.

Syntax

export route-policy *route-policy*

undo export route-policy

Default

No export routing policy is applied to a VPN instance.

Views

VPN instance view

VPN instance IPv4 VPN view

VPN instance IPv6 VPN view

Predefined user roles

network-admin

Parameters

route-policy: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify an export routing policy to filter advertised routes or modify their route attributes for the VPN instance.

If you execute this command multiple times, the most recent configuration takes effect.

An export routing policy specified in VPN instance view applies to both IPv4 VPN and IPv6 VPN. An export routing policy specified in VPN instance IPv4 VPN view applies only to IPv4 VPN. An export routing policy specified in VPN instance IPv6 VPN view applies only to IPv6 VPN.

If you have specified export routing policies in both VPN instance IPv4 VPN view and VPN instance view, IPv4 VPN uses the export routing policy specified in VPN instance IPv4 VPN view.

If you have specified export routing policies in both VPN instance IPv6 VPN view and VPN instance view, IPv6 VPN uses the export routing policy specified in VPN instance IPv6 VPN view.

Examples

Apply export routing policy **poly-1** to VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] export route-policy poly-1
```

Related commands

import route-policy

route-policy (*Layer 3—IP Routing Command Reference*)

1.1.5. import route-policy

Use **import route-policy** to apply an import routing policy to a VPN instance.

Use **undo import route-policy** to restore the default.

Syntax

import route-policy *route-policy*

undo import route-policy

Default

All routes matching the import target attribute are accepted.

Views

VPN instance view

VPN instance IPv4 VPN view

VPN instance IPv6 VPN view

Predefined user roles

network-admin

Parameters

route-policy: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify an import routing policy to filter received routes or modify their route attributes for the VPN instance.

If you execute this command multiple times, the most recent configuration takes effect.

An import routing policy specified in VPN instance view applies to both IPv4 VPN and IPv6 VPN. An import routing policy specified in VPN instance IPv4 VPN view applies only to IPv4 VPN. An import routing policy specified in VPN instance IPv6 VPN view applies only to IPv6 VPN.

If you have specified import routing policies in both VPN instance IPv4 VPN view and VPN instance view, IPv4 VPN uses the import routing policy specified in VPN instance IPv4 VPN view.

If you have specified import routing policies in both VPN instance IPv6 VPN view and VPN instance view, IPv6 VPN uses the import routing policy specified in VPN instance IPv6 VPN view.

Examples

Apply import routing policy **poly-1** to VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] import route-policy poly-1
```

Related commands

export route-policy

route-policy (*Layer 3—IP Routing Command Reference*)

1.1.6. ip binding vpn-instance

Use **ip binding vpn-instance** to associate an interface with a VPN instance.

Use **undo ip binding vpn-instance** to restore the default.

Syntax

ip binding vpn-instance *vpn-instance-name*

undo ip binding vpn-instance

Default

An interface is associated with no VPN instance and belongs to the public network.

Views

Interface view

Predefined user roles

network-admin

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

Use this command to associate the VPN instance with the interface connected to the CE.

This command or its undo form clears the IP address and routing protocol configuration on the interface.

The specified VPN instance must have been created by using the **ip vpn-instance** command in system view.

To associate a new VPN instance with an interface, first execute the **undo ip binding vpn-instance** command to remove the existing association.

Examples

Associate VLAN-interface 1 with VPN instance **vpn1**.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ip binding vpn-instance vpn1
```

Related commands

ip vpn-instance (system view)

1.1.7. ip vpn-instance (system view)

Use **ip vpn-instance** to create a VPN instance and enter its view, or enter the view of an existing VPN instance.

Use **undo ip vpn-instance** to delete a VPN instance.

Syntax

ip vpn-instance *vpn-instance-name*

undo ip vpn-instance *vpn-instance-name*

Default

No VPN instances exist.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance-name: Specifies a VPN instance name, a case-sensitive string of 1 to 31 characters.

Examples

Create a VPN instance named **vpn1** and enter its view.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1]
```

Related commands

route-distinguisher

1.1.8. route-distinguisher (VPN instance view)

Use **route-distinguisher** to configure an RD for a VPN instance.

Use **undo route-distinguisher** to restore the default.

Syntax

route-distinguisher *route-distinguisher*

undo route-distinguisher

Default

No RD is specified for a VPN instance.

Views

VPN instance view

Predefined user roles

network-admin

Parameters

route-distinguisher: Specifies an RD for the VPN instance, a string of 3 to 21 characters in one of the following formats:

- *16-bit AS number*:*32-bit user-defined number*. For example, 101:3.
- *32-bit IP address*:*16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

Usage guidelines

RDs enable VPNs to use the same address space. An RD and an IPv4 prefix form a unique VPN-IPv4 prefix.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the AS number or IP address in an RD to any private AS number or private IP address.

To modify an RD, execute the **undo route-distinguisher** command to remove the RD and then execute the **route-distinguisher** command.

Examples

Configure RD 22:1 for VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
```

```
[Switch-vpn-instance-vpn1] route-distinguisher 22:1
```

1.1.9. routing-table limit

Use **routing-table limit** to set the maximum number of active routes in a VPN instance.

Use **undo routing-table limit** to restore the default.

Syntax

routing-table limit *number* { *warn-threshold* | **simply-alert** }

undo routing-table limit

Default

The number of active routes in a VPN instance is not limited.

Views

VPN instance view

VPN instance IPv4 VPN view

VPN instance IPv6 VPN view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of active routes. In VPN instance view, the value range for this argument is 1 to 24576. In VPN instance IPv4 VPN view, the value range for this argument is 1 to 49152. In VPN instance IPv6 VPN view, the value range for this argument is 1 to 24576.

warn-threshold: Specifies a warning threshold in the range of 1 to 100 in percentage. When the percentage of the existing active routes to the maximum active routes exceeds the threshold, the system gives a log message but still allows new active routes. If active routes in the VPN instance reach the maximum, no more active routes are added.

simply-alert: Specifies that when active routes exceed the maximum number, the system still accepts active routes but generates a log message.

Usage guidelines

Setting the maximum number of active routes for a VPN instance can prevent a PE from learning too many routes.

A limit configured in VPN instance view applies to both the IPv4 VPN and the IPv6 VPN. A limit configured in VPN instance IPv4 VPN view applies only to the IPv4 VPN. A limit configured in VPN instance IPv6 VPN view applies only to the IPv6 VPN.

If you have specified the limit in both VPN instance IPv4 VPN view and VPN instance view, IPv4 VPN uses the limit specified in VPN instance IPv4 VPN view.

If you have specified the limit in both VPN instance IPv6 VPN view and VPN instance view, IPv6 VPN uses the limit specified in VPN instance IPv6 VPN view.

Examples

Specify that VPN instance **vpn1** supports a maximum of 1000 active routes. When active routes exceed this limit, the device can receive new active routes but generates a log message.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] route-distinguisher 100:1
```

```
[Switch-vpn-instance-vpn1] routing-table limit 1000 simply-alert
```

1.1.10. vpn-instance-capability simple (OSPF view)

Use **vpn-instance-capability simple** to disable routing loop detection for a VPN OSPF process.

Use **undo vpn-instance-capability** to enable routing loop detection for a VPN OSPF process.

Syntax

vpn-instance-capability simple

undo vpn-instance-capability

Default

Routing loop detection is enabled for a VPN OSPF process.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

For the MCE to receive OSPF routes from the PE, you must disable routing loop detection for a VPN OSPF process on the MCE.

This command is applicable only to VPN OSPF processes.

Examples

Disable routing loop detection for VPN OSPF process 100.

```
<Switch> system-view
[Switch] ospf 100 vpn-instance vpna
[Switch-ospf-100] vpn-instance-capability simple
```

1.1.11. vpn-target

Use **vpn-target** to configure route targets for a VPN instance.

Use **undo vpn-target** to remove the specified or all route targets of a VPN instance.

Syntax

vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

undo vpn-target { **all** | *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**] }

Default

No route targets are configured for a VPN instance.

Views

VPN instance view

VPN instance IPv4 VPN view

VPN instance IPv6 VPN view

Predefined user roles

network-admin

Parameters

vpn-target&<1-8>: Specifies a space-separated list of up to eight route targets.

A route target is a string of 3 to 21 characters in one of the following formats:

- *16-bit AS number*:*32-bit user-defined number*. For example, 101:3.
- *32-bit IP address*:*16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number*:*16-bit user-defined number*, where the AS number must not be less than 65536. For example, 65536:1.

both: Uses the specified route targets as both import targets and export targets. The **both** keyword is also used when you do not specify any of the following keywords: **both**, **export-extcommunity**, and **import-extcommunity**.

export-extcommunity: Uses the specified route targets as export targets.

import-extcommunity: Uses the specified route targets as import targets.

all: Removes all route targets.

Usage guidelines

Route targets are used to control the advertisement of VPN routing information. A PE adds the configured export targets into the route target attribute of routes advertised to a peer. The peer uses the local import targets to match the route targets of received routes. If a match is found, the peer adds the routes to the routing table of the VPN instance.

Route targets configured in VPN instance view apply to both the IPv4 VPN and the IPv6 VPN. Route targets configured in VPN instance IPv4 VPN view apply only to the IPv4 VPN. Route targets configured in VPN instance IPv6 VPN view apply only to the IPv6 VPN.

IPv4 VPN prefers the route targets configured in VPN instance IPv4 VPN view over those configured in VPN instance view.

IPv6 VPN prefers the route targets configured in VPN instance IPv6 VPN view over those configured in VPN instance view.

Examples

Configure route targets for VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[Switch-vpn-instance-vpn1] vpn-target 4:4 import-extcommunity
[Switch-vpn-instance-vpn1] vpn-target 5:5 both
```

2. IPv6 MCE commands 2-1
2.1. IPv6 MCE commands 2-1
2.1.1. address-family ipv6 (VPN instance view) 2-1
2.1.2. vpn-instance-capability simple (OSPFv3 view) 2-1

2. IPv6 MCE commands

2.1. IPv6 MCE commands

This chapter describes only IPv6 MCE-specific commands. For information about the commands available for both IPv4 MCE and IPv6 MCE, see "MCE commands."

2.1.1. address-family ipv6 (VPN instance view)

Use **address-family ipv6** to enter VPN instance IPv6 VPN view.

Use **undo address-family ipv6** to remove all configurations from VPN instance IPv6 VPN view.

Syntax

address-family ipv6

undo address-family ipv6

Views

VPN instance view

Predefined user roles

network-admin

Usage guidelines

In VPN instance IPv6 VPN view, you can configure IPv6 VPN parameters such as inbound and outbound routing policies.

Examples

Enter VPN instance IPv6 VPN view.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] address-family ipv6
[Switch-vpn-ipv6-vpn1]
```

Related commands

address-family ipv4 (VPN instance view)

2.1.2. vpn-instance-capability simple (OSPFv3 view)

Use **vpn-instance-capability simple** to disable routing loop detection for a VPN OSPFv3 process.

Use **undo vpn-instance-capability** to enable routing loop detection for a VPN OSPFv3 process.

Syntax

vpn-instance-capability simple

undo vpn-instance-capability

Default

Routing loop detection is enabled for a VPN OSPFv3 process.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

For the MCE to receive OSPFv3 routes from the PE, you must disable routing loop detection for a VPN OSPFv3 process on the MCE.

This command is applicable only to VPN OSPFv3 processes.

Examples

Disable routing loop detection for VPN OSPFv3 process 100.

```
<Switch> system-view
[Switch] ospfv3 100 vpn-instance vpn1
[Switch-ospfv3-100] vpn-instance-capability simple
```

1.1.20. rule comment 1-35
1.1.21. step 1-35

1. ACL commands

1.1. ACL commands

1.1.1. acl

Use **acl** to create an ACL and enter its view, or enter the view of an existing ACL.

Use **undo acl** to delete the specified or all ACLs.

Syntax

Command set 1:

acl [**ipv6**] { **name** *acl-name* | **number** *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }] }

undo acl [**ipv6**] { **all** | **name** *acl-name* | **number** *acl-number* }

Command set 2:

acl [**ipv6**] { **advanced** | **basic** } { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

undo acl [**ipv6**] { **all** | { **advanced** | **basic** } { *acl-number* | **name** *acl-name* } }

undo acl mac { **all** | *acl-number* | **name** *acl-name* }

Default

No ACLs exist.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type. To specify the IPv4 ACL type, do not use this keyword.

basic: Specifies the basic ACL type.

advanced: Specifies the advanced ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Assigns a number to the ACL. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Assigns a name to the ACL. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

match-order: Specifies the order in which ACL rules are compared against packets.

- **auto**: Compares ACL rules in depth-first order.
- **config**: Compares ACL rules in ascending order of rule ID. The rule with a smaller ID has a higher priority. If you do not specify a match order, the **config** order applies by default.

all: Specifies all ACLs of the specified type.

Usage guidelines

If you create a numbered ACL, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **number** *acl-number*
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } *acl-number*

If you create an ACL by using the **acl** [**ipv6**] **number** *acl-number* **name** *acl-name* command, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **name** *acl-name* (for basic ACLs and advanced ACLs only)
- **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*]
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*

If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name* command, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **name** *acl-name* (for basic ACLs and advanced ACLs only)
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*

You can change the match order only for ACLs that do not contain any rules.

Matching packets are forwarded through slow forwarding if an ACL rule contains match criteria or has functions enabled in addition to the following match criteria and functions:

- Source and destination IP addresses.
- Source and destination ports.
- Transport layer protocol.
- ICMP or ICMPv6 message type, message code, and message name.
- Logging.
- Time range.

Slow forwarding requires packets to be sent to the control plane for forwarding entry calculation, which affects the device forwarding performance.

Examples

Create IPv4 basic ACL 2000 and enter its view.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000]
```

Create IPv4 basic ACL **flow** and enter its view.

```
<Switch> system-view
[Switch] acl basic name flow
[Switch-acl-ipv4-basic-flow]
```

Create IPv4 advanced ACL 3000 and enter its view.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000]
```

Create IPv6 basic ACL 2000 and enter its view.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000]
```

Create IPv6 basic ACL **flow** and enter its view.

```
<Switch> system-view
[Switch] acl ipv6 basic name flow
[Switch-acl-ipv6-basic-flow]
```

Create IPv6 advanced ACL **abc** and enter its view.

```
<Switch> system-view
[Switch] acl ipv6 advanced name abc
[Switch-acl-ipv6-adv-abc]
```

Create Layer 2 ACL 4000 and enter its view.

```
<Switch> system-view
[Switch] acl mac 4000
[Switch-acl-mac-4000]
```

Create Layer 2 ACL **flow** and enter its view.

```
<Switch> system-view
[Switch] acl mac name flow
[Switch-acl-mac-flow]
```

Related commands

display acl

1.1.2. acl copy

Use **acl copy** to create an ACL by copying an ACL that already exists.

Syntax

acl [**ipv6** | **mac**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

source-acl-number: Specifies an existing source ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *source-acl-name*: Specifies an existing source ACL by its name. The *source-acl-name* argument is a case-insensitive string of 1 to 63 characters.

dest-acl-number: Assigns a unique number to the new ACL. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *dest-acl-name*: Assigns a unique name to the new ACL. The *dest-acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

Usage guidelines

The new ACL and the source ACL must be the same type.

The new ACL has the same properties and content as the source ACL, but uses a different number or name from the source ACL.

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Create IPv4 basic ACL 2002 by copying IPv4 basic ACL 2001.

```
<Switch> system-view
[Switch] acl copy 2001 to 2002
```

Create IPv4 basic ACL **paste** by copying IPv4 basic ACL **test**.

```
<Switch> system-view
[Switch] acl copy name test to name paste
```

1.1.3. acl logging interval

Use **acl logging interval** to enable logging for packet filtering and set the interval.

Use **undo acl logging interval** to restore the default.

Syntax

acl logging interval *interval*

undo acl logging interval

Default

The interval is 0. The device does not generate log entries for packet filtering.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval at which log entries are generated and output. It must be a multiple of 5, in the range of 0 to 1440 minutes. To disable the logging, set the value to 0.

Usage guidelines

The logging feature is available for IPv4 or IPv6 ACL rules that have the **logging** keyword.

You can configure the ACL module to generate log entries for packet filtering and output them to the information center at the output interval. The log entry records the number of matching packets and the matched ACL rules. When the first packet of a flow matches an ACL rule, the output interval

starts. When the output interval ends, the device outputs a log entry for all matching packets. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to generate and output packet filtering log entries every 10 minutes.

```
<Switch> system-view
[Switch] acl logging interval 10
```

rule (IPv6 basic ACL view)

1.1.4. description

Use **description** to configure a description for an ACL.

Use **undo description** to delete an ACL description.

Syntax

description *text*

undo description

Default

An ACL does not have a description.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 127 characters.

Examples

Configure a description for IPv4 basic ACL 2000.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] description This is an IPv4 basic ACL.
```

Related commands

display acl

1.1.5. display acl

Use **display acl** to display ACL configuration and match statistics.

Syntax

display acl [**ipv6** | **mac**] { *acl-number* | **all** | **name** *acl-name* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

all: Specifies all ACLs of the specified type.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command displays ACL rules in **config** or **auto** order, whichever is configured.

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Display configuration and match statistics for IPv4 basic ACL 2001.

```
<Switch> display acl 2001
Basic IPv4 ACL 2001, 1 rule, match-order is auto,
This is an IPv4 basic ACL.
ACL's step is 5, start ID is 0
 rule 5 permit source 1.1.1.1 0
 rule 5 comment This rule is used on GigabitEthernet1/0/1.
```

Table 1-1 Command output

Field	Description
Basic IPv4 ACL 2001	Type and number of the ACL. The following field information is about IPv4 basic ACL 2001.
1 rule	The ACL contains one rule.
match-order is auto	The match order for the ACL is **auto**, which sorts ACL rules in depth-first order. This field is not displayed when the match order is **config**.
This is an IPv4 basic ACL.	Description of the ACL.
ACL's step is 5	The rule numbering step is 5.
start ID is 0	The start rule ID is 0.
rule 5 permit source 1.1.1.1	Content of rule 5. The rule permits packets sourced from the

Field	Description
0	IP address 1.1.1.1.
rule 5 comment This rule is used on GigabitEthernet1/0/1.	Comment of rule 5.

1.1.6. display packet-filter

Use **display packet-filter** to display ACL application information for packet filtering.

Syntax

display packet-filter interface [*interface-type interface-number*] [**inbound** | **outbound**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If you do not specify an interface, this command displays ACL application information for packet filtering on all interfaces. If you specify an Ethernet interface, you do not need to specify the **slot** *slot-number* option.

inbound: Specifies the inbound direction.

outbound: Specifies the outbound direction.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ACL application information for packet filtering for the master device.

Usage guidelines

If neither the **inbound** keyword nor the **outbound** keyword is specified, this command displays ACL application information for packet filtering in both directions.

Examples

Display ACL application information for inbound packet filtering on interface GigabitEthernet 1/0/1.

```
<Switch> display packet-filter interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
 Inbound policy:
  IPv4 ACL 2001
  IPv6 ACL 2002 (Failed)
  MAC ACL 4003
```

Table 1-2 Command output

Field	Description
Interface	Interface to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.

Field	Description
Outbound policy	ACL used for filtering outgoing traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv6 ACL 2002 (Failed)	The device has failed to apply IPv6 basic ACL 2002.
Hardware-count	ACL rule match counting in hardware has been successfully enabled.
Hardware-count (Failed)	The device has failed to enable counting ACL rule matches in hardware.
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

1.1.7. display packet-filter statistics

Use **display packet-filter statistics** to display packet filtering statistics.

Syntax

display packet-filter statistics interface *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

inbound: Specifies the inbound direction.

outbound: Specifies the outbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

brief: Displays brief statistics.

Usage guidelines

If *acl-number*, **name** *acl-name*, **ipv6**, or **mac** is not specified, this command displays packet filtering statistics for all ACLs.

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Display packet filtering statistics for all ACLs on incoming packets of GigabitEthernet 1/0/1.

```
<Switch> display packet-filter statistics interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
 Inbound policy:
  IPv4 ACL 2001, Hardware-count
   From 2011-06-04 10:25:21 to 2011-06-04 10:35:57
   rule 0 permit source 2.2.2.2 0 (2 packets)
   rule 5 permit source 1.1.1.1 0 (Failed)
   Totally 2 packets permitted, 0 packets denied
   Totally 100% permitted, 0% denied

  IPv6 ACL 2000

  MAC ACL 4000
   rule 0 permit
```

Table 1-3 Command output

Field	Description
Interface	Interface to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.
Outbound policy	ACL used for filtering outgoing traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv4 ACL 2002 (Failed)	The device has failed to apply IPv4 basic ACL 2002.

Field	Description
Hardware-count	ACL rule match counting in hardware has been successfully enabled.
Hardware-count (Failed)	The device has failed to enable counting ACL rule matches in hardware.
From 2011-06-04 10:25:21 to 2011-06-04 10:35:57	Start time and end time of the statistics.
2 packets	Two packets matched the rule. This field is not displayed when no packets matched the rule.
No resource	Resources are not enough for counting matches for the rule. In packet filtering statistics, this field is displayed for a rule when resources are not sufficient for rule match counting.
rule 5 permit source 1.1.1.1 0 (Failed)	The device has failed to apply rule 5.
Totally 2 packets permitted, 0 packets denied	Number of packets permitted and denied by the ACL.
Totally 100% permitted, 0% denied	Ratios of permitted and denied packets to all packets.
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

Related commands

reset packet-filter statistics

1.1.8. display packet-filter statistics sum

Use **display packet-filter statistics sum** to display accumulated packet filtering statistics for an ACL.

Syntax

display packet-filter statistics sum { **inbound** | **outbound** } [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inbound: Specifies the inbound direction.

outbound: Specifies the outbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

brief: Displays brief statistics.

Usage guidelines

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Display accumulated packet filtering statistics for IPv4 basic ACL 2001 on incoming packets.

```
<Switch> display packet-filter statistics sum inbound 2001
Sum:
 Inbound policy:
  IPv4 ACL 2001
   rule 0 permit source 2.2.2.2 0 (2 packets)
   rule 5 permit source 1.1.1.1 0
   Totally 2 packets permitted, 0 packets denied
   Totally 100% permitted, 0% denied
```

Display brief accumulated packet filtering statistics for IPv4 basic ACL 2000 on incoming packets.

```
<Switch> display packet-filter statistics sum inbound 2000 brief
Sum:
 Inbound policy:
  IPv4 ACL 2000
```

```
Totally 2 packets permitted, 0 packets denied
Totally 100% permitted, 0% denied
```

Table 1-4 Command output

Field	Description
Sum	Accumulated packet filtering statistics.
Inbound policy	Accumulated packet filtering statistics in the inbound direction.
Outbound policy	Accumulated packet filtering statistics in the outbound direction.
IPv4 ACL 2001	Accumulated packet filtering statistics of IPv4 basic ACL 2001.
2 packets	Two packets matched the rule. This field is not displayed when no packets matched the rule.
Totally 2 packets permitted, 0 packets denied	Number of packets permitted and denied by the ACL.
Totally 100% permitted, 0% denied	Ratios of permitted and denied packets to all packets.

Related commands

reset packet-filter statistics

1.1.9. display packet-filter verbose

Use **display packet-filter verbose** to display ACL application details for packet filtering.

Syntax

display packet-filter verbose interface *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The **slot** *slot-number* option is not available for an Ethernet interface.

inbound: Specifies the inbound direction.

outbound: Specifies the outbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.

- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ACL application details for packet filtering for the master device.

Usage guidelines

If *acl-number*, **name** *acl-name*, **ipv6**, or **mac** is not specified, this command displays application details of all ACLs for packet filtering.

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Display application details of all ACLs for inbound packet filtering on GigabitEthernet 1/0/1.

```
<Switch> display packet-filter verbose interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
 Inbound policy:
  IPv4 ACL 2001
   rule 0 permit
   rule 5 permit source 1.1.1.1 0 (Failed)

  IPv6 ACL 2000
   rule 0 permit

  MAC ACL 4000

  IPv4 default action: Deny

  IPv6 default action: Deny, Hardware-count

  MAC default action: Deny
```

Table 1-5 Command output

Field	Description
Interface	Interface to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.
Outbound policy	ACL used for filtering outgoing traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv4 ACL 2002 (Failed)	The device has failed to apply IPv4 basic ACL 2002.
Hardware-count	ACL rule match counting in hardware has been successfully enabled.
Hardware-count (Failed)	The device has failed to enable counting ACL rule matches in hardware.
rule 5 permit source 1.1.1.1 0 (Failed)	The device has failed to apply rule 5.

Field	Description
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

1.1.10. display qos-acl resource

Use **display qos-acl resource** to display QoS and ACL resource usage.

Syntax

display qos-acl resource [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays QoS and ACL resource usage for all member devices.

Examples

Display QoS and ACL resource usage.

```
<Switch> display qos-acl resource
Interfaces: GE1/0/1 to GE1/0/24, XGE1/0/25 to XGE1/0/28
            GE1/1/1 to GE1/1/8 (slot 1)
```

```
-------------------------------------------------------------------------
 Type              Total      Reserved   Configured Remaining  Usage
-------------------------------------------------------------------------
 TTI ACL           3072       0          2          3070       0%
 IPCL0+IPCL2 ACL   1024       32         5          987        3%
 IPCL Counter      2048       28         2          2018       1%
 EPCL+IPCL1 ACL    512        0          0          512        0%
 EPCL Counter      1024       0          0          1024       0%
 IPCL Meter        4888       30         0          4858       0%
 EPCL Meter        4096       0          0          4096       0%
```

Table 1-6 Command output

Field	Description
Interfaces	Interface range for the resources.
Type	Resource type: • **TTI ACL**—ACL resources used for tunnel termination and interfaces. • **IPCL0+IPCL2 ACL**—ACL resources used for inbound policies. • **IPCL Counter**—Accounting resources used for inbound policies. • **EPCL+IPCL1 ACL**—ACL resources used for inbound and outbound policies. • **EPCL Counter**—Accounting resources used for outbound policies. • **IPCL Meter**—Traffic policing resources used in inbound QoS policies. • **EPCL Meter**—Traffic policing resources used in outbound QoS policies.
Total	Total number of resources.
Reserved	Number of reserved resources.
Configured	Number of resources that has been applied.
Remaining	Number of resources that you can apply.
Usage	Configured and reserved resources as a percentage of total resources. If the percentage is not an integer, this field displays the integer part. For example, if the actual usage is 50.8%, this field displays 50%.

1.1.11. packet-filter

Use **packet-filter** to apply an ACL to an interface to filter packets.

Use **undo packet-filter** to remove an ACL from an interface.

Syntax

packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** } [**hardware-count**]

undo packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** }

Default

No ACL is applied to an interface to filter packets.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

VLAN interface view

VSI interface view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

inbound: Filters incoming packets.

outbound: Filters outgoing packets.

hardware-count: Enables counting ACL rule matches performed in hardware. If you do not specify this keyword, rule matches for the ACL are not counted in hardware.

Usage guidelines

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

The **hardware-count** keyword in this command enables match counting in hardware for all rules in an ACL, and the **counting** keyword in the **rule** command enables match counting specific to rules.

To disable ACL rule match counting in hardware when resources are insufficient, you must execute the **undo packet-filter** command and then reconfigure the **packet-filter** command without specifying the **hardware-count** keyword.

To disable ACL rule match counting in hardware when resources are sufficient, you can directly reconfigure the **packet-filter** command without specifying the **hardware-count** keyword.

To the same direction of an interface, you can apply a maximum of three ACLs: one IPv4 ACL, one IPv6 ACL, and one Layer 2 ACL.

Examples

Apply IPv4 basic ACL 2001 to filter incoming traffic on GigabitEthernet 1/0/1, and enable counting ACL rule matches performed in hardware.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] packet-filter 2001 inbound hardware-count
```

Related commands

display packet-filter

display packet-filter statistics

display packet-filter verbose

NOTE:

When you configure same **packet-filter** command in same vlan-interface, the packet-filter is conflicted on the vlan-interface. You can check the failed command by **display packet-filter verbose interface Vlan-interface** command.

1.1.12. packet-filter filter

NOTE:

packet-filter filter command is being supported with after Ver7.2.17.

Use **packet-filter filter** to specify the applicable scope of packet filtering on a VLAN interface.

Use **undo packet-filter filter** to restore the default.

Syntax

packet-filter filter [**route** | **all**]

undo packet-filter filter

Default

The packet filtering filters packets forwarded at Layer 3.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

route: Filters packets forwarded at Layer 3 by the VLAN interface.

all: Filters all packets, including packets forwarded at Layer 3 by the VLAN interface and packets forwarded at Layer 2 by the physical ports associated with the VLAN interface.

Examples

Configure the packet filtering on VLAN-interface 2 to filter packets forwarded at Layer 3.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] packet-filter filter route
```

1.1.13. reset acl counter

Use **reset acl counter** to clear statistics for ACLs.

Syntax

reset acl [**ipv6** | **mac**] **counter** { *acl-number* | **all** | **name** *acl-name* }

Views

User view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

all: Clears statistics for all ACLs of the specified type.

name *acl-name*: Clears statistics of an ACL specified by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Clear statistics for IPv4 basic ACL 2001.

```
<Switch> reset acl counter 2001
```

Related commands

display acl

1.1.14. reset packet-filter statistics

Use **reset packet-filter statistics** to clear the packet filtering statistics.

Syntax

reset packet-filter statistics interface [*interface-type interface-number*] { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }]

Views

User view

Predefined user roles

network-admin

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If you do not specify an interface, this command clears packet filtering statistics for all interfaces.

inbound: Specifies the inbound direction.

outbound: Specifies the outbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number.

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

If *acl-number*, **name** *acl-name*, **ipv6**, or **mac** is not specified, this command clears the packet filtering statistics for all ACLs.

To specify the IPv4 ACL type, do not specify the **ipv6** or **mac** keyword.

Examples

Clear IPv4 basic ACL 2001 statistics for inbound packet filtering on GigabitEthernet 1/0/1.

```
<Switch> reset packet-filter statistics interface gigabitethernet 1/0/1 inbound 2001
```

1.1.15. rule (IPv4 advanced ACL view)

Use **rule** to create or edit an IPv4 advanced ACL rule.

Use **undo rule** to delete an entire IPv4 advanced ACL rule or some attributes in the rule.

Syntax

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port* | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port* | **time-range** *time-range-name*] *

undo rule *rule-id* [{ { **ack** | **fin** | **psh** | **rst** | **syn** | **urg** } * | **established** } | **counting** | **destination** | **destination-port** | { **dscp** | { **precedence** | **tos** } * } | **fragment** | **icmp-type** | **logging** | **source** | **source-port** | **time-range**] *

undo rule { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port* | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port* | **time-range** *time-range-name*] *

Default

No IPv4 advanced ACL rules exist.

Views

IPv4 advanced ACL view

Predefined user roles

network-admin

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

protocol: Specifies one of the following values:

- A protocol number in the range of 0 to 255.
- A protocol by its name: **gre** (47), **icmp** (1), **igmp** (2), **ip**, **ipinip** (4), **ospf** (89), **tcp** (6), or **udp** (17). The **ip** keyword specifies all protocols.

Table 1-7 describes the parameters that you can specify regardless of the value for the *protocol* argument.

Table 1-7 Match criteria and other rule information for IPv4 advanced ACL rules

Parameters	Function	Description
source { *source-address source-wildcard* | **any** }	Specifies a source address.	The *source-address source-wildcard* arguments specify a source IP address and a wildcard mask in dotted decimal notation. An all-zero wildcard represents a host address. The **any** keyword specifies any source IP address.
destination { *dest-address dest-wildcard* | **any** }	Specifies a destination address.	The *dest-address dest-wildcard* arguments specify a destination IP address and a wildcard mask in dotted decimal notation. An all-zero wildcard mask represents a host address. The **any** keyword represents any destination IP address.
counting	Enables rule match counting in software.	The **counting** keyword enables match counting specific to rules, and the **hardware-count** keyword in the **packet-filter** command enables match counting in hardware for all rules in an ACL. If the **counting** keyword is not specified, matches for the rule are not counted in software.
precedence *precedence*	Specifies an IP precedence value.	The *precedence* argument can be a number in the range of 0 to 7, or in words: **routine** (0), **priority** (1), **immediate** (2), **flash** (3), **flash-override** (4), **critical** (5),

Parameters	Function	Description
		internet (6), or **network** (7).
tos *tos*	Specifies a ToS preference.	The *tos* argument can be a number in the range of 0 to 15, or in words: **max-reliability** (2), **max-throughput** (4), **min-delay** (8), **min-monetary-cost** (1), or **normal** (0).
dscp *dscp*	Specifies a DSCP priority.	The *dscp* argument can be a number in the range of 0 to 63, or in words: **af11** (10), **af12** (12), **af13** (14), **af21** (18), **af22** (20), **af23** (22), **af31** (26), **af32** (28), **af33** (30), **af41** (34), **af42** (36), **af43** (38), **cs1** (8), **cs2** (16), **cs3** (24), **cs4** (32), **cs5** (40), **cs6** (48), **cs7** (56), **default** (0), or **ef** (46).
fragment	Applies the rule only to fragments.	If you do not specify this keyword, the rule applies to all fragments and non-fragments.
logging	Logs matching packets.	This feature requires that the module (for example, packet filtering) that uses the ACL supports logging.
time-range *time-range-name*	Specifies a time range for the rule.	The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. It must start with an English letter. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

If the *protocol* argument is **tcp** (6) or **udp** (17), set the parameters shown in Table 1-8 .

Table 1-8 TCP/UDP-specific parameters for IPv4 advanced ACL rules

Parameters	Function	Description
source-port *operator port*	Specifies one or more UDP or TCP source ports.	The *operator* argument can be **eq** (equal to). The *port* argument is TCP or UDP port numbers in the range of 0 to 65535. TCP port numbers can be represented as: **chargen** (19), **bgp** (179), **cmd** (514), **daytime** (13), **discard** (9), **dns** (53), **domain** (53), **echo** (7), **exec** (512), **finger** (79), **ftp** (21), **ftp-data** (20), **gopher** (70), **hostname** (101), **irc** (194), **klogin** (543), **kshell** (544), **login** (513), **lpd** (515), **nntp** (119), **pop2** (109), **pop3** (110), **smtp** (25), **sunrpc** (111), **tacacs** (49), **talk** (517), **telnet** (23), **time** (37), **uucp** (540), **whois** (43), and **www** (80). UDP port numbers can be represented as: **biff** (512), **bootpc** (68), **bootps** (67), **discard** (9), **dns** (53), **dnsix** (90), **echo** (7), **mobilip-ag** (434), **mobilip-mn** (435), **nameserver** (42), **netbios-dgm** (138), **netbios-ns** (137), **netbios-ssn** (139), **ntp**
destination-port *operator port*	Specifies one or more UDP or TCP destination ports.	

Parameters	Function	Description
		(123), **rip** (520), **snmp** (161), **snmptrap** (162), **sunrpc** (111), **syslog** (514), **tacacs-ds** (65), **talk** (517), **tftp** (69), **time** (37), **who** (513), and **xdmcp** (177).
{ **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* }*	Specifies one or more TCP flags including ACK, FIN, PSH, RST, SYN, and URG.	Parameters specific to TCP. The value for each argument can be 0 (flag bit not set) or 1 (flag bit set). The TCP flags in a rule are ANDed. For example, a rule configured with **ack** 0 **psh** 1 matches packets that have the ACK flag bit not set and the PSH flag bit set.
established	Specifies the flags for indicating the established status of a TCP connection.	Parameter specific to TCP. The rule matches TCP connection packets with the ACK or RST flag bit set.

If the *protocol* argument is **icmp** (1), set the parameters shown in Table 1-9 .

Table 1-9 ICMP-specific parameters for IPv4 advanced ACL rules

Parameters	Function	Description
icmp-type { *icmp-type* *icmp-code* | *icmp-message* }	Specifies the ICMP message type and code.	The *icmp-type* argument is in the range of 0 to 255. The *icmp-code* argument is in the range of 0 to 255. The *icmp-message* argument specifies a message name. Supported ICMP message names and their corresponding type and code values are listed in Table 1-10 .

Table 1-10 ICMP message names supported in IPv4 advanced ACL rules

ICMP message name	ICMP message type	ICMP message code
echo	8	0
echo-reply	0	0
fragmentneed-DFset	3	4
host-redirect	5	1
host-tos-redirect	5	3
host-unreachable	3	1
information-reply	16	0
information-request	15	0
net-redirect	5	0
net-tos-redirect	5	2
net-unreachable	3	0
parameter-problem	12	0

ICMP message name	ICMP message type	ICMP message code
port-unreachable	3	3
protocol-unreachable	3	2
reassembly-timeout	11	1
source-quench	4	0
source-route-failed	3	5
timestamp-reply	14	0
timestamp-request	13	0
ttl-exceeded	11	0

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

When an IPv4 advanced ACL is used for QoS traffic classification or packet filtering in a VXLAN network, the ACL matches packets as follows:

- If the ACL is applied to the outgoing VXLAN packets on a VTEP, the ACL matches outer IPv4 header information.
- If the ACL is applied to the incoming VXLAN packets on a VTEP, the ACL matches inner IPv4 header information.
- If the ACL is applied to the incoming VXLAN packets on an intermediate transport device, the ACL matches outer IPv4 header information.

To view the existing IPv4 basic and advanced ACL rules, use the **display acl all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv4 advanced ACL rule to permit TCP packets with the destination port 80 from 129.9.0.0/16 to 202.38.160.0/24.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit tcp source 129.9.0.0 0.0.255.255 destination
202.38.160.0 0.0.0.255 destination-port eq 80
```

Create IPv4 advanced ACL rules to permit all IP packets but the ICMP packets destined for 192.168.1.0/24.

```
<Switch> system-view
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule deny icmp destination 192.168.1.0 0.0.0.255
[Switch-acl-ipv4-adv-3001] rule permit ip
```

Create IPv4 advanced ACL rules to permit inbound and outbound FTP packets.

```
<Switch> system-view
```

```
[Switch] acl advanced 3002
[Switch-acl-ipv4-adv-3002] rule permit tcp source-port eq ftp
[Switch-acl-ipv4-adv-3002] rule permit tcp source-port eq ftp-data
[Switch-acl-ipv4-adv-3002] rule permit tcp destination-port eq ftp
[Switch-acl-ipv4-adv-3002] rule permit tcp destination-port eq ftp-data
```

Create IPv4 advanced ACL rules to permit inbound and outbound SNMP and SNMP trap packets.

```
<Switch> system-view
[Switch] acl advanced 3003
[Switch-acl-ipv4-adv-3003] rule permit udp source-port eq snmp
[Switch-acl-ipv4-adv-3003] rule permit udp source-port eq snmptrap
[Switch-acl-ipv4-adv-3003] rule permit udp destination-port eq snmp
[Switch-acl-ipv4-adv-3003] rule permit udp destination-port eq snmptrap
```

1.1.16. rule (IPv4 basic ACL view)

Use **rule** to create or edit an IPv4 basic ACL rule.

Use **undo rule** to delete an entire IPv4 basic ACL rule or some attributes in the rule.

Syntax

rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging** | **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name*] *

undo rule *rule-id* [**counting** | **fragment** | **logging** | **source** | **time-range**] *

undo rule { **deny** | **permit** } [**counting** | **fragment** | **logging** | **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name*] *

Default

No IPv4 basic ACL rules exist.

Views

IPv4 basic ACL view

Predefined user roles

network-admin

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

fragment: Applies the rule only to fragments. If you do not specify this keyword, the rule applies to both fragments and non-fragments.

logging: Logs matching packets. This feature is available only when the application module (for example, packet filtering) that uses the ACL supports the logging feature.

source { *source-address source-wildcard* | **any** }: Matches a source address. The *source-address* and *source-wildcard* arguments specify a source IP address and a wildcard mask in dotted decimal notation. A wildcard mask of zeros represents a host address. The **any** keyword represents any source IP address.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. It must start with an English letter. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

When an IPv4 basic ACL is used for QoS traffic classification or packet filtering in a VXLAN network, the ACL matches packets as follows:

- If the ACL is applied to the outgoing VXLAN packets on a VTEP, the ACL matches outer IPv4 header information.
- If the ACL is applied to the incoming VXLAN packets on a VTEP, the ACL matches inner IPv4 header information.
- If the ACL is applied to the incoming VXLAN packets on an intermediate transport device, the ACL matches outer IPv4 header information.

The **counting** keyword in this command enables match counting specific to rules, and the **hardware-count** keyword in the **packet-filter** command enables match counting in hardware for all rules in an ACL.

To view the existing IPv4 basic and advanced ACL rules, use the **display acl all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create a rule in IPv4 basic ACL 2000 to deny the packets from any source IP subnet but 10.0.0.0/8, 172.17.0.0/16, or 192.168.1.0/24.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 10.0.0.0 0.255.255.255
[Switch-acl-ipv4-basic-2000] rule permit source 172.17.0.0 0.0.255.255
[Switch-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] rule deny source any
```

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

protocol: Specifies one of the following values:

- A protocol number in the range of 0 to 255.
- A protocol name: **gre** (47), **icmpv6** (58), **ipv6**, **ipv6-ah** (51), **ipv6-esp** (50), **ospf** (89), **tcp** (6), or **udp** (17). The **ipv6** keyword specifies all protocols.

Table 1-11 describes the parameters that you can specify regardless of the value for the *protocol* argument.

Table 1-11 Match criteria and other rule information for IPv6 advanced ACL rules

Parameters	Function	Description
source { *source-address source-prefix* | *source-address/source-prefix* | **any** }	Specifies a source IPv6 address.	The *source-address* argument specifies an IPv6 source address. The *source-prefix* argument specifies a prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 source address.
destination { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** }	Specifies a destination IPv6 address.	The *dest-address* argument specifies a destination IPv6 address. The *dest-prefix* argument specifies a prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 destination address.
counting	Enables rule match counting in software.	The **counting** keyword enables match counting specific to rules, and the **hardware-count** keyword in the **packet-filter ipv6** command enables match counting in hardware for all rules in an ACL. If the **counting** keyword is not specified, matches for the rule are not counted in software.
dscp *dscp*	Specifies a DSCP preference.	The *dscp* argument can be a number in the range of 0 to 63, or in words, **af11** (10), **af12** (12), **af13** (14), **af21** (18), **af22** (20), **af23** (22), **af31** (26), **af32** (28), **af33** (30), **af41** (34), **af42** (36), **af43** (38), **cs1** (8), **cs2** (16), **cs3** (24), **cs4** (32), **cs5** (40), **cs6** (48), **cs7** (56), **default** (0), or **ef** (46).
flow-label *flow-label-value*	Specifies a flow label value in an IPv6 packet header.	The *flow-label-value* argument is in the range of 0 to 1048575.
fragment	Applies the rule only to fragments.	If you do not specify this keyword, the rule applies to all fragments and non-fragments.
logging	Logs matching packets.	This feature requires that the module (for example, packet filtering) that uses the ACL supports

Parameters	Function	Description
		logging.
routing [**type** *routing-type*]	Specifies an IPv6 routing header type.	*routing-type*: Value of the IPv6 routing header type, in the range of 0 to 255. If you specify the **type** *routing-type* option, the rule applies to the specified type of IPv6 routing header. If you do not specify the **type** *routing-type* option, the rule applies to all types of IPv6 routing headers.
time-range *time-range-name*	Specifies a time range for the rule.	The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. It must start with an English letter. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

If the *protocol* argument is **tcp** (6) or **udp** (17), set the parameters shown in Table 1-12 .

Table 1-12 TCP/UDP-specific parameters for IPv6 advanced ACL rules

Parameters	Function	Description
source-port *operator port*	Specifies one or more UDP or TCP source ports.	The *operator* argument can be **eq** (equal to). The *port* argument is TCP or UDP port numbers in the range of 0 to 65535. TCP port numbers can be represented as: **chargen** (19), **bgp** (179), **cmd** (514), **daytime** (13), **discard** (9), **dns** (53), **domain** (53), **echo** (7), **exec** (512), **finger** (79), **ftp** (21), **ftp-data** (20), **gopher** (70), **hostname** (101), **irc** (194), **klogin** (543), **kshell** (544), **login** (513), **lpd** (515), **nntp** (119), **pop2** (109), **pop3** (110), **smtp** (25), **sunrpc** (111), **tacacs** (49), **talk** (517), **telnet** (23), **time** (37), **uucp** (540), **whois** (43), and **www** (80). UDP port numbers can be represented as: **biff** (512), **bootpc** (68), **bootps** (67), **discard** (9), **dns** (53), **dnsix** (90), **echo** (7), **mobilip-ag** (434), **mobilip-mn** (435), **nameserver** (42), **netbios-dgm** (138), **netbios-ns** (137), **netbios-ssn** (139), **ntp** (123), **rip** (520), **snmp** (161), **snmptrap** (162), **sunrpc** (111), **syslog** (514), **tacacs-ds** (65), **talk** (517), **tftp** (69), **time** (37), **who** (513), and **xdmcp** (177).
destination-port *operator port*	Specifies one or more UDP or TCP destination ports.	

Parameters	Function	Description
{ **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* }*	Specifies one or more TCP flags, including ACK, FIN, PSH, RST, SYN, and URG.	Parameters specific to TCP. The value for each argument can be 0 (flag bit not set) or 1 (flag bit set). The TCP flags in a rule are ANDed. For example, a rule configured with **ack** 0 **psh** 1 matches packets that have the ACK flag bit not set and the PSH flag bit set.
established	Specifies the flags for indicating the established status of a TCP connection.	Parameter specific to TCP. The rule matches TCP packets with the ACK or RST flag bit set.

If the *protocol* argument is **icmpv6** (58), set the parameters shown in Table 1-13 .

Table 1-13 ICMPv6-specific parameters for IPv6 advanced ACL rules

Parameters	Function	Description
icmp6-type { *icmp6-type icmp6-code* | *icmp6-message* }	Specifies the ICMPv6 message type and code.	The *icmp6-type* argument is in the range of 0 to 255. The *icmp6-code* argument is in the range of 0 to 255. The *icmp6-message* argument specifies a message name. Supported ICMP message names and their corresponding type and code values are listed in Table 1-14 .

Table 1-14 ICMPv6 message names supported in IPv6 advanced ACL rules

ICMPv6 message name	ICMPv6 message type	ICMPv6 message code
echo-reply	129	0
echo-request	128	0
err-Header-field	4	0

unknown-next-hdr	4	1

Usage guidelines

If an IPv6 advanced ACL is for QoS traffic classification or packet filtering:

- Do not specify the **fragment** keyword.
- Do not specify the **routing**, or **flow-label** keyword if the ACL is for outbound application.
- Do not specify **ipv6-ah** for the *protocol* argument, or set its value to 0, 43, 44, 51, or 60 if the ACL is for outbound application.

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing IPv6 basic and advanced ACL rules, use the **display acl ipv6 all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for a rule.

The **undo rule** { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv6 advanced ACL rule to permit TCP packets with the destination port 80 from 2030:5060::/64 to FE80:5060::/96.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule permit tcp source 2030:5060::/64 destination
fe80:5060::/96 destination-port eq 80
```

Create IPv6 advanced ACL rules to permit all IPv6 packets but the ICMPv6 packets destined for FE80:5060:1001::/48.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3001
[Switch-acl-ipv6-adv-3001] rule deny icmpv6 destination fe80:5060:1001:: 48
[Switch-acl-ipv6-adv-3001] rule permit ipv6
```

Create IPv6 advanced ACL rules to permit inbound and outbound FTP packets.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3002
[Switch-acl-ipv6-adv-3002] rule permit tcp source-port eq ftp
[Switch-acl-ipv6-adv-3002] rule permit tcp source-port eq ftp-data
[Switch-acl-ipv6-adv-3002] rule permit tcp destination-port eq ftp
[Switch-acl-ipv6-adv-3002] rule permit tcp destination-port eq ftp-data
```

Create IPv6 advanced ACL rules to permit inbound and outbound SNMP and SNMP trap packets.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3003
[Switch-acl-ipv6-adv-3003] rule permit udp source-port eq snmp
[Switch-acl-ipv6-adv-3003] rule permit udp source-port eq snmptrap
[Switch-acl-ipv6-adv-3003] rule permit udp destination-port eq snmp
[Switch-acl-ipv6-adv-3003] rule permit udp destination-port eq snmptrap
```

1.1.18. rule (IPv6 basic ACL view)

Use **rule** to create or edit an IPv6 basic ACL rule.

Use **undo rule** to delete an entire IPv6 basic ACL rule or some attributes in the rule.

Syntax

rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging** | **routing** [**type** *routing-type*] | **source** { *source-address source-prefix* | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name*] *

undo rule *rule-id* [**counting** | **fragment** | **logging** | **routing** | **source** | **time-range**] *

undo rule { **deny** | **permit** } [**counting** | **fragment** | **logging** | **routing** [**type** *routing-type*] | **source** { *source-address source-prefix* | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name*] *

Default

No IPv6 basic ACL rules exist.

Views

IPv6 basic ACL view

Predefined user roles

network-admin

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

fragment: Applies the rule only to non-first fragments. If you do not specify this keyword, the rule applies to both fragments and non-fragments.

logging: Logs matching packets. This feature is available only when the application module (for example, packet filtering) that uses the ACL supports the logging feature.

routing [**type** *routing-type*]: Applies the rule to the specified type of IPv6 routing header or all types of IPv6 routing headers. The *routing-type* argument specifies the value of the IPv6 routing header type, in the range of 0 to 255. If you do not specify the **type** *routing-type* option, the rule applies to all types of IPv6 routing headers.

source { *source-address source-prefix* | *source-address*/*source-prefix* | **any** }: Matches a source IPv6 address. The *source-address* argument specifies a source IPv6 address. The *source-prefix* argument specifies an address prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 source address.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. It must start with an English letter. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

Usage guidelines

The **fragment** keyword is not supported for a QoS policy or a packet filter.

The **routing** keyword is not supported for an outbound QoS policy or packet filter.

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

The **counting** keyword in this command enables match counting specific to rules, and the **hardware-count** keyword in the **packet-filter ipv6** command enables match counting in hardware for all rules in an ACL.

To view the existing IPv6 basic and advanced ACL rules, use the **display acl ipv6 all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for a rule.

The **undo rule** { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv6 basic ACL rule to deny the packets from any source IP subnet but 1001::/16, 3124:1123::/32, or FE80:5060:1001::/48.

```
<Switch> system-view
[Switch] acl ipv6 basic 2000
[Switch-acl-ipv6-basic-2000] rule permit source 1001:: 16
[Switch-acl-ipv6-basic-2000] rule permit source 3124:1123:: 32
[Switch-acl-ipv6-basic-2000] rule permit source fe80:5060:1001:: 48
[Switch-acl-ipv6-basic-2000] rule deny source any
```

1.1.19. rule (Layer 2 ACL view)

Use **rule** to create or edit a Layer 2 ACL rule.

Use **undo rule** to delete an entire Layer 2 ACL rule or some attributes in the rule.

Syntax

rule [*rule-id*] { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | { **lsap** *lsap-type lsap-type-mask* | **type** *protocol-type protocol-type-mask* } | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *

undo rule *rule-id* [**counting** | **time-range**] *

undo rule { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | { **lsap** *lsap-type lsap-type-mask* | **type** *protocol-type protocol-type-mask* } | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *

Default

No Layer 2 ACL rules exist.

Views

Layer 2 ACL view

Predefined user roles

network-admin

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

cos *dot1p*: Matches an 802.1p priority. The 802.1p priority can be specified by one of the following values:

- A priority number in the range of 0 to 7.
- A priority name: **best-effort** (0), **background** (1), **spare** (2), **excellent-effort** (3), **controlled-load** (4), **video** (5), **voice** (6), or **network-management** (7).

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

dest-mac *dest-address dest-mask*: Matches a destination MAC address range. The *dest-address* and *dest-mask* arguments represent a destination MAC address and mask in the H-H-H format.

lsap *lsap-type lsap-type-mask:* Matches the DSAP and SSAP fields in LLC encapsulation. The *lsap-type* argument is a hexadecimal number that represents the encapsulation format. The value range for the *lsap-type* argument is 0 to ffff. The *lsap-type-mask* argument is a hexadecimal number that represents the LSAP mask. The value range for the *lsap-type-mask* argument is 0 to ffff.

type *protocol-type protocol-type-mask*: Matches one or more protocols in the Layer 2. The *protocol-type* argument is a hexadecimal number that represents a protocol type in Ethernet_II and Ethernet_SNAP frames. The value range for the *protocol-type* argument is 0 to ffff. The *protocol-type-mask* argument is a hexadecimal number that represents a protocol type mask. The value range for the *protocol-type-mask* argument is 0 to ffff.

source-mac *source-address source-mask:* Matches a source MAC address range. The *source-address* argument represents a source MAC address, and the *sour-mask* argument represents a mask in the H-H-H format.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. It must start with an English letter. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

The **counting** keyword in this command enables match counting specific to rules, and the **hardware-count** keyword in the **packet-filter** command enables match counting in hardware for all rules in an ACL.

To view the existing Layer 2 ACL rules, use the **display acl mac all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create a rule in Layer 2 ACL 4000 to permit ARP packets and deny RARP packets.

```
<Switch> system-view
[Switch] acl mac 4000
[Switch-acl-mac-4000] rule permit type 0806 ffff
[Switch-acl-mac-4000] rule deny type 8035 ffff
```

1.1.20. rule comment

Use **rule comment** to configure a comment for an ACL rule.

Use **undo rule comment** to delete an ACL rule comment.

Syntax

rule *rule-id* **comment** *text*

undo rule *rule-id* **comment**

Default

A rule does not have a comment.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

Parameters

rule-id: Specifies an ACL rule ID in the range of 0 to 65534. The ACL rule must already exist.

text: Specifies a comment about the ACL rule, a case-sensitive string of 1 to 127 characters.

Usage guidelines

This command adds a comment to a rule if the rule does not have a comment. It modifies the comment for a rule if the rule already has a comment.

Examples

Create a rule for IPv4 basic ACL 2000, and add a comment about the rule.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule 0 deny source 1.1.1.1 0
[Switch-acl-ipv4-basic-2000] rule 0 comment This rule is used on gigabitethernet 1/0/1.
```

Related commands

display acl

1.1.21. step

Use **step** to set a rule numbering step for an ACL.

Use **undo step** to restore the default.

Syntax

step *step-value*

undo step

Default

The rule numbering step is 5, and the start rule ID is 0.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

Parameters

step-value: Specifies the ACL rule numbering step in the range of 1 to 20.

Usage guidelines

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step or start rule ID changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Examples

Set the rule numbering step to 2 for IPv4 basic ACL 2000.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] step 2
```

2. QoS policy commands

2.1. Traffic class commands

2.1.1. display traffic classifier

Use **display traffic classifier** to display traffic classes.

Syntax

display traffic classifier user-defined [*classifier-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

user-defined: Specifies user-defined traffic classes.

classifier-name: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic class, this command displays all traffic classes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the traffic classes for the master device.

Examples

Display all user-defined traffic classes.

```
<Switch> display traffic classifier user-defined

  User-defined classifier information:

   Classifier: 1 (ID 100)
     Operator: AND
     Rule(s) :
      If-match acl 2000

   Classifier: 2 (ID 101)
     Operator: AND
     Rule(s) :
      If-match protocol ipv6

   Classifier: 3 (ID 102)
     Operator: AND
     Rule(s) :
      -none-
```

Table 2-1 Command output

Field	Description
Classifier	Traffic class name and its match criteria.
Operator	Match operator you set for the traffic class. If the operator is AND, the traffic class matches the packets that match all its match criteria. If the operator is OR, the traffic class matches the packets that match any of its match criteria.
Rule(s)	Match criteria.

2.1.2. if-match

Use **if-match** to define a match criterion.

Use **undo if-match** to delete a match criterion.

Syntax

if-match *match-criteria*

undo if-match *match-criteria*

Default

No match criterion is configured.

Views

Traffic class view

Predefined user roles

network-admin

Parameters

match-criteria: Specifies a match criterion. Table 2-2 shows the available match criteria.

Table 2-2 Available match criteria

Option	Description
acl [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }	Matches an ACL. The value range for the *acl-number* argument is as follows: • 2000 to 3999 for IPv4 ACLs. • 2000 to 3999 for IPv6 ACLs. • 4000 to 4999 for Layer 2 MAC ACLs. The *acl-name* argument is a case-insensitive string of 1 to 63 characters, which must start with an English letter. To avoid confusion, make sure the argument is not **all**.
any	Matches all packets.
customer-dot1p *dot1p-value*&<1-8>	Matches 802.1p priority values in inner VLAN tags of double-tagged packets. The *dot1p-value*&<1-8> argument specifies a space-separated list of up to eight 802.1p priority values. The value range for the *dot1p-value* argument is 0 to 7.

Option	Description
customer-vlan-id *vlan-id-list*	Matches VLAN IDs in inner VLAN tags of double-tagged packets. The *vlan-id-list* argument specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* **to** *vlan-id2*. The value for *vlan-id2* must be greater than or equal to the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.
destination-mac *mac-address*	Matches a destination MAC address. This option takes effect only on Ethernet interfaces.
dscp *dscp-value&<1-8>*	Matches DSCP values. The *dscp-value&<1-8>* argument specifies a space-separated list of up to eight DSCP values. The value range for the *dscp-value* argument is 0 to 63 or keywords shown in Table 2-4 .
protocol *protocol-name*	Matches a protocol. The *protocol-name* argument can be **ip** or **ipv6**.
service-dot1p *dot1p-value&<1-8>*	Matches 802.1p priority values in outer VLAN tags. The *dot1p-value&<1-8>* argument specifies a space-separated list of up to eight 802.1p priority values. The value range for the *dot1p-value* argument is 0 to 7.
service-vlan-id *vlan-id-list*	Matches VLAN IDs in outer VLAN tags. The *vlan-id-list* argument specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* **to** *vlan-id2*. The value for *vlan-id2* must be greater than or equal to the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. You can use this option to match single-tagged packets.
source-mac *mac-address*	Matches a source MAC address. This option takes effect only on Ethernet interfaces.
tunnel-id *tunnel-id*	Matches a VXLAN tunnel ID. For the traffic class to take effect, the tunnel must be a VXLAN tunnel.
vxlan { **any** | *vxlan-id* }	Matches a VXLAN ID.

Usage guidelines

In a traffic class with the logical OR operator, you can configure multiple **if match** commands for any of the available match criteria.

When you configure a match criterion that can have multiple values in one **if-match** command, follow these restrictions and guidelines:

- You can specify up to eight values for any of the following match criteria in one **if-match** command:
  - 802.1p priority.
  - DSCP.
  - VLAN ID.
- If a packet matches one of the specified values, it matches the **if-match** command.
- To delete a criterion that has multiple values, the specified values in the **undo if-match** command must be the same as those specified in the **if-match** command. The order of the values can be different.

When you configure ACL-based match criteria, follow these restrictions and guidelines:

- The ACL must already exist.
- The ACL is used for classification only and the permit/deny actions in ACL rules are ignored. Actions taken on matching packets are defined in traffic behaviors.

You can use both AND and OR operators to define the match relationships between the criteria for a class. For example, you can define relationships among three match criteria in traffic class **classA** as follows:

```
traffic classifier classB operator and
if-match criterion 1
if-match criterion 2
traffic classifier classA operator or
if-match criterion 3
```

Examples

Define a match criterion for traffic class **class1** to match the packets with a destination MAC address of 0050-ba27-bed3.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match destination-mac 0050-ba27-bed3
```

Define a match criterion for traffic class **class2** to match the packets with a source MAC address of 0050-ba27-bed2.

```
<Switch> system-view
[Switch] traffic classifier class2
[Switch-classifier-class2] if-match source-mac 0050-ba27-bed2
```

Define a match criterion for traffic class **class1** to match the packets with 802.1p priority 5 in the outer VLAN tag.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match service-dot1p 5
```

Define a match criterion for traffic class **class1** to match advanced ACL 3101.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match acl 3101
```

Define a match criterion for traffic class **class1** to match the ACL named **flow**.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match acl name flow
```

Define a match criterion for traffic class **class1** to match advanced IPv6 ACL 3101.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match acl ipv6 3101
```

Define a match criterion for traffic class **class1** to match the IPv6 ACL named **flow**.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match acl ipv6 name flow
```

Define a match criterion for traffic class **class1** to match all packets.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match any
```

Define a match criterion for traffic class **class1** to match the packets with a DSCP value of 1, 6, or 9.

```
<Switch> system-view
[Switch] traffic classifier class1 operator or
[Switch-classifier-class1] if-match dscp 1 6 9
```

Define a match criterion for traffic class **class1** to match IP packets.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match protocol ip
```

Define a match criterion for traffic class **class1** to match the packets with VLAN ID 2, 7, or 10 in the outer VLAN tag.

```
<Switch> system-view
[Switch] traffic classifier class1 operator or
[Switch-classifier-class1] if-match service-vlan-id 2 7 10
```

Define a match criterion for traffic class **class1** to match the VXLAN packets with tunnel ID 2.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match tunnel-id 2
```

Define a match criterion for traffic class **class1** to match the packets with VXLAN 10.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1] if-match vxlan 10
```

2.1.3. traffic classifier

Use **traffic classifier** to create a traffic class and enter its view, or enter the view of an existing traffic class.

Use **undo traffic classifier** to delete a traffic class.

Syntax

traffic classifier *classifier-name* [**operator** { **and** | **or** }]

undo traffic classifier *classifier-name*

Default

No traffic classes exist.

Views

System view

Predefined user roles

network-admin

Parameters

classifier-name: Specifies a name for the traffic class, a case-sensitive string of 1 to 31 characters.

operator: Sets the operator to logic AND (the default) or OR for the traffic class.

and: Specifies the logic AND operator. The traffic class matches the packets that match all its criteria.

or: Specifies the logic OR operator. The traffic class matches the packets that match any of its criteria.

Examples

Create a traffic class named **class1**.

```
<Switch> system-view
[Switch] traffic classifier class1
[Switch-classifier-class1]
```

Related commands

display traffic classifier

2.2. Traffic behavior commands

2.2.1. accounting

Use **accounting** to configure a traffic accounting action in a traffic behavior.

Use **undo accounting** to restore the default.

Syntax

accounting { **byte** | **packet** }

undo accounting

Default

No traffic accounting action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

byte: Counts traffic in bytes.

packet: Counts traffic in packets.

Examples

Configure a traffic accounting action in traffic behavior **database** to count traffic in bytes.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] accounting byte
```

2.2.2. car

Use **car** to configure a CAR action in absolute value in a traffic behavior.

Use **undo car** to restore the default.

Syntax

car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

undo car

Default

No CAR action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

cir *committed-information-rate*: Specifies the committed information rate (CIR) in the range of 1 to 160000000 kbps.

cbs *committed-burst-size*: Specifies the committed burst size (CBS) in bytes. The value range for *committed-burst-size* is 512 to 256000000, in increments of 512. The default value for this argument is the product of 62.5 and the CIR and must be an integral multiple of 512. When the product is not an integral multiple of 512, it is rounded up to the nearest integral multiple of 512 that is greater than the product. A default value greater than 256000000 is converted to 256000000.

ebs *excess-burst-size*: Specifies the excess burst size (EBS) in bytes. The value range for *excess-burst-size* is 0 to 256000000, in increments of 512. If the PIR is configured, the default EBS is the product of 62.5 and the PIR and must be an integral multiple of 512. When the product is not an integral multiple of 512, it is rounded up to the nearest integral multiple of 512. A default value greater than 256000000 is converted to 256000000.

pir *peak-information-rate*: Specifies the peak information rate (PIR) in the range of 1 to 160000000 kbps.

green *action*: Specifies the action to take on packets that conform to the CIR. The default setting is **pass**.

red *action*: Specifies the action to take on packets that conform to neither CIR nor PIR. The default setting is **discard**.

yellow *action*: Specifies the action to take on packets that conform to the PIR but not to the CIR. The default setting is **pass**.

action: Sets the action to take on the packet:

- **discard**: Drops the packet.

- **pass**: Permits the packet to pass through.
- **remark-dot1p-pass** *new-cos*: Sets the 802.1p priority value of the 802.1p packet to *new-cos* and permits the packet to pass through. The *new-cos* argument is in the range of 0 to 7.
- **remark-dscp-pass** *new-dscp*: Sets the DSCP value of the packet to *new-dscp* and permits the packet to pass through. The *new-dscp* argument is in the range of 0 to 63.
- **remark-lp-pass** *new-local-precedence*: Sets the local precedence value of the packet to *new-local-precedence* and permits the packet to pass through. The *new-local-precedence* argument is in the range of 0 to 7.

Usage guidelines

To use two rates for traffic policing, configure the **car** command with the **pir** *peak-information-rate* option. To use one rate for traffic policing, configure the **car** command without the **pir** *peak-information-rate* option.

If you execute the **car** command multiple times in the same traffic behavior, the most recent configuration takes effect.

IMPORTANT

For TCP communications (e.g., FTP, CIFS, SMTP, HTTP, etc.), a low CBS value can cause retransmission processing more likely and may slow down.

Setting the CBS value to a sufficiently larger value reduces the retransmission process and prevents slowing down.

The CIR value must be adjusted based on the CBS value and is recommended to be set in units of 1000 Kbps (1 Mbps) or higher.

Type	CIR		CBS		
	Granularity (Kbps)	Maximum (Kbps)	Granularity (B)	Minimum (B)	Maximum (B)
3	1,000	102,300,000	512	4,194,304	33,553,920
4	10,000	1,023,000,000	4,096	33,554,432	256,000,000

・If you want to set the CIR to a range of up to 102,300,000Kbps, set the CIR in 1000Kbps (1Mbps).CBS should range from 4,194,304 to 33,553,920B and be set at an integer multiple of 512.
・If you set the CIR to more than 102,300,000Kbps (up to 1,023,000,000Kbps), CBS should be set in the range of 33,554,432 to 256,000,000B and an integer multiple of 4,096.

Examples

Configure a CAR action in traffic behavior **database**:

- Set the CIR to 200 kbps, CBS to 51200 bytes, and EBS to 0.
- Transmit the conforming packets, and mark the excess packets with DSCP value 0 and transmit them.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] car cir 200 cbs 51200 ebs 0 green pass red remark-dscp-pass
0
```

2.2.3. display traffic behavior

Use **display traffic behavior** to display traffic behaviors.

Syntax

display traffic behavior user-defined [*behavior-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

user-defined: Specifies user-defined traffic behaviors.

behavior-name: Specifies a behavior by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic behavior, this command displays all traffic behaviors.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the traffic behaviors for the master device.

Examples

Display all user-defined traffic behaviors.

```
<Switch> display traffic behavior user-defined

  User-defined behavior information:

    Behavior: 1 (ID 100)
      Marking:
        Remark dscp 3
      Committed Access Rate:
        CIR 112 (kbps), CBS 5120 (Bytes), EBS 512 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard

    Behavior: 2 (ID 101)
      Accounting enable: Packet
      Filter enable: Permit
      Redirecting:
        Redirect to the CPU

    Behavior: 3 (ID 102)
      -none-
```

Table 2-3 Command output

Field	Description
Behavior	Name and contents of a traffic behavior.

Field	Description
Marking	Information about priority marking.
Remark dscp	Action of setting the DSCP value for packets.
Committed Access Rate	Information about the CAR action.
Green action	Action to take on green packets.
Yellow action	Action to take on yellow packets.
Red action	Action to take on red packets.
Accounting enable	Class-based accounting action.
Filter enable	Traffic filtering action.
Redirecting	Information about traffic redirecting.
Mirroring	Information about traffic mirroring.
none	No other traffic behavior is configured.

2.2.4. filter

Use **filter** to configure a traffic filtering action in a traffic behavior.

Use **undo filter** to restore the default.

Syntax

filter { **deny** | **permit** }

undo filter

Default

No traffic filtering action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

deny: Drops packets.

permit: Transmits packets.

Examples

Configure a traffic filtering action as **deny** in traffic behavior **database**.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] filter deny
```

2.2.5. nest top-most

Use **nest top-most** to configure an outer VLAN tag adding action in a traffic behavior.

Use **undo nest top-most** to restore the default.

Syntax

nest top-most vlan *vlan-id*

undo nest top-most

Default

No outer VLAN tag adding action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

vlan-id *vlan-id*: Specifies the VLAN ID to be added in the outer VLAN tag, in the range of 1 to 4094.

Usage guidelines

If a QoS policy contains an outer VLAN tag adding action, apply it only to the incoming traffic of an interface.

If you execute the **nest top-most** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure traffic behavior **b1** to add an outer VLAN tag with VLAN ID 123.

```
<Switch> system-view
[Switch] traffic behavior b1
[Switch-behavior-b1] nest top-most vlan 123
```

2.2.6. redirect

Use **redirect** to configure a traffic redirecting action in a traffic behavior.

Use **undo redirect** to restore the default.

Syntax

redirect { **cpu** | **interface** *interface-type interface-number* }

undo redirect { **cpu** | **interface** *interface-type interface-number* }

Default

No traffic redirecting action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

cpu: Redirects traffic to the CPU.

interface *interface-type interface-number*: Redirects traffic to an interface specified by its type and number.

Usage guidelines

If you execute the **redirect** command multiple times in the same traffic behavior, the most recent configuration takes effect.

A traffic redirecting action takes effect only when the QoS policy is applied to the inbound direction.

For traffic redirecting to an access port, make sure the PVID of the interfaces to which the QoS policy is applied is the same as the PVID of the access port. Otherwise, the access port drops redirected packets.

For traffic redirecting to a trunk port, make sure the PVID of the interfaces to which the QoS policy is applied is in the allowed VLAN list of the trunk port. Otherwise, the trunk port drops redirected packets.

If a QoS policy applied to a user profile contains the **redirect interface** action, make sure the interface and the incoming interface of packets are in the same VLAN.

Examples

Configure redirecting traffic to GigabitEthernet 1/0/1 in traffic behavior **database**.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] redirect interface gigabitethernet 1/0/1
```

Related commands

classifier behavior

qos policy

traffic behavior

2.2.7. remark dot1p

Use **remark dot1p** to configure an 802.1p priority marking action or an inner-to-outer tag priority copying action in a traffic behavior.

Use **undo remark dot1p** to restore the default.

Syntax

remark [**green** | **red** | **yellow**] **dot1p** *dot1p-value*

undo remark [**green** | **red** | **yellow**] **dot1p**

remark dot1p customer-dot1p-trust

undo remark dot1p

Default

No 802.1p priority marking action or inner-to-outer tag priority copying action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

green: Specifies green packets.

red: Specifies red packets.

yellow: Specifies yellow packets.

dot1p-value: Specifies the 802.1p priority to be marked for packets, in the range of 0 to 7.

customer-dot1p-trust: Copies the 802.1p priority value in the inner VLAN tag to the outer VLAN tag.

Usage guidelines

The **remark dot1p** and **remark dot1p customer-dot1p-trust** commands override each other in the same traffic behavior. The **remark dot1p customer-dot1p-trust** command does not take effect on single-tagged packets.

If you execute the **remark dot1p** command multiple times for the same color, the most recent configuration takes effect.

An 802.1p priority marking action takes effect only when the QoS policy is applied to the inbound direction.

Examples

Configure traffic behavior **database** to mark matching traffic with 802.1p 2.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] remark dot1p 2
```

Configure an inner-to-outer tag priority copying action in traffic behavior **database**.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] remark dot1p customer-dot1p-trust
```

2.2.8. remark drop-precedence

Use **remark drop-precedence** to configure a drop priority marking action in a traffic behavior.

Use **undo remark drop-precedence** to restore the default.

Syntax

remark drop-precedence *drop-precedence-value*

undo remark drop-precedence

Default

No drop priority marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

drop-precedence-value: Specifies the drop priority to be marked for packets, in the range of 0 to 2.

Usage guidelines

A drop priority marking action takes effect only when the QoS policy is applied to the inbound direction.

If you execute the **remark drop-precedence** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure traffic behavior **database** to mark matching traffic with drop priority 2.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] remark drop-precedence 2
```

2.2.9. remark dscp

Use **remark dscp** to configure a DSCP marking action in a traffic behavior.

Use **undo remark dscp** to restore the default.

Syntax

remark [**green** | **red** | **yellow**] **dscp** *dscp-value*

undo remark [**green** | **red** | **yellow**] **dscp**

Default

No DSCP marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

green: Specifies green packets.

red: Specifies red packets.

yellow: Specifies yellow packets.

dscp-value: Specifies a DSCP value, which can be a number from 0 to 63 or a keyword in Table 2-4 .

Table 2-4 DSCP keywords and values

Keyword	DSCP value (binary)	DSCP value (decimal)
af11	001010	10
af12	001100	12
af13	001110	14
af21	010010	18
af22	010100	20
af23	010110	22
af31	011010	26
af32	011100	28
af33	011110	30
af41	100010	34

Keyword	DSCP value (binary)	DSCP value (decimal)
af42	100100	36
af43	100110	38
cs1	001000	8
cs2	010000	16
cs3	011000	24
cs4	100000	32
cs5	101000	40
cs6	110000	48
cs7	111000	56
default	000000	0
ef	101110	46

Examples

Configure traffic behavior **database** to mark matching traffic with DSCP 6.

```
<Switch> system-view
[Switch] traffic behavior database
[Switch-behavior-database] remark dscp 6
```

2.2.10. remark local-precedence

Use **remark local-precedence** to configure a local precedence marking action in a traffic behavior.

Use **undo remark local-precedence** to restore the default.

Syntax

remark local-precedence *local-precedence-value*

undo remark local-precedence

Default

No local precedence marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

local-precedence-value: Specifies the local precedence to be marked for packets, in the range of 0 to 7.

Examples

Configure traffic behavior **database** to mark matching traffic with local precedence 2.

```
<Switch> system-view
[Switch] traffic behavior database
```

```
[Switch-behavior-database] remark local-precedence 2
```

2.2.11. remark service-vlan-id

Use **remark service-vlan-id** to configure an SVLAN marking action in a traffic behavior.

Use **undo remark service-vlan-id** to restore the default.

Syntax

remark service-vlan-id *vlan-id*

undo remark service-vlan-id

Default

No SVLAN marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies an SVLAN ID in the range of 1 to 4094.

Examples

Configure traffic behavior **b1** to mark matching packets with SVLAN 222.

```
<Switch> system-view
[Switch] traffic behavior b1
[Switch-behavior-b1] remark service-vlan-id 222
```

2.2.12. traffic behavior

Use **traffic behavior** to create a traffic behavior and enter its view, or enter the view of an existing traffic behavior.

Use **undo traffic behavior** to delete a traffic behavior.

Syntax

traffic behavior *behavior-name*

undo traffic behavior *behavior-name*

Default

No traffic behaviors exist.

Views

System view

Predefined user roles

network-admin

Parameters

behavior-name: Specifies a name for the traffic behavior, a case-sensitive string of 1 to 31 characters.

Examples

Create a traffic behavior named **behavior1**.

```
<Switch> system-view
[Switch] traffic behavior behavior1
[Switch-behavior-behavior1]
```

Related commands

display traffic behavior

2.3. QoS policy commands

2.3.1. classifier behavior

Use **classifier behavior** to associate a traffic behavior with a traffic class in a QoS policy.

Use **undo classifier** to delete a class-behavior association from a QoS policy.

Syntax

classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]

undo classifier *classifier-name*

Default

No traffic behavior is associated with a traffic class.

Views

QoS policy view

Predefined user roles

network-admin

Parameters

classifier-name: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters.

behavior-name: Specifies a traffic behavior by its name, a case-sensitive string of 1 to 31 characters.

insert-before *before-classifier-name*: Inserts the new traffic class before an existing traffic class in the QoS policy. The *before-classifier-name* argument specifies an existing traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify the **insert-before** *before-classifier-name* option, the new traffic class is placed at the end of the QoS policy.

Usage guidelines

A traffic class can be associated only with one traffic behavior in a QoS policy.

If the specified traffic class or traffic behavior does not exist, the system defines a null traffic class or traffic behavior.

Examples

Associate traffic class **database** with traffic behavior **test** in QoS policy **user1**.

```
<Switch> system-view
[Switch] qos policy user1
```

```
[Switch-qospolicy-user1] classifier database behavior test
```

Associate traffic class **database** with traffic behavior **test** in QoS policy **user1**, and insert traffic class **database** before an existing traffic class named **class-a**.

```
<Switch> system-view
[Switch] qos policy user1
[Switch-qospolicy-user1] classifier database behavior test insert-before class-a
```

Related commands

qos policy

2.3.2. display qos policy

Use **display qos policy** to display QoS policies.

Syntax

display qos policy user-defined [*policy-name* [**classifier** *classifier-name*]] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

user-defined: Specifies user-defined QoS policies.

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a QoS policy, this command displays all user-defined QoS policies.

classifier *classifier-name*: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic class, this command displays all traffic classes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the QoS policies for the master device.

Examples

Display all user-defined QoS policies.

```
<Switch> display qos policy user-defined

  User-defined QoS policy information:

  Policy: 1 (ID 100)
   Classifier: 1 (ID 100)
     Behavior: 1
      Marking:
        Remark dscp 3
      Committed Access Rate:
        CIR 112 (kbps), CBS 51200 (Bytes), EBS 512 (Bytes)
        Green action  : pass
        Yellow action : pass
```

```
      Red action    : discard
  Classifier: 2 (ID 101)
    Behavior: 2
     Accounting enable: Packet
     Filter enable: Permit
     Marking:
       Remark dot1p 4
  Classifier: 3 (ID 102)
    Behavior: 3
     -none-
```

Table 2-5 Command output

Field	Description
User-defined QoS policy information	Information about a user-defined QoS policy.
System-defined QoS policy information	Information about a system-defined QoS policy.
Policy	QoS policy name.

For the description of other fields, see Table 2-1 and Table 2-3 .

2.3.3. display qos policy global

Use **display qos policy global** to display QoS policies applied globally.

Syntax

display qos policy global [**slot** *slot-number*] [**inbound** | **outbound**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inbound: Specifies the QoS policy applied in the inbound direction.

outbound: Specifies the QoS policy applied in the outbound direction.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays global QoS policies for the master device.

Usage guidelines

If you do not specify a direction, this command displays both inbound and outbound global QoS policies.

Examples

Display QoS policies applied globally.

```
<Switch> display qos policy global
  Direction: Inbound
  Policy: 1
```

```
Classifier: 1
  Operator: AND
  Rule(s) :
   If-match acl 2000
  Behavior: 1
   Marking:
     Remark dscp 3
   Committed Access Rate:

  Behavior: 2
   Accounting enable:
     0 (Packets)
   Filter enable: Permit
   Marking:
     Remark dscp 3
Classifier: 3
  Operator: AND
  Rule(s) :
   -none-
  Behavior: 3
   -none-
```

Table 2-6 Command output

Field	Description
Direction	Direction in which the QoS policy is applied.
Green packets	Statistics about green packets.
Yellow packets	Statistics about yellow packets.
Red packets	Statistics about red packets.

For the description of other fields, see Table 2-1 and Table 2-3 .

2.3.4. display qos policy interface

Use **display qos policy interface** to display the QoS policies applied to interfaces.

Syntax

display qos policy interface [*interface-type interface-number*] [**inbound** | **outbound**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

inbound: Specifies the QoS policy applied to incoming traffic.

outbound: Specifies the QoS policy applied to outgoing traffic.

Usage guidelines

If you do not specify a direction, this command displays the QoS policy applied to incoming traffic and the QoS policy applied to outgoing traffic.

Examples

Display the QoS policy applied to the incoming traffic of GigabitEthernet 1/0/1.

```
<Switch> display qos policy interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: 1
   Classifier: 1
     Matched : 0 (Packets) 0 (Bytes)
     5-minute statistics:
      Forwarded: 0/0 (pps/bps)
      Dropped  : 0/0 (pps/bps)
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: 1
      Marking:
        Remark dscp 3

       Green packets : 0(Packets)
       Red packets   : 0 (Packets)

Interface: GigabitEthernet1/0/3
  Direction: Inbound
  Policy: a
   Classifier: a
     Operator: AND
     Rule(s) :
      If-match any
     Behavior: a
      Mirroring:
        Mirror to the interface: GigabitEthernet1/0/4
      Committed Access Rate:
        CIR 112 (kbps), CBS 51200 (Bytes), EBS 0 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard
        Green packets : 0 (Packets)
        Red packets   : 0 (Packets)
```

Table 2-7 Command output

Field	Description
Direction	Direction in which the QoS policy is applied.
Policy	QoS policy name.
Matched	Number of matching packets.
Forwarded	Average rate of successfully forwarded matching packets in a statistics collection period.
Dropped	Average rate of dropped matching packets in a statistics collection period.
Green packets	Traffic statistics for green packets.
Yellow packets	Traffic statistics for yellow packets.
Red packets	Traffic statistics for red packets.

For the description of other fields, see Table 2-1 and Table 2-3 .

2.3.5. display qos vlan-policy

Use **display qos vlan-policy** to display QoS policies applied to VLANs.

Syntax

display qos vlan-policy { **name** *policy-name* | **vlan** [*vlan-id*] } [**slot** *slot-number*] [**inbound** | **outbound**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *policy-name*: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

inbound: Displays QoS policies applied to incoming traffic.

outbound: Displays QoS policies applied to outgoing traffic.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays QoS policies applied to VLANs for the master device.

Usage guidelines

If you do not specify a direction, this command displays QoS policies applied to VLANs in both the inbound and outbound directions.

Examples

Display QoS policies applied to VLAN 2.

```
<Switch> display qos vlan-policy vlan 2
Vlan 2
  Direction: Inbound
  Policy: 1
   Classifier: 1
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: 1
      Marking:
        Remark dscp 3
      Committed Access Rate:
        CIR 112 (kbps), CBS 5120 (Bytes), EBS 512 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard
        Green packets : 0 (Packets) 0 (Bytes)
        Yellow packets: 0 (Packets) 0 (Bytes)
        Red packets   : 0 (Packets) 0 (Bytes)
   Classifier: 2
     Operator: AND
     Rule(s) :
      If-match protocol ipv6
```

```
    Behavior: 2
     Accounting enable:
       0 (Packets)
     Filter enable: Permit
     Marking:
       Remark dscp 3
  Classifier: 3
    Operator: AND
    Rule(s) :
     -none-
    Behavior: 3
     -none-
```

Table 2-8 Command output

Field	Description
Direction	Direction in which the QoS policy is applied.
Green packets	Statistics about green packets.
Yellow packets	Statistics about yellow packets.
Red packets	Statistics about red packets.

For the description of other fields, see Table 2-1 and Table 2-3 .

2.3.6. qos apply policy (interface view)

Use **qos apply policy** to apply a QoS policy to an interface.

Use **undo qos apply policy** to remove an applied QoS policy.

Syntax

qos apply policy *policy-name* { **inbound** | **outbound** }

undo qos apply policy *policy-name* { **inbound** | **outbound** }

Default

No QoS policy is applied.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters.

inbound: Applies the QoS policy to incoming traffic.

outbound: Applies the QoS policy to outgoing traffic.

Examples

Apply QoS policy **USER1** to the outgoing traffic of GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos apply policy USER1 outbound
```

2.3.7. qos apply policy global

Use **qos apply policy global** to apply a QoS policy globally.

Use **undo qos apply policy global** to remove a globally applied QoS policy.

Syntax

qos apply policy *policy-name* **global** { **inbound** | **outbound** }

undo qos apply policy *policy-name* **global** { **inbound** | **outbound** }

Default

No QoS policy is applied globally.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters.

inbound: Applies the QoS policy to the incoming packets on all interfaces.

outbound: Applies the QoS policy to the outgoing packets on all interfaces.

Usage guidelines

A global QoS policy takes effect on all incoming or outgoing traffic depending on the direction in which the QoS policy is applied.

Examples

Globally apply QoS policy **user1** to the incoming traffic.

```
<Switch> system-view
[Switch] qos apply policy user1 global inbound
```

2.3.8. qos policy

Use **qos policy** to create a QoS policy and enter its view, or enter the view of an existing QoS policy.

Use **undo qos policy** to delete a QoS policy.

Syntax

qos policy *policy-name*

undo qos policy *policy-name*

Default

No QoS policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a name for the QoS policy, a case-sensitive string of 1 to 31 characters.

Usage guidelines

To delete a QoS policy that has been applied to an object, you must first remove the QoS policy from the object.

Examples

Create a QoS policy named **user1**.

```
<Switch> system-view
[Switch] qos policy user1
[Switch-qospolicy-user1]
```

Related commands

classifier behavior

qos apply policy

qos apply policy global

qos vlan-policy

NOTE:

- This command and **packet-filter** command cannot use on a same port.
- The **mirror-to** command cannot use on an **outbound** port.

2.3.9. qos vlan-policy

Use **qos vlan-policy** to apply a QoS policy to the specified VLANs.

Use **undo qos vlan-policy** to remove a QoS policy from the specified VLANs.

Syntax

qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** }

undo qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** }

Default

No QoS policy is applied to a VLAN.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters.

vlan *vlan-id-list*: Specifies a space-separated list of up to eight VLAN IDs or a VLAN ID range in the form of *vlan-id1* **to** *vlan-id2*. The value for *vlan-id2* must be greater than or equal to the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

inbound: Applies the QoS policy to incoming packets.

outbound: Applies the QoS policy to outgoing packets.

Examples

Apply QoS policy **test** to the incoming traffic of VLAN 200, VLAN 300, VLAN 400, and VLAN 500.

```
<Switch> system-view
[Switch] qos vlan-policy test vlan 200 300 400 500 inbound
```

2.3.10. reset qos policy global

Use **reset qos policy global** to clear the statistics of a global QoS policy.

Syntax

reset qos policy global [**inbound** | **outbound**]

Views

User view

Predefined user roles

network-admin

Parameters

inbound: Clears the statistics of the global QoS policy applied to incoming traffic globally.

outbound: Clears the statistics of the global QoS policy applied to outgoing traffic globally.

Usage guidelines

If you do not specify a direction, this command clears the statistics of the global QoS policies in both directions.

Examples

Clear the statistics of the global QoS policy applied to the incoming traffic globally.

```
<Switch> reset qos policy global inbound
```

2.3.11. reset qos vlan-policy

Use **reset qos vlan-policy** to clear the statistics for QoS policies applied to VLANs.

Syntax

reset qos vlan-policy [**vlan** *vlan-id*] [**inbound** | **outbound**]

Views

User view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

inbound: Specifies the QoS policy applied to incoming traffic.

outbound: Specifies the QoS policy applied to outgoing traffic.

Usage guidelines

If you do not specify a direction, this command clears the statistics of the QoS policies in both directions of the VLAN.

Examples

Clear the statistics of QoS policies applied to VLAN 2.

```
<Switch> reset qos vlan-policy vlan 2
```

3. Priority mapping commands

3.1. Priority map commands

3.1.1. display qos map-table

Use **display qos map-table** to display the configuration of priority maps.

Syntax

display qos map-table [**dot1p-lp** | **dscp-dot1p** | **dscp-dscp**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

The device provides the following types of priority map.

Table 3-1 Priority maps

Priority mapping	Description
dot1p-lp	802.1p-local priority map.
dscp-dot1p	DSCP-802.1p priority map.
dscp-dscp	DSCP-DSCP priority map.

Usage guidelines

If you do not specify a priority map, this command displays the configuration of all priority maps.

Examples

Display the configuration of the 802.1p-local priority map.

```
<Switch> display qos map-table dot1p-lp
MAP-TABLE NAME: dot1p-lp   TYPE: pre-define
IMPORT  :  EXPORT
   0    :    2
   1    :    0
   2    :    1
   3    :    3
   4    :    4
   5    :    5
   6    :    6
   7    :    7
```

Table 3-2 Command output

Field	Description
MAP-TABLE NAME	Name of the priority map.
TYPE	Type of the priority map.
IMPORT	Input values of the priority map.
EXPORT	Output values of the priority map.

3.1.2. import

Use **import** to configure mappings for a priority map.

Use **undo import** to restore the specified or all mappings to the default for a priority map.

Syntax

import *import-value-list* **export** *export-value*

undo import { *import-value-list* | **all** }

Default

The default priority maps are used. For more information, see *ACL and QoS Configuration Guide*.

Views

Priority map view

Predefined user roles

network-admin

Parameters

import-value-list: Specifies a list of input values.

export-value: Specifies the output value.

all: Restores all mappings in the priority map to the default.

Examples

Configure the 802.1p-local priority map to map 802.1p priority values 4 and 5 to local priority 1.

```
<Switch> system-view
[Switch] qos map-table dot1p-lp
[Switch-maptbl-dot1p-lp] import 4 5 export 1
```

Related commands

display qos map-table

3.1.3. qos map-table

Use **qos map-table** to enter the specified priority map view.

Syntax

qos map-table { **dot1p-lp** | **dscp-dot1p** | **dscp-dscp** }

Views

System view

Predefined user roles

network-admin

Parameters

For the description of the keywords, see Table 3-1 .

Examples

Enter 802.1p-local priority map view.

```
<Switch> system-view
[Switch] qos map-table dot1p-lp
[Switch-maptbl-dot1p-lp]
```

Related commands

display qos map-table

import

3.2. Priority trust mode commands

3.2.1. display qos trust interface

Use **display qos trust interface** to display the priority trust mode and port priorities of an interface.

Syntax

display qos trust interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the priority trust mode and port priorities of all interfaces.

Examples

Display the priority trust mode and port priority of GigabitEthernet 1/0/1.

```
<Switch> display qos trust interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
 Port priority trust information
  Port priority:4
  Port priority trust type: dscp
```

Table 3-3 Command output

Field	Description
Interface	Interface type and interface number.

Field	Description
Port priority	Port priority set for the interface.
Port priority trust type	Priority trust mode on the interface: • **dot1p**—Uses the 802.1p priority of received packets for mapping. • **dscp**—Uses the DSCP precedence of received IP packets for mapping. • **none**—Trusts no packet priority.

3.2.2. qos trust

Use **qos trust** to configure the priority trust mode for an interface.

Use **undo qos trust** to restore the default.

Syntax

qos trust { **dot1p** | **dscp** }

undo qos trust

Default

An interface does not trust any packet priority and uses the port priority as the 802.1p priority for mapping.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

dot1p: Uses the 802.1p priority in incoming packets for priority mapping.

dscp: Uses the DSCP value in incoming packets for priority mapping.

Examples

Set the priority trust mode to 802.1p priority on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos trust dot1p
```

Related commands

display qos trust interface

3.3. Port priority commands

3.3.1. qos priority

Use **qos priority** to change the port priority of an interface.

Use **undo qos priority** to restore the default.

Syntax

qos priority *priority-value*

undo qos priority

Default

The port priority is 0.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

priority-value: Specifies a port priority value in the range of 0 to 7.

Examples

Set the port priority of GigabitEthernet 1/0/1 to 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos priority 2
```

4. GTS and rate limit commands

4.1. GTS commands

4.1.1. display qos gts interface

Use **display qos gts interface** to display the GTS configuration and statistics for interfaces.

Syntax

display qos gts interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the GTS configuration and statistics for all interfaces.

Examples

Display the GTS configuration and statistics for all interfaces.

```
<Switch> display qos gts interface
Interface: GigabitEthernet1/0/1
 Rule: If-match queue 1
  CIR 512 (kbps), CBS 51200 (Bytes)
```

Table 4-1 Command output

Field	Description
Interface	Interface name, including the interface type and interface number.
Rule	Match criteria.
CIR	CIR in kbps.
CBS	CBS in bytes.

4.1.2. qos gts

Use **qos gts** to set GTS parameters on an interface.

Use **undo qos gts** to delete the GTS configuration on an interface.

Syntax

qos gts queue *queue-id* **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

undo qos gts queue *queue-id*

Default

No GTS parameters are configured.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

queue *queue-id*: Shapes the packets in a queue specified by its ID. The value range for *queue-id* is 0 to 7.

cir *committed-information-rate*: Specifies the CIR in kbps. The value range for *committed-information-rate* is 1000 to 1048576 for GE interfaces and 1000 to 10485760 for 10-GE interfaces.

cbs *committed-burst-size*: Specifies the CBS in bytes. The value range for *committed-burst-size* is 512 to 16777216, in increments of 512. The default value for this argument is the product of 62.5 and the CIR and must be an integral multiple of 512. When the product is not an integral multiple of 512, it is rounded up to the nearest integral multiple of 512 that is greater than the product. A default value greater than 16777216 is converted to 16777216.

Examples

Shape the packets of queue 1 on GigabitEthernet 1/0/1. The GTS parameters are as follows:

- The CIR is 6400 kbps.
- The CBS is 51200 bytes.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos gts queue 1 cir 6400 cbs 51200
```

4.2. Rate limit commands

4.2.1. display qos lr interface

Use **display qos lr interface** to display the rate limit configuration for interfaces.

Syntax

display qos lr interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the rate limit configuration for all interfaces.

Examples

Display the rate limit configuration for all interfaces.

```
<Switch> display qos lr interface
Interface: GigabitEthernet1/0/1
 Direction: Outbound
  CIR 2000 (kbps), CBS 20480 (Bytes)
```

Table 4-2 Command output

Field	Description
Interface	Interface name, including the interface type and interface number.
Direction	Direction in which the rate limit configuration is applied.
CIR	CIR in kbps.
CBS	CBS in bytes.

4.2.2. qos lr

Use **qos lr** to configure rate limiting on an interface.

Use **undo qos lr** to delete the rate limit configuration on an interface.

Syntax

qos lr { **inbound** | **outbound** } **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

undo qos lr { **inbound** | **outbound** }

Default

No rate limit is configured.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

inbound: Limits the rate of incoming packets.

outbound: Limits the rate of outgoing packets.

cir *committed-information-rate*: Specifies the CIR in kbps. The value range for *committed-information-rate* is 1000 to 1048576 for GE interfaces and 1000 to 10485760 for 10-GE interfaces.

cbs *committed-burst-size*: Specifies the CBS in bytes. The value range for *committed-burst-size* is 512 to 134217728, in increments of 512. The default value for this argument is the product of 62.5 and the CIR and must be an integral multiple of 512. When the product is not an integral multiple of 512, it is rounded up to the nearest integral multiple of 512 that is greater than the product. A default value greater than 134217728 is converted to 134217728.

Examples

Limit the rate of outgoing packets on GigabitEthernet 1/0/1, with CIR 256 kbps and CBS 51200 bytes.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] qos lr outbound cir 256 cbs 51200
```

5.1.1. display qos queue sp interface

Use **display qos queue sp interface** to display the SP queuing configuration of an interface.

Syntax

display qos queue sp interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the SP queuing configuration of all interfaces.

Examples

Display the SP queuing configuration of GigabitEthernet 1/0/1.

```
<Switch> display qos queue sp interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
 Output queue: Strict Priority queuing
```

Table 5-1 Command output

Field	Description
Interface	Interface type and interface number.
Output queue	Type of the current output queue.

5.1.2. qos sp

Use **qos sp** to enable SP queuing on an interface.

Use **undo qos sp** to restore the default.

Syntax

qos sp

undo qos sp

Default

An interface uses packet-count WRR queuing.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable SP queuing on GigabitEthernet 1/0/1.

```
<Switch> system-view

5.2. WRR commands

5.2.1. display qos queue wrr interface

Use **display qos queue wrr interface** to display the WRR queuing configuration of an interface.

Syntax

display qos queue wrr interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the WRR queuing configuration of all interfaces.

Examples

Display the WRR queuing configuration of GigabitEthernet 1/0/1.

```
<Switch> display qos queue wrr interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
 Output queue: Weighted Round Robin queuing
 Queue ID        Queue name      Group           Weight
 ------------------------------------------------------
 0               be              1               1
 1               af1             1               1
 2               af2             1               1
 3               af3             1               1
 4               af4             1               1
 5               ef              1               1
 6               cs6             1               1
 7               cs7             sp              N/A
```

Table 5-2 Command output

Field	Description
Interface	Interface type and interface number.
Output queue	Type of the current output queue.
Group	ID of the group a queue is assigned to. The group ID can only be 1.
Weight	Packet-count queue scheduling weight of a queue. N/A is displayed for a queue that uses the SP scheduling algorithm.

5.2.2. qos wrr

Use **qos wrr** to enable WRR queuing on an interface.

Use **undo qos wrr** to restore the default.

Syntax

qos wrr weight

undo qos wrr weight

Default

An interface uses packet-count WRR queuing.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

weight: Allocates bandwidth to queues in packets.

Usage guidelines

You must use the **qos wrr** command to enable WRR queuing before you can configure WRR queuing parameters for a queue on an interface.

Examples

Enable packet-count WRR queuing on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos wrr weight
```

Related commands

display qos queue wrr interface

5.2.3. qos wrr weight

Use **qos wrr weight** to configure the WRR queuing parameters for a queue on an interface.

Use **undo qos wrr** to restore the default.

Syntax

qos wrr *queue-id* **group 1 weight** *schedule-value*

undo qos wrr *queue-id*

Default

All queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

queue-id: Specifies a queue by its ID. The value range for this argument is 0 to 7 or keywords in Table 5-3 .

Table 5-3 The number-keyword map for the queue-id argument

Number	Keyword
0	be
1	af1
2	af2
3	af3
4	af4
5	ef
6	cs6
7	cs7

group 1: Specifies WRR group 1. Only WRR group 1 is supported in the current software version.

weight: Allocates bandwidth to queues in packets.

schedule-value: Specifies a scheduling weight in the range of 1 to 15.

Usage guidelines

You must use the **qos wrr** command to enable WRR queuing before you can configure WRR queuing parameters for a queue on an interface.

Examples

Enable packet-based WRR queuing on GigabitEthernet 1/0/1, assign queue 0 to WRR group 1, and specify scheduling weight 10 for queue 0.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos wrr weight
[Switch-GigabitEthernet1/0/1] qos wrr 0 group 1 weight 10
```

Related commands

display qos queue wrr interface

qos wrr

5.2.4. qos wrr group sp

Use **qos wrr group sp** to assign a queue to the SP group.

Use **undo qos wrr group sp** to remove a queue from the SP group.

Syntax

qos wrr *queue-id* **group sp**

undo qos wrr *queue-id*

Default

All queues on a WRR-enabled interface are in WRR group 1.

Views

Layer 2/Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

queue-id: Specifies a queue by its ID. The value range for this argument is 0 to 7 or keywords in Table 5-3 .

Usage guidelines

This command is available only on a WRR-enabled interface. Queues in the SP group are scheduled with SP. The SP group has higher scheduling priority than the WRR groups.

You must use the **qos wrr** command to enable WRR queuing before you can configure this command on an interface.

Examples

Enable WRR queuing on GigabitEthernet 1/0/1, and assign queue 0 to the SP group.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qos wrr weight
[Switch-GigabitEthernet1/0/1] qos wrr 0 group sp
```

Related commands

display qos queue wrr interface

qos wrr

5.3. Queue-based accounting commands

5.3.1. display qos queue-statistics interface outbound

Use **display qos queue-statistics interface outbound** to display queue-based outgoing traffic statistics for interfaces.

Syntax

display qos queue-statistics interface [*interface-type interface-number*] **outbound**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the queue-based outgoing traffic statistics for all interfaces.

Examples

Display queue-based outgoing traffic statistics for GigabitEthernet 1/0/1.

```
<Switch> display qos queue-statistics interface gigabitethernet 1/0/1 outbound
Interface: GigabitEthernet1/0/1
 Direction: outbound
 Forwarded: 0 packets, 0 bytes
 Dropped: 0 packets, 0 bytes
 Queue 0
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 1
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 2
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 3
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 4
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 5
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 6
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
  Dropped: 0 packets, 0 bytes
  Current queue length: 0 packets
 Queue 7
  Forwarded: 0 packets, 0 bytes, 0 pps, 0 bps
```

```
Dropped: 0 packets, 0 bytes
Current queue length: 0 packets
```

Table 5-4 Command output

Field	Description
Interface	Interface for which queue-based traffic statistics are displayed.
Direction	Direction of traffic for which statistics are collected.
Forwarded	Counts forwarded traffic both in packets and in bytes.
Dropped	Counts dropped traffic both in packets and in bytes.
Current queue length	Number of packets in the queue.

6. Data buffer commands 6-1
6.1. Data buffer commands 6-1
6.1.1. buffer apply 6-1
6.1.2. buffer shared 6-1
6.1.3. burst-mode enable 6-2
6.1.4. display buffer 6-3

6. Data buffer commands

6.1. Data buffer commands

6.1.1. buffer apply

Use **buffer apply** to apply manually configured data buffer settings.

Use **undo buffer apply** to restore the default.

Syntax

buffer apply

undo buffer apply

Views

System view

Predefined user roles

network-admin

Usage guidelines

For data buffer settings to take effect, you must execute this command after configuring data buffer settings.

After applying manually configured data buffer settings, you cannot directly modify the applied settings. To modify them, you must cancel the application, reconfigure data buffer settings, and reapply the new settings.

Examples

Apply manually configured data buffer settings.

```
<Switch> system-view
[Switch] buffer apply
```

NOTE:

buffer apply command is supported from later software, including Version 7.3.24.

6.1.2. buffer shared

Use **buffer shared** to set the maximum shared-area ratio for each port or a queue.

Use **undo buffer shared** to delete the maximum shared-area ratio setting of each port or a queue.

Syntax

buffer egress [**slot** *slot-number*] **cell** [**queue** *queue-id*] **shared ratio** *ratio*

undo buffer egress [**slot** *slot-number*] **cell** [**queue** *queue-id*] **shared**

Default

The maximum cell resource ratio for a port is 33% of the total cell resources.

The maximum cell resource ratio for a queue is 33% of the total cell resources.

Views

System view

Predefined user roles

network-admin

Parameters

egress: Specifies the egress buffer.

slot *slot-number*: Specifies an IRF member device by its member ID (slot number). If you do not specify an IRF member device, this command applies to all IRF member devices.

cell: Specifies cell resources.

queue-id: Specifies a queue by its ID in the range of 0 to 7.

ratio *ratio*: Specifies the maximum shared-area space ratio, in percentage. The value range for *ratio* is 0 to 100.

Usage guidelines

By default, all ports or queueshave an equal share of the shared area. You can set the shared-area ratio for each port or a queue. The unconfigured queues use the default setting. The shared-area space for each port or queue is finally determined by the chip based on your configuration and the number of packets to be received and sent.

Examples

Configure queue 0 to use up to 10% shared-area space of cell resources in the egress buffer.

```
<Switch> system-view
[Switch] buffer egress cell queue 0 shared ratio 4
```

NOTE:

- **buffer shared** command is supported from later software, including Version 7.3.24.
- NEC recommends that you use this command for only QoS Congestion management such as SP queuing, and NEC recommends the following parameters:

  buffer egress cell queue 7 shared ratio 4
  buffer egress cell queue 6 shared ratio 4
  buffer egress cell queue 5 shared ratio 4
  buffer egress cell queue 4 shared ratio 4
  buffer egress cell queue 3 shared ratio 4
  buffer egress cell queue 2 shared ratio 4
  buffer egress cell queue 1 shared ratio 4
  buffer egress cell queue 0 shared ratio 4
- Inappropriate data buffer changes can cause system problems. Before manually changing data buffer settings, make sure you understand its impact on your device. NEC recommends testing before manually changing to other parameters.

6.1.3. burst-mode enable

Use **burst-mode enable** to enable the Burst feature.

Use **undo burst-mode enable** to disable the Burst feature.

Syntax

burst-mode enable

undo burst-mode enable

Default

The Burst feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The Burst feature is especially useful for reducing packet losses under the following circumstances:

- Broadcast or multicast traffic is intensive, resulting in bursts of traffic.
- Traffic enters a device from a high-speed interface and goes out of a low-speed interface.
- Traffic enters a device from multiple same-rate interfaces and goes out of an interface with the same rate.

Examples

Enable the Burst feature.

```
<Switch> system-view
[Switch] burst-mode enable
```

6.1.4. display buffer

Use **display buffer** to display buffer size settings.

Syntax

display buffer [**slot** *slot-number*][**queue** [*queue-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID (slot number). If you do not specify an IRF member device, this command displays buffer size settings for all IRF member devices.

queue *queue-id*: Specifies a queue by its number in the range of 0 to 7. If you specify a queue, this command displays the fixed-area ratio and shared-area ratio for the specified queue. If you specify the **queue** keyword without the *queue-id* argument, this command displays the fixed-area ratio and shared-area ratio for each queue. If you do not specify the **queue** keyword, this command displays the total shared-area ratio.

Examples

Display buffer size settings.

```
<Switch> display buffer
Slot  Type    Eg(Total-shared , Shared)
1     cell    77 , 33

          Eg: Size of the sending buffer
Total-shared: Size of the shared buffer for all ports
      Shared: Size of the maximum shared buffer per port
        Unit: Ratio
```

Display the fixed-area ratio and shared-area ratio for the queues.

```
<Switch> display buffer queue
Slot  Queue        Type    Eg(Guaranteed , Shared)
1     0-7          cell    12 , 10

          Eg: Size of the sending buffer
  Guaranteed: Size of the minimum guaranteed buffer per queue
      Shared: Size of the maximum shared buffer per queue
        Unit: Ratio
```

Table 6-1 Command output

Field	Description
Type	Resource type.
Queue	Queue ID in the range of 0 to 7.
Eg	Egress buffer.
(Total-shared , Shared)	Total-shared indicates the total shared-area ratio. Shared indicates the shared-area ratio of a port.
(Guaranteed , Shared)	• **Guaranteed** indicates the fixed-area ratio of a queue. • **Shared** indicates the shared-area ratio of a queue.

NOTE:

display buffer command is supported from later software, including Version 7.3.24.

7.1.1. display time-range 7-1
7.1.2. time-range 7-1

7. Time range commands

7.1. Time range commands

7.1.1. display time-range

Use **display time-range** to display time range configuration and status.

Syntax

display time-range { *time-range-name* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

time-range-name: Specifies a time range name, a case-insensitive string of 1 to 32 characters. It must start with an English letter.

all: Displays the configuration and status of all existing time ranges.

Examples

Display the configuration and status of time range **t4**.

```
<Switch> display time-range t4
Current time is 17:12:34 11/23/2010 Tuesday

Time-range : t4 (Inactive)
 10:00 to 12:00 Mon
 14:00 to 16:00 Wed
 from 00:00 1/1/2011 to 00:00 1/1/2012
 from 00:00 6/1/2011 to 00:00 7/1/2011
```

Table 7-1 Command output

Field	Description
Current time	Current system time.
Time-range	Configuration and status of the time range, including its name, status (active or inactive), and start time and end time.

7.1.2. time-range

Use **time-range** to create or edit a time range.

Use **undo time-range** to delete a time range or a statement in the time range.

Syntax

time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

undo time-range *time-range-name* [*start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2*]

Default

No time ranges exist.

Views

System view

Predefined user roles

network-admin

Parameters

time-range-name: Specifies a time range name. The name is a case-insensitive string of 1 to 32 characters. It must start with an English letter. To avoid confusion, it cannot be **all**.

start-time **to** *end-time*: Specifies a periodic statement. Both *start-time* and *end-time* are in hh:mm format (24-hour clock). The value is in the range of 00:00 to 23:59 for the start time, and 00:00 to 24:00 for the end time. The end time must be greater than the start time.

days: Specifies the day or days of the week (in words or digits) on which the periodic statement is valid. If you specify multiple values, separate each value with a space, and make sure they do not overlap. These values can take one of the following forms:

- A digit in the range of 0 to 6, for Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.
- A day of a week in abbreviated words: **Sun**, **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, and **Sat**.
- **working-day** for Monday through Friday.
- **off-day** for Saturday and Sunday.
- **daily** for the whole week.

from *time1 date1*: Specifies the start time and date of an absolute statement. The *time1* argument specifies the time of the day in hh:mm format (24-hour clock). Its value is in the range of 00:00 to 23:59. The *date1* argument specifies a date in MM/DD/YYYY or YYYY/MM/DD format, where MM is the month of the year in the range of 1 to 12, DD is the day of the month with the range varying by MM, and YYYY is the year in the calendar in the range of 1970 to 2100. If you do not specify this option, the start time is 01/01/1970 00:00 AM, the earliest time available in the system.

to *time2 date2*: Specifies the end time and date of the absolute time statement. The *time2* argument has the same format as the *time1* argument, but its value is in the range of 00:00 to 24:00. The *date2* argument has the same format and value range as the *date1* argument. The end time must be greater than the start time. If you do not specify this option, the end time is 12/31/2100 24:00 PM, the maximum time available in the system.

Usage guidelines

If an existing time range name is provided, this command adds a statement to the time range.

You can create multiple statements in a time range. Each time statement can take one of the following forms:

- Periodic statement in the *start-time* **to** *end-time days* format. A periodic statement recurs periodically on a day or days of the week.

- Absolute statement in the **from** *time1 date1* **to** *time2 date2* format. An absolute statement does not recur.
- Compound statement in the *start-time* **to** *end-time days* **from** *time1 date1* **to** *time2 date2* format. A compound statement recurs on a day or days of the week only within the specified period. For example, to create a time range that is active from 08:00 to 12:00 on Monday between January 1, 2015, 00:00 and December 31, 2015, 23:59, use the **time-range test 08:00 to 12:00 Mon from 00:00 01/01/2015 to 23:59 12/31/2015** command.

You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements. The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Examples

Create a periodic time range **t1**, setting it to be active between 8:00 to 18:00 during working days.

```
<Switch> system-view
[Switch] time-range t1 08:00 to 18:00 working-day
```

Create an absolute time range **t2**, setting it to be active in the whole year of 2011.

```
<Switch> system-view
[Switch] time-range t2 from 00:00 1/1/2011 to 24:00 12/31/2011
```

Create a compound time range **t3**, setting it to be active from 08:00 to 12:00 on Saturdays and Sundays of the year 2011.

```
<Switch> system-view
[Switch] time-range t3 08:00 to 12:00 off-day from 00:00 1/1/2011 to 24:00 12/31/2011
```

Create a compound time range **t4**, setting it to be active from 10:00 to 12:00 on Mondays and from 14:00 to 16:00 on Wednesdays in January and June of the year 2011.

```
<Switch> system-view
[Switch] time-range t4 10:00 to 12:00 1 from 00:00 1/1/2011 to 24:00 1/31/2011
[Switch] time-range t4 14:00 to 16:00 3 from 00:00 6/1/2011 to 24:00 6/30/2011
```

1. AAA commands

1.1. General AAA commands

1.1.1. aaa session-limit

Use **aaa session-limit** to set the maximum number of concurrent users that can log on to the device through the specified method.

Use **undo aaa session-limit** to restore the default maximum number of concurrent users for the specified login method.

Syntax

aaa session-limit { **ftp** | **http** | **https** | **ssh** | **telnet** } *max-sessions*

undo aaa session-limit { **ftp** | **http** | **https** | **ssh** | **telnet** }

Default

The maximum number of concurrent users is 32 for each user type.

Views

System view

Predefined user roles

network-admin

Parameters

ftp: FTP users.

http: HTTP users.

https: HTTPS users.

ssh: SSH users.

telnet: Telnet users.

max-sessions: Specifies the maximum number of concurrent login users. The value range is 1 to 32 for FTP, SSH, and Telnet services, and is 1 to 64 for HTTP and HTTPS services.

Usage guidelines

After the maximum number of concurrent login users for a user type exceeds the upper limit, the system denies the subsequent users of this type.

Examples

Set the maximum number of concurrent FTP users to 4.

```
<Switch> system-view
[Switch] aaa session-limit ftp 4
```

1.1.2. accounting default

Use **accounting default** to specify default accounting methods for an ISP domain.

Use **undo accounting default** to restore the default.

Syntax

accounting default { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo accounting default

Default

The default accounting method of an ISP domain is local.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local accounting.

none: Does not perform accounting.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

The default accounting method is used for all users that support this method and do not have an accounting method configured.

Local accounting is only used for monitoring and controlling the number of local user connections. It does not provide the statistics function that the accounting feature generally provides.

You can specify one primary default accounting method and multiple backup default accounting methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **accounting default radius-scheme** *radius-scheme-name* **local none** command specifies the primary default RADIUS accounting method and two backup methods (local accounting and no accounting). The device performs RADIUS accounting by default and performs local accounting when the RADIUS server is invalid. The device does not perform accounting when both of the previous methods are invalid.

Examples

In ISP domain **test**, use RADIUS scheme **rd** as the primary default accounting method and use local accounting as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting default radius-scheme rd local
```

Related commands

local-user

radius scheme

1.1.3. accounting lan-access

Use **accounting lan-access** to specify accounting methods for LAN users.

Use **undo accounting lan-access** to restore the default.

Syntax

accounting lan-access { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo accounting lan-access

Default

The default accounting methods of the ISP domain are used for LAN users.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local accounting.

none: Does not perform accounting.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

You can specify one primary accounting method and multiple backup accounting methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **accounting lan-access radius-scheme** *radius-scheme-name* **local none** command specifies a primary RADIUS accounting method and two backup methods (local accounting and no accounting). The device performs RADIUS accounting by default and performs local accounting when the RADIUS server is invalid. The device does not perform accounting when both of the previous methods are invalid.

Examples

In ISP domain **test**, perform local accounting for LAN users.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting lan-access local
```

In ISP domain **test**, perform RADIUS accounting for LAN users based on scheme **rd** and use local accounting as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting lan-access radius-scheme rd local
```

Related commands

accounting default

local-user

radius scheme

1.1.4. accounting login

Use **accounting login** to specify accounting methods for login users.

Use **undo accounting login** to restore the default.

Syntax

accounting login { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo accounting login

Default

The default accounting methods of the ISP domain are used for login users.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local accounting.

none: Does not perform accounting.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

Accounting is not supported for FTP, SFTP, and SCP users.

You can specify one primary accounting method and multiple backup accounting methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **accounting login radius-scheme** *radius-scheme-name* **local none** command specifies a primary default RADIUS accounting method and two backup methods (local accounting and no accounting). The device performs RADIUS accounting by default and performs local accounting when the RADIUS server is invalid. The device does not perform accounting when both of the previous methods are invalid.

Examples

In ISP domain **test**, perform local accounting for login users.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting login local
```

In ISP domain **test**, perform RADIUS accounting for login users based on scheme **rd** and use local accounting as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting login radius-scheme rd local
```

Related commands

radius scheme

1.1.5. accounting start-fail

Use **accounting start-fail** to configure access control for users that encounter accounting-start failures.

Use **undo accounting start-fail** to restore the default.

Syntax

accounting start-fail { **offline** | **online** }

undo accounting start-fail

Default

The device allows users that encounter accounting-start failures to stay online.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

offline: Logs off users that encounter accounting-start failures.

online: Allows users that encounter accounting-start failures to stay online.

Examples

In ISP domain **test**, configure the device to allow users that encounter accounting-start failures to stay online.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting start-fail online
```

1.1.6. accounting update-fail

Use **accounting update-fail** to configure access control for users that have failed all their accounting-update attempts.

Use **undo accounting update-fail** to restore the default.

Syntax

accounting update-fail { [**max-times** *max-times*] **offline** | **online** }

undo accounting update-fail

Default

The device allows users that have failed all their accounting-update attempts to stay online.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

max-times *max-times*: Specifies the maximum number of consecutive accounting-update failures allowed by the device for each user. The value range for the *times* argument is 1 to 255, and the default value is 1.

offline: Logs off users that have failed all their accounting-update attempts.

online: Allows users that have failed all their accounting-update attempts to stay online.

Examples

In ISP domain **test**, configure the device to allow users that have failed all their accounting-update attempts to stay online.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] accounting update-fail online
```

1.1.7. authentication default

Use **authentication default** to specify default authentication methods for an ISP domain.

Use **undo authentication default** to restore the default.

Syntax

authentication default { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo authentication default

Default

The default authentication method of an ISP domain is local.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local authentication.

none: Does not perform authentication.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

The default authentication method is used for all users that support this method and do not have an authentication method configured.

You can specify one primary default authentication method and multiple backup default authentication methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **authentication default radius-scheme** *radius-scheme-name* **local none** command specifies a primary default RADIUS authentication method and two backup methods (local authentication and no authentication). The device performs RADIUS authentication by default and performs local authentication when the RADIUS server is invalid. The device does not perform authentication when both of the previous methods are invalid.

Examples

In ISP domain **test**, use RADIUS scheme **rd** as the primary default authentication method and use local authentication as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authentication default radius-scheme rd local
```

Related commands

local-user

radius scheme

1.1.8. authentication lan-access

Use **authentication lan-access** to specify authentication methods for LAN users.

Use **undo authentication lan-access** to restore the default.

Syntax

authentication lan-access { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo authentication lan-access

Default

The default authentication methods of the ISP domain are used for LAN users.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local authentication.

none: Does not perform authentication.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

You can specify one primary authentication method and multiple backup authentication methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **authentication lan-access radius-scheme** *radius-scheme-name* **local none** command specifies a primary RADIUS authentication method and two backup methods (local authentication and no authentication). The device performs RADIUS authentication by default and performs local authentication when the RADIUS server is invalid. The device does not perform authentication when both of the previous methods are invalid.

Examples

In ISP domain **test**, perform local authentication for LAN users.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authentication lan-access local
```

In ISP domain **test**, perform RADIUS authentication for LAN users based on scheme **rd** and use local authentication as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authentication lan-access radius-scheme rd local
```

Related commands

local-user

radius scheme

1.1.9. authentication login

Use **authentication login** to specify authentication methods for login users.

Use **undo authentication login** to restore the default.

Syntax

authentication login { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo authentication login

Default

The default authentication methods of the ISP domain are used for login users.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local authentication.

none: Does not perform authentication.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

You can specify one primary authentication method and multiple backup authentication methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **authentication login radius-scheme** *radius-scheme-name* **local none** command specifies the default primary RADIUS authentication method and two backup methods (local authentication and no authentication). The device performs RADIUS authentication by default and performs local authentication when the RADIUS server is invalid. The device does not perform authentication when both of the previous methods are invalid.

Examples

In ISP domain **test**, perform local authentication for login users.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authentication login local
```

In ISP domain **test**, perform RADIUS authentication for login users based on scheme **rd** and use local authentication as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authentication login radius-scheme rd local
```

Related commands

authentication default

local-user

radius scheme

1.1.10. authorization command

Use **authorization command** to specify command authorization methods.

Use **undo authorization command** to restore the default.

Syntax

authorization command { **local** [**none**] | **none** }

undo authorization command

Default

The default authorization methods of the ISP domain are used for command authorization.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local authorization.

none: Does not perform authorization. The authorization server does not verify whether the entered commands are permitted by the user role. The commands are executed successfully if the user role has permission to the commands.

Usage guidelines

Command authorization restricts login users to execute only authorized commands by employing an authorization server to verify whether each entered command is permitted.

When local command authorization is configured, the device compares each entered command with the user's configuration on the device. The command is executed only when it is permitted by the user's authorized user roles.

The commands that can be executed are controlled by both the access permission of user roles and command authorization of the authorization server. Access permission only controls whether the authorized user roles have access to the entered commands, but it does not control whether the user roles have obtained authorization to these commands. If a command is permitted by the access permission but denied by command authorization, this command cannot be executed.

You can specify one primary command authorization method and multiple backup command authorization methods.

When the default authorization method is invalid, the device attempts to use the backup authorization methods in sequence.

For example, the **authorization command local none** command specifies the default local authorization method and two backup methods (local authorization and no authorization). The device performs local authorization by default and performs no authorization when the local server is invalid.

Examples

In ISP domain **test**, configure the device to perform local command authorization.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authorization command local
```

Related commands

1.1.11. authorization default

Use **authorization default** to specify default authorization methods for an ISP domain.

Use **undo authorization default** to restore the default.

Syntax

authorization default { **local** [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

undo authorization default

Default

The default authorization method of an ISP domain is local.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

local: Performs local authorization.

none: Does not perform authorization. The following default authorization information applies after users pass authentication:

- Login users obtain the level-0 user role. Login users include the Telnet, FTP, SFTP, SCP, and terminal users. Terminal users can access the device through the console port. For more information about the level-0 user role, see RBAC configuration in *Fundamentals Configuration Guide*.
- The working directory for FTP, SFTP, and SCP login users is the root directory of the NAS. However, the users do not have permission to access the root directory.
- Non-login users can access the network.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

The default authorization method is used for all users that support this method and do not have an authorization method configured.

The RADIUS authorization configuration takes effect only when the authentication method and authorization method of the ISP domain use the same RADIUS scheme.

You can specify one primary authorization method and multiple backup authorization methods.

When the default authorization method is invalid, the device attempts to use the backup authorization methods in sequence. For example, the **authorization default radius-scheme** *radius-scheme-name* **local none** command specifies the default RADIUS authorization method and two backup methods (local authorization and no authorization). The device performs RADIUS authorization by default and performs local authorization when the RADIUS server is invalid. The device does not perform authorization when both of the previous methods are invalid.

Examples

In ISP domain **test**, use RADIUS scheme **rd** as the primary default authorization method and use local authorization as the backup.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authorization default radius-scheme rd local
```

Parameters

local: Performs local authorization.

none: Does not perform authorization. An authenticated LAN user directly accesses the network.

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

The RADIUS authorization configuration takes effect only when authentication and authorization methods of the ISP domain use the same RADIUS scheme.

You can specify one primary authorization method and multiple backup authorization methods.

When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **authorization lan-access radius-scheme** *radius-scheme-name* **local none** command specifies a primary RADIUS authorization method and two backup methods

(local authorization and no authorization). The device performs RADIUS authorization by default and performs local authorization when the RADIUS server is invalid. The device does not perform authorization when both of the previous methods are invalid.

Examples

In ISP domain **test**, perform local authorization for LAN users.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] authorization lan-access local
```

In ISP domain **test**, perform RADIUS authorization for LAN users based on scheme **rd** and use local authorization as the backup.

```

Table 1-1 Command output

Field	Description
Domain	ISP domain name.
State	Status of the ISP domain.
Default authentication scheme	Default authentication methods.
Default authorization scheme	Default authorization methods.
Default accounting scheme	Default accounting methods.
Login authentication scheme	Authentication methods for login users.
Login authorization scheme	Authorization methods for login users.
Login accounting scheme	Accounting methods for login users.
Super authentication scheme	Authentication methods for obtaining another user role without reconnecting to the device.
Command authorization scheme	Command line authorization methods.
Command accounting scheme	Command line accounting method.
LAN access authentication scheme	Authentication methods for LAN users.
LAN access authorization scheme	Authorization methods for LAN users.
LAN access accounting scheme	Accounting methods for LAN users.
Portal authentication scheme	Authentication methods for portal users.
Portal authorization scheme	Authorization methods for portal users.
Portal accounting scheme	Accounting methods for portal users.
RADIUS	RADIUS scheme.
HWTACACS	HWTACACS scheme.
LDAP	LDAP scheme.
Local	Local scheme.
None	No authentication, no authorization, or no accounting.
Accounting start failure action	Access control for users that encounter accounting-start failures: • **Online**—Allows the users to stay online. • **Offline**—Logs off the users.
Accounting update failure max-times	Maximum number of consecutive accounting-update failures allowed by the device for each user in the domain.
Accounting update failure action	Access control for users that have failed all their accounting-update attempts: • **Online**—Allows the users to stay online. • **Offline**—Logs off the users.
Accounting quota out policy	Access control for users that have used up their data quotas: • **Online**—Allows the users to stay online. • **Offline**—Logs off the users.

Field	Description
Service type	This field is not supported in the current software version. Service type of the ISP domain, including HSI, STB, and VoIP.
Session time	Online duration sent to the server for users that went offline due to connection failure or malfunction: • **Include idle time**—The online duration includes the idle timeout period. • **Exclude idle time**—The online duration does not include the idle timeout period.
Dual-stack accounting method	This field is not supported in the current software version. Accounting method for dual-stack users: • **Merge**—Merges IPv4 data with IPv6 data for accounting. • **Separate**—Separates IPv4 data from IPv6 data for accounting.
Authorization attributes	Authorization attributes for users in the ISP domain.
Idle cut	This field is not supported in the current software version. Idle cut feature status: • **Enabled**—The feature is enabled. The device logs off users that do not meet the minimum traffic requirements in an idle timeout period. • **Disabled**—The feature is disabled. It is the default idle cut state.
IP pool	Name of the authorization IPv4 address pool.
User profile	Name of the authorization user profile.
Inbound CAR	Authorization inbound CAR: • **CIR**—Committed information rate in bps. • **PIR**—Peak information rate in bps. If no inbound CAR is authorized, this field displays **N/A**.
Outbound CAR	Authorization outbound CAR: • **CIR**—Committed information rate in bps. • **PIR**—Peak information rate in bps. If no outbound CAR is authorized, this field displays **N/A**.
ACL number	Authorization ACL for users.
User group	Authorization user group for users.
IPv6 pool	Name of the authorization IPv6 address pool for users.
URL	Authorization redirect URL for users.
IGMP max access number	Maximum number of IGMP groups that an IPv4 user is authorized to join concurrently.
MLD max access number	Maximum number of MLD groups that an IPv6 user is authorized to join concurrently.

1.1.15. domain

Use **domain** to create an ISP domain and enter its view, or enter the view of an existing ISP domain.

Use **undo domain** to delete an ISP domain.

Syntax

domain *isp-name*

undo domain *isp-name*

Default

A system-defined ISP domain exists. The domain name is **system**.

Views

System view

Predefined user roles

network-admin

Parameters

isp-name: Specifies the ISP domain name, a case-insensitive string of 1 to 255 characters. The name must meet the following requirements:

- The name cannot contain a forward slash (/), backslash (\), vertical bar (|), quotation marks ("), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or at sign (@).
- The name cannot be **d**, **de**, **def**, **defa**, **defau**, **defaul**, **default**, **i**, **if**, **if-**, **if-u**, **if-un**, **if-unk**, **if-unkn**, **if-unkno**, **if-unknow**, or **if-unknown**.

Usage guidelines

All ISP domains are in active state when they are created.

You can modify settings for the system-defined ISP domain **system**, but you cannot delete this domain.

An ISP domain cannot be deleted when it is the default ISP domain. Before you use the **undo domain** command, change the domain to a non-default ISP domain by using the **undo domain default enable** command.

Use short domain names to ensure that user names containing a domain name do not exceed the maximum name length required by different types of users.

Examples

Create an ISP domain named **test** and enter ISP domain view.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test]
```

Related commands

display domain

domain default enable

state (ISP domain view)

1.1.16. domain default enable

Use **domain default enable** to specify the default ISP domain. Users without any domain name included in the usernames are considered in the default domain.

Use **undo domain default enable** to restore the default.

Syntax

domain default enable *isp-name*

undo domain default enable

Default

The default ISP domain is the system-defined ISP domain **system**.

Views

System view

Predefined user roles

network-admin

Parameters

isp-name: Specifies the ISP domain name, a case-insensitive string of 1 to 255 characters. The ISP domain must already exist.

Usage guidelines

The system has only one default ISP domain.

An ISP domain cannot be deleted when it is the default ISP domain. Before you use the **undo domain** command, change the domain to a non-default ISP domain by using the **undo domain default enable** command.

Examples

Create an ISP domain named **test**, and configure the domain as the default ISP domain.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] quit
[Switch] domain default enable test
```

Related commands

display domain

domain

1.1.17. state (ISP domain view)

Use **state** to set the status of an ISP domain.

Use **undo state** to restore the default.

Syntax

state { **active** | **block** }

undo state

Default

An ISP domain is in active state.

Views

ISP domain view

Predefined user roles

network-admin

Parameters

active: Places the ISP domain in active state to allow the users in the ISP domain to request network services.

block: Places the ISP domain in blocked state to prevent users in the ISP domain from requesting network services.

Usage guidelines

By blocking an ISP domain, you disable offline users of the domain from requesting network services. However, the online users are not affected.

Examples

Place ISP domain **test** in blocked state.

```
<Switch> system-view
[Switch] domain test
[Switch-isp-test] state block
```

Related commands

display domain

1.2. Local user commands

1.2.1. access-limit

Use **access-limit** to set the maximum number of concurrent logins using the local user name.

Use **undo access-limit** to restore the default.

Syntax

access-limit *max-user-number*

undo access-limit

Default

The number of concurrent logins using the local user name is not limited.

Views

Local user view

Predefined user roles

network-admin

Parameters

max-user-number: Specifies the maximum number of concurrent logins, in the range of 1 to 1024.

Usage guidelines

This command takes effect only when local accounting is configured for the local user. The command does not apply to FTP, SFTP, or SCP users. These users do not support accounting.

Examples

Set the maximum number of concurrent logins to 5 for users using the local user name **abc**.

```
<Switch> system-view
[Switch] local-user abc
[Switch-luser-manage-abc] access-limit 5
```

Related commands

display local-user

1.2.2. authorization-attribute (local user view/user group view)

Use **authorization-attribute** to configure authorization attributes for a local user or user group. After the local user or a local user in the user group passes authentication, the device assigns these attributes to the user.

Use **undo authorization-attribute** to restore the default of an authorization attribute.

Syntax

authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **user-role** *role-name* | **vlan** *vlan-id* | **work-directory** *directory-name* } *

undo authorization-attribute { **acl** | **idle-cut** | **user-role** *role-name* | **vlan** | **work-directory** } *

Default

The working directory for FTP, SFTP, and SCP users is the root directory of the NAS. However, the users do not have permission to access the root directory.

The local users created by a network-admin or level-15 user are assigned the network-operator user role.

Views

Local user view

User group view

Predefined user roles

network-admin

Parameters

acl *acl-number*: Specifies an authorization ACL. The value range for the *acl-number* argument is 2000 to 4999. After passing authentication, a local user can access the network resources specified by this ACL.

idle-cut *minutes*: Specifies an idle timeout period in minutes. The value range for the *minutes* argument is 1 to 120. An online user is logged out if its idle period exceeds the specified idle timeout period.

user-role *role-name*: Specifies an authorized user role. The *role-name* argument is a case-sensitive string of 1 to 63 characters. A maximum of 64 user roles can be specified for a user.

For user role-related commands, see *Fundamentals Command Reference* for RBAC commands. This option is available only in local user view, and is not available in user group view.

vlan *vlan-id*: Specifies an authorized VLAN. The value range for the *vlan-id* argument is 1 to 4094. After passing authentication and being authorized a VLAN, a local user can access only the resources in this VLAN.

work-directory *directory-name*: Specifies the working directory for FTP, SFTP, or SCP users. The *directory-name* argument is a case-insensitive string of 1 to 255 characters. The directory must already exist.

Usage guidelines

Configure authorization attributes according to the application environments and purposes. Support for authorization attributes depends on the service types of users.

For LAN users, only the following authorization attributes take effect: **acl**, and **vlan**.

For SSH, Telnet, and terminal users, only authorization attributes **idle-cut** and **user-role** take effect.

For HTTP and HTTPS users, only authorization attribute **user-role** takes effect.

For FTP users, only authorization attributes **user-role** and **work-directory** take effect.

For other types of local users, no authorization attribute takes effect.

Authorization attributes configured for a user group are intended for all local users in the group. You can group local users to improve configuration and management efficiency. An authorization attribute configured in local user view takes precedence over the same attribute configured in user group view.

To make sure FTP, SFTP, and SCP users can access the directory after an IRF master/subordinate switchover, do not specify slot information for the working directory.

To make sure the user have only the user roles authorized by using this command, use the **undo authorization-attribute user-role** command to remove the default user role.

Examples

Configure the authorized VLAN of network access user **abc** as VLAN 2.

```
<Switch> system-view
[Switch] local-user abc class network
[Switch-luser-network-abc] authorization-attribute vlan 2
```

Configure the authorized VLAN of user group **abc** as VLAN 3.

```
<Switch> system-view
[Switch] user-group abc
[Switch-ugroup-abc] authorization-attribute vlan 3
```

Related commands

display local-user

display user-group

1.2.3. bind-attribute

Use **bind-attribute** to configure binding attributes for a local user.

Use **undo bind-attribute** to remove binding attributes of a local user.

Syntax

bind-attribute { **ip** *ip-address* | **location interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

undo bind-attribute { **ip** | **location** | **mac** | **vlan** } *

Default

No binding attributes are configured for a local user.

Views

Local user view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Specifies the IP address to which the user is bound. This option applies only to 802.1X users.

location interface *interface-type interface-number*: Specifies the interface to which the user is bound. The *interface-type* argument represents the interface type, and the *interface-number* argument represents the interface number. To pass authentication, the user must access the network through the bound interface. This option applies only to LAN users.

mac *mac-address*: Specifies the MAC address of the user in the format H-H-H. This option applies only to LAN users.

vlan *vlan-id*: Specifies the VLAN to which the user belongs. The *vlan-id* argument is in the range of 1 to 4094. This option applies only to LAN users.

Usage guidelines

To perform local authentication of a user, the device matches the actual user attributes with the configured binding attributes. If the user has a non-matching attribute or lacks a required attribute, the user will fail authentication.

Binding attribute check takes effect on all access services. Configure the binding attributes for a user based on the access services and make sure the device can obtain all attributes to be checked from the user's packet. For example, you can configure an IP address binding for an 802.1X user, because 802.1X authentication can include the user's IP address in the packet. However, you cannot configure IP address bindings for MAC authentication users, because MAC authentication does not use IP addresses.

The binding interface type must meet the requirements of the local user. Configure the binding interface based on the service type of the user.

- If the user is an 802.1X user, specify the 802.1X-enabled Layer 2 Ethernet interface or Layer 2 aggregate interface.
- If the user is a MAC authentication user, specify the MAC authentication-enabled Layer 2 Ethernet interface or Layer 2 aggregate interface.
- If the user is a Web authentication user, specify the Web authentication-enabled Layer 2 Ethernet interface.

Examples

Bind MAC address 11-11-11 with network access user **abc**.

```
<Switch> system-view
[Switch] local-user abc class network
[Switch-luser-network-abc] bind-attribute mac 11-11-11
```

Related commands

display local-user

1.2.4. display local-user

Use **display local-user** to display the local user configuration and online user statistics.

Syntax

display local-user [**class** { **manage** | **network** } | **idle-cut** { **disable** | **enable** } | **service-type** { **ftp** | **lan-access** | **ssh** | **telnet** | **terminal** } | **state** { **active** | **block** } | **user-name** *user-name* **class** { **manage** | **network** } | **vlan** *vlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

class: Specifies the local user type.

manage: Device management user.

network: Network access user.

idle-cut { **disable** | **enable** }: Specifies local users by the status of the idle cut feature.

service-type: Specifies the local users that use a specific type of service.

ftp: FTP users.

lan-access: LAN users that typically access the network through an Ethernet, such as 802.1X users.

ssh: SSH users.

telnet: Telnet users.

terminal: Terminal users that log in through console ports.

state { **active** | **block** }: Specifies local users in active or blocked state. A local user in active state can access network services, but a local user in blocked state cannot.

user-name *user-name*: Specifies all local users using the specified username. The username must be a case-sensitive string of 1 to 55 characters. The name must meet the following requirements:

- Cannot contain the domain name.
- Cannot contain any of the following characters: forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), and at sign (@).
- Cannot be **a**, **al**, or **all**.

vlan *vlan-id*: Specifies all local users in a VLAN. The *vlan-id* argument is in the range of 1 to 4094.

Usage guidelines

If you do not specify any parameters, this command displays information about all local users.

Examples

Display information about all local users.

```
<Switch> display local-user
Device management user root:
  State:                     Active
  Service type:              SSH/Telnet/Terminal
  Access limit:              Enabled          Max access number: 3
  Current access number:     1
  User group:                system
  Bind attributes:
  Authorization attributes:
    Work directory:          flash:
    User role list:          network-admin
  Password control configurations:
    Password aging:          3 days

Network access user jj:
  State:                      Active
  Service type:               LAN-access
  User group:                 system
  Bind attributes:
    IP address:               2.2.2.2
    Location bound:           GigabitEthernet1/0/1
    MAC address:              0001-0001-0001
    VLAN ID:                  2
  Authorization attributes:
    Idle timeout:             33 minutes
    Work directory:           flash:
    ACL number:               2000
  User profile:               pp
  User role list:             network-operator, level-0, level-3
  Description:                A network access user from company cc
  Validity period:
    Start date and time:      2016/01/01-00:01:01
    Expiration date and time: 2017/01/01-01:01:01

Total 2 local users matched.
```

Table 1-2 Command output

Field	Description
State	Status of the local user: active or blocked.
Service type	Service types that the local user can use.
Access limit	Whether the concurrent login limit is enabled.
Max access number	Maximum number of concurrent logins using the local user name.
Current access number	Current number of concurrent logins using the local user name.
User group	Group to which the local user belongs.

Field	Description
Bind attributes	Binding attributes of the local user.
IP address	IP address of the local user.
Location bound	Binding port of the local user.
MAC address	MAC address of the local user.
VLAN ID	Binding VLAN of the local user.
Authorization attributes	Authorization attributes of the local user.
Idle timeout	Idle timeout period of the user, in minutes.
Session-timeout	Session timeout timer for the user, in minutes.
Work directory	Directory that the FTP, SFTP, or SCP user can access.
ACL number	Authorization ACL of the local user.
VLAN ID	Authorized VLAN of the local user.
User profile	Authorization user profile of the local user.
User role list	Authorized roles of the local user.
IP pool	IPv4 address pool authorized to the local user.
IPv6 pool	IPv6 address pool authorized to the local user.
Password control configurations	Password control attributes that are configured for the local user.
Password aging	Password expiration time.
Password length	Minimum number of characters that a password must contain.
Password composition	Password composition policy: • Minimum number of character types that a password must contain. • Minimum number of characters from each type in a password.
Password complexity	Password complexity checking policy: • Reject a password that contains the username or the reverse of the username. • Reject a password that contains any character repeated consecutively three or more times.
Maximum login attempts	Maximum number of consecutive failed login attempts.
Action for exceeding login attempts	Action to take on the user that failed to log in after using up all login attempts.
Description	Description of the network access user.
Validity period	Validity period of the network access user.
Start date and time	Date and time from which the network access user begins to take effect.
Expiration date and time	Date and time at which the network access user expires.

1.2.5. display user-group

Use **display user-group** to display user group configuration.

Syntax

display user-group { **all** | **name** *group-name* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Specifies all user groups.

name *group-name*: Specifies a user group by its name, a case-insensitive string of 1 to 32 characters.

Examples

Display the configuration of all user groups.

```
<Switch> display user-group all
Total 2 user groups matched.

User group: system
  Authorization attributes:
    Work directory:          flash:
User group: jj
  Authorization attributes:
    Idle timeout:            2 minutes
    Work directory:          flash:/
    ACL number:              2000
    VLAN ID:                 2
    User profile:            pp
  Password control configurations:
    Password aging:          2 days
```

Table 1-3 Command output

Field	Description
User group	User group name.
Authorization attributes	Authorization attributes of the user group.
Idle timeout	Idle timeout period, in minutes.
Session-timeout	Session timeout timer, in minutes.
Work directory	Directory that FTP, SFTP, or SCP users in the group can access.
ACL number	Authorization ACL.
VLAN ID	Authorized VLAN.

Field	Description
User profile	Authorization user profile.
IP pool	IPv4 address pool authorized to the user group.
IPv6 pool	IPv6 address pool authorized to the user group.
Password control configurations	Password control attributes that are configured for the user group.
Password aging	Password expiration time.
Password length	Minimum number of characters that a password must contain.
Password composition	Password composition policy: • Minimum number of character types that a password must contain. • Minimum number of characters from each type in a password.
Password complexity	Password complexity checking policy: • Reject a password that contains the username or the reverse of the username. • Reject a password that contains any character repeated consecutively three or more times.
Maximum login attempts	Maximum number of consecutive failed login attempts.
Action for exceeding login attempts	Action to take on the user that failed to log in after using up all login attempts.

1.2.6. group

Use **group** to assign a local user to a user group.

Use **undo group** to restore the default.

Syntax

group *group-name*

undo group

Default

A local user belongs to user group **system**.

Views

Local user view

Predefined user roles

network-admin

Parameters

group-name: Specifies the user group name, a case-insensitive string of 1 to 32 characters.

Examples

Assign device management user **111** to user group **abc**.

```
<Switch> system-view
[Switch] local-user 111 class manage
```

```
[Switch-luser-manage-111] group abc
```

Related commands

display local-user

1.2.7. local-user

Use **local-user** to add a local user and enter its view, or enter the view of an existing local user.

Use **undo local-user** to delete local users.

Syntax

local-user *user-name* [**class** { **manage** | **network** }]

undo local-user { *user-name* **class** { **manage** | **network** } | **all** [**service-type** { **ftp** | **lan-access** | **ssh** | **telnet** | **terminal** } | **class** { **manage** | **network** }] }

Default

No local users exist.

Views

System view

Predefined user roles

network-admin

Parameters

user-name: Specifies the local user name, a case-sensitive string of 1 to 55 characters. The name must meet the following requirements:

- Cannot contain a domain name.
- Cannot contain any of the following characters: forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), and at sign (@).
- Cannot be **a**, **al**, or **all**.

class: Specifies the local user type. If you do not specify this keyword, the command adds a device management user.

manage: Device management user that can configure and monitor the device after login. Device management users can use FTP, HTTP, HTTPS, Telnet, SSH, and terminal services.

network: Network access user that accesses network resources through the device. Network access users can use LAN access services.

all: Specifies all users.

service-type: Specifies the local users that use a specific type of service.

ftp: FTP users.

lan-access: LAN users that typically access the network through an Ethernet, such as 802.1X users.

ssh: SSH users.

telnet: Telnet users.

terminal: Terminal users that log in through console ports.

Examples

Add a device management user named **user1** and enter local user view.

```
<Switch> system-view
[Switch] local-user user1 class manage
[Switch-luser-manage-user1]
```

Add a network access user named **user2** and enter local user view.

```
<Switch> system-view
[Switch] local-user user2 class network
[Switch-luser-network-user2]
```

Related commands

display local-user

service-type

1.2.8. password (device management user view)

Use **password** to configure a password for a device management user.

Use **undo password** to restore the default.

Syntax

password [{ **hash** | **simple** } *string*]

undo password

Default

A device management user does not have a password and can pass authentication after entering the correct username and passing attribute checks.

Views

Device management user view

Predefined user roles

network-admin

Parameters

hash: Specifies a password encrypted by the hash algorithm.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password string. This argument is case sensitive. The hashed form of the password is a string of 1 to 110 characters. The plaintext form of the password is a string of 1 to 63 characters.

Usage guidelines

If you do not specify any parameters, you enter the interactive mode to set a plaintext password.

A device management user for which no password is specified can pass authentication after entering the correct username and passing attribute checks. To enhance security, configure a password for each device management user.

Examples

Set the password to **123456TESTplat&!** in plaintext form for device management user **user1**.

```
<Switch> system-view
```

```
[Switch] local-user user1 class manage
[Switch-luser-manage-user1] password simple 123456TESTplat&!
```

Configure the password in interactive mode for device management user **test**.

```
<Switch> system-view
[Switch] local-user test class manage
[Switch-luser-manage-test] password
Password:
confirm :
```

Related commands

display local-user

1.2.9. password (network access user view)

Use **password** to configure a password for a network access user.

Use **undo password** to restore the default.

Syntax

password { **cipher** | **simple** } *string*

undo password

Default

A network access user does not have a password and can pass authentication after entering the correct username and passing attribute checks.

Views

Network access user view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password string. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

As a best practice to enhance security, configure a password for each network access user.

Examples

Set the password to **123456TESTuser&!** in plaintext form for network access user **user1**.

```
<Switch> system-view
[Switch] local-user user1 class network
[Switch-luser-network-user1] password simple 123456TESTuser&!
```

Related commands

display local-user

1.2.10. service-type

Use **service-type** to specify the service types that a local user can use.

Use **undo service-type** to remove service types configured for a local user.

Syntax

service-type { **ftp** | **lan-access** | { **ssh** | **telnet** | **terminal** } * }

undo service-type { **ftp** | **lan-access** | { **ssh** | **telnet** | **terminal** } * }

Default

A local user is not authorized to use any service.

Views

Local user view

Predefined user roles

network-admin

Parameters

ftp: Authorizes the user to use the FTP service. The authorized directory can be modified by using the **authorization-attribute work-directory** command.

lan-access: Authorizes the user to use the LAN access service. The users are typically Ethernet users, for example, 802.1X users.

ssh: Authorizes the user to use the SSH service.

telnet: Authorizes the user to use the Telnet service.

terminal: Authorizes the user to use the terminal service and log in from a console port.

Usage guidelines

You can assign multiple service types to a user.

Examples

Authorize device management user **user1** to use the Telnet and FTP services.

```
<Switch> system-view
[Switch] local-user user1 class manage
[Switch-luser-manage-user1] service-type telnet
[Switch-luser-manage-user1] service-type ftp
```

Related commands

display local-user

1.2.11. state (local user view)

Use **state** to set the status of a local user.

Use **undo state** to restore the default.

Syntax

state { **active** | **block** }

undo state

Default

A local user is in active state.

Views

Local user view

Predefined user roles

network-admin

Parameters

active: Places the local user in active state to allow the local user to request network services.

block: Places the local user in blocked state to prevent the local user from requesting network services.

Examples

Place device management user **user1** in blocked state.

```
<Switch> system-view
[Switch] local-user user1 class manage
[Switch-luser-manage-user1] state block
```

Related commands

display local-user

1.2.12. user-group

Use **user-group** to create a user group and enter its view, or enter the view of an existing user group.

Use **undo user-group** to delete a user group.

Syntax

user-group *group-name*

undo user-group *group-name*

Default

A system-defined user group exists. The group name is **system**.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies the user group name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

A user group consists of a group of local users and has a set of local user attributes. You can configure local user attributes for a user group to implement centralized management of user attributes for the local users in the group.

A user group that has local users cannot be deleted.

You can modify settings for the system-defined user group named **system**, but you cannot delete the user group.

Examples

Create a user group named **abc** and enter user group view.

```
<Switch> system-view
[Switch] user-group abc
[Switch-ugroup-abc]
```

Related commands

display user-group

1.3. RADIUS commands

1.3.1. accounting-on enable

Use **accounting-on enable** to configure the accounting-on feature.

Use **undo accounting-on enable** to disable the accounting-on feature.

Syntax

accounting-on enable [**interval** *interval* | **send** *send-times*] *

undo accounting-on enable

Default

The accounting-on feature is disabled.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the time interval for retransmitting an accounting-on packet in seconds. The value range for the *interval* argument is 1 to 15, and the default setting is 3.

send *send-times*: Specifies the maximum number of accounting-on packet transmission attempts. The value range for the *send-times* argument is 1 to 255, and the default setting is 50.

Usage guidelines

The accounting-on feature enables the device to automatically send an accounting-on packet to the RADIUS server after a device reboot. Upon receiving the accounting-on packet, the RADIUS server logs out all online users so they can log in again through the device.

Execute the **save** command to ensure that the **accounting-on enable** command takes effect at the next device reboot. For information about the **save** command, see *Fundamentals Command Reference*.

Parameters set by using the **accounting-on enable** command take effect immediately.

Examples

Enable the accounting-on feature for RADIUS scheme **radius1**, and set the retransmission interval to 5 seconds and the transmission attempts to 15.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] accounting-on enable interval 5 send 15
```

Related commands

display radius scheme

1.3.2. data-flow-format (RADIUS scheme view)

Use **data-flow-format** to set the data flow and packet measurement units for traffic statistics.

Use **undo data-flow-format** to restore the default.

Syntax

data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } } *

undo data-flow-format { **data** | **packet** }

Default

Traffic is counted in bytes and packets.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

data: Specifies the unit for data flows.

byte: Specifies the unit as byte.

giga-byte: Specifies the unit as gigabyte.

kilo-byte: Specifies the unit as kilobyte.

mega-byte: Specifies the unit as megabyte.

packet: Specifies the unit for data packets.

giga-packet: Specifies the unit as giga-packet.

kilo-packet: Specifies the unit as kilo-packet.

mega-packet: Specifies the unit as mega-packet.

one-packet: Specifies the unit as one-packet.

Usage guidelines

The data flow and packet measurement units for traffic statistics must be the same as configured on the RADIUS accounting servers. Otherwise, accounting results might be incorrect.

Examples

In RADIUS scheme **radius1**, set the data flow and packet measurement units for traffic statistics to kilobyte and kilo-packet, respectively.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] data-flow-format data kilo-byte packet kilo-packet
```

Related commands

display radius scheme

1.3.3. display radius scheme

Use **display radius scheme** to display RADIUS scheme configuration.

Syntax

display radius scheme [*radius-scheme-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

radius-scheme-name: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters. If you do not specify a RADIUS scheme, this command displays the configuration of all RADIUS schemes.

Examples

Display the configuration of all RADIUS schemes.

```
<Switch> display radius scheme
Total 1 RADIUS schemes

------------------------------------------------------------------
RADIUS scheme name: radius1
  Index : 0
  Primary authentication server:
    Host name: Not configured
    IP   : 2.2.2.2                                Port: 1812

  server-load-sharing                         : Enabled
  Attribute 31 MAC format                     : hh:hh:hh:hh:hh:hh
  Stop-accounting-packet send-force           : Disabled
------------------------------------------------------------------
```

Table 1-4 Command output

Field	Description
Index	Index number of the RADIUS scheme.
Primary authentication server	Information about the primary authentication server.
Primary accounting server	Information about the primary accounting server.
Second authentication server	Information about the secondary authentication server.
Second accounting server	Information about the secondary accounting server.
Host name	Host name of the server. This field displays **Not configured** in the following situations: • The server is not configured. • The server is specified by IP address.
IP	IP address of the server. This field displays **Not configured** in the following situations: • The server is not configured.

Field	Description
	• The server is specified by hostname, and the hostname is not resolved.
Port	Service port number of the server. If no port number is specified, this field displays the default port number.
VPN	VPN instance to which the server or the RADIUS scheme belongs. If no VPN instance is specified for the server, this field displays **Not configured**.
State	Status of the server: • **Active**—The server is in active state. • **Block**—The server is changed to blocked state automatically. • **Block (Mandatory)**—The server is set to blocked state manually.
Test profile	Test profile used for RADIUS server status detection.
Probe username	Username used for RADIUS server status detection.
Probe interval	Server status detection interval, in minutes.
Weight	Weight value of the RADIUS server.
Accounting-On function	Whether the accounting-on feature is enabled.
extended function	Whether the extended accounting-on feature is enabled.
retransmission times	Number of accounting-on packet transmission attempts.
retransmission interval(seconds)	Interval at which the device retransmits accounting-on packets, in seconds.
Timeout Interval(seconds)	RADIUS server response timeout period, in seconds.
Retransmission times	Maximum number of attempts for transmitting a RADIUS packet to a single RADIUS server.
Retransmission Times for Accounting Update	Maximum number of accounting attempts.
Server Quiet Period(minutes)	Quiet period for the servers, in minutes.
Realtime Accounting Interval(seconds)	Interval for sending real-time accounting updates, in seconds.
Stop-accounting packets buffering	Whether buffering of nonresponded RADIUS stop-accounting requests is enabled.
Retransmission times	Maximum number of transmission attempts for individual RADIUS stop-accounting requests.
NAS IP Address	Source IP address for outgoing RADIUS packets.
User Name Format	Format for the usernames sent to the RADIUS server: • **with-domain**—Includes the domain name. • **without-domain**—Excludes the domain name. • **keep-original**—Forwards the username as the username is entered.
Data flow unit	Measurement unit for data flow.
Packet unit	Measurement unit for packets.
Attribute 15 check-mode	RADIUS Login-Service attribute check method for SSH, FTP,

Field	Description
	and terminal users: • **Strict**—Matches Login-Service attribute values 50, 51, and 52 for SSH, FTP, and terminal services, respectively. • **Loose**—Matches the standard Login-Service attribute value 0 for SSH, FTP, and terminal services.
Attribute 25	RADIUS attribute 25 interpretation status: • **Standard**—The attribute is not interpreted as CAR parameters. • **CAR**—The attribute is interpreted as CAR parameters.
Attribute Remanent-Volume unit	Data measurement unit for the RADIUS Remanent_Volume attribute.
server-load-sharing	Status of the RADIUS server load sharing feature: • **Disabled**—The feature is disabled. The device forwards traffic to the server selected based on primary and secondary server roles. • **Enabled**—The feature is enabled. The device distributes traffic among multiple servers for load sharing.
Attribute 31 MAC format	MAC address format for RADIUS attribute 31.
Stop-accounting-packet send-force	Whether the device is enabled to forcibly send stop-accounting packets when users for which no start-accounting packets are sent go offline.

1.3.4. display radius statistics

Use **display radius statistics** to display RADIUS packet statistics.

Syntax

display radius statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display RADIUS packet statistics.

```
<Switch> display radius statistics

                          Auth.         Acct.       SessCtrl.
        Request Packet:   0             0           0
          Retry Packet:   0             0           -
        Timeout Packet:   0             0           -
     Access Challenge:    0             -           -
       Account Start:     -             0           -
      Account Update:     -             0           -
        Account Stop:     -             0           -
```

```
      Terminate Request:          -           -           0
             Set Policy:          -           -           0
   Packet With Response:          0           0           0
Packet Without Response:          0           0           -
         Access Rejects:          0           -           -
         Dropped Packet:          0           0           0
         Check Failures:          0           0           0
```

Table 1-5 Command output

Field	Description
Auth.	Authentication packets.
Acct.	Accounting packets.
SessCtrl.	Session-control packets.
Request Packet	Number of request packets.
Retry Packet	Number of retransmitted request packets.
Timeout Packet	Number of request packets timed out.
Access Challenge	Number of access challenge packets.
Account Start	Number of start-accounting packets.
Account Update	Number of accounting update packets.
Account Stop	Number of stop-accounting packets.
Terminate Request	Number of packets for logging off users forcibly.
Set Policy	Number of packets for updating user authorization information.
Packet With Response	Number of packets for which responses were received.
Packet Without Response	Number of packets for which no responses were received.
Access Rejects	Number of Access-Reject packets.
Dropped Packet	Number of discarded packets.
Check Failures	Number of packets with checksum errors.

Related commands

reset radius statistics

1.3.5. display stop-accounting-buffer (for RADIUS)

Use **display stop-accounting-buffer** to display information about buffered RADIUS stop-accounting requests to which no responses have been received.

Syntax

display stop-accounting-buffer { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

session-id *session-id*: Specifies a session by its ID. The *session-id* argument is a string of 1 to 64 characters and cannot contain a letter. A session ID uniquely identifies an online user for a RADIUS scheme.

time-range *start-time end-time*: Specifies a time range. The start time and end time must be in the format of hh:mm:ss-mm/dd/yyyy or hh:mm:ss-yyyy/mm/dd.

user-name *user-name*: Specifies a user by its name, a case-sensitive string of 1 to 255 characters. Whether the *user-name* argument should include the domain name depends on the setting configured by using the **user-name-format** command for the RADIUS scheme.

Examples

Display information about nonresponded RADIUS stop-accounting requests buffered for user **abc**.

```
<Switch> display stop-accounting-buffer user-name abc
Total entries: 2
Scheme      Session ID          Username    First sending time   Attempts
rad1        1000326232325010    abc         23:27:16-08/31/2015  19
aaa         1000326232326010    abc         23:33:01-08/31/2015  20
```

Table 1-6 Command output

Field	Description
First sending time	Time when the stop-accounting request was first sent.
Attempts	Number of attempts that were made to send the stop-accounting request.

reset stop-accounting-buffer (for RADIUS)

retry

retry stop-accounting (RADIUS scheme view)

stop-accounting-buffer enable (RADIUS scheme view)

user-name-format (RADIUS scheme view)

1.3.6. key (RADIUS scheme view)

Use **key** to set the shared key for secure RADIUS authentication or accounting communication.

Use **undo key** to delete the shared key for secure RADIUS authentication or accounting communication.

Syntax

key { **accounting** | **authentication** } { **cipher** | **simple** } *string*

undo key { **accounting** | **authentication** }

Default

No shared key is configured for secure RADIUS authentication or accounting communication.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

accounting: Specifies the shared key for secure RADIUS accounting communication.

authentication: Specifies the shared key for secure RADIUS authentication communication.

cipher: Specifies the key in encrypted form.

simple: Specifies the key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive. the encrypted form of the key is a string of 1 to 117 characters. The plaintext form of the key is a string of 1 to 64 characters.

Usage guidelines

The shared keys configured by using this command apply to all servers in the scheme. Make sure the settings match the shared keys configured on the RADIUS servers.

The shared keys specified for specific RADIUS servers take precedence over the shared key specified with this command.

Examples

In RADIUS scheme **radius1**, set the shared key to **ok** in plaintext form for secure accounting communication.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] key accounting simple ok
```

Related commands

display radius scheme

1.3.7. nas-ip (RADIUS scheme view)

Use **nas-ip** to specify a source IP address for outgoing RADIUS packets.

Use **undo nas-ip** to delete the source IP address of the specified type for outgoing RADIUS packets.

Syntax

nas-ip { *ipv4-address* | **ipv6** *ipv6-address* }

undo nas-ip [**ipv6**]

Default

The source IP address of an outgoing RADIUS packet is that specified by using the **radius nas-ip** command in system view.

If the **radius nas-ip** command is not configured, the source IP address is the primary IP address of the outbound interface.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 address, which must be an address of the device. The IP address cannot be 0.0.0.0, 255.255.255.255, a class D address, a class E address, or a loopback address.

ipv6 *ipv6-address*: Specifies an IPv6 address, which must be a unicast address of the device and cannot be a loopback address or a link-local address.

Usage guidelines

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS that is configured on the RADIUS server. A RADIUS server identifies a NAS by its IP address. Upon receiving a RADIUS packet, a RADIUS server checks whether the source IP address of the packet is the IP address of a managed NAS.

- If the source IP address of the packet is the IP address of a managed NAS, the server processes the packet.
- If the source IP address of the packet is not the IP address of a managed NAS, the server drops the packet.

As a best practice, specify a loopback interface address as the source IP address for outgoing RADIUS packets to avoid RADIUS packet loss caused by physical port errors.

If you use both the **nas-ip** command and **radius nas-ip** command, the following guidelines apply:

- The setting configured by using the **nas-ip** command in RADIUS scheme view applies only to the RADIUS scheme.
- The setting configured by using the **radius nas-ip** command in system view applies to all RADIUS schemes.
- The setting in RADIUS scheme view takes precedence over the setting in system view.

A RADIUS scheme can have only one source IPv4 address and one source IPv6 address for outgoing RADIUS packets.

If you do not specify the **ipv6** keyword for the **undo nas-ip** command, the command deletes the configured source IPv4 address for outgoing RADIUS packets.

Examples

In RADIUS scheme **radius1**, specify IP address 10.1.1.1 as the source IP address for outgoing RADIUS packets.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] nas-ip 10.1.1.1
```

Related commands

display radius scheme

radius nas-ip

1.3.8. primary accounting (RADIUS scheme view)

Use **primary accounting** to specify the primary RADIUS accounting server.

Use **undo primary accounting** to restore the default.

Syntax

primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *

undo primary accounting

Default

The primary RADIUS accounting server is not specified.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

host-name: Specifies the host name of the primary RADIUS accounting server, a case-insensitive string of 1 to 253 characters.

ipv4-address: Specifies the IPv4 address of the primary RADIUS accounting server.

ipv6 *ipv6-address*: Specifies the IPv6 address of the primary RADIUS accounting server.

port-number: Specifies the service port number of the primary RADIUS accounting server. The value range for the UDP port number is 1 to 65535. The default setting is 1813.

key: Specifies the shared key for secure communication with the primary RADIUS accounting server.

cipher: Specifies the key in encrypted form.

simple: Specifies the key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive. the encrypted form of the key is a string of 1 to 117 characters. The plaintext form of the key is a string of 1 to 64 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the primary RADIUS accounting server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the server is on the public network, do not specify this option.

Usage guidelines

Make sure the port number and shared key settings of the primary RADIUS accounting server are the same as those configured on the server.

Two accounting servers specified for a scheme, primary or secondary, cannot have identical VPN instance, host name, IP address, and port number settings.

The shared key configured by using this command takes precedence over the shared key configured with the **key accounting** command.

If the specified server resides on a VPN, specify the VPN instance by using the **vpn-instance** *vpn-instance-name* option. The VPN instance specified by this command takes precedence over the VPN instance specified for the RADIUS scheme.

If you use the **primary accounting** command to modify or delete the primary accounting server to which the device is sending a start-accounting request, communication with the primary server times out.

- When the RADIUS server load sharing feature is disabled, the device tries to communicate with an active server that has the highest priority for accounting.
- When the RADIUS server load sharing feature is enabled, the device returns an accounting failure message rather than searching for another active accounting server.

If you remove an actively used accounting server, the device no longer sends users' real-time accounting requests and stop-accounting requests. It does not buffer the stop-accounting requests. The device can generate incorrect accounting results.

Examples

In RADIUS scheme **radius1**, specify the primary accounting server with IP address 10.110.1.2, UDP port number 1813, and plaintext shared key **123456TESTacct&!**.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] primary accounting 10.110.1.2 1813 key simple 123456TESTacct&!
```

Related commands

display radius scheme

key (RADIUS scheme view)

secondary accounting (RADIUS scheme view)

1.3.9. primary authentication (RADIUS scheme view)

Use **primary authentication** to specify the primary RADIUS authentication server.

Use **undo primary authentication** to restore the default.

Syntax

primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *

undo primary authentication

Default

The primary RADIUS authentication server is not specified.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

host-name: Specifies the host name of the primary RADIUS authentication server, a case-insensitive string of 1 to 253 characters.

ipv4-address: Specifies the IPv4 address of the primary RADIUS authentication server.

ipv6 *ipv6-address*: Specifies the IPv6 address of the primary RADIUS authentication server.

port-number: Specifies the service port number of the primary RADIUS authentication server. The value range for the UDP port number is 1 to 65535. The default setting is 1812.

key: Specifies the shared key for secure communication with the primary RADIUS authentication server.

cipher: Specifies the key in encrypted form.

simple: Specifies the key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive. The encrypted form of the key is a string of 1 to 117 characters. The plaintext form of the key is a string of 1 to 64 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the primary RADIUS authentication server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the server is on the public network, do not specify this option.

Usage guidelines

Make sure the service port and shared key settings of the primary RADIUS authentication server are the same as those configured on the server.

Two authentication servers specified for a scheme, primary or secondary, cannot have identical VPN instance, host name, IP address, and port number settings.

The shared key configured by this command takes precedence over the shared key configured with the **key authentication** command.

If the specified server resides on a VPN instance, specify the VPN instance by using the **vpn-instance** *vpn-instance-name* option. The VPN instance specified by this command takes precedence over the VPN instance specified for the RADIUS scheme.

If you use the **primary authentication** command to modify or delete the primary authentication server during an authentication process, communication with the primary server times out.

- When the RADIUS server load sharing feature is disabled, the device tries to communicate with an active server that has the highest priority for authentication.
- When the RADIUS server load sharing feature is enabled, the device performs the following operations:
  a. Checks the number of currently served users for each active server.
  b. Determines the most appropriate server in performance to receive an AAA request.

Examples

In RADIUS scheme **radius1**, specify the primary authentication server with IP address 10.110.1.1, UDP port number 1812, and plaintext shared key **123456TESTauth&!**.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] primary authentication 10.110.1.1 1812 key simple
123456TESTauth&!
```

1.3.10. radius dscp

Use **radius dscp** to change the DSCP priority of RADIUS packets.

Use **undo radius dscp** to restore the default.

Syntax

radius [**ipv6**] **dscp** *dscp-value*

undo radius [**ipv6**] **dscp**

Default

The DSCP priority of RADIUS packets is 0.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 RADIUS packets. If you do not specify this keyword, the command sets the DSCP priority for the IPv4 RADIUS packets.

dscp-value: Specifies the DSCP priority of RADIUS packets, in the range of 0 to 63. A larger value represents a higher priority.

Usage guidelines

Use this command to set the DSCP priority in the ToS field of RADIUS packets for changing their transmission priority.

Examples

Set the DSCP priority of IPv4 RADIUS packets to 10.

```
<Switch> system-view
[Switch] radius dscp 10
```

1.3.11. radius nas-ip

Use **radius nas-ip** to specify a source IP address for outgoing RADIUS packets.

Use **undo radius nas-ip** to delete a source IP address for outgoing RADIUS packets.

Syntax

radius nas-ip { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

undo radius nas-ip { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

Default

The source IP address of an outgoing RADIUS packet is the primary IP address of the outbound interface.

Views

System view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 address, which must be an address of the device. The IP address cannot be 0.0.0.0, 255.255.255.255, a class D address, a class E address, or a loopback address.

ipv6 *ipv6-address*: Specifies an IPv6 address, which must be a unicast address of the device and cannot be a loopback address or a link-local address.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the source IP address belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. To configure a public-network source IP address, do not specify this option.

Usage guidelines

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS that is configured on the RADIUS server. A RADIUS server identifies a NAS by its IP address. Upon receiving a RADIUS packet, a RADIUS server checks whether the source IP address of the packet is the IP address of a managed NAS.

- If the source IP address of the packet is the IP address of a managed NAS, the server processes the packet.
- If the source IP address of the packet is not the IP address of a managed NAS, the server drops the packet.

As a best practice, specify a loopback interface address as the source IP address for outgoing RADIUS packets to avoid RADIUS packet loss caused by physical port errors.

If you use both the **nas-ip** command and **radius nas-ip** command, the following guidelines apply:

- The setting configured by using the **nas-ip** command in RADIUS scheme view applies only to the RADIUS scheme.
- The setting configured by using the **radius nas-ip** command in system view applies to all RADIUS schemes.
- The setting in RADIUS scheme view takes precedence over the setting in system view.

You can specify a maximum of 16 source IP addresses in system view, including:

- Zero or one public-network source IPv4 address.
- Zero or one public-network source IPv6 address.
- Private-network source IP addresses.

Each VPN instance can have only one private-network source IPv4 address and one private-network source IPv6 address in system view.

Examples

Specify IP address 129.10.10.1 as the source address for outgoing RADIUS packets.

```
<Switch> system-view
[Switch] radius nas-ip 129.10.10.1
```

Related commands

nas-ip (RADIUS scheme view)

1.3.12. radius scheme

Use **radius scheme** to create a RADIUS scheme and enter its view, or enter the view of an existing RADIUS scheme.

Use **undo radius scheme** to delete a RADIUS scheme.

Syntax

radius scheme *radius-scheme-name*

undo radius scheme *radius-scheme-name*

Default

No RADIUS schemes exist.

Views

System view

Predefined user roles

network-admin

Parameters

radius-scheme-name: Specifies the RADIUS scheme name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

A RADIUS scheme can be used by more than one ISP domain at the same time.

The device supports a maximum of 16 RADIUS schemes.

Examples

Create a RADIUS scheme named **radius1** and enter RADIUS scheme view.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1]
```

Related commands

display radius scheme

1.3.13. reauthentication server-select

> 🕮 **memo:**
>
> **reauthentication server-select** command is being supported from software after Version 7.2.16.

Use **reauthentication server-select** to specify a RADIUS server selection mode for reauthentication.

Use **undo reauthentication server-select** to restore the default.

Syntax

reauthentication server-select { **inherit** | **reselect** }

undo reauthentication server-select

Default

The inherit mode is used.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

inherit: Uses the RADIUS server that performed authentication for reauthentication.

reselect: Reselects a RADIUS server for reauthentication.

Usage guidelines

Use this command to configure the RADIUS server selection mechanism in reauthentication. Use one of the following modes depending on the network condition:

- **Inherit**—The device uses the RADIUS server that performed authentication for a user to perform reauthentication for that user. This mode reduces the amount of time used in reauthentication. However, if the RADIUS server is unreachable, the reauthentication will fail.
- **Reselect**—The device searches for a reachable RADIUS server to perform reauthentication for a user. This mode requires more time than the inherit mode. However, this mode ensures that the device can find the most suitable reachable RADIUS server for reauthentication. The following factors affect the RADIUS server selection:
  - Server configuration in the RADIUS scheme, including the configuration order.
  - Enabling status of the RADIUS server load sharing feature.
  - Status of the RADIUS servers in the RADIUS scheme.

Examples

In RADIUS scheme **radius1**, set the RADIUS server selection mode to reselect for reauthentication.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] reauthentication server-select reselect
```

1.3.14. reset radius statistics

Use **reset radius statistics** to clear RADIUS statistics.

Syntax

reset radius statistics

display radius statistics

1.3.15. reset stop-accounting-buffer (for RADIUS)

Use **reset stop-accounting-buffer** to clear buffered RADIUS stop-accounting requests to which no responses have been received.

Syntax

reset stop-accounting-buffer { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }

Views

User view

Predefined user roles

network-admin

Parameters

radius-scheme *radius-scheme-name*: Specifies a RADIUS scheme by its name, a case-insensitive string of 1 to 32 characters.

session-id *session-id*: Specifies a session by its ID. The *session-id* argument is a string of 1 to 64 characters and cannot contain a letter. A session ID uniquely identifies an online user for a RADIUS scheme.

time-range *start-time end-time*: Specifies a time range. The start time and end time must be in the format of hh:mm:ss-mm/dd/yyyy or hh:mm:ss-yyyy/mm/dd.

user-name *user-name*: Specifies a user by its name, a case-sensitive string of 1 to 255 characters. Whether the *user-name* argument should include the domain name depends on the setting configured by using the **user-name-format** command for the RADIUS scheme.

Examples

Clear nonresponded RADIUS stop-accounting requests buffered for user **user0001@test**.

```
<Switch> reset stop-accounting-buffer user-name user0001@test
```

Clear nonresponded RADIUS stop-accounting requests buffered from 0:0:0 to 23:59:59 on August 31, 2015.

```
<Switch> reset stop-accounting-buffer time-range 0:0:0-08/31/2015 23:59:59-08/31/2015
```

Related commands

display stop-accounting-buffer (for RADIUS)

stop-accounting-buffer enable (RADIUS scheme view)

1.3.16. retry

Use **retry** to set the maximum number of attempts for transmitting a RADIUS packet to a single RADIUS server.

Use **undo retry** to restore the default.

Syntax

retry *retries*

undo retry

Default

The maximum number of RADIUS packet transmission attempts is 3.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of RADIUS packet transmission attempts, in the range of 1 to 20.

Usage guidelines

Because RADIUS uses UDP packets to transmit data, the communication is not reliable.

If the device does not receive a response to its request from the RADIUS server within the response timeout period, the device retransmits the RADIUS request. To set the response timeout period, use the **timer response-timeout** command.

If the device does not receive a response from the RADIUS server after the maximum number of transmission attempts is reached, the device considers the request a failure.

If the client times out during the authentication process, the user is immediately logged off. To avoid user logoffs, the value multiplied by the following items cannot be larger than the client timeout period defined by the access module:

- The maximum number of RADIUS packet transmission attempts.
- The RADIUS server response timeout period.
- The number of RADIUS authentication servers in the RADIUS scheme.

When the device sends a RADIUS request to a new RADIUS server, it checks the total amount of time it has taken to transmit the RADIUS packet. If the amount of time has reached 300 seconds, the device stops sending the RADIUS request to the next RADIUS server. As a best practice, consider the number of RADIUS servers when you configure the maximum number of packet transmission attempts and the RADIUS server response timeout period.

Examples

In RADIUS scheme **radius1**, set the maximum number of RADIUS packet transmission attempts to 5.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] retry 5
```

Related commands

radius scheme

timer response-timeout (RADIUS scheme view)

1.3.17. retry realtime-accounting

Use **retry realtime-accounting** to set the maximum number of accounting attempts.

Use **undo retry realtime-accounting** to restore the default.

Syntax

retry realtime-accounting *retries*

undo retry realtime-accounting

Default

The maximum number of accounting attempts is 5.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of accounting attempts, in the range of 1 to 255.

Usage guidelines

Typically, a RADIUS accounting server checks whether a user is online by using a timeout timer. If the server does not receive a real-time accounting request for a user in the timeout period, it considers that a line or device failure has occurred. The server stops accounting for the user.

To work with the RADIUS server, the NAS needs to send real-time accounting requests to the server before the timer on the server expires and to keep pace with the server in disconnecting the user when a failure occurs. The NAS disconnects from a user according to the maximum number of accounting attempts and specific parameters.

For example, the following conditions exist:

- The RADIUS server response timeout period is 3 seconds (set by using the **timer response-timeout** command).
- The maximum number of RADIUS packet transmission attempts is 3 (set by using the **retry** command).
- The real-time accounting interval is 12 minutes (set by using the **timer realtime-accounting** command).
- The maximum number of accounting attempts is 5 (set by using the **retry realtime-accounting** command).

In the above case, the device generates an accounting request every 12 minutes, and retransmits the request if it sends the request but receives no response within 3 seconds. If the device receives no response after transmitting the request three times, it considers the accounting attempt a failure, and makes another accounting attempt. If five consecutive accounting attempts fail, the device cuts the user connection.

Examples

In RADIUS scheme **radius1**, set the maximum number of accounting attempts to 10.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] retry realtime-accounting 10
```

Related commands

retry

timer realtime-accounting (RADIUS scheme view)

timer response-timeout (RADIUS scheme view)

1.3.18. retry stop-accounting (RADIUS scheme view)

Use **retry stop-accounting** to set the maximum number of transmission attempts for individual RADIUS stop-accounting requests.

Use **undo retry stop-accounting** to restore the default.

Syntax

retry stop-accounting *retries*

undo retry stop-accounting

Default

The maximum number of transmission attempts is 500 for individual RADIUS stop-accounting requests.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of transmission attempts. The value range is 10 to 65535.

Usage guidelines

The maximum number of stop-accounting request transmission attempts controls the transmission of stop-accounting requests together with the following parameters:

- RADIUS server response timeout timer (set by using the **timer response-timeout** command).
- Maximum number of times to transmit a RADIUS packet per round (set by using the **retry** command).

For example, the following settings exist:

- The RADIUS server response timeout timer is 3 seconds.
- The maximum number of times to transmit a RADIUS packet per round is five.
- The maximum number of stop-accounting request transmission attempts is 20.

A stop-accounting request is retransmitted if the device does not receive a response within 3 seconds. When all five transmission attempts in this round are used, the device buffers the request and starts another round of retransmission. If 20 consecutive rounds of attempts fail, the device discards the request.

Examples

Set the maximum number of stop-accounting request transmission attempts to 1000 for RADIUS scheme **radius1**.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] retry stop-accounting 1000
```

Related commands

display stop-accounting-buffer (for RADIUS)

retry

timer response-timeout (RADIUS scheme view)

1.3.19. secondary accounting (RADIUS scheme view)

Use **secondary accounting** to specify a secondary RADIUS accounting server.

Use **undo secondary accounting** to remove a secondary RADIUS accounting server.

Syntax

secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *

undo secondary accounting [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *]

Default

No secondary RADIUS accounting servers are specified.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

host-name: Specifies the host name of a secondary RADIUS accounting server, a case-insensitive string of 1 to 253 characters.

ipv4-address: Specifies the IPv4 address of a secondary RADIUS accounting server.

ipv6 *ipv6-address*: Specifies the IPv6 address of a secondary RADIUS accounting server.

port-number: Specifies the service port number of the secondary RADIUS accounting server. The value range for the UDP port number is 1 to 65535. The default setting is 1813.

key: Specifies the shared key for secure communication with the secondary RADIUS accounting server.

cipher: Specifies the key in encrypted form.

simple: Specifies the key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive. The encrypted form of the key is a string of 1 to 117 characters. The plaintext form of the key is a string of 1 to 64 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the secondary RADIUS accounting server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the server is on the public network, do not specify this option.

Usage guidelines

Make sure the port number and shared key settings of each secondary RADIUS accounting server are the same as those configured on the corresponding server.

A RADIUS scheme supports a maximum of 16 secondary RADIUS accounting servers. If the primary server fails, the device tries to communicate with a secondary server in active state. The device connects to the secondary servers in the order they are configured.

Two accounting servers specified for a scheme, primary or secondary, cannot have identical VPN instance, host name, IP address, and port number settings.

The shared key configured by this command takes precedence over the shared key configured with the **key accounting** command.

If the specified server resides on a VPN instance, specify the VPN instance by using the **vpn-instance** *vpn-instance-name* option. The VPN instance specified by this command takes precedence over the VPN instance specified for the RADIUS scheme.

If you use the **secondary accounting** command to modify or delete a secondary accounting server to which the device is sending a start-accounting request, communication with the secondary server times out.

- When the RADIUS server load sharing feature is disabled, the device tries to communicate with an active server that has the highest priority for accounting.
- When the RADIUS server load sharing feature is enabled, the device returns an accounting failure message rather than searching for another active accounting server.

If you remove an actively used accounting server, the device no longer sends users' real-time accounting requests and stop-accounting requests. The device does not buffer the stop-accounting requests, either.

Examples

In RADIUS scheme **radius1**, specify a secondary accounting server with IP address 10.110.1.1 and UDP port 1813.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] secondary accounting 10.110.1.1 1813
```

In RADIUS scheme **radius2**, specify two secondary accounting servers with IP addresses 10.110.1.1 and 10.110.1.2 and UDP port 1813.

```
<Switch> system-view
[Switch] radius scheme radius2
[Switch-radius-radius2] secondary accounting 10.110.1.1 1813
[Switch-radius-radius2] secondary accounting 10.110.1.2 1813
```

Related commands

primary accounting (RADIUS scheme view)

1.3.20. secondary authentication (RADIUS scheme view)

Use **secondary authentication** to specify a secondary RADIUS authentication server.

Use **undo secondary authentication** to remove a secondary RADIUS authentication server.

Syntax

secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *

undo secondary authentication [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *]

Default

No secondary RADIUS authentication servers are specified.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

host-name: Specifies the host name of a secondary RADIUS authentication server, a case-insensitive string of 1 to 253 characters.

ipv4-address: Specifies the IPv4 address of a secondary RADIUS authentication server.

ipv6 *ipv6-address*: Specifies the IPv6 address of a secondary RADIUS authentication server.

port-number: Specifies the service port number of the secondary RADIUS authentication server. The value range for the UDP port number is 1 to 65535. The default setting is 1812.

key: Specifies the shared key for secure communication with the secondary RADIUS authentication server.

cipher: Specifies the key in encrypted form.

simple: Specifies the key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive. The encrypted form of the key is a string of 1 to 117 characters. The plaintext form of the key is a string of 1 to 64 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the secondary RADIUS authentication server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the server is on the public network, do not specify this option.

Usage guidelines

Make sure the port number and shared key settings of each secondary RADIUS authentication server are the same as those configured on the corresponding server.

A RADIUS scheme supports a maximum of 16 secondary RADIUS authentication servers. If the primary server fails, the device tries to communicate with a secondary server in active state. The device connects to the secondary servers in the order they are configured.

Two authentication servers specified for a scheme, primary or secondary, cannot have identical VPN instance, host name, IP address, and port number settings.

The shared key configured by this command takes precedence over the shared key configured with the **key authentication** command.

If the specified server resides on a VPN instance, specify the VPN instance by using the **vpn-instance** *vpn-instance-name* option. The VPN instance specified by this command takes precedence over the VPN instance specified for the RADIUS scheme.

If you use the **secondary authentication** command to modify or delete a secondary authentication server during an authentication process, communication with the secondary server times out.

- When the RADIUS server load sharing feature is disabled, the device tries to communicate with an active server that has the highest priority for authentication.
- When the RADIUS server load sharing feature is enabled, the device performs the following operations:
  a. Checks the number of currently served users for each active server.
  b. Determines the most appropriate server in performance to receive an AAA request.

Examples

In RADIUS scheme **radius1**, specify a secondary authentication server with IP address 10.110.1.2 and UDP port 1812.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] secondary authentication 10.110.1.2 1812
```

In RADIUS scheme **radius2**, specify two secondary authentication servers with IP addresses 10.110.1.1 and 10.110.1.2 and UDP port 1812.

```
<Switch> system-view
[Switch] radius scheme radius2
[Switch-radius-radius2] secondary authentication 10.110.1.1 1812
[Switch-radius-radius2] secondary authentication 10.110.1.2 1812
```

Related commands

key (RADIUS scheme view)

primary authentication (RADIUS scheme view)

1.3.21. snmp-agent trap enable radius

Use **snmp-agent trap enable radius** to enable SNMP notifications for RADIUS.

Use **undo snmp-agent trap enable radius** to disable SNMP notifications for RADIUS.

Syntax

snmp-agent trap enable radius [**accounting-server-down** | **accounting-server-up** | **authentication-error-threshold** | **authentication-server-down** | **authentication-server-up**] *

undo snmp-agent trap enable radius [**accounting-server-down** | **accounting-server-up** | **authentication-error-threshold** | **authentication-server-down** | **authentication-server-up**] *

Default

All RADIUS SNMP notifications are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

accounting-server-down: Specifies notifications to be sent when the RADIUS accounting server becomes unreachable.

accounting-server-up: Specifies notifications to be sent when the RADIUS accounting server becomes reachable.

authentication-error-threshold: Specifies notifications to be sent when the number of authentication failures exceeds the specified threshold. The threshold is represented by the ratio of the authentication failures to the total number of authentication attempts. The value range is 1 to 100, and the default value is 30. This threshold can only be configured through the MIB.

authentication-server-down: Specifies notifications to be sent when the RADIUS authentication server becomes unreachable.

authentication-server-up: Specifies notifications to be sent when the RADIUS authentication server becomes reachable.

Usage guidelines

If you do not specify any keywords, this command enables or disables all types of notifications for RADIUS.

When SNMP notifications for RADIUS are enabled, the device supports the following notifications generated by RADIUS:

- **RADIUS server unreachable notification**—The RADIUS server cannot be reached. RADIUS generates this notification if it cannot receive any response to an accounting or authentication request within the specified RADIUS request transmission attempts.
- **RADIUS server reachable notification**—The RADIUS server can be reached. RADIUS generates this notification for a previously blocked RADIUS server after the quiet timer expires.
- **Excessive authentication failures notification**—RADIUS generates this notification when the number of authentication failures to the total number of authentication attempts exceeds the specified threshold.

Examples

Enable the device to send RADIUS accounting server unreachable notifications.

```
<Switch> system-view
[Switch] snmp-agent trap enable radius accounting-server-down
```

1.3.22. state primary

Use **state primary** to set the status of a primary RADIUS server.

Syntax

state primary { **accounting** | **authentication** } { **active** | **block** }

Default

A primary RADIUS server is in active state.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

accounting: Specifies the primary RADIUS accounting server.

authentication: Specifies the primary RADIUS authentication server.

active: Specifies the active state, the normal operation state.

block: Specifies the blocked state, the out-of-service state.

Usage guidelines

When the RADIUS server load sharing feature is disabled, the device first tries to communicate with the primary server if the primary server is in active state. If the primary server is unavailable, the device performs the following operations:

- Changes the status of the primary server to blocked.

- Starts a quiet timer for the server.
- Tries to communicate with a secondary server in active state.

When the quiet timer of the primary server times out, the status of the server automatically changes to active. If you set the server status to blocked before the quiet timer times out, the server status cannot change back to active unless you manually set the status to active.

When the RADIUS server load sharing feature is enabled, the device checks the number of currently served users only for servers in active state. The most appropriate active server is selected for communication.

When the primary server and all secondary servers are in blocked state, the device tries to communicate with the primary server.

Examples

In RADIUS scheme **radius1**, set the status of the primary authentication server to blocked.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] state primary authentication block
```

Related commands

display radius scheme

state secondary

1.3.23. state secondary

Use **state secondary** to set the status of a secondary RADIUS server.

Syntax

state secondary { **accounting** | **authentication** } [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }

Default

A secondary RADIUS server is in active state.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

accounting: Specifies a secondary RADIUS accounting server.

authentication: Specifies a secondary RADIUS authentication server.

host-name: Specifies the host name of the secondary RADIUS server, a case-insensitive string of 1 to 253 characters.

ipv4-address: Specifies the IPv4 address of a secondary RADIUS server.

ipv6 *ipv6-address*: Specifies the IPv6 address of a secondary RADIUS server.

port-number: Specifies the service port number of a secondary RADIUS server. The value range for the UDP port number is 1 to 65535. The default port numbers for authentication and accounting are 1812 and 1813, respectively.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the secondary RADIUS server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters.

active: Specifies the active state, the normal operation state.

block: Specifies the blocked state, the out-of-service state.

Usage guidelines

If you do not specify an IP address, this command changes the status of all configured secondary RADIUS servers.

If the device finds that a secondary server in active state is unreachable, the device performs the following operations:

- Changes the status of the secondary server to blocked.
- Starts a quiet timer for the server.
- Tries to communicate with another secondary server in active state.

When the quiet timer of a server times out, the status of the server automatically changes to active. If you set the server status to blocked before the quiet timer times out, the server status cannot change back to active unless you manually set the status to active. If all configured secondary servers are unreachable, the device considers the authentication or accounting attempt a failure.

When the RADIUS server load sharing feature is enabled, the device checks the number of currently served users only for servers in active state. The most appropriate active server is selected for communication.

Examples

In RADIUS scheme **radius1**, set the status of all the secondary authentication servers to blocked.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] state secondary authentication block
```

Related commands

display radius scheme

state primary

1.3.24. stop-accounting-buffer enable (RADIUS scheme view)

Use **stop-accounting-buffer enable** to enable buffering of RADIUS stop-accounting requests to which no responses have been received.

Use **undo stop-accounting-buffer enable** to disable the buffering feature.

Syntax

stop-accounting-buffer enable

undo stop-accounting-buffer enable

Default

The device buffers the RADIUS stop-accounting requests to which no responses have been received.

Views

RADIUS scheme view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to buffer a RADIUS stop-accounting request that has no response after the maximum transmission attempts (set by using the **retry** command) have been made. The device resends the buffered request until it receives a server response or when the number of stop-accounting request transmission attempts reaches the upper limit. If no more attempts are available, the device discards the request. However, if you have removed an accounting server, stop-accounting requests destined for the server are not buffered.

Examples

Enable buffering of RADIUS stop-accounting requests to which no responses have been received.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] stop-accounting-buffer enable
```

Related commands

display stop-accounting-buffer (for RADIUS)

reset stop-accounting-buffer (for RADIUS)

1.3.25. timer quiet (RADIUS scheme view)

Use **timer quiet** to set the quiet timer for the servers specified in a RADIUS scheme.

Use **undo timer quiet** to restore the default.

Syntax

timer quiet *minutes*

undo timer quiet

Default

The server quiet timer period is 5 minutes in a RADIUS scheme.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

minutes: Specifies the server quiet period in minutes, in the range of 1 to 255.

Usage guidelines

Make sure the server quiet timer is set correctly.

A timer that is too short might result in frequent authentication or accounting failures. This is because the device will continue to attempt to communicate with an unreachable server that is in active state.

A timer that is too long might temporarily block a reachable server that has recovered from a failure. This is because the server will remain in blocked state until the timer expires.

Examples

In RADIUS scheme **radius1**, set the quiet timer to 10 minutes for the servers.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] timer quiet 10
```

Related commands

display radius scheme

1.3.26. timer realtime-accounting (RADIUS scheme view)

Use **timer realtime-accounting** to set the real-time accounting interval.

Use **undo timer realtime-accounting** to restore the default.

Syntax

timer realtime-accounting *interval*

undo timer realtime-accounting

Default

The real-time accounting interval is 12 minutes.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

interval: Specifies the real-time accounting interval in the range of 0 to 71582.

Usage guidelines

When the real-time accounting interval on the device is not zero, the device sends online user accounting information to the RADIUS accounting server at the configured interval.

When the real-time accounting interval on the device is zero, the device sends online user accounting information to the RADIUS accounting server at the real-time accounting interval configured on the server. If the real-time accounting interval is not configured on the server, the device does not send online user accounting information.

A short interval helps improve accounting precision but requires many system resources.

Table 1-7 Recommended real-time accounting intervals

Number of users	Real-time accounting interval
1 to 99	3 minutes
100 to 499	6 minutes
500 to 999	12 minutes
1000 or more	15 minutes or longer

Examples

In RADIUS scheme **radius1**, set the real-time accounting interval to 51 minutes.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] timer realtime-accounting 51
```

Related commands

retry realtime-accounting

1.3.27. timer response-timeout (RADIUS scheme view)

Use **timer response-timeout** to set the RADIUS server response timeout timer.

Use **undo timer response-timeout** to restore the default.

Syntax

timer response-timeout *seconds*

undo timer response-timeout

Default

The RADIUS server response timeout period is 3 seconds.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

seconds: Specifies the RADIUS server response timeout period, in the range of 1 to 10 seconds.

Usage guidelines

If a NAS receives no response from the RADIUS server in a period of time after sending a RADIUS request, it resends the request so that the user has more opportunity to obtain the RADIUS service. The NAS uses the RADIUS server response timeout timer to control the transmission interval.

If the client times out during the authentication process, the user is immediately logged off. To avoid user logoffs, the value multiplied by the following items cannot be larger than the client timeout period defined by the access module:

- The maximum number of RADIUS packet transmission attempts.
- The RADIUS server response timeout period.
- The number of RADIUS servers in the RADIUS scheme.

When the device sends a RADIUS request to a new RADIUS server, it checks the total amount of time it has taken to transmit the RADIUS packet. If the amount of time has reached 300 seconds, the device stops sending the RADIUS request to the next RADIUS server. As a best practice, consider the number of RADIUS servers when you configure the maximum number of packet transmission attempts and the RADIUS server response timeout period.

Examples

In RADIUS scheme **radius1**, set the RADIUS server response timeout timer to 5 seconds.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] timer response-timeout 5
```

Related commands

display radius scheme

retry

1.3.28. user-name-format (RADIUS scheme view)

Use **user-name-format** to specify the format of the username to be sent to a RADIUS server.

Use **undo user-name-format** to restore the default.

Syntax

user-name-format { **keep-original** | **with-domain** | **without-domain** }

undo user-name-format

Default

The ISP domain name is included in the usernames sent to a RADIUS server.

Views

RADIUS scheme view

Predefined user roles

network-admin

Parameters

keep-original: Sends the username to the RADIUS server as the username is entered.

with-domain: Includes the ISP domain name in the username sent to the RADIUS server.

without-domain: Excludes the ISP domain name from the username sent to the RADIUS server.

Usage guidelines

A username is generally in the *userid@isp-name* format, of which the *isp-name* argument is used by the device to determine the ISP domain to which a user belongs. Some earlier RADIUS servers, however, cannot recognize a username containing an ISP domain name. Before sending a username including a domain name to such a RADIUS server, the device must remove the domain name. This command allows you to specify whether to include a domain name in a username sent to a RADIUS server.

If a RADIUS scheme defines that the username is sent without the ISP domain name, do not apply the scheme to more than one ISP domain. Otherwise, the RADIUS server will consider two users in different ISP domains but with the same *userid* as one user.

For 802.1X users using EAP authentication, the **user-name-format** command configured for a RADIUS scheme does not take effect. The device does not change the usernames from clients before forwarding them to the RADIUS server.

Examples

In RADIUS scheme **radius1**, configure the device to remove the domain name from the usernames sent to the RADIUS servers.

```
<Switch> system-view
[Switch] radius scheme radius1
[Switch-radius-radius1] user-name-format without-domain
```

Table 2-1 Command output

Field	Description
Global 802.1X parameters	Global 802.1X configuration.
802.1X authentication	Whether 802.1X is enabled globally.
CHAP authentication	Performs EAP termination and uses CHAP to communicate with the RADIUS server.
EAP authentication	Relays EAP packets and supports any of the EAP authentication methods to communicate with the RADIUS server.
PAP authentication	Performs EAP termination and uses PAP to communicate with the RADIUS server.
Max-tx period	Username request timeout timer in seconds.
Handshake period	Handshake timer in seconds.
Quiet timer	Status of the quiet timer, enabled or disabled.
Quiet period	Quiet timer in seconds.
Supp timeout	Client timeout timer in seconds.
Server timeout	Server timeout timer in seconds.
Reauth period	Periodic reauthentication timer in seconds.
Max auth requests	Maximum number of attempts for sending an authentication request to a client.
EAD assistant function	Whether EAD assistant is enabled.
URL	Redirect URL for unauthenticated users using a Web browser to access the network.
Free IP	Network segment accessible to unauthenticated users.
EAD timeout	EAD rule timer in minutes.
Domain delimiter	Domain delimiters supported by the device.
Online 802.1X wired users	Number of wired online 802.1X users, including users that have passed 802.1X authentication and users that are performing 802.1X authentication.
GigabitEthernet1/0/1 is link-up	Status of the port. In this example, GigabitEthernet 1/0/1 is up.
802.1X authentication	Whether 802.1X is enabled on the port.
Handshake	Whether the online user handshake feature is enabled on the port.
Handshake reply	Whether the online user handshake reply feature is enabled on the port.
Handshake security	Whether the online user handshake security feature is enabled on the port.
Unicast trigger	Whether the 802.1X unicast trigger is enabled on the port.
Periodic reauth	Whether 802.1X periodic reauthentication is enabled on the port.
Port role	Role of the port. The port functions only as an **Authenticator**.

Field	Description
Authorization mode	Authorization state of the port, which can be Force-Authorized, Auto, or Force-Unauthorized.
Port access control	Access control method of the port: • **MAC-based**—MAC-based access control. • **Port-based**—Port-based access control.
Multicast trigger	Whether the 802.1X multicast trigger feature is enabled.
Mandatory auth domain	Mandatory authentication domain on the port.
Guest VLAN	802.1X guest VLAN configured on the port. If no 802.1X guest VLAN is configured on the port, this field displays **Not configured**.
Auth-Fail VLAN	802.1X Auth-Fail VLAN configured on the port. If no 802.1X Auth-Fail VLAN is configured on the port, this field displays **Not configured**.
Critical VLAN	802.1X critical VLAN configured on the port. If no 802.1X critical VLAN is configured on the port, this field displays **Not configured**.
Critical voice VLAN	Whether the 802.1X critical voice VLAN feature is enabled on the port.
Add Guest VLAN delay	Status and mode of the 802.1X guest VLAN assignment delay feature on a port: • **EAPOL**—EAPOL-triggered 802.1X guest VLAN assignment delay is enabled. • **NewMac**—New MAC-triggered 802.1X guest VLAN assignment delay is enabled. • **ALL**—Both EAPOL-triggered and new MAC-triggered 802.1X guest VLAN assignment delays are enabled. • **Disabled**—802.1X guest VLAN assignment delay is disabled.
Re-auth server-unreachable	Whether to log off online 802.1X users or keep them online when no server is reachable for 802.1X reauthentication.
Max online users	Maximum number of concurrent 802.1X users on the port.
User IP freezing	Whether user IP freezing is enabled on the port.
Reauth period	Periodic reauthentication timer in seconds on the port.
Send Packets Without Tag	Whether to remove the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients.
Max Attempts Fail Number	Maximum number of 802.1X authentication attempts for MAC authenticated users.
Guest VSI	802.1X guest VSI configured on the port. If no 802.1X guest VSI is configured on the port, this field displays **Not configured**.
Auth-Fail VSI	802.1X Auth-Fail VSI configured on the port. If no 802.1X Auth-Fail VSI is configured on the port, this field displays **Not configured**.
Critical VSI	802.1X critical VSI configured on the port. If no 802.1X critical VSI is configured on the port, this field

Field	Description
	displays **Not configured**.
Add Guest VSI delay	Status and mode of the 802.1X guest VSI assignment delay feature on a port: • **EAPOL only**—EAPOL-triggered 802.1X guest VSI assignment delay is enabled. • **NewMAC only**—New MAC-triggered 802.1X guest VSI assignment delay is enabled. • **EAPOL or NewMAC**—Both EAPOL-triggered and new MAC-triggered 802.1X guest VSI assignment delays are enabled. • **Disabled**—802.1X guest VSI assignment delay is disabled.
EAPOL packets	Number of sent (Tx) and received (Rx) EAPOL packets.
Sent EAP Request/Identity packets	Number of sent EAP-Request/Identity packets.
EAP Request/Challenge packets	Number of sent EAP-Request/MD5-Challenge packets.
EAP Success packets	Number of sent EAP-Success packets.
EAP Failure packets	Number of sent EAP-Failure packets.
Received EAPOL Start packets	Number of received EAPOL-Start packets.
EAPOL LogOff packets	Number of received EAPOL-LogOff packets.
EAP Response/Identity packets	Number of received EAP-Response/Identity packets.
EAP Response/Challenge packets	Number of received EAP-Response/MD5-Challenge packets.
Error packets	Number of received error packets.
Online 802.1X users	Number of online 802.1X users on the port, including users that have passed 802.1X authentication and users that are performing 802.1X authentication.
MAC address	MAC addresses of the online 802.1X users.
Auth state	Authentication status of the online 802.1X users.

2.1.2. display dot1x connection

Use **display dot1x connection** to display information about online 802.1X users.

Syntax

display dot1x connection [**interface** *interface-type interface-number* | **slot** *slot-number* | **user-mac** *mac-address* | **user-name** *name-string*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify a port, this command displays online 802.1X user information for all ports.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays online 802.1X user information for all member devices.

user-mac *mac-address*: Specifies an 802.1X user by MAC address. The *mac-address* argument represents the MAC address of the user, in the form of H-H-H. If you do not specify an 802.1X user, this command displays all online 802.1X user information.

user-name *name-string*: Specifies an 802.1X user by its name. The *name-string* argument represents the username, a case-sensitive string of 1 to 253 characters. If you do not specify an 802.1X user, this command displays all online 802.1X user information.

Examples

Display information about all online 802.1X users.

```
<Switch> display dot1x connection
Total connections: 1

Slot ID: 1
User MAC address: 0015-e9a6-7cfe
Access interface: GigabitEthernet1/0/1
Username: ias
User access state: Successful
Authentication domain: nec
IPv4 address: 192.168.1.1
IPv6 address: 2000:0:0:0:1:2345:6789:abcd
Authentication method: CHAP
Initial VLAN: 1
Authorization untagged VLAN: 6
Authorization tagged VLAN list: 1 to 5 7 9 11 13 15 17 19 21 23 25 27 29 31 33 29 31 33
                                35 37 40 to 100
Authorization VSI: N/A
Authorization ACL ID: 3001
Authorization user profile: N/A
Authorization CAR:
  Average input rate: 102400
  Peak input rate: 204800
  Average output rate: 102400
  Peak output rate: 204800
Termination action: Default
Session timeout period: 2 s
Online from: 2013/03/02  13:14:15
Online duration: 0h 2m 15s
```

Table 2-2 Command output

Field	Description
Total connections	Number of online 802.1X users.
User MAC address	MAC address of the user.

Field	Description
Access interface	Interface through which the user access the device.
User access state	Access state of the user. • **Successful**—The user passes 802.1X authentication and comes online. • **Open**—The user uses a nonexistent username or an incorrect password to come online in open authentication mode.
Authentication domain	ISP domain used for 802.1X authentication.
IPv4 address	IPv4 address of the user. If the device does not get the IPv4 address of the user, this field is not available.
IPv6 address	IPv6 address of the user. If the device does not get the IPv6 address of the user, this field is not available.
Authentication method	EAP message handling method: • **CHAP**—Performs EAP termination and uses CHAP to communicate with the RADIUS server. • **EAP**—Relays EAP packets and supports any of the EAP authentication methods to communicate with the RADIUS server. • **PAP**—Performs EAP termination and uses PAP to communicate with the RADIUS server.
Initial VLAN	VLAN to which the user belongs before 802.1X authentication.
Authorization untagged VLAN	Untagged VLAN authorized to the user.
Authorization tagged VLAN list	Tagged VLANs authorized to the user.
Authorization VSI	VSIs authorized to the user.
Authorization ACL ID	ACL authorized to the user. If the ACL authorization fails, this field displays **(Not effective)** after the ACL ID.
Authorization user profile	User profile authorized to the user.
Authorization CAR	Authorization CAR attributes assigned by the server. • **Average input rate**—Average rate of inbound traffic in bps. • **Peak input rate**—Peak rate of inbound traffic in bps. • **Average output rate**—Average rate of outbound traffic in bps. • **Peak output rate**—Peak rate of outbound traffic in bps. If the server does not assign the peak rates, the peak rates by default are the same as the assigned average rates. In the current software version, the device does not support exclusive assignment of peak rates from the server. If no authorization CAR attributes are assigned, this field displays **N/A**.
Termination action	Action attribute assigned by the server to terminate the user session: • **Default**—Logs off the online authenticated 802.1X user

Field	Description
	when the session timeout timer expires. This attribute does not take effect when 802.1X periodic reauthentication is enabled and the periodic reauthentication timer is shorter than the session timeout timer. • **Radius-request**—Reauthenticates the online user when the session timeout timer expires, regardless of whether the 802.1X periodic reauthentication feature is enabled or not. If the device performs local authentication, this field displays **Default**.
Session timeout period	Session timeout timer assigned by the server.
Online from	Time from which the 802.1X user came online.
Online duration	Online duration of the 802.1X user.

2.1.3. dot1x

Use **dot1x** to enable 802.1X globally or on a port.

Use **undo dot1x** to disable 802.1X globally or on a port.

Syntax

dot1x

undo dot1x

Default

802.1X is neither enabled globally nor enabled for any port.

Views

System view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

For the 802.1X feature to take effect on a port, you must enable the feature both globally and on the port.

Examples

Enable 802.1X globally.

```
<Switch> system-view
[Switch] dot1x
```

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x
[Switch-GigabitEthernet1/0/1] quit
```

Related commands

display dot1x

NOTE:
QX-S5600G series can be certified up to 100PPS.

2.1.4. dot1x access-user log enable

Use **dot1x access-user log enable** to enable logging for 802.1X users.

Use **undo dot1x access-user log enable** to disable logging for 802.1X users.

Syntax

dot1x access-user log enable [**abnormal-logoff** | **failed-login** | **normal-logoff** | **successful-login**] *

undo dot1x access-user log enable [**abnormal-logoff** | **failed-login** | **normal-logoff** | **successful-login**] *

Default

Logging for 802.1X users is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

abnormal-logoff: Specifies logs generated for exceptional logoffs of 802.1X users, such as logoffs caused by realtime accounting failures and reauthentication failures.

failed-login: Specifies logs generated for login failures of 802.1X users.

normal-logoff: Specifies logs generated for logoffs requested by 802.1X users.

successful-login: Specifies logs generated for successful logins of 802.1X users.

Usage guidelines

As a best practice, disable this feature to prevent excessive output of logs for 802.1X users.

If you do not specify any parameters, this command enables all logging functions for 802.1X users.

Examples

Enable logging for login failures of 802.1X users.

```
<Switch> system-view
[Switch] dot1x access-user log enable failed-login
```

Related commands

info-center source dot1x logfile deny (*Network Management and Monitoring Command Reference*)

2.1.5. dot1x authentication-method

Use **dot1x authentication-method** to specify an EAP message handling method.

Use **undo dot1x authentication-method** to restore the default.

Syntax

dot1x authentication-method { **chap** | **eap** | **pap** }

undo dot1x authentication-method

Default

The access device performs EAP termination and uses CHAP to communicate with the RADIUS server.

Views

System view

Predefined user roles

network-admin

Parameters

chap: Configures the access device to perform Extensible Authentication Protocol (EAP) termination and use the Challenge Handshake Authentication Protocol (CHAP) to communicate with the RADIUS server.

eap: Configures the access device to relay EAP packets, and supports any of the EAP authentication methods to communicate with the RADIUS server.

pap: Configures the access device to perform EAP termination and use the Password Authentication Protocol (PAP) to communicate with the RADIUS server.

Usage guidelines

The access device terminates or relays EAP packets.

- **In EAP termination mode**—The access device re-encapsulates and sends the authentication data from the client in standard RADIUS packets to the RADIUS server. The device performs either CHAP or PAP authentication with the RADIUS server. In this mode, the RADIUS server supports only MD5-Challenge EAP authentication and the username and password EAP authentication initiated by an iNode client.
  - PAP transports usernames and passwords in plain text. The authentication method applies to scenarios that do not require high security. To use PAP, the client can be an iNode 802.1X client.
  - CHAP transports usernames in plain text and passwords in encrypted form over the network. CHAP is more secure than PAP.
- **In EAP relay mode**—The access device relays EAP messages between the client and the RADIUS server. The EAP relay mode supports multiple EAP authentication methods, such as MD5-Challenge, EAP-TLS, and PEAP. To use this mode, make sure the RADIUS server meets the following requirements:
  - Supports the EAP-Message and Message-Authenticator attributes.
  - Uses the same EAP authentication method as the client.

  If this mode is used, the **user-name-format** command configured in RADIUS scheme view does not take effect. For more information about the **user-name-format** command, see "RADIUS commands."

If RADIUS authentication is used, you must configure the access device to use the same authentication method (PAP, CHAP, or EAP) as the RADIUS server.

Examples

Enable the access device to terminate EAP packets and perform PAP authentication with the RADIUS server.

```
<Switch> system-view
```

```
[Switch] dot1x authentication-method pap
```

Related commands

display dot1x

2.1.6. dot1x auth-fail vlan

Use **dot1x auth-fail vlan** to configure an 802.1X Auth-Fail VLAN on a port.

Use **undo dot1x auth-fail vlan** to restore the default.

Syntax

dot1x auth-fail vlan *authfail-vlan-id*

undo dot1x auth-fail vlan

Default

No 802.1X Auth-Fail VLAN exists on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

authfail-vlan-id: Specifies the ID of the 802.1X Auth-Fail VLAN on the port. The value range for the VLAN ID is 1 to 4094. Make sure the VLAN has been created.

Usage guidelines

An 802.1X Auth-Fail VLAN accommodates users that have failed 802.1X authentication for any reason other than unreachable servers. Users in the Auth-Fail VLAN can access a limited set of network resources.

To delete a VLAN that has been configured as an 802.1X Auth-Fail VLAN, you must first use the **undo dot1x auth-fail vlan** command.

Examples

Configure VLAN 100 as the Auth-Fail VLAN on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x auth-fail vlan 100
```

Related commands

display dot1x

2.1.7. dot1x guest-vlan

Use **dot1x guest-vlan** to configure an 802.1X guest VLAN on a port.

Use **undo dot1x guest-vlan** to restore the default.

Syntax

dot1x guest-vlan *guest-vlan-id*

undo dot1x guest-vlan

Default

No 802.1X guest VLAN exists on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

guest-vlan-id: Specifies the ID of the 802.1X guest VLAN. The value range for the VLAN ID is 1 to 4094. Make sure the VLAN has been created.

Usage guidelines

An 802.1X guest VLAN accommodates users that have not performed 802.1X authentication. In the guest VLAN, users can access a limited set of network resources, such as a software server, to download anti-virus software and system patches.

To delete a VLAN that has been configured as a guest VLAN, you must use the **undo dot1x guest-vlan** command first.

Examples

Specify VLAN 100 as the 802.1X guest VLAN on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x guest-vlan 100
```

Related commands

display dot1x

2.1.8. dot1x handshake

Use **dot1x handshake** to enable the online user handshake feature.

Use **undo dot1x handshake** to disable the online user handshake feature.

Syntax

dot1x handshake

undo dot1x handshake

Default

The online user handshake feature is enabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

The online user handshake feature enables the device to periodically send EAP-Request/Identity packets to the client for verifying the connectivity status of online 802.1X users. The device sets a user to the offline state if it does not receive an EAP-Response/Identity packet from the user after making the maximum attempts before the handshake timer expires. To set the handshake timer, use

the **dot1x timer handshake-period** command. To set the maximum handshake attempts, use the **dot1x retry** command.

Examples

Enable the online user handshake feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x handshake
```

Related commands

display dot1x

dot1x timer handshake-period

dot1x retry

2.1.9. dot1x handshake reply enable

Use **dot1x handshake reply enable** to enable the 802.1X online user handshake reply feature.

Use **undo dot1x handshake reply enable** to disable the 802.1X online user handshake reply feature.

Syntax

dot1x handshake reply enable

undo dot1x handshake reply enable

Default

The 802.1X online user handshake reply feature is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to reply to 802.1X clients' EAP-Response/Identity packets with EAP-Success packets during the online handshake process.

Use this command only if 802.1X clients will go offline without receiving EAP-Success packets from the device.

Examples

Enable the 802.1X online user handshake reply feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x handshake reply enable
```

Related commands

dot1x handshake

2.1.10. dot1x mandatory-domain

Use **dot1x mandatory-domain** to specify a mandatory 802.1X authentication domain on a port.

Use **undo dot1x mandatory-domain** to restore the default.

Syntax

dot1x mandatory-domain *domain-name*

undo dot1x mandatory-domain

Default

No mandatory 802.1X authentication domain is specified on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the ISP domain name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

When the system authenticates an 802.1X user trying to access a port, it selects an authentication domain in the following order:

1. Mandatory domain.
2. ISP domain specified in the username.
3. Default ISP domain.

Examples

Specify **my-domain** as the mandatory authentication domain for 802.1X users on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x mandatory-domain my-domain
```

Related commands

display dot1x

2.1.11. dot1x max-user

Use **dot1x max-user** to set the maximum number of concurrent 802.1X users on a port.

Use **undo dot1x max-user** to restore the default.

Syntax

dot1x max-user *max-number*

undo dot1x max-user

Default

The maximum number of the configurable setting is 4294967295, but the number which can be used actually will be 2048.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of concurrent 802.1X users on a port. The value range is 1 to 4294967295.

Usage guidelines

Set the maximum number of concurrent 802.1X users on a port to prevent the system resources from being overused. When the maximum number is reached, the port denies subsequent 802.1X users.

Examples

Set the maximum number of concurrent 802.1X users to 32 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x max-user 32
```

Related commands

display dot1x

2.1.12. dot1x multicast-trigger

Use **dot1x multicast-trigger** to enable the 802.1X multicast trigger feature.

Use **undo dot1x multicast-trigger** to disable the 802.1X multicast trigger feature.

Syntax

dot1x multicast-trigger

undo dot1x multicast-trigger

Default

The 802.1X multicast trigger feature is enabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

The multicast trigger feature enables the device to act as the initiator. The device periodically multicasts EAP-Request/Identity packets out of a port to detect 802.1X clients and trigger authentication. You can use the **dot1x timer tx-period** command to set the interval for sending multicast EAP-Request/Identity packets.

Examples

Enable the multicast trigger feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x multicast-trigger
```

Related commands

display dot1x

dot1x timer tx-period

dot1x unicast-trigger

2.1.13. dot1x port-control

Use **dot1x port-control** to set the authorization state for the port.

Use **undo dot1x port-control** to restore the default.

Syntax

dot1x port-control { **authorized-force** | **auto** | **unauthorized-force** }

undo dot1x port-control

Default

The default port authorization state is **auto**.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

authorized-force: Places the port in authorized state, enabling users on the port to access the network without authentication.

auto: Places the port initially in unauthorized state to allow only EAPOL packets to pass, and places the port in authorized state after a user passes authentication. You can use this option in most scenarios.

unauthorized-force: Places the port in unauthorized state, denying any access requests from users on the port.

Usage guidelines

You can use this command to set the port authorization state to determine whether a client is granted access to the network.

Examples

Set the authorization state of GigabitEthernet 1/0/1 to **unauthorized-force**.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x port-control unauthorized-force
```

Related commands

display dot1x

2.1.14. dot1x port-method

Use **dot1x port-method** to specify an access control method for the port.

Use **undo dot1x port-method** to restore the default.

Syntax

dot1x port-method { **macbased** | **portbased** }

undo dot1x port-method

Default

MAC-based access control applies.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

macbased: Uses MAC-based access control on the port to separately authenticate each user attempting to access the network. Using this method, when an authenticated user logs off, no other online users are affected.

portbased: Uses port-based access control on the port. Using this method, once an 802.1X user passes authentication on the port, any subsequent user can access the network through the port without authentication. When the authenticated user logs off, all other users are logged off.

Examples

Configure GigabitEthernet 1/0/1 to implement port-based access control.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x port-method portbased
```

Related commands

display dot1x

2.1.15. dot1x quiet-period

Use **dot1x quiet-period** to enable the quiet timer.

Use **undo dot1x quiet-period** to disable the quiet timer.

Syntax

dot1x quiet-period

undo dot1x quiet-period

Default

The quiet timer is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When a client fails 802.1X authentication, the device must wait a period of time before it can process authentication requests from the client. You can use the **dot1x timer quiet-period** command to set the quiet timer.

Examples

Enable the quiet timer and set the quiet timer to 100 seconds.

```
<Switch> system-view
[Switch] dot1x quiet-period
[Switch] dot1x timer quiet-period 100
```

Related commands

display dot1x

dot1x timer

2.1.16. dot1x re-authenticate

Use **dot1x re-authenticate** to enable the 802.1X periodic reauthentication feature.

Use **undo dot1x re-authenticate** to disable the 802.1X periodic reauthentication feature.

Syntax

dot1x re-authenticate

undo dot1x re-authenticate

Default

The 802.1X periodic reauthentication feature is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Periodic reauthentication enables the access device to periodically authenticate online 802.1X users on a port. This feature tracks the connection status of online users and updates the authorization attributes assigned by the server, such as the ACL and VLAN.

You can use the **dot1x timer reauth-period** command to configure the interval for reauthentication.

Examples

Enable the 802.1X periodic reauthentication feature on GigabitEthernet 1/0/1, and set the periodic reauthentication interval to 1800 seconds.

```
<Switch> system-view
[Switch] dot1x timer reauth-period 1800
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x re-authenticate
```

Related commands

display dot1x

dot1x timer

2.1.17. dot1x retry

Use **dot1x retry** to set the maximum number of attempts for sending an authentication request to a client.

Use **undo dot1x retry** to restore the default.

Syntax

dot1x retry *retries*

undo dot1x retry

Default

A maximum of two attempts are made to send an authentication request to a client.

Views

System view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of attempts for sending an authentication request to a client. The value range is 1 to 10.

Usage guidelines

The access device retransmits an authentication request to a client in any of the following situations:

- The device does not receive any responses from the client within the username request timeout interval. The timer is set by using the **dot1x timer tx-period** *tx-period-value* command for the EAP-Request/Identity packet.
- The device does not receive any responses from the client within the client timeout interval. The timer is set by using the **dot1x timer supp-timeout** *supp-timeout-value* command for the EAP-Request/MD5-Challenge packet.

The access device stops retransmitting the request, if it has made the maximum number of request transmission attempts but still received no response.

Examples

Set the maximum number of attempts to 9 for sending an authentication request to a client.

```
<Switch> system-view
[Switch] dot1x retry 9
```

Related commands

display dot1x

dot1x timer

2.1.18. dot1x timer

Use **dot1x timer** to set an 802.1X timer.

Use **undo dot1x timer** to restore the default of an 802.1X timer.

Syntax

dot1x timer { **handshake-period** *handshake-period-value* | **quiet-period** *quiet-period-value* | **reauth-period** *reauth-period-value* | **server-timeout**

server-timeout-value | **supp-timeout** *supp-timeout-value* | **tx-period** *tx-period-value* }

undo dot1x timer { **handshake-period** | **quiet-period** | **reauth-period** | **server-timeout** | **supp-timeout** | **tx-period** }

Default

The following 802.1X timers apply:

- Handshake timer: 15 seconds.
- Quiet timer: 60 seconds.
- Periodic reauthentication timer: 3600 seconds.
- Server timeout timer: 100 seconds.
- Client timeout timer: 30 seconds.
- Username request timeout timer: 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

handshake-period *handshake-period-value*: Specifies the handshake timer in seconds. The value range for the *handshake-period-value* argument is 5 to 1024.

quiet-period *quiet-period-value*: Specifies the quiet timer in seconds. The value range for the *quiet-period-value* argument is 10 to 120.

reauth-period *reauth-period-value*: Specifies the periodic reauthentication timer in seconds. The value range for the *reauth-period-value* argument is 60 to 7200.

server-timeout *server-timeout-value*: Specifies the server timeout timer in seconds. The value range for the *server-timeout-value* argument is 100 to 300.

supp-timeout *supp-timeout-value*: Specifies the client timeout timer in seconds. The value range for the *supp-timeout-value* argument is 1 to 120.

tx-period *tx-period-value*: Specifies the username request timeout timer in seconds. The value range for the *tx-period-value* argument is 1 to 120.

Usage guidelines

In most cases, the default settings are sufficient. You can edit the timers, depending on the network conditions.

- In a low-speed network, increase the client timeout timer.
- In a vulnerable network, set the quiet timer to a high value.
- In a high-performance network with quick authentication response, set the quiet timer to a low value.
- In a network with authentication servers of different performance, adjust the server timeout timer.

The network device uses the following 802.1X timers:

- **Handshake timer (handshake-period)**—Sets the interval at which the access device sends client handshake requests to check the online status of a client that has passed authentication. If the device does not receive a response after sending the maximum number of handshake requests, it considers that the client has logged off.

- **Quiet timer (`quiet-period`)**—Starts when a client fails authentication. The access device must wait the time period before it can process the authentication attempts from the client.
- **Periodic reauthentication timer (`reauth-period`)**—Sets the interval at which the network device periodically reauthenticates online 802.1X users. To enable 802.1X periodic reauthentication on a port, use the **`dot1x re-authenticate`** command.
- **Server timeout timer (`server-timeout`)**—Starts when the access device sends a RADIUS Access-Request packet to the authentication server. If no response is received when this timer expires, the 802.1X authentication fails.
- **Client timeout timer (`supp-timeout`)**—Starts when the access device sends an EAP-Request/MD5-Challenge packet to a client. If no response is received when this timer expires, the access device retransmits the request to the client.
- **Username request timeout timer (`tx-period`)**—Starts when the device sends an EAP-Request/Identity packet to a client in response to an authentication request. If the device does not receive a response before this timer expires, it retransmits the request. The timer also sets the interval at which the network device sends multicast EAP-Request/Identity packets to detect clients that cannot actively request authentication.

The change to the periodic reauthentication timer applies to the users that have been online only after the old timer expires. Other timer changes take effect immediately on the device.

Examples

Set the server timeout timer to 150 seconds.

```
<Switch> system-view
[Switch] dot1x timer server-timeout 150
```

Related commands

`display dot1x`

2.1.19. dot1x timer reauth-period

Use **`dot1x timer reauth-period`** to set the 802.1X periodic reauthentication timer on a port.

Use **`undo dot1x timer reauth-period`** to restore the default.

Syntax

`dot1x timer reauth-period` *`reauth-period-value`*

`undo dot1x timer reauth-period`

Default

No 802.1X periodic reauthentication timer is configured on a port. The port uses the global 802.1X periodic reauthentication timer.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

`reauth-period-value`: Specifies the 802.1X periodic reauthentication timer in seconds. The value range for the *`reauth-period-value`* argument is 60 to 7200.

Usage guidelines

The device reauthenticates online 802.1X users on a port at the specified periodic reauthentication interval when the port is enabled with periodic reauthentication. To enable periodic reauthentication on a port, use the **dot1x re-authenticate** command.

A change to the periodic reauthentication timer applies to online users only after the old timer expires.

The device selects a periodic reauthentication timer for 802.1X reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

Examples

Set the 802.1X periodic reauthentication timer to 60 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x timer reauth-period 60
```

2.1.20. dot1x unicast-trigger

Use **dot1x unicast-trigger** to enable the 802.1X unicast trigger feature.

Use **undo dot1x unicast-trigger** to disable the 802.1X unicast trigger feature.

Syntax

dot1x unicast-trigger

undo dot1x unicast-trigger

Default

The 802.1X unicast trigger feature is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

The unicast trigger feature enables the access device to initiate 802.1X authentication when the device receives a data frame from an unknown source MAC address. The device sends a unicast EAP-Request/Identity packet to the unknown source MAC address. It will retransmit the packet if it does not receive any responses within a period of time (set by using the **dot1x timer tx-period** command). This process continues until the maximum number of request attempts (set by using the **dot1x retry** command) is reached.

Examples

Enable the unicast trigger feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
```

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dot1x unicast-trigger
```

2.1.21. reset dot1x guest-vlan

Use **reset dot1x guest-vlan** to remove users from the 802.1X guest VLAN on a port.

Syntax

reset dot1x guest-vlan interface *interface-type interface-number* [**mac-address** *mac-address*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number.

mac-address *mac-address*: Specifies the MAC address of an 802.1X user in the guest VLAN. If you do not specify this option, the command removes all 802.1X users from the 802.1X guest VLAN on the port.

Examples

Remove the 802.1X user with MAC address 1-1-1 from the 802.1X guest VLAN on GigabitEthernet 1/0/1.

```
<Switch> reset dot1x guest-vlan interface gigabitethernet 1/0/1 mac-address 1-1-1
```

Related commands

dot1x guest-vlan

2.1.22. reset dot1x statistics

Use **reset dot1x statistics** to clear 802.1X statistics.

Syntax

reset dot1x statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify a port, this command clears 802.1X statistics on all ports.

Examples

Clear 802.1X statistics on GigabitEthernet 1/0/1.

```
<Switch> reset dot1x statistics interface gigabitethernet 1/0/1
```

3.1.1. display mac-authentication

Use **display mac-authentication** to display MAC authentication settings and statistics.

Syntax

display mac-authentication [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If the specified port is not enabled with MAC authentication, this command displays only global MAC authentication information.

Usage guidelines

If you do not specify any parameters, this command displays all MAC authentication information including the global settings, port-specific settings, MAC authentication statistics, and online user statistics.

Examples

Display all MAC authentication settings and statistics.

```
<Switch> display mac-authentication
Global MAC authentication parameters:
   MAC authentication     : Enabled
   Username format        : MAC address in lowercase(xxxxxxxxxxxx)
           Username       : mac
           Password       : Not configured
   Offline detect period  : 300 s
   Quiet period           : 60 s
   Server timeout         : 100 s
   Reauth period          : 3600 s
   Authentication domain  : Not configured, use default domain
 Online MAC-auth wired users    : 1

 Silent MAC users:
          MAC address       VLAN ID  From port               Port index

```

Table 3-1 Command output

Field	Description
MAC authentication	Whether MAC authentication is enabled globally.
Username format	User account type: MAC-based or shared. • If MAC-based accounts are used, this field displays the format settings for the username. For example, **MAC address in lowercase(xxxxxxxxxxxx)** indicates that the MAC address is in the hexadecimal notation without hyphens, and letters are in lower case. • If a shared account is used, this field displays **Fixed account**.
Username	Username for MAC authentication. • If MAC-based accounts are used, this field displays **mac**. The device uses the MAC address of each user as the username and password for MAC authentication. • If a shared account is used, this field displays the username of the shared account for MAC authentication users. By default, the username is **mac**.
Password	Password for MAC authentication.

Field	Description
	• If MAC-based accounts are used or if a shared account is used but no password is configured, this field displays **Not configured**. • If a shared account is used and a password is configured, this field displays a string of asterisks (******).
Offline detect period	Offline detect timer.
Quiet period	Quiet timer.
Server timeout	Server timeout timer.
Reauth period	Periodic MAC reauthentication timer in seconds.
Authentication domain	MAC authentication domain specified in system view. If no authentication domain is specified in system view, this field displays **Not configured, use default domain**.
Online MAC-auth wired users	Number of wired online MAC authentication users, including users that have passed MAC authentication and users that are performing MAC authentication.
Silent MAC users	Information about silent MAC addresses, including MAC addresses that have failed MAC authentication and MAC addresses that have been assigned the blackhole MAC attribute from the RADIUS server.
MAC address	Silent MAC address.
VLAN ID	ID of the VLAN to which the silent MAC address belongs.
From port	Name of the port that marks the MAC address as a silent MAC address.
Port index	Index of the port that marks the MAC address as a silent MAC address.
GigabitEthernet1/0/1 is link-up	Status of the link on GigabitEthernet 1/0/1. In this example, the link is up.
MAC authentication	Whether MAC authentication is enabled on the port.
Carry User-IP	Whether user IP addresses are included in MAC authentication requests.
Authentication domain	MAC authentication domain specified for the port.
Auth-delay timer	Whether MAC authentication delay is enabled on the port.
Auth-delay period	MAC authentication delay timer.
Periodic reauth	Whether periodic MAC reauthentication is enabled on the port.
Reauth period	Periodic MAC reauthentication timer on the port.
Re-auth server-unreachable	Action taken when no server is reachable for MAC reauthentication: • **Logoff**—Logs off online MAC authentication users. • **Online**—Keeps MAC authenticated users online.
Guest VLAN	MAC authentication guest VLAN configured on the port. If no MAC authentication guest VLAN is configured, this field displays **Not configured**.

Field	Description
Guest VLAN auth-period	Authentication interval for users in the MAC authentication guest VLAN on the port.
Critical VLAN	MAC authentication critical VLAN configured on the port. If no MAC authentication critical VLAN is configured, this field displays **Not configured**.
Critical voice VLAN	Whether the MAC authentication critical voice VLAN feature is enabled on the port.
Host mode	• If multi-VLAN mode is disabled, this field displays **Single VLAN**. • If multi-VLAN mode is enabled, this field displays **Multiple VLAN**.
Offline detection	Status of MAC authentication offline detection: • **Enabled**. • **Disabled**.
Authentication order	If parallel processing of MAC authentication and 802.1X authentication is disabled, this field displays **Default**. If parallel processing of MAC authentication and 802.1X authentication is enabled, this field displays **Parallel**.
Guest VSI	MAC authentication guest VSI configured on the port. If no MAC authentication guest VSI is configured, this field displays **Not configured**.
Guest VSI auth-period	Authentication interval for users in the MAC authentication guest VSI on the port.
Critical VSI	MAC authentication critical VSI configured on the port. If no MAC authentication critical VSI is configured, this field displays **Not configured**.
Auto-tag feature	This field is not supported in the current software version. Status of the authorization VLAN auto-tag feature: • **Enabled**. • **Disabled**.
VLAN tag configuration ignoring	This field is not supported in the current software version. Status of the ignore-config mode: • **Enabled**. • **Disabled**.
Max online users	Maximum number of concurrent online users allowed on the port.
Authentication attempts: successful 1, failed 0	MAC authentication statistics, including the number of successful and unsuccessful authentication attempts.
MAC address	MAC address of the online user.
Auth state	User status: • **Authenticated**—The user has passed MAC authentication. • **Unauthenticated**—The user failed MAC authentication.

3.1.2. display mac-authentication connection

Use **display mac-authentication connection** to display information about online MAC authentication users.

Syntax

display mac-authentication connection [**interface** *interface-type interface-number* | **slot** *slot-number* | **user-mac** *mac-address* | **user-name** *user-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify a port, this command displays information about online MAC authentication users for all ports.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about online MAC authentication users for all member devices.

user-mac *mac-address*: Specifies an online MAC authentication user by its MAC address. The *mac-address* argument represents the MAC address of the user, in the form of H-H-H. If you do not specify an online MAC authentication user, this command displays all online MAC authentication user information.

user-name *user-name*: Specifies an online MAC authentication user by its username. The user name is a case-sensitive string of 1 to 55 characters, and it can include the domain name. If you do not specify an online MAC authentication user, this command displays all online MAC authentication user information.

Examples

Display information about all online MAC authentication users.

```
<Switch> display mac-authentication connection
Total connections: 1

Slot ID: 1
User MAC address: 0015-e9a6-7cfe
Access interface: GigabitEthernet1/0/1
Username: ias
User access state: Successful
Authentication domain: macusers
IPv4 address: 192.168.1.1
IPv6 address: 2000:0:0:0:1:2345:6789:abcd
Initial VLAN: 1
Authorization untagged VLAN: 100
Authorization tagged VLAN: N/A
Authorization VSI: N/A
```

```
Authorization ACL ID: 3001
Authorization user profile: N/A
Authorization CAR: N/A
Termination action: Radius-request
Session timeout period: 2 s
Online from: 2013/03/02  13:14:15
Online duration: 0h 2m 15s
```

Table 3-2 Command output

Field	Description
Total connections	Total number of online MAC authentication users.
User MAC address	MAC address of the user.
Access interface	Interface through which the user accesses the device.
User access state	Access state of the user: • **Successful**—The user passes MAC authentication and comes online. • **Open**—The user uses a nonexistent username or an incorrect password to come online in open authentication mode.
Authentication domain	MAC authentication domain to which the user belongs.
IPv4 address	IPv4 address of the user. If no user IPv4 address is available, this field is not displayed.
IPv6 address	IPv6 address of the user. If no user IPv6 address is available, this field is not displayed.
Initial VLAN	VLAN that holds the user before MAC authentication.
Authorization untagged VLAN	Untagged VLAN authorized to the user.
Authorization tagged VLAN	Tagged VLAN authorized to the user.
Authorization VSI	VSI authorized to the user.
Authorization ACL ID	ACL authorized to the user. If the ACL authorization fails, this field displays **(Not effective)** after the ACL ID.
Authorization user profile	User profile authorized to the user.
Authorization CAR	Authorization CAR attributes assigned by the server. • **Average input rate**—Average rate of inbound traffic in bps. • **Peak input rate**—Peak rate of inbound traffic in bps. • **Average output rate**—Average rate of outbound traffic in bps. • **Peak output rate**—Peak rate of outbound traffic in bps. If the server does not assign the peak rates, the peak rates by default are the same as the assigned average rates. In the current software version, the device does not support exclusive assignment of peak rates from the server. If no authorization CAR attributes are assigned, this field displays **N/A**.

Field	Description
Termination action	Action attribute assigned by the server to terminate the user session: • **Default**—Logs off the online authenticated user when the session timeout timer expires. This attribute does not take effect when periodic MAC reauthentication is enabled and the periodic reauthentication timer is shorter than the session timeout timer. • **Radius-request**—Reauthenticates the online user when the session timeout timer expires, regardless of whether the periodic MAC reauthentication feature is enabled or not. If the device performs local authentication, this field displays **N/A**.
Session timeout period	Session timeout timer assigned by the server.
Online from	Time from which the MAC authentication user came online.
Online duration	Online duration of the MAC authentication user.

3.1.3. mac-authentication

Use **mac-authentication** to enable MAC authentication globally or on a port.

Use **undo mac-authentication** to disable MAC authentication globally or on a port.

Syntax

mac-authentication

undo mac-authentication

Default

MAC authentication is disabled globally or on any port.

Views

System view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

To use MAC authentication on a port, you must enable the feature both globally and on the port.

Examples

Enable MAC authentication globally.

```
<Switch> system-view
[Switch] mac-authentication
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication
```

Related commands

display mac-authentication

> **NOTE:**
> QX-S5600G series can be certified up to 100PPS.

3.1.4. mac-authentication access-user log enable

Use **mac-authentication access-user log enable** to enable logging for MAC authentication users.

Use **undo mac-authentication access-user log enable** to disable logging for MAC authentication users.

Syntax

mac-authentication access-user log enable [**failed-login** | **ip-change** | **logoff** | **successful-login**] *

undo mac-authentication access-user log enable [**failed-login** | **ip-change** | **logoff** | **successful-login**] *

Default

Logging for MAC authentication users is enabled.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

failed-login: Specifies logs generated for login failures of MAC authentication users.

ip-change: Logs user IP address changes.

logoff: Specifies logs generated for logoffs of MAC authentication users.

successful-login: Specifies logs generated for successful logins of MAC authentication users.

Usage guidelines

As a best practice, disable this feature to prevent excessive output of logs for MAC authentication users.

If you do not specify any parameters, this command enables all logging functions for MAC authentication users.

This feature takes effect on an interface only if you enable it both globally and on that interface.

Examples

Disable all types of MAC authentication user logging on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] undo mac-authentication access-user log enable
```

Related commands

info-center source maca logfile deny (*Network Management and Monitoring Command Reference*)

3.1.5. mac-authentication domain

Use **mac-authentication domain** to specify a global or port-specific authentication domain.

Use **undo mac-authentication domain** to restore the default.

Syntax

mac-authentication domain *domain-name*

undo mac-authentication domain

Default

The system default authentication domain is used. For more information about the default authentication domain, see the **domain default enable** command in "*AAA commands*."

Views

System view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the name of an ISP domain, a case-insensitive string of 1 to 255 characters.

Usage guidelines

The global authentication domain applies to all MAC authentication-enabled ports. An authentication domain specified in Layer 2 Ethernet interface view or Layer 2 aggregate interface view applies only to the port. You can specify different authentication domains on different ports.

A port chooses an authentication domain for MAC authentication users in the following order:

1. Authentication domain specified on the port.
2. Global authentication domain specified in system view.
3. Default authentication domain.

Examples

Specify ISP domain **domain1** as the global MAC authentication domain.

```
<Switch> system-view
[Switch] mac-authentication domain domain1
```

Specify ISP domain **aabbcc** as the MAC authentication domain on GigabitEthernet 1/0/1.

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication domain aabbcc
```

Related commands

display mac-authentication

domain default enable

3.1.6. mac-authentication guest-vlan

Use **mac-authentication guest-vlan** to configure a MAC authentication guest VLAN on a port.

Use **undo mac-authentication guest-vlan** to restore the default.

Syntax

mac-authentication guest-vlan *guest-vlan-id*

undo mac-authentication guest-vlan

Default

No MAC authentication guest VLAN exists on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

guest-vlan-id: Specifies a VLAN as the MAC authentication guest VLAN. The value range for the VLAN ID is 1 to 4094. Make sure the VLAN has been created.

Usage guidelines

The MAC authentication guest VLAN accommodates users that have failed MAC authentication for any reason other than server unreachable. For example, the VLAN accommodates users for which incorrect passwords are entered. You can deploy a limited set of network resources in the MAC authentication guest VLAN. For example, a software server for downloading software and system patches.

You cannot specify a VLAN as both a super VLAN and a MAC authentication guest VLAN on a port. For more information about super VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Before you delete a VLAN that has been set as a MAC authentication guest VLAN, use the **undo mac-authentication guest-vlan** command to remove the guest VLAN configuration.

Examples

Configure VLAN 100 as the MAC authentication guest VLAN on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication guest-vlan 100
```

Related commands

display mac-authentication

reset mac-authentication guest-vlan

3.1.7. mac-authentication guest-vlan auth-period

Use **mac-authentication guest-vlan auth-period** to set the interval at which the device authenticates users in the MAC authentication guest VLAN.

Use **undo mac-authentication guest-vlan auth-period** to restore the default.

Syntax

mac-authentication guest-vlan auth-period *period-value*

undo mac-authentication guest-vlan auth-period

Default

The device authenticates users in the MAC authentication guest VLAN every 30 seconds.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

period-value: Sets the authentication interval for users in the MAC authentication guest VLAN. The value range is 1 to 3600, in seconds.

Usage guidelines

For this command to take effect, you must use the **mac-authentication guest-vlan re-authenticate** command to enable guest VLAN reauthentication in MAC authentication.

As a best practice, set the reauthentication interval to a value greater than 30 seconds if the number of concurrent MAC authentication users on a port is likely to exceed 300.

Examples

Set the authentication interval to 150 seconds for users in the MAC authentication guest VLAN on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication guest-vlan auth-period 150
```

Related commands

display mac-authentication

mac-authentication guest-vlan

3.1.8. mac-authentication max-user

Use **mac-authentication max-user** to set the maximum number of concurrent MAC authentication users on a port.

Use **undo mac-authentication max-user** to restore the default.

Syntax

mac-authentication max-user *max-number*

undo mac-authentication max-user

Default

The maximum number of the configurable setting is 4294967295, but the number which can be used actually will be 2048.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of concurrent MAC authentication users on the port. The value range for this argument is 1 to 4294967295.

Usage guidelines

Set the maximum number of concurrent MAC authentication users on a port to prevent the system resources from being overused. When the maximum number is reached, the port denies subsequent MAC authentication users.

Examples

Configure GigabitEthernet 1/0/1 to support a maximum of 32 concurrent MAC authentication users.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication max-user 32
```

Related commands

display mac-authentication

3.1.9. mac-authentication parallel-with-dot1x

Use **mac-authentication parallel-with-dot1x** to enable parallel processing of MAC authentication and 802.1X authentication on a port.

Use **undo mac-authentication parallel-with-dot1x** to restore the default.

Syntax

mac-authentication parallel-with-dot1x

undo mac-authentication parallel-with-dot1x

Default

Parallel processing of MAC authentication and 802.1X authentication is disabled on a port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When you configure this command on a port, follow these restrictions and guidelines:

- Make sure the port meets the following requirements:
  - The port is configured with both 802.1X authentication and MAC authentication and performs MAC-based access control for 802.1X authentication.
  - The port is enabled with the 802.1X unicast trigger.
- For the port to perform MAC authentication before it is assigned to the 802.1X guest VLAN or guest VSI, use the **dot1x guest-vlan-delay new-mac** or **dot1x guest-vsi-delay new-mac** command to delay assigning the port to the 802.1X guest VLAN or guest VSI.

- Do not enable MAC authentication delay on the port. This operation will delay MAC authentication after 802.1X authentication is triggered.
- To configure both 802.1X authentication and MAC authentication on the port, use one of the following methods:
  - Enable the 802.1X and MAC authentication features separately on the port.
  - Enable port security on the port. The port security mode must be **userlogin-secure-or-mac** or **userlogin-secure-or-mac-ext**.

    For information about port security mode configuration, see port security in *Security Configuration Guide*.

Examples

Enable parallel processing of MAC authentication and 802.1X authentication on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication parallel-with-dot1x
```

Related commands

display mac-authentication

3.1.10. mac-authentication timer

Use **mac-authentication timer** to configure a MAC authentication timer.

Use **undo mac-authentication timer** to restore the default of a MAC authentication timer.

Syntax

mac-authentication timer { **offline-detect** *offline-detect-value* | **quiet** *quiet-value* | **reauth-period** *reauth-period-value* | **server-timeout** *server-timeout-value* }

undo mac-authentication timer { **offline-detect** | **quiet** | **reauth-period** | **server-timeout** }

Default

The following MAC authentication timers apply:

- The offline detect timer is 300 seconds.
- The quiet timer is 60 seconds.
- The global periodic MAC reauthentication timer is 3600 seconds.
- The server timeout timer is 100 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

offline-detect *offline-detect-value*: Specifies the offline detect timer in the range of 60 to 2147483647, in seconds.

quiet *quiet-value*: Specifies the quiet timer in the range of 1 to 3600, in seconds.

reauth-period *reauth-period-value*: Specifies the global periodic MAC reauthentication timer in the range of 60 to 7200, in seconds.

server-timeout *server-timeout-value*: Specifies the server timeout timer in the range of 100 to 300, in seconds.

Usage guidelines

MAC authentication uses the following timers:

- **Offline detect timer**—Sets the interval that the device waits for traffic from a user before the device regards the user as idle. The device logs off the user and requests to stop accounting for the user after the timer expires. This timer takes effect only when the MAC authentication offline detection feature is enabled.
- **Quiet timer**—Sets the interval that the device must wait before the device can perform MAC authentication for a user that has failed MAC authentication. All packets from the MAC address are dropped during the quiet time. This quiet mechanism prevents repeated authentication from affecting system performance.
- **Periodic MAC reauthentication timer**—Sets the interval at which the device reauthenticates online MAC authentication users on a port if the port is enabled with periodic MAC reauthentication. A change to the global periodic reauthentication timer applies to online users only after the old timer expires.
- **Server timeout timer**—Sets the interval that the device waits for a response from a RADIUS server before the device regards the RADIUS server unavailable. If the timer expires during MAC authentication, the user cannot access the network.

Examples

Set the server timeout timer to 150 seconds.

```
<Switch> system-view
[Switch] mac-authentication timer server-timeout 150
```

Related commands

display mac-authentication

3.1.11. mac-authentication timer auth-delay

Use **mac-authentication timer auth-delay** to configure a MAC authentication timer on a port.

Use **undo mac-authentication timer auth-delay** to restore the default of a MAC authentication timer.

Syntax

mac-authentication timer auth-delay *auth-delay-time*

undo mac-authentication timer auth-delay

Default

No MAC authentication delay timer is set on a port. MAC authentication delay is disabled. MAC authentication starts immediately after it is triggered by a user packet.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

auth-delay *auth-delay-time*: Specifies the delay time for MAC authentication in seconds. The value range is 1 to 180.

Usage guidelines

When both 802.1X authentication and MAC authentication are enabled on a port, you can delay MAC authentication so that 802.1X authentication is preferentially triggered. If no 802.1X authentication is triggered or if 802.1X authentication fails within the delay period, the port continues to process MAC authentication.

Do not set the port security mode to **mac-else-userlogin-secure** or **mac-else-userlogin-secure-ext** when you want to use MAC authentication delay. The delay does not take effect on a port in either of the two modes. For more information about port security modes, see "*Port security commands*".

Examples

Enable MAC authentication delay on GigabitEthernet 1/0/1 and set the delay time to 10 seconds.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-authentication timer auth-delay 10
```

Related commands

display mac-authentication

port-security port-mode

3.1.12. mac-authentication user-name-format

Use **mac-authentication user-name-format** to configure the type of user accounts for MAC authentication users.

Use **undo mac-authentication user-name-format** to restore the default.

Syntax

mac-authentication user-name-format { **fixed** [**account** *name*] [**password** { **cipher** | **simple** } *string*] | **mac-address** [{ **with-hyphen** | **without-hyphen** } [**lowercase** | **uppercase**]] }

undo mac-authentication user-name-format

Default

Each user's MAC address is used as the username and password for MAC authentication. A MAC address is in the hexadecimal notation without hyphens, and letters are in lower case.

Views

System view

Predefined user roles

network-admin

Parameters

fixed: Uses a shared account for all MAC authentication users.

account *name*: Specifies the username for the shared account. The name is a case-sensitive string of 1 to 55 characters, excluding the at sign (@). If you do not specify a username, the default name **mac** applies.

password: Specifies the password for the shared user account.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

mac-address: Uses MAC-based user accounts for MAC authentication users. You can also specify the format of username and password by using the following keywords:

- **with-hyphen**: Includes hyphens in the MAC address, for example xx-xx-xx-xx-xx-xx.
- **without-hyphen**: Excludes hyphens from the MAC address, for example, xxxxxxxxxxxx.
- **lowercase**: Enters letters in lower case.
- **uppercase**: Enters letters in upper case.

Usage guidelines

If you specify the MAC-based user account, the device uses the MAC address of a user as the username and password for MAC authentication of the user. This user account type ensures high authentication security. However, you must create on the authentication server a user account for each user, using the MAC address of the user as both the username and password.

If you specify a shared user account, the device uses the specified username and password for MAC authentication of all users. Because all MAC authentication users use a single account for authentication, you only need to create one account on the authentication server. This user account type is suitable for trusted networks.

Examples

Configure a shared account for MAC authentication users, and set the username to **abc** and password to plaintext string of **xyz**.

```
<Switch> system-view
[Switch] mac-authentication user-name-format fixed account abc password simple xyz
```

Use MAC-based user accounts for MAC authentication users. Each MAC address must be in the hexadecimal notation with hyphens, and letters are in upper case.

```
<Switch> system-view
[Switch] mac-authentication user-name-format mac-address with-hyphen uppercase
```

display mac-authentication

3.1.13. reset mac-authentication guest-vlan

Use **reset mac-authentication guest-vlan** to remove users from the MAC authentication guest VLAN on a port.

Syntax

reset mac-authentication guest-vlan interface *interface-type interface-number* [**mac-address** *mac-address*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number.

mac-address *mac-address*: Specifies a user by its MAC address. If you do not specify this option, the command removes all users from the MAC authentication guest VLAN on the port.

Examples

Remove the user with MAC address **1-1-1** from the MAC authentication guest VLAN on GigabitEthernet 1/0/1.

```
<Switch> reset mac-authentication guest-vlan interface gigabitethernet 1/0/1 mac-address
1-1-1
```

Related commands

display mac-authentication

mac-authentication guest-vlan

3.1.14. reset mac-authentication statistics

Use **reset mac-authentication statistics** to clear MAC authentication statistics.

Syntax

reset mac-authentication statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify a port, this command clears both global and port-specific MAC authentication statistics.

Examples

Clear MAC authentication statistics on GigabitEthernet 1/0/1.

```
<Switch> reset mac-authentication statistics interface gigabitethernet 1/0/1
```

4. Web authentication commands

4.1. Web authentication commands

4.1.1. display web-auth

Use **display web-auth** to display Web authentication configuration and running status on interfaces.

Syntax

display web-auth [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays Web authentication configuration for all interfaces.

Examples

Display Web authentication configuration on GigabitEthernet 1/0/1.

```
<Switch> display web-auth interface gigabitethernet 1/0/1
 Global Web-auth parameters  :
  Proxy Port Numbers         : Not configured
  Total online web-auth users: 1
 GigabitEthernet1/0/1  is link-up
   Port role                 : Authenticator
   Web-auth domain           : my-domain
   Auth-Fail VLAN            : Not configured
   Offline-detect            : Not configured
   Max online users          : 1024
   Web-auth enable           : Enabled

  Total online web-auth users: 1
```

Table 4-1 Command output

Field	Description
Global Web-auth parameters	Global Web authentication configuration.
Proxy Port Numbers	Port numbers of the Web proxy servers.
Total online web-auth users	Total number of online Web authentication users on the device.
GigabitEthernet1/0/1 is	State of the interface:

Field	Description
link-up	• **link-up**—The interface is both administratively and physically up. • **link-down**—The interface is down.
Port role	Role of the port. The port functions only as an **Authenticator**.
Web-auth domain	ISP domain used by Web authentication.
Auth-fail VLAN	Auth-Fail VLAN for Web authentication. This field displays **Not configured** if no Auth-Fail VLAN is configured.
Offline-detect	Interval of Web authentication user detection. This field displays **Not configured** if online detection for Web authentication users is disabled.
Max online users	Maximum number of Web authentication users allowed on the interface.
Web-auth enable	State of Web authentication: • Enabled. • Disabled.
Total online web-auth users	Total number of online Web authentication users on the interface.

4.1.2. display web-auth free-ip

Use **display web-auth free-ip** to display Web authentication-free subnets.

Syntax

display web-auth free-ip

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display Web authentication-free subnets.

```
<Switch> display web-auth free-ip
       Free IP
                          : 1.1.0.0          255.255.0.0
                          : 1.2.0.0          255.255.0.0
```

Related commands

web-auth free-ip

4.1.3. display web-auth server

Use **display web-auth server** to display Web authentication server information.

Syntax

display web-auth server [*server-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

server-name: Specifies a Web authentication server name, a case-sensitive string of 1 to 32 characters. If you do not specify a Web authentication server, this command displays information about all Web authentication servers.

Examples

Display information about Web authentication server **aaa**.

```
<Switch> display web-auth server aaa
Web-auth server: aaa
  IP                       : 8.8.8.8
  Port                     : 80
  URL                      : http://8.8.8.8/portal/
  Redirect-wait-time     : 5
  URL parameters          : Not configured
```

Table 4-2 Command output

Field	Description
Web-auth server	Name of the Web authentication server.
IP	IP address of the Web authentication server.
Port	Port number of the Web authentication server.
URL	Redirection URL of the Web authentication server.
Redirect-wait-time	Time before redirecting an authenticated user to the webpage requested by the user.
URL parameters	Parameters in the redirection URL.

4.1.4. display web-auth user

Use **display web-auth user** to display information about online Web authentication users on interfaces.

Syntax

display web-auth user [**interface** *interface-type interface-number* | **slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about online Web authentication users on all interfaces.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays online Web authentication user information for all member devices.

Examples

Display information about online Web authentication users on GigabitEthernet 1/0/1.

```
<Switch> display web-auth user interface gigabitethernet 1/0/1
  Total online web-auth users: 1

User name: user1
  MAC address: 0000-2700-b076
  Access interface: GigabitEthernet 1/0/1
  Initial VLAN: 1
  Authorization VLAN: N/A
  Authorization ACL ID: N/A
  Authorization user profile: N/A
```

Table 4-3 Command output

Field	Description
Total online web-auth users	Total number of online Web authentication users.
User Name	Name of the online Web authentication user.
MAC address	MAC address of the online Web authentication user.
Access interface	Access interface of the online Web authentication user.
Initial VLAN	Initial VLAN of the user before the user passes Web authentication.
Authorization VLAN	Authorization VLAN ID of the online Web authentication user.
Authorization ACL ID	Authorization ACL number of the online Web authentication user.
Authorization user profile	Status of user profile of the online Web authentication user: • **N/A**—No user profile is authorized. • **Active**—The authorized user profile is applied to the user access interface successfully. • **Inactive**—The authorized user profile is not applied to the user access interface or the user profile does not exist on the device.

4.1.5. ip

Use **ip** to specify the IP address and port number for a Web authentication server.

Use **undo ip** to restore the default.

Syntax

ip *ipv4-address* **port** *port-number*

undo ip

Default

No IP address or port number is specified for a Web authentication server.

Views

Web authentication server view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the IPv4 address of the Web authentication server. This IP address is that of a Layer 3 interface on the access device and must be routable to and from the Web authentication user.

port *port-number*: Specifies the port number of the Web authentication server, in the range of 1 to 65535.

User guidelines

As a best practice, use the IP address of a loopback interface as the IP address of the Web authentication server. A loopback interface has the following advantages:

- The status of a loopback interface is stable. This can avoid authentication page access failures caused by interface failures.
- A loopback interface does not forward received packets. This can avoid impacting system performance when there are many network access requests.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enter the view of Web authentication server **wbs**.

```
<Switch> system-view
[Switch] web-auth server wbs
```

Specify 192.168.1.1 as the IP address and 8080 as the port number for Web authentication server **wbs**.

```
[Switch-web-auth-server-wbs] ip 192.168.1.1 port 8080
```

Related commands

url

tcp-port

4.1.6. url

Use **url** to specify the redirection URL for a Web authentication server.

Use **undo url** to restore the default.

Syntax

url *url-string*

undo url

Default

No redirection URL is specified for a Web authentication server.

Views

Web authentication server view

Predefined user roles

network-admin

Parameters

url-string: Specifies the redirection URL for the Web authentication server, a case-sensitive string of 1 to 256 characters.

Usage guidelines

The redirection URL is a URL that can be accessed through standard HTTP or HTTPS. The redirection URL should start with http:// or https://. If the redirection URL does not start with http:// or https://, the system determines that the URL begins with http://.

The IP address and port number in the URL must be the same as the IP address and port number of the Web authentication server.

Examples

Specify http://192.168.1.1/portal/ as the redirection URL for Web authentication server **wbs**.

```
<Switch> system-view
[Switch] web-auth server wbs
[Switch-web-auth-server-wbs] url http://192.168.1.1:80/portal/
```

Related commands

ip

tcp-port

4.1.7. web-auth auth-fail vlan

Use **web-auth auth-fail vlan** to specify an Auth-Fail VLAN for Web authentication.

Use **undo web-auth auth-fail vlan** to restore the default.

Syntax

web-auth auth-fail vlan *authfail-vlan-id*

undo web-auth auth-fail vlan

Default

No Auth-Fail VLAN is specified for Web authentication.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

authfail-vlan-id: Specifies the Auth-Fail VLAN ID in a range of 1 to 4094. The specified VLAN must already exist.

User guidelines

After you configure this command on an interface, users who failed Web authentication on the interface can access resources in the Auth-Fail VLAN. You must also configure the IP address of the server that provides the resources as an authentication-free IP address.

To make the Auth-Fail VLAN take effect, you must also enable MAC-based VLAN on the interface, and set the subnet of the Auth-Fail VLAN as the Web authentication-free subnet.

Because MAC-based VLAN takes effect only on Hybrid ports, Auth-Fail VLAN also takes effect only on Hybrid ports.

If a user fails Web authentication, the device maps the MAC address of the user to the Auth-Fail VLAN.

You cannot delete the VLAN that has been configured as an Auth-Fail VLAN. To delete this VLAN, first cancel the Auth-Fail VLAN configuration by using **undo web-auth auth-fail vlan** command.

If a VLAN is specified as the super VLAN, do not configure this VLAN as an Auth-Fail VLAN of an interface. If a VLAN is specified as an Auth-Fail VLAN of an interface, do not configure this VLAN as a super VLAN.

Examples

Specify VLAN 5 as Web authentication Auth-Fail VLAN on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type hybrid
[Switch-GigabitEthernet1/0/1] mac-vlan enable
[Switch-GigabitEthernet1/0/1] web-auth auth-fail vlan 5
```

Related commands

display web-auth

4.1.8. web-auth domain

Use **web-auth domain** to specify an authentication domain for Web authentication users on an interface.

Use **undo web-auth domain** to restore the default.

Syntax

web-auth domain *domain-name*

undo web-auth domain

Default

No authentication domain is specified for Web authentication users on an interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

domain-name: Specifies an ISP authentication domain name, a case-insensitive string of 1 to 255 characters.

User guidelines

After you configure this command, the device uses the authentication domain for authentication, authorization and accounting (AAA) of the Web authentication users on the interface.

Examples

Specify domain **my-domain** as the authentication domain of Web authentication users on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] web-auth domain my-domain
```

4.1.9. web-auth enable

Use **web-auth enable** to enable Web authentication.

Use **undo web-auth enable** to disable Web authentication.

Syntax

web-auth enable apply server *server-name*

undo web-auth enable

Default

Web authentication is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

server-name: Specifies the Web authentication server name, a case-sensitive string of 1 to 32 characters.

User guidelines

Use this command to enable Web authentication on an interface and specify a Web authentication server.

For Web authentication to operate correctly, do not enable port security or configure the port security mode on the Layer 2 Ethernet interface enabled with Web authentication.

Examples

Enable Web authentication and specify Web authentication server **wbs** on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] web-auth enable apply server wbs
```

Related commands

web-auth server

4.1.10. web-auth free-ip

Use **web-auth free-ip** to specify a Web authentication-free subnet.

Use **undo web-auth free-ip** to restore the default.

Syntax

web-auth free-ip *ip-address* { *mask-length* | *mask* }

undo web-auth free-ip { *ip-address* { *mask-length* | *mask* } | **all** }

Default

No Web-authentication-free subnets exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the Web authentication-free subnet address.

mask-length: Specifies the mask length of the Web authentication-free subnet address, in the range of 1 to 32.

mask: Specifies a mask for the Web authentication-free subnet in dotted decimal notation.

all: Specifies all Web authentication-free subnets.

User guidelines

Web authentication users can access resources in Web authentication-free subnets without being authenticated.

You can repeat this command to configure multiple Web authentication-free subnets.

Examples

Configure subnet 192.168.0.0/24 as a Web authentication-free subnet.

```
<Switch> system-view
[Switch] web-auth free-ip 192.168.0.0 24
```

4.1.11. web-auth max-user

Use **web-auth max-user** to set the maximum number of Web authentication users allowed on an interface.

Use **undo web-auth max-user** to restore the default.

Syntax

web-auth max-user *max-number*

undo web-auth max number

Default

The maximum number of Web authentication users on an interface is 1024.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of Web authentication users allowed on an interface. The value range for this argument is 1 to 2048.

User guidelines

If the specified maximum number is smaller than the number of current online Web authentication users on the interface, the limit can be set successfully. The limit does not impact the online Web authentication users. However, the device does not allow new Web authentication users to log in from the interface until the number drops down below the limit.

This command specifies the maximum number of only IPv4 Web authentication users.

Examples

On GigabitEthernet 1/0/1, set the maximum number of Web authentication users to 32.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] web-auth max-user 32
```

Related commands

display web-auth

4.1.12. web-auth offline-detect

Use **web-auth offline-detect** to enable online detection of Web authentication users.

Use **undo web-auth max-user** to disable online detection of Web authentication users.

Syntax

web-auth offline-detect interval *interval*

undo web-auth offline-detect interval

Default

Online detection of Web authentication users is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the Web authentication user detection interval, in the range of 60 to 65535 seconds.

User guidelines

This feature enables the device to detect packets of an online user at the specified detection interval. If no packet from the user is received within the interval, the device logs out the user and notifies the RADIUS server to stop accounting for the user.

To prevent the device from mistakenly logging out users, set the detection interval to be the same as the aging time of MAC address entries.

Examples

On GigabitEthernet 1/0/1, enable online detection of Web authentication users and set the detection interval to 3600 seconds.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] web-auth offline-detect interval 3600
```

4.1.13. web-auth proxy port

Use **web-auth proxy port** to add the port number of a Web proxy server, so that HTTP requests forwarded by the Web proxy server trigger Web authentication.

Use **undo web-auth proxy port** to delete one or all Web proxy server port numbers.

Syntax

web-auth proxy port *port number*

undo web-auth proxy port { *port-number* | **all** }

Default

No Web proxy server port numbers are configured on the device.

Views

System view

Predefined user roles

network-admin

Parameters

port number: Specifies a Web proxy server TCP port number, in the range of 1 to 65535.

all: Specifies all Web proxy server TCP port numbers.

User guidelines

By default, proxied HTTP requests cannot trigger Web authentication but are silently dropped. To allow such HTTP requests to trigger Web authentication, specify the port numbers of the Web proxy servers on the device.

You can repeat this command to add the port numbers of multiple Web proxy servers.

If a user's browser uses the Web Proxy Auto-Discovery (WPAD) protocol to discover Web proxy servers, you must perform the following tasks:

- Add the port numbers of the Web proxy servers on the device.
- Configure authentication-free rules to allow user packets destined for the IP address of the WPAD server to pass without authentication.
- For Web authentication to support Web proxy:
- You must add the port numbers of the Web proxy servers on the device.
- Users must make sure their browsers that use a Web proxy server do not use the proxy server for the listening IP address of the local portal Web service. Then, HTTP packets that the Web authentication user sends to the local portal Web service are not sent to the Web proxy server.

Examples

Add the Web proxy server TCP port number of 7777 for Web authentication.

```
<Switch> system-view
[Switch] web-auth proxy port 7777
```

4.1.14. web-auth server

Use **web-auth server** to create a Web authentication server and enter its view, or enter the view of an existing Web authentication server.

Use **undo web-auth server** to delete a Web authentication server.

Syntax

web-auth server *server-name*

undo web-auth server *server-name*

Default

No Web authentication servers exist.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies a Web authentication server name, a case-sensitive string of 1 to 32 characters.

User guidelines

In Web authentication server view, you can configure the following parameters and features for the Web authentication server:

- IP address of the server.
- Redirection URL.
- Parameters to be carried in the redirection URL.

Examples

Create a Web authentication server named **wbs** and enter its view.

```
<Switch> system-view
[Switch] web-auth server wbs
[Switch-web-auth-server-wbs]
```

Related commands

web-auth enable apply server

5.1. Port security commands

5.1.1. display port-security

Use **display port-security** to display port security configuration, operation information, and statistics for ports.

Syntax

display port-security [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify a port, this command displays port security information for all ports.

Examples

Display port security information for all ports.

```
<Switch> display port-security
Global port security parameters:
   Port security          : Enabled
   AutoLearn aging time   : 0 min
   Disableport timeout    : 20 s
   MAC move               : Denied
   Authorization fail     : Online
   NAS-ID profile         : Not configured
   Dot1x-failure trap     : Disabled
   Dot1x-logon trap       : Disabled
   Dot1x-logoff trap      : Enabled
   Intrusion trap         : Disabled
   Address-learned trap   : Enabled
   Mac-auth-failure trap  : Disabled
   Mac-auth-logon trap    : Enabled
   Mac-auth-logoff trap   : Disabled
   Open authentication    : Disabled

    Index :  1           Value : 123401

 GigabitEthernet1/0/1 is link-up
   Port mode                     : userLogin
```

```
NeedToKnow mode                : Disabled
Intrusion protection mode      : NoAction
Security MAC address attribute
    Learning mode              : Sticky
    Aging type                 : Periodical
Max secure MAC addresses       : 32
Current secure MAC addresses   : 0
Authorization                  : Permitted
NAS-ID profile                 : Not configured
Free VLANs                     : Not configured
Open authentication           : Disabled
```

Table 5-1 Command output

Field	Description
Port security	Whether the port security feature is enabled.
AutoLearn aging time	Sticky MAC address aging timer, in minutes or seconds.
Disableport timeout	Silence period (in seconds) of the port that receives illegal packets.
MAC move	Status of MAC move: • If the feature is enabled, this field displays **Permitted**. • If the feature is disabled, this field displays **Denied**.
Authorization fail	Action to be taken for users that fail authorization: • **Online**—Allows the users to go online. • **Offline**—Logs off the users.
NAS-ID profile	NAS-ID profile applied globally.
Dot1x-failure trap	Whether SNMP notifications for 802.1X authentication failures are enabled.
Dot1x-logon trap	Whether SNMP notifications for 802.1X authentication successes are enabled.
Dot1x-logoff trap	Whether SNMP notifications for 802.1X authenticated user logoffs are enabled.
Intrusion trap	Whether SNMP notifications for intrusion protection are enabled. If they are enabled, the device sends SNMP notifications after illegal packets are detected.
Address-learned trap	Whether SNMP notifications for MAC address learning are enabled. If they are enabled, the device sends SNMP notifications after it learns a new MAC address.
Mac-auth-failure trap	Whether SNMP notifications for MAC authentication failures are enabled.
Mac-auth-logon trap	Whether SNMP notifications for MAC authentication successes are enabled.
Mac-auth-logoff trap	Whether SNMP notifications for MAC authentication user logoffs are enabled.
Open authentication	Whether global open authentication mode is enabled.
OUI value list	List of OUI values allowed for authentication.
Port mode	Port security mode:

Field	Description
	• noRestrictions. • autoLearn. • macAddressWithRadius. • macAddressElseUserLoginSecure. • macAddressElseUserLoginSecureExt. • secure. • userLogin. • userLoginSecure. • userLoginSecureExt. • macAddressOrUserLoginSecure. • macAddressOrUserLoginSecureExt. • userLoginWithOUI. For more information about port security modes, see *Security Configuration Guide*.
NeedToKnow mode	Need to know (NTK) mode: • **NeedToKnowOnly**—Allows only unicast packets with authenticated destination MAC addresses. • **NeedToKnowWithBroadcast**—Allows only unicast packets and broadcasts with authenticated destination MAC addresses. • **NeedToKnowWithMulticast**—Allows unicast packets, multicasts, and broadcasts with authenticated destination MAC addresses. • **Disabled**—NTK is disabled.
Intrusion protection mode	Intrusion protection action: • **BlockMacAddress**—Adds the source MAC address of the illegal packet to the blocked MAC address list. • **DisablePort**—Shuts down the port that receives illegal packets permanently. • **DisablePortTemporarily**—Shuts down the port that receives illegal packets for some time. • **NoAction**—Does not perform intrusion protection.
Learning mode	Secure MAC address learning mode: • **Dynamic**. • **Sticky**.
Aging type	Secure MAC address aging type: • **Periodical**—Timer aging only. • **Inactivity**—Inactivity aging feature together with the aging timer. QX-S5600G series does not support the inactivity aging.
Max secure MAC addresses	Maximum number of secure MAC addresses (or online users) that port security allows on the port.
Current secure MAC addresses	Number of secure MAC addresses stored.
Authorization	Whether the authorization information from the authentication server (RADIUS server or local device) is ignored: • **Permitted**—Authorization information from the authentication server takes effect. • **Ignored**—Authorization information from the

Field	Description
	authentication server does not take effect.
NAS-ID profile	NAS-ID profile applied to the port.
Free VLANs	VLANs in which packets will not trigger authentication. If you do not configure free VLANs, this field displays **Not configured**.
Open authentication	Whether open authentication mode is enabled on the port.

5.1.2. display port-security mac-address block

Use **display port-security mac-address block** to display information about blocked MAC addresses.

Syntax

display port-security mac-address block [**interface** *interface-type interface-number*] [**vlan** *vlan-id*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number.

vlan *vlan-id*: Specifies a VLAN by its ID. The value range is 1 to 4094.

count: Displays only the count of the blocked MAC addresses.

Usage guidelines

If you do not specify any parameters, this command displays information about all blocked MAC addresses.

Examples

Display information about all blocked MAC addresses.

```
<Switch> display port-security mac-address block
 MAC ADDR              Port                        VLAN ID
 000f-3d80-0d2d        GE1/0/1                     30

 --- On slot 1, 1 MAC address(es) found ---

 --- 1 mac address(es) found ---
```

Display the count of all blocked MAC addresses.

```
<Switch> display port-security mac-address block count

--- On slot 1, 1 MAC address(es) found ---

--- 1 mac address(es) found ---
```

Table 5-2 Command output

Field	Description
MAC ADDR	Blocked MAC address.
Port	Port having received frames with the blocked MAC address being the source address.
VLAN ID	ID of the VLAN to which the port belongs.
number mac address(es) found	Number of blocked MAC addresses.

Related commands

port-security intrusion-mode

5.1.3. display port-security mac-address security

Use **display port-security mac-address security** to display information about secure MAC addresses.

Syntax

display port-security mac-address security [**interface** *interface-type interface-number*] [**vlan** *vlan-id*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number.

vlan *vlan-id*: Specifies a VLAN by its ID. The value range is 1 to 4094.

count: Displays only the count of the secure MAC addresses.

Usage guidelines

Secure MAC addresses are those that are automatically learned by the port in autoLearn mode or configured by the **port-security mac-address security** command.

If you do not specify any parameters, this command displays information about all secure MAC addresses.

Examples

Display information about all secure MAC addresses.

```
<Switch> display port-security mac-address security
 MAC ADDR          VLAN ID  STATE          PORT INDEX                    AGING TIME
 0002-0002-0002    1        Security       GE1/0/1                        Not aged

 --- Number of secure MAC addresses: 1 ---
```

Display only the count of the secure MAC addresses.

```
<Switch> display port-security mac-address security count
```

```
--- Number of secure MAC addresses: 1 ---
```

Table 5-3 Command output

Field	Description
MAC ADDR	Secure MAC address.
VLAN ID	ID of the VLAN to which the port belongs.
STATE	Type of the MAC address. This field displays **Security** for a secure MAC address.
PORT INDEX	Port to which the secure MAC address belongs.
AGING TIME	Period of time before the secure MAC address ages out. • If the secure MAC address is a static MAC address, this field displays **Not aged**. • If the secure MAC address is a sticky MAC address, this field displays the remaining lifetime. If the remaining lifetime is less than 60 seconds, the lifetime is counted in seconds. If the lifetime is not less than 60 seconds, the lifetime is counted in minutes. By default, sticky MAC addresses do not age out, and this field displays **Not aged**.
Number of secure MAC addresses	Number of secure MAC addresses stored.

Related commands

port-security mac-address security

5.1.4. port-security access-user log enable

Use **port-security access-user log enable** to enable logging for port security users.

Use **undo port-security access-user log enable** to disable logging for port security users.

Syntax

port-security access-user log enable [**failed-authorization** | **mac-learning** | **violation**] *

undo port-security access-user log enable [**failed-authorization** | **mac-learning** | **violation**] *

Default

Logging is enabled for port security users.

Views

System view

Predefined user roles

network-admin

Parameters

failed-authorization: Specifies logs generated for authorization failures of 802.1X or MAC authentication users.

mac-learning: Specifies logs generated for new MAC address learning.

violation: Specifies logs generated when intrusion protection is triggered.

Usage guidelines

As a best practice, disable this feature to prevent excessive output of logs for port security users.

If you do not specify any parameters, this command enables all logging functions for port security users.

Examples

Enable logging for intrusion protection.

```
<Switch> system-view
[Switch] port-security access-user log enable violation
```

Related commands

info-center source portsec logfile deny (*Network Management and Monitoring Command Reference*)

5.1.5. port-security authorization ignore

Use **port-security authorization ignore** to configure a port to ignore the authorization information received from the authentication server (a RADIUS server or the local device).

Use **undo port-security authorization ignore** to restore the default.

Syntax

port-security authorization ignore

undo port-security authorization ignore

Default

A port uses the authorization information from the server.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

After a user passes RADIUS or local authentication, the server performs authorization based on the authorization attributes configured for the user account. For example, the server can assign a VLAN. If you do not want the port to use such authorization attributes for users, use this command to ignore the authorization information from the server.

Examples

Configure GigabitEthernet 1/0/1 to ignore the authorization information from the authentication server.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security authorization ignore
```

Related commands

display port-security

5.1.6. port-security enable

Use **port-security enable** to enable port security.

Use **undo port-security enable** to disable port security.

Syntax

port-security enable

undo port-security enable

Default

Port security is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You must disable global 802.1X and MAC authentication before you enable port security on a port.

Enabling or disabling port security resets the following security settings to the default:

- 802.1X access control mode is MAC-based.
- Port authorization state is auto.

When online users are present on a port, disabling port security logs off the online users.

Examples

Enable port security.

```
<Switch> system-view
[Switch] port-security enable
```

Related commands

display port-security

dot1x

dot1x port-control

dot1x port-method

mac-authentication

5.1.7. port-security intrusion-mode

Use **port-security intrusion-mode** to configure the intrusion protection feature so the port takes the predefined actions when intrusion protection detects illegal frames on the port.

Use **undo port-security intrusion-mode** to restore the default.

Syntax

port-security intrusion-mode { **blockmac** | **disableport** | **disableport-temporarily** }

undo port-security intrusion-mode

Default

Intrusion protection is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

blockmac: Adds the source MAC addresses of illegal frames to the blocked MAC address list and discards frames with blocked source MAC addresses. This action implements illegal traffic filtering on the port. A blocked MAC address is restored to normal after being blocked for 3 minutes, which is not user configurable. To display the blocked MAC address list, use the **display port-security mac-address block** command.

disableport: Disables the port permanently upon detecting an illegal frame received on the port.

disableport-temporarily: Disables the port for a period of time whenever it receives an illegal frame. You can use the **port-security timer disableport** command to set the period.

Usage guidelines

To restore the connection of the port disabled by the intrusion protection feature, use the **undo shutdown** command.

Examples

Configure GigabitEthernet 1/0/1 to block the source MAC addresses of illegal frames after intrusion protection detects the illegal frames.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security intrusion-mode blockmac
```

Related commands

display port-security

display port-security mac-address block

port-security timer disableport

5.1.8. port-security mac-address security

Use **port-security mac-address security** to add a secure MAC address.

Use **undo port-security mac-address security** to remove a secure MAC address.

Syntax

In Layer 2 Ethernet interface view:

port-security mac-address security [**sticky**] *mac-address* **vlan** *vlan-id*

undo port-security mac-address security [**sticky**] *mac-address* **vlan** *vlan-id*

In system view:

port-security mac-address security [**sticky**] *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*

undo port-security mac-address security [[*mac-address* [**interface** *interface-type interface-number*]] **vlan** *vlan-id*]

Default

No manually configured secure MAC address entries exist.

Views

System view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

sticky: Specifies the MAC address type as sticky. If you do not specify this keyword, the command configures a static secure MAC address.

mac-address: Specifies a MAC address, in H-H-H format.

interface *interface-type interface-number*: Specifies a port by its type and number.

vlan *vlan-id*: Specifies the VLAN to which the secure MAC address belongs. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Secure MAC addresses are MAC addresses configured or learned in autoLearn mode, and if saved, can survive a device reboot. You can bind a secure MAC address only to one port in a VLAN.

You can add important or frequently used MAC addresses as sticky or static secure MAC addresses to avoid the secure MAC address limit causing authentication failure. To successfully add secure MAC addresses on a port, first complete the following tasks:

- Enable port security on the port.
- Set the port security mode to autoLearn.
- Configure the port to permit packets of the specified VLAN to pass or add the port to the VLAN. Make sure the VLAN already exists.

Sticky MAC addresses can be manually configured or automatically learned in autoLearn mode. Sticky MAC addresses do not age out by default. You can use the **port-security timer autolearn aging** command to set an aging timer for the sticky MAC addresses. When the timer expires, the sticky MAC addresses are removed.

Static secure MAC addresses never age out unless you perform the following operations:

- Remove these MAC addresses by using the **undo port-security mac-address security** command.
- Change the port security mode.
- Disable the port security feature.

You cannot change the type of a secure address entry that has been added or add two entries that are identical except for their entry type. For example, you cannot add the **port-security mac-address security sticky 1-1-1 vlan 10** entry when a **port-security mac-address security 1-1-1 vlan 10** entry exists. To add the new entry, you must delete the old entry.

Examples

Enable port security, set GigabitEthernet 1/0/1 to operate in autoLearn mode, and configure the port to support a maximum number of 100 secure MAC addresses.

```
<Switch> system-view
```

```
[Switch] port-security enable
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security max-mac-count 100
[Switch-GigabitEthernet1/0/1] port-security port-mode autolearn
```

Specify MAC address 0001-0002-0003 in VLAN 4 as a sticky MAC address.

```
[Switch-GigabitEthernet1/0/1] port-security mac-address security sticky 0001-0002-0003
vlan 4
[Switch-GigabitEthernet1/0/1] quit
```

In system view, specify MAC address 0001-0001-0002 in VLAN 10 as a secure MAC address for GigabitEthernet 1/0/1.

```
[Switch] port-security mac-address security 0001-0001-0002 interface gigabitethernet
1/0/1 vlan 10
```

Related commands

display port-security

port-security timer autolearn aging

5.1.9. port-security mac-move permit

Use **port-security mac-move permit** to enable MAC move on the device.

Use **undo port-security mac-move permit** to disable MAC move on the device.

Syntax

port-security mac-move permit

undo port-security mac-move permit

Default

MAC move is enabled on the device.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command takes effect on both 802.1X and MAC authentication users.

MAC move allows 802.1X or MAC authenticated users to move between ports on a device. For example, if an 802.1X-authenticated user moves to another 802.1X-enabled port on the device, the authentication session is deleted from the first port. The user is reauthenticated on the new port.

If MAC move is disabled, 802.1X or MAC users authenticated on one port cannot pass authentication after they move to another port.

802.1X or MAC authenticated users cannot move between ports on a device if the number of online users on the authentication server (local or remote) has reached the upper limit.

Examples

Enable MAC move.

```
<Switch> system-view
[Switch] port-security mac-move permit
```

Related commands

display port-security

5.1.10. port-security max-mac-count

Use **port-security max-mac-count** to set the maximum number of secure MAC addresses that port security allows on a port.

Use **undo port-security max-mac-count** to restore the default.

Syntax

port-security max-mac-count *max-count* [**vlan** [*vlan-id-list*]]

undo port-security max-mac-count [**vlan** [*vlan-id-list*]]

Default

Port security does not limit the number of secure MAC addresses on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

max-count: Specifies the maximum number of secure MAC addresses that port security allows on the port. The value range is 1 to 2147483647. The maximum number of the configurable setting is 2147483647, but the number which can be used actually will be 2048.

vlan [*vlan-id-list*]: Specifies a space-separated list of up to 10 VLAN items. Each VLAN item specifies a VLAN ID or a range of VLAN IDs in the form of *start-vlan-id* **to** *end-vlan-id*. The end VLAN ID cannot be smaller than the start VLAN ID. The value range for VLAN IDs is 1 to 4094. If you do not specify the **vlan** keyword, this command sets the maximum number of secure MAC addresses that port security allows on a port. If you do not specify the *vlan-id-list* argument, this command sets the maximum number of secure MAC addresses for each VLAN on the port. This option takes effect only on a port that operates in autoLearn mode.

Usage guidelines

For autoLearn mode, this command sets the maximum number of secure MAC addresses (both configured and automatically learned) on the port.

In any other mode that enables 802.1X, MAC authentication, or both, this command sets the maximum number of authenticated MAC addresses on the port. The actual maximum number of concurrent users that the port accepts equals the smaller of the following values:

- The value set by using this command.
- The maximum number of concurrent users allowed by the authentication mode in use.

For example, in userLoginSecureExt mode, if 802.1X allows more concurrent users than port security's limit on the number of MAC addresses, port security's limit takes effect.

When you configure this command, follow these guidelines and restrictions:

- Make sure the maximum number of secure MAC addresses for a VLAN is not less than the number of MAC addresses currently saved for the VLAN.
- If you execute this command multiple times to set the maximum number of secure MAC addresses for the same VLAN, the most recent configuration takes effect.

- You cannot change port security's limit on the number of MAC addresses when the port is operating in autoLearn mode.

Examples

Set the maximum number of secure MAC address port security allows on GigabitEthernet 1/0/1 to 100.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security max-mac-count 100
```

Related commands

display port-security

5.1.11. port-security ntk-mode

Use **port-security ntk-mode** to configure the NTK feature.

Use **undo port-security ntk-mode** to restore the default.

Syntax

port-security ntk-mode { **ntk-withbroadcasts** | **ntk-withmulticasts** | **ntkonly** }

undo port-security ntk-mode

Default

The NTK feature is not configured on a port and all frames are allowed to be sent.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

ntk-withbroadcasts: Forwards only broadcast frames and unicast frames with authenticated destination MAC addresses.

ntk-withmulticasts: Forwards only broadcast frames, multicast frames, and unicast frames with authenticated destination MAC addresses.

ntkonly: Forwards only unicast frames with authenticated destination MAC addresses.

Usage guidelines

The NTK feature checks the destination MAC addresses in outbound frames. This feature allows frames to be sent only to devices passing authentication, preventing illegal devices from intercepting network traffic.

Examples

Set the NTK mode of GigabitEthernet 1/0/1 to **ntkonly**, allowing the port to forward received packets only to devices passing authentication.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security ntk-mode ntkonly
```

Related commands

display port-security

5.1.12. port-security oui

Use **port-security oui** to configure an OUI value for user authentication.

Use **undo port-security oui** to delete the OUI value with the specified OUI index.

Syntax

port-security oui index *index-value* **mac-address** *oui-value*

undo port-security oui index *index-value*

Default

No OUI values are configured.

Views

System view

Predefined user roles

network-admin

Parameters

index-value: Specifies the OUI index, in the range of 1 to 16.

oui-value: Specifies an OUI string, a 48-bit MAC address in the H-H-H format. The system uses only the 24 high-order bits as the OUI value.

Usage guidelines

You can configure multiple OUI values.

An OUI, the first 24 binary bits of a MAC address, is assigned by IEEE to uniquely identify a device vendor. Use this command to allow devices of specific vendors to access the network without being authenticated. For example, you can specify the OUIs of IP phones and printers.

The OUI values configured by this command apply only to the ports operating in userLoginWithOUI mode. In userLoginWithOUI mode, a port allows only one 802.1X user and one user whose MAC address matches one of the configured OUI values.

Examples

Configure an OUI value of 000d2a, and set the index to 4.

```
<Switch> system-view
[Switch] port-security oui index 4 mac-address 000d-2a10-0033
```

Related commands

display port-security

5.1.13. port-security port-mode

Use **port-security port-mode** to set the port security mode of a port.

Use **undo port-security port-mode** to restore the default.

Syntax

```
port-security port-mode { autolearn | mac-authentication |
mac-else-userlogin-secure | mac-else-userlogin-secure-ext | secure |
userlogin | userlogin-secure | userlogin-secure-ext |
userlogin-secure-or-mac | userlogin-secure-or-mac-ext |
userlogin-withoui }

undo port-security port-mode
```

Default

A port operates in noRestrictions mode, where port security does not take effect.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

Keyword	Security mode	Description
autolearn	autoLearn	A port in this mode can learn MAC addresses. The automatically learned MAC addresses are not added to the MAC address table as dynamic MAC address. Instead, the MAC addresses are added to the secure MAC address table as secure MAC addresses. You can also configure secure MAC addresses by using the **port-security mac-address security** command. A port in autoLearn mode allows frames sourced from the following MAC addresses to pass: • Secure MAC addresses. • MAC addresses configured by using the **mac-address dynamic** and **mac-address static** commands. When the number of secure MAC addresses reaches the upper limit set by the **port-security max-mac-count** command, the port changes to **secure** mode.
mac-authentication	macAddressWithRadius	In this mode, a port performs MAC authentication for users and services multiple users.
mac-else-userlogin-secure	macAddressElseUserLoginSecure	This mode is the combination of the macAddressWithRadius and userLoginSecure modes, with MAC authentication having a higher priority. In this mode, the port allows one 802.1X authentication user and multiple MAC authentication users to log in. • Upon receiving a non-802.1X frame, a port in this mode performs only MAC authentication. • Upon receiving an 802.1X frame, the port performs MAC authentication and then, if MAC authentication fails, 802.1X authentication.

Keyword	Security mode	Description
mac-else-userlogin-secure-ext	macAddressElseUserLoginSecureExt	Same as the macAddressElseUserLoginSecure mode except that a port in this mode supports multiple 802.1X and MAC authentication users.
secure	secure	In this mode, MAC address learning is disabled on the port and you can configure MAC addresses by using the **mac-address static** and **mac-address dynamic** commands. The port permits only frames sourced from the following MAC addresses to pass: • Secure MAC addresses. • MAC addresses configured by using the **mac-address static** and **mac-address dynamic** commands.
userlogin	userLogin	In this mode, a port performs 802.1X authentication and implements port-based access control. If one 802.1X user passes authentication, all the other 802.1X users of the port can access the network without authentication.
userlogin-secure	userLoginSecure	In this mode, a port performs 802.1X authentication and implements MAC-based access control. The port services only one user passing 802.1X authentication.
userlogin-secure-ext	userLoginSecureExt	Same as the userLoginSecure mode, except that this mode supports multiple online 802.1X users.
userlogin-secure-or-mac	macAddressOrUserLoginSecure	This mode is the combination of the userLoginSecure and macAddressWithRadius modes. In this mode, the port allows one 802.1X authentication user and multiple MAC authentication users to log in. In this mode, the port performs 802.1X authentication first. By default, if 802.1X authentication fails, MAC authentication is performed. However, the port in this mode processes authentication differently when the following conditions exist: • The port is enabled with parallel processing of MAC authentication and 802.1X authentication. • The port is enabled with the 802.1X unicast trigger. • The port receives a packet from an unknown MAC address. Under such conditions, the port sends a unicast EAP-Request/Identity packet to the MAC address to initiate 802.1X authentication. After that, the port immediately processes MAC authentication without waiting for the 802.1X authentication result.
userlogin-se	macAddressOrUs	Same as the macAddressOrUserLoginSecure

Keyword	Security mode	Description
cure-or-mac-ext	erLoginSecureExt	mode, except that a port in this mode supports multiple 802.1X and MAC authentication users.
userlogin-withoui	userLoginWithOUI	Similar to the userLoginSecure mode. In addition, a port in this mode also permits frames from a user whose MAC address contains a specific OUI. In this mode, the port performs OUI check at first. If the OUI check fails, the port performs 802.1X authentication. The port permits frames that pass OUI check or 802.1X authentication.

Usage guidelines

To change the security mode for a port security enabled port, you must set the port in noRestrictions mode first. Do not change port security mode when the port has online users.

IMPORTANT:

If you are configuring the autoLearn mode, first set port security's limit on the number of secure MAC addresses by using the **port-security max-mac-count** command. You cannot change the setting when the port is operating in autoLearn mode.

When port security is enabled, you cannot enable 802.1X or MAC authentication, or change the access control mode or port authorization state. The port security automatically modifies these settings in different security modes.

As a best practice, do not enable the **mac-else-userlogin-secure** or **mac-else-userlogin-secure-ext** mode on the port where MAC authentication delay is enabled. The two modes are mutually exclusive with the MAC authentication delay feature. For more information about MAC authentication delay, see "*MAC authentication commands*".

Examples

Enable port security, and set GigabitEthernet 1/0/1 to operate in secure mode.

```
<Switch> system-view
[Switch] port-security enable
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security port-mode secure
```

Change the port security mode of GigabitEthernet 1/0/1 to userLogin.

```
[Switch-GigabitEthernet1/0/1] undo port-security port-mode
[Switch-GigabitEthernet1/0/1] port-security port-mode userlogin
```

Related commands

port-security max-mac-count

5.1.14. port-security timer autolearn aging

Use **port-security timer autolearn aging** to set the secure MAC aging timer.

Use **undo port-security timer autolearn aging** to restore the default.

Syntax

port-security timer autolearn aging second *time-value*

undo port-security timer autolearn aging

Default

Secure MAC addresses do not age out.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

second *time-value*: Specifies the secure MAC aging timer. The value range for the time-value argument is 10 to 7776000 in seconds.

Usage guidelines

The timer applies to all sticky secure MAC addresses and those automatically learned by a port.

The effective aging timer varies by the aging timer setting:

- If the aging timer is set in seconds, the effective aging timer can be either of the following values:
  - The nearest multiple of 30 seconds to the configured aging timer if the configured timer is not less than 60 seconds. The effective aging timer is not less than the configured aging timer. For example, if you set the aging timer to 80 seconds, the actual aging timer that takes effect is 90 seconds.
  - The configured aging timer if the configured timer is less than 60 seconds..

A short aging time improves port access security and port resource utility but affects online user stability. Set an appropriate secure MAC address aging timer according to your device performance and the network environment.

When a short aging time (less than 60 seconds) works with inactivity aging, do not assign a large value to the maximum number of secure MAC addresses on a port. A large value in this case might affect device performance. QX-S5600G series does not support the inactivity aging.

When you configure the secure MAC address aging timer in both interface view and system view, the configuration in interface view takes priority. The actual aging timer that takes effect uses the value set in interface view.

Examples

Set the secure MAC address aging timer to 50 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security timer autolearn aging second 50
```

5.1.15. port-security timer disableport

Use **port-security timer disableport** to set the silence period during which the port remains disabled.

Use **undo port-security timer disableport** to restore the default.

Syntax

port-security timer disableport *time-value*

undo port-security timer disableport

Default

The port silence period is 20 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-value: Specifies the silence period in seconds during which the port remains disabled. The value is in the range of 20 to 300.

Usage guidelines

If you configure the intrusion protection action as disabling the port temporarily, use this command to set the silence period.

Examples

Configure the intrusion protection action on GigabitEthernet 1/0/1 as disabling the port temporarily, and set the port silence period to 30 seconds.

```
<Switch> system-view
[Switch] port-security timer disableport 30
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-security intrusion-mode disableport-temporarily
```

Related commands

display port-security

port-security intrusion-mode

5.1.16. snmp-agent trap enable port-security

Use **snmp-agent trap enable port-security** to enable SNMP notifications for port security.

Use **undo snmp-agent trap enable port-security** to disable SNMP notifications for port security.

Syntax

snmp-agent trap enable port-security [**address-learned** | **dot1x-failure** | **dot1x-logoff** | **dot1x-logon** | **intrusion** | **mac-auth-failure** | **mac-auth-logoff** | **mac-auth-logon**] *

undo snmp-agent trap enable port-security [**address-learned** | **dot1x-failure** | **dot1x-logoff** | **dot1x-logon** | **intrusion** | **mac-auth-failure** | **mac-auth-logoff** | **mac-auth-logon**] *

Default

All port security SNMP notifications are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

address-learned: Specifies notifications about MAC address learning.

dot1x-failure: Specifies notifications about 802.1X authentication failures.

dot1x-logoff: Specifies notifications about 802.1X user logoffs.

dot1x-logon: Specifies notifications about 802.1X authentication successes.

intrusion: Specifies notifications about illegal frame detection.

mac-auth-failure: Specifies notifications about MAC authentication failures.

mac-auth-logoff: Specifies notifications about MAC authentication user logoffs.

mac-auth-logon: Specifies notifications about MAC authentication successes.

Usage guidelines

To report critical port security events to an NMS, enable SNMP notifications for port security. For port security event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

If you do not specify a notification, this command enables all SNMP notifications for port security.

For this command to take effect, make sure the intrusion protection feature is configured.

Examples

Enable SNMP notifications about MAC address learning.

```
<Switch> system-view
[Switch] snmp-agent trap enable port-security address-learned
```

6. Password control commands

6.1. Password control commands

6.1.1. display password-control

Use **display password-control** to display password control configuration.

Syntax

display password-control [**super**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

super: Displays the password control information for the super passwords. If you do not specify this keyword, the command displays the global password control configuration.

Examples

Display the global password control configuration.

```
<Switch> display password-control
 Global password control configurations:
 Password control:                       Disabled
 Password aging:                         Enabled (90 days)
 Password length:                        Enabled (10 characters)
 Password composition:                   Enabled (1 types, 1 characters per type)
 Password history:                       Enabled (max history records:4)
 Early notice on password expiration:  7 days
 Maximum login attempts:                 3
 Action for exceeding login attempts:  Lock user for 1 minutes
 Minimum interval between two updates: 24 hours
 User account idle time:                 90 days
 Logins with aged password:              3 times in 30 days
 Password complexity:                    Disabled (username checking)
                                         Disabled (repeated characters checking)
 Password change:                       Enabled (first login)
                                         Enabled (mandatory weak password change)
 All line:                               Disabled (all line blacklist)
```

Display the password control configuration for super passwords.

```
<Switch> display password-control super
 Super password control configurations:
 Password aging:                         Enabled (90 days)
 Password length:                        Enabled (10 characters)
```

```
Password composition:                Enabled (1 types, 1 characters per type)
```

Table 6-1 Command output

Field	Description
Password control	Whether the password control feature is enabled.
Password aging	Whether password expiration is enabled and, if enabled, the aging time.
Password length	Whether the minimum password length restriction feature is enabled and, if enabled, the setting.
Password composition	Whether the password composition restriction feature is enabled and, if enabled, the settings.
Password history	Whether the password history feature is enabled and, if enabled, the setting.
Early notice on password expiration	Number of days during which the user is notified of the pending password expiration.
Maximum login attempts	Allowed maximum number of consecutive failed login attempts for FTP and VTY users.
Action for exceeding login attempts	Action to be taken after a user fails to log in after the specified number of attempts.
Minimum interval between two updates	Minimum password update interval.
Logins with aged password	Number of times and maximum number of days a user can log in using an expired password.
Password complexity	Whether the following password complexity checking is enabled: • **username checking**—Checks whether a password contains the username or the reverse of the username. • **repeated characters checking**—Checks whether a password contains any character that appears consecutively three or more times.
Password change	Status of the password change at first login feature: • Enabled (first login). • Disabled (first login). • Enabled (mandatory weak password change). Disabled (mandatory weak password change). Supported from version 7.3.21 and later software.
All line	Status of the password control blacklist feature for all user line types: • Enabled (all line blacklist). Disabled (all line blacklist). Supported from version 7.3.21 and later software.

6.1.2. display password-control blacklist

Use **display password-control blacklist** to display password control blacklist information.

Syntax

display password-control blacklist [**user-name** *user-name* | **ip** *ipv4-address* | **ipv6** *ipv6-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

user-name *user-name*: Specifies a user by its username, a case-sensitive string of 1 to 55 characters.

ip *ipv4-address*: Specifies the IPv4 address of a user.

ipv6 *ipv6-address*: Specifies the IPv6 address of a user.

Usage guidelines

Before **Version 7.2.**18 and Version 7.2.23：

If you do not specify any parameters, this command displays information about all users in the password control blacklist.

The users' IP addresses and user accounts are added to the password control blacklist when the users fail authentication. You can use this command to view information about blacklisted FTP and virtual terminal line (VTY) users.

Users accessing the system through the console interface are not blacklisted for the following reasons:

- The system is unable to obtain the IP addresses of these users.
- These users are privileged and, therefore, relatively secure to the system.

After Version 7.3.21 :

If you do not specify any parameters, this command displays information about all users in the password control blacklist.

When the AUX or USB users fail authentication, their user accounts are added to the password control blacklist. When FTP or virtual terminal line (VTY) users fail authentication, their IP addresses and user accounts are added to the password control blacklist. You can use this command to view information about the blacklisted users.

Examples

Display password control blacklist information.

```
<Switch> display password-control blacklist
 Blacklist items matched: 2.
 Username                    IP address          Login failures   Lock flag
 abcd                        169::168:34:1       4                lock
 admin                       192.168.34.1        1                unlock
```

Table 6-2 Command output

Field	Description
Blacklist items matched	Number of blacklisted users.

Field	Description
IP address	IP address of the user.
Login failures	Number of login failures.
Lock flag	Whether the user account is locked for the user: • **unlock**—Not limited. • **lock**—Disabled temporarily or permanently, depending on the **password-control login-attempt** command.

6.1.3. password-control { aging | composition | history | length } enable

Use **password-control { aging | composition | history | length } enable** to enable the password expiration, composition restriction, history, or minimum length restriction feature.

Use **undo password-control { aging | composition | history | length } enable** to disable a password control feature.

Syntax

password-control { aging | composition | history | length } enable

undo password-control { aging | composition | history | length } enable

Default

The password control features (**aging**, **composition**, **history**, and **length**) are all enabled.

Views

System view

Predefined user roles

network-admin

Parameters

aging: Enables the password expiration feature.

composition: Enables the password composition restriction feature.

history: Enables the password history feature.

length: Enables the minimum password length restriction feature.

Usage guidelines

For a specific password control feature to take effect, make sure the global password control and the specific password control feature are both enabled. For example, if the global password control and the minimum length restriction feature are not enabled, the **password-control length** command does not take effect.

The system stops recording history passwords after you execute the **undo password-control history enable** command, but it does not delete the prior records.

If the global password control feature is enabled but the minimum password length restriction feature is disabled. A password must contain a minimum of 4 characters and a minimum of 4 characters must be different.

Examples

Enable the password control feature globally.

```
<Switch> system-view
[Switch] password-control enable
```

Enable the password composition restriction feature.

```
[Switch] password-control composition enable
```

Enable the password expiration feature.

```
[Switch] password-control aging enable
```

Enable the minimum password length restriction feature.

```
[Switch] password-control length enable
```

Enable the password history feature.

```
[Switch] password-control history enable
```

Related commands

display password-control

password-control enable

6.1.4. password-control aging

Use **password-control aging** to set the password aging time.

Use **undo password-control aging** to restore the default.

Syntax

password-control aging *aging-time*

undo password-control aging

Default

A password expires after 90 days. The password aging time for a user group equals the global setting. The password aging time for a local user equals that of the user group to which the local user belongs.

Views

System view

User group view

Local user view

Predefined user roles

network-admin

Parameters

aging-time: Specifies the password aging time in days, in the range of 1 to 365.

Usage guidelines

The aging time depends on the view:

- The time in system view has global significance and applies to all user groups.
- The time in user group view applies to all local users in the user group.
- The time in local user view applies only to the local user.

A password aging time with a smaller application scope has higher priority. The system prefers to use the password aging time in local user view for a local user.

- If no password aging time is configured for the local user, the system uses the password aging time for the user group to which the local user belongs.
- If no password aging time is configured for the user group, the system uses the global password aging time.

Examples

Globally set the passwords to expire after 80 days.

```
<Switch> system-view
[Switch] password-control aging 80
```

Set the passwords for user group **test** to expire after 90 days.

```
[Switch] user-group test
[Switch-ugroup-test] password-control aging 90
[Switch-ugroup-test] quit
```

Set the password for device management user **abc** to expire after 100 days.

```
[Switch] local-user abc class manage
[Switch-luser-manage-abc] password-control aging 100
```

Related commands

display local-user

display password-control

display user-group

password-control aging enable

6.1.5. password-control alert-before-expire

Use **password-control alert-before-expire** to set the number of days before a user's password expires during which the user is notified of the pending password expiration.

Use **undo password-control alert-before-expire** to restore the default.

Syntax

password-control alert-before-expire *alert-time*

undo password-control alert-before-expire

Default

The default is 7 days.

Views

System view

Predefined user roles

network-admin

Parameters

alert-time: Specifies the number of days before a user password expires during which the user is notified of the pending password expiration. The value range is 1 to 30.

Usage guidelines

This command is effective only for non-FTP users. FTP users can only have their passwords changed by the administrator.

Examples

Configure the device to notify a user about pending password expiration 10 days before the user's password expires.

```
<Switch> system-view
[Switch] password-control alert-before-expire 10
```

Related commands

display password-control

6.1.6. password-control blacklist all-line

> 🕮 **MEMO:**
>
> **password-control blacklist all-line** command is supported from later software, including Version 7.3.21.

Use **password-control blacklist all-line** to enable the password control blacklist feature for all user line types.

Use **undo password-control blacklist all-line** to disable the password control blacklist feature for all user line types.

Syntax

password-control blacklist all-line

undo password-control blacklist all-line

Default

The password control blacklist feature is disabled for all user line types.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the password control blacklist feature is enabled only for FTP and VTY users when you enable the global password control feature. To enable the password control blacklist feature for login users on all user lines (AUX, VTY, and USB lines), you must also execute this command. For more information about user lines, see login management configuration in in *Fundamentals Configuration Guide*.

With this feature enabled, the number of consecutive login failures on the same user account is accumulated for users on AUX and USB lines. If the number reaches the limit for console, AUX, TTY, and USB users, the system adds the user account to the blacklist and takes corresponding action.

Use **password-control login-attempt** to configure the maximum number of consecutive login failures and the action to be taken when the maximum number is reached.

Examples

Enable the password control blacklist feature for all user line types.

```
<Sysname> system-view
[Sysname] password-control blacklist all-line
```

Related commands

display password-control

display password-control blacklist

password-control enable

password-control login-attempt

6.1.7. password-control change-password first-login enable

> 🕮 **MEMO:**
>
> **password-control change-password first-login enable** command is supported from later software, including Version 7.3.21.

Use **password-control change-password first-login enable** to enable the password change at first login feature.

Use **undo password-control change-password first-login enable** to disable the password change at first login feature.

Syntax

password-control change-password first-login enable

undo password-control change-password first-login enable

Default

The password change at first login feature is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For the password change at first login feature to take effect, make sure the global password control and password change features are both enabled.

In FIPS mode, the password change at first login feature cannot be disabled.

Examples

Enable password change at first login.

```
<Sysname> system-view
[Sysname] password-control change-password first-login enable
```

Related commands

display password-control

password-control enable

6.1.8. password-control change-password weak-password enable

> 🕮 **MEMO:**
>
> **password-control change-password weak-password enable** command is supported from later software, including Version 7.3.21.

Use **password-control change-password weak-password enable** to enable mandatory weak password change.

Use **undo password-control change-password weak-password enable** to disable mandatory weak password change.

Syntax

password-control change-password weak-password enable

undo password-control change-password weak-password enable

Default

The mandatory weak password change feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The system checks for weak login passwords for Telnet, SSH, HTTP, or HTTPS device management users. A password is weak if it does not meet the following requirements:

- Password composition restriction.
- Minimum password length restriction.
- Cannot contain the username or the reverse letters of the username.

By default, the system displays a message about a weak password but does not force the user to change it. To improve the device security, you can enable the mandatory weak password change feature, which forces the users to change the identified weak passwords. The users can log in to the device only after their passwords meet the password requirements.

To view the password composition restriction and the minimum password length restriction, use the **display password-control** command. To change the password composition restriction and minimum password length, use the **password-control composition** and **password-control length** commands, respectively.

Examples

Enable the mandatory weak password change feature.

```
<Sysname> system-view
[Sysname] password-control change-password weak-password enable
```

Related commands

display password-control

password-control { **aging** | **composition** | **history** | **length** }

password-control complexity

password-control composition

password-control length

password-control enable

6.1.9. password-control complexity

Use **password-control complexity** to configure the password complexity checking policy.

Use **undo password-control complexity** to remove a password complexity checking item.

Syntax

password-control complexity { **same-character** | **user-name** } **check**

undo password-control complexity { **same-character** | **user-name** } **check**

Default

The global password complexity checking policy is that both username checking and repeated character checking are disabled. The password complexity checking policy for a user group equals the global setting. The password complexity checking policy for a local user equals that of the user group to which the local user belongs.

Views

System view

User group view

Local user view

Predefined user roles

network-admin

Parameters

same-character: Refuses a password that contains a minimum of three consecutive identical characters. For example, the password **aaabc** is not complex enough.

user-name: Refuses a password that contains the username or the reverse of the username. For example, if the username is **123**, a password such as **abc123** or **321df** is not complex enough.

Usage guidelines

The password complexity checking policy depends on the view:

- The policy in system view has global significance and applies to all user groups.
- The policy in user group view applies to all local users in the user group.
- The policy in local user view applies only to the local user.

A password complexity checking policy with a smaller application scope has higher priority. The system prefers to use the password complexity checking policy in local user view for a local user.

- If no policy is configured for the local user, the system uses the policy for the user group to which the local user belongs.
- If no policy is configured for the user group, the system uses the global policy.

You can enable both username checking and repeated character checking.

Examples

Configure the password complexity checking policy, refusing any password that contains the username or the reverse of the username.

```
<Switch> system-view
```

```
[Switch] password-control complexity user-name check
```

Related commands

display local-user

display password-control

display user-group

6.1.10. password-control composition

Use **password-control composition** to configure the password composition policy.

Use **undo password-control composition** to restore the default.

Syntax

password-control composition type-number *type-number* [**type-length** *type-length*]

undo password-control composition

Default

The password using the global composition policy must contain a minimum of one character type and a minimum of one character for each type.

The password composition policy for a user group is the same as the global policy. The password composition policy for a local user is the same as that of the user group to which the local user belongs.

network-admin

Parameters

type-number *type-number*: Specifies the minimum number of character types that a password must contain. The value range for the *type-number* argument is 1 to 4.

type-length *type-length*: Specifies the minimum number of characters that are from each type in the password. The value range for the *type-length* argument is 1 to 63.

Usage guidelines

The password composition policy depends on the view:

- The policy in system view has global significance and applies to all user groups.
- The policy in user group view applies to all local users in the user group.
- The policy in local user view applies only to the local user.

A password composition policy with a smaller application scope has higher priority. The system prefers to use the password composition policy in local user view for a local user.

- If no policy is configured for the local user, the system uses the policy for the user group to which the local user belongs.
- If no policy is configured for the user group, the system uses the global policy.

The product of the minimum number of character types and minimum number of characters for each type must be smaller than the maximum length of passwords.

Examples

Specify that all passwords must each contain a minimum of four character types and a minimum of five characters for each type.

```
<Switch> system-view
[Switch] password-control composition type-number 4 type-length 5
```

Specify that passwords in user group **test** must contain a minimum of four character types and a minimum of five characters for each type.

```
[Switch] user-group test
[Switch-ugroup-test] password-control composition type-number 4 type-length 5
[Switch-ugroup-test] quit
```

Specify that the password of device management user **abc** must contain a minimum of four character types and a minimum of five characters for each type.

```
[Switch] local-user abc class manage
[Switch-luser-manage-abc] password-control composition type-number 4 type-length 5
```

Related commands

display user-group

password-control composition enable

6.1.11. password-control enable

Use **password-control enable** to enable the password control feature globally.

Use **undo password-control enable** to disable the password control feature globally.

Syntax

password-control enable

undo password-control enable

Default

The password control feature is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A specific password control feature takes effect only after the global password control feature is enabled.

After the global password control feature is enabled, you cannot display the password and super password configurations for device management users by using the corresponding **display** commands. The configuration for network access user passwords can be displayed. The first password configured for device management users must contain a minimum of four different characters.

Examples

Enable the password control feature globally.

```
<Switch> system-view
[Switch] password-control enable
```

Related commands

display password-control

password-control { **aging** | **composition** | **history** | **length** } **enable**

6.1.12. password-control expired-user-login

Use **password-control expired-user-login** to set the maximum number of days and maximum number of times that a user can log in after the password expires.

Use **undo password-control expired-user-login** to restore the defaults.

Syntax

password-control expired-user-login delay *delay* **times** *times*

undo password-control expired-user-login

Default

A user can log in three times within 30 days after the password expires.

Views

System view

Predefined user roles

network-admin

Parameters

delay *delay*: Specifies the maximum number of days during which a user can log in using an expired password. The value range for the *delay* argument is 1 to 90.

times *times*: Specifies the maximum number of times a user can log in after the password expires. The value range is 0 to 10. To deny users to log in after the password expires, set the value to 0.

Usage guidelines

This command is effective only on non-FTP login users. An FTP user cannot continue to log in after its password expires.

Examples

Allow a user to log in five times within 60 days after the password expires.

```
<Switch> system-view
[Switch] password-control expired-user-login delay 60 times 5
```

Related commands

display password-control

6.1.13. password-control history

Use **password-control history** to set the maximum number of history password records for each user.

Use **undo password-control history** to restore the default.

Syntax

password-control history *max-record-number*

undo password-control history

Default

The maximum number of history password records for each user is 4.

Views

System view

Predefined user roles

network-admin

Parameters

max-record-number: Specifies the maximum number of history password records for each user. The value range is 2 to 15.

Usage guidelines

When the number of history password records reaches the maximum number, the subsequent history record overwrites the earliest one.

The system stops recording passwords after you execute the **undo password-control history enable** command, but it does not delete the prior records.

To delete the existing records, use one of the following methods:

- Use the **undo password-control enable** command to disable the password control feature globally.
- Use the **reset password-control history-record** command to clear the passwords manually.

Examples

Set the maximum number of history password records for each user to 10.

```
<Switch> system-view
[Switch] password-control history 10
```

Related commands

display password-control

password-control history enable

reset password-control blacklist

6.1.14. password-control length

Use **password-control length** to set the minimum password length.

Use **undo password-control length** to restore the default.

Syntax

password-control length *length*

undo password-control length

Default

The global minimum password length is 10 characters.

The minimum password length for a user group equals the global setting. The minimum password length for a local user equals that of the user group to which the local user belongs.

Views

System view

User group view

Local user view

Predefined user roles

network-admin

Parameters

length: Specifies the minimum password length in characters. The value range for this argument is 4 to 32.

Usage guidelines

The minimum length setting depends on the view:

- The setting in system view has global significance and applies to all user groups.
- The setting in user group view applies to all local users in the user group.
- The setting in local user view applies only to the local user.

A minimum password length with a smaller application scope has higher priority. The system prefers to use the minimum password length in local user view for a local user.

- If no minimum password length is configured for the local user, the system uses the minimum password length for the user group to which the local user belongs.
- If no minimum password length is configured for the user group, the system uses the global minimum password length.

Examples

Set the global minimum password length to 16 characters.

```
<Switch> system-view
[Switch] password-control length 16
```

Set the minimum password length to 16 characters for the user group **test**.

```
[Switch] user-group test
[Switch-ugroup-test] password-control length 16
[Switch-ugroup-test] quit
```

Set the minimum password length to 16 characters for the device management user **abc**.

```
[Switch] local-user abc class manage
[Switch-luser-manage-abc] password-control length 16
```

Related commands

display local-user

display password-control

password-control length enable

6.1.15. password-control login idle-time

Use **password-control login idle-time** to set the maximum account idle time.

Use **undo password-control login idle-time** to restore the default.

Syntax

password-control login idle-time *idle-time*

undo password-control login idle-time

Default

The maximum account idle time is 90 days.

Views

System view

Predefined user roles

network-admin

Parameters

idle-time: Specifies the maximum account idle time in days. The value range is 0 to 365. 0 means no restriction for account idle time.

Usage guidelines

If a user account is idle for this period of time, the account becomes invalid and can no longer be used to log in to the device.

Examples

Set the maximum account idle time to 30 days.

```
<Switch> system-view
[Switch] password-control login idle-time 30
```

Related commands

display password-control

6.1.16. password-control login-attempt

Use **password-control login-attempt** to configure the login attempt limit. The settings include the maximum number of consecutive login failures and the action to be taken when the maximum number is reached.

Use **undo password-control login-attempt** to restore the default.

Syntax

password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

undo password-control login-attempt

Default

The global login-attempt settings:

- The maximum number of consecutive login failures is 3.
- The locking period is 1 minute.

The login-attempt settings for a user group equal the global settings.

The login-attempt settings for a local user equal those for the user group to which the local user belongs.

Views

System view

User group view

Local user view

Predefined user roles

network-admin

Parameters

login-times: Specifies the maximum number of consecutive login failures. The value range is 2 to 10.

exceed: Specifies an action to be taken for the user who fails to log in after making the maximum number of attempts.

- **lock**: Disables the user account permanently.
- **lock-time** *time*: Disables the user account for a period of time. The user can uses this user account when the timer expires. The value range for the *time* argument is 1 to 360 minutes.
- **unlock**: Allows the user account to continue using this account to perform login attempts.

Usage guidelines

The login-attempt policy depends on the view:

- The policy in system view has global significance and applies to all user groups.
- The policy in user group view applies to all local users in the user group.
- The policy in local user view applies only to the local user.

A login-attempt policy with a smaller application scope has higher priority. The system prefers to use the login-attempt policy in local user view for a local user.

- If no policy is configured for the local user, the system uses the policy for the user group to which the local user belongs.
- If no policy is configured for the user group, the system uses the global policy.

If an FTP or VTY user fails to log in, the system adds the user account and the user's IP address to the password control blacklist. When the maximum number of consecutive login failures is reached, the login attempt limit feature is triggered.

Whether a blacklisted user and user account are locked depends on the locking setting:

- If a user account is permanently locked for a user, the user cannot use this account unless this account is removed from the password control blacklist. To remove the user account, use the **reset password-control blacklist** command.
- To use a temporarily locked user account, the user can perform either of the following tasks:
  - Wait until the locking timer expires.
  - Remove the user account from the password control blacklist.
- If the user account and the user are blacklisted but not locked, the user can continue using this account to log in. The account and the user's IP address are removed from the password control blacklist when the user uses the account to successfully log in to the device.

NOTE:

This account is locked only for this user. Other users can still use this account, and the blacklisted user can use other user accounts.

The **password-control login-attempt** command takes effect immediately after being executed, and can affect the users already in the password control blacklist.

Examples

Allow a maximum of four consecutive login failures on a user account, and disable the user account if the limit is reached.

```
<Switch> system-view
[Switch] password-control login-attempt 4 exceed lock
```

Use the user account **test** to log in to the device, and enter incorrect password for four times.

Display the password control blacklist. The output shows that the user account is on the blacklist, and its status is **lock**.

```
[Switch] display password-control blacklist

 Username: test
    IP: 192.168.44.1        Login failures: 4      Lock flag: lock

 Blacklist items matched: 1.
```

Verify that the user at 192.168.44.1 cannot use this user account to log in.

Allow a maximum of two consecutive login failures on a user account, and disable the account for 3 minutes if the limit is reached.

```
<Switch> system-view
[Switch] password-control login-attempt 2 exceed lock-time 3
```

Use the user account **test** to log in to the device, and enter incorrect password for two attempts.

Display the password control blacklist. The output shows that the user account is on the blacklist and its status is **lock**.

```
[Switch] display password-control blacklist

 Username: test
    IP: 192.168.44.1        Login failures: 2      Lock flag: lock

 Blacklist items matched: 1.
```

Verify that after 3 minutes, the user account is removed from the password control blacklist and the user at 192.168.44.1 can use this account.

6.1.17. password-control super aging

Use **password-control super aging** to set the aging time for super passwords.

Use **undo password-control super aging** to restore the default.

Syntax

password-control super aging *aging-time*

undo password-control super aging

Default

A super password expires after 90 days.

Views

System view

Predefined user roles

network-admin

Parameters

aging-time: Specifies the super password aging time in days, in the range of 1 to 365.

Examples

Set the super passwords to expire after 10 days.

```
<Switch> system-view
[Switch] password-control super aging 10
```

Related commands

display password-control

password-control aging

6.1.18. password-control super composition

Use **password-control super composition** to configure the composition policy for super passwords.

Use **undo password-control super composition** to restore the default.

Syntax

password-control super composition type-number *type-number* [**type-length** *type-length*]

undo password-control super composition

Default

A super password must contain a minimum of one character type and a minimum of one character for each type.

Views

System view

Predefined user roles

network-admin

Parameters

type-number *type-number*: Specifies the minimum number of character types that a super password must contain. The value range for the *type-number* argument is 1 to 4.

type-length *type-length*: Specifies the minimum number of characters that are from each character type. The value range for the *type-length* argument is 1 to 63.

Usage guidelines

The product of the minimum number of character types and minimum number of characters for each type must be smaller than the maximum length of the super password.

Examples

Specify that a super password must contain a minimum of four character types and a minimum of five characters for each type.

```
<Switch> system-view
[Switch] password-control super composition type-number 4 type-length 5
```

Related commands

display password-control

password-control composition

6.1.19. password-control super length

Use **password-control super length** to set the minimum length for super passwords.

Use **undo password-control super length** to restore the default.

Syntax

password-control super length *length*

undo password-control super length

Default

The minimum super password length is 10 characters.

Views

System view

Predefined user roles

network-admin

Parameters

length: Specifies the minimum length of super passwords in characters. The value range for this argument is 4 to 63.

Examples

Set the minimum length of super passwords to 16 characters.

```
<Switch> system-view
[Switch] password-control super length 16
```

6.1.20. password-control update-interval

Use **password-control update-interval** to set the minimum password update interval, which is the minimum interval at which users can change their passwords.

Use **undo password-control update-interval** to restore the default.

Syntax

password-control update-interval *interval*

undo password-control update-interval

Default

The minimum password update interval is 24 hours.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum password update interval in hours, in the range of 0 to 168. 0 means no requirements for password update interval.

Usage guidelines

The set minimum interval is not effective on a user who is prompted to change the password at the first login or after the password expires.

Examples

Set the minimum password update interval to 36 hours.

```
<Switch> system-view
[Switch] password-control update-interval 36
```

Related commands

display password-control

6.1.21. reset password-control blacklist

Use **reset password-control blacklist** to remove blacklisted users.

Syntax

reset password-control blacklist [**user-name** *user-name*]

Views

User view

Predefined user roles

network-admin

Parameters

user-name *user-name*: Specifies the username of a user account to be removed from the password control blacklist. The username is a case-sensitive string of 1 to 55 characters.

Usage guidelines

You can use this command to remove a user account that is blacklisted due to excessive login failures. Then the blacklisted user can use this user account to log in.

Examples

Remove the user account named **test** from the password control blacklist.

```
<Switch> reset password-control blacklist user-name test
```

```
Are you sure to delete the specified user in blacklist? [Y/N]:
```

Related commands

display password-control blacklist

6.1.22. reset password-control history-record

Use **reset password-control history-record** to delete history password records.

Syntax

reset password-control history-record [**super** [**role** *role name*] | **user-name** *user-name*]

Views

User view

Predefined user roles

network-admin

Parameters

super: Deletes the history records of the specified super password or all super passwords.

role *role name*: Specifies a user role name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command deletes the history records of all super passwords.

user-name *user-name*: Specifies the username of the user whose password records are to be deleted. The *user-name* argument is a case-sensitive string of 1 to 55 characters.

Usage guidelines

If you do not specify any parameters, this command deletes the history password records of all local users.

Examples

Clear the history password records of all local users.

```
<Switch> reset password-control history-record
Are you sure to delete all local user's history records? [Y/N]:y
```

7.1. Public key management commands

7.1.1. display public-key local public

Use **display public-key local public** to display local public keys.

Syntax

display public-key local { **dsa** | **rsa** } **public** [**name** *key-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

dsa: Specifies the DSA key pair type.

rsa: Specifies the RSA key pair type.

name *key-name*: Specifies a local key pair by its name, a case-insensitive string of 1 to 64 characters. Valid characters are letters, digits, and hyphens (-). If you do not specify a key pair, this command displays the public keys of all local key pairs of the specified type.

Usage guidelines

You can copy and distribute the public key of a local key pair to peer devices.

You cannot display a host public key that has the default key pair name by specifying the **name** *key-name* option. To view a host public key that has the default key pair name, display all local public keys by using this command without specifying a key pair name.

Examples

Display all local RSA public keys.

```
<Switch> display public-key local rsa public

```

Table 7-1 Command output

Field	Description
Key name	Name of the local key pair. If you did not specify a name when creating the key pair, the default name is used followed by the word **default** in brackets. The following is the default key pair name for each key algorithm:

Field	Description
	• **hostkey**—Default RSA host key pair name. • **serverkey**—Default RSA server key pair name. • **dsakey**—Default DSA host key pair name.
Key type	Options include: • RSA. • DSA.
Time when key pair created	Date and time when the local key pair was created.
Key code	Public key string.

Related commands

public-key local create

7.1.2. display public-key peer

Use **display public-key peer** to display information about peer host public keys.

Syntax

display public-key peer [**brief** | **name** *publickey-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

brief: Displays brief information about all peer host public keys. The brief information includes only the key type, key modulus, and key name.

name *publickey-name*: Displays detailed information about a peer host public key, including its key code. The *publickey-name* argument specifies a peer host public by its name, a case-sensitive string of 1 to 64 characters.

Usage guidelines

If you do not specify any keywords, this command displays detailed information about all peer host public keys configured on the local device.

You can use the **public-key peer** command or the **public-key peer import sshkey** command to configure a peer host public key on the local device.

Examples

Display detailed information about the peer host public key **idrsa**.

```
<Switch> display public-key peer name idrsa

=========================================
Key name: idrsa
Key type: RSA
Key modulus: 1024
```

```
Key code:
   30819F300D06092A864886F70D010101050003818D0030818902818100C5971581A78B5388
   B3C9063EC6B53D395A6704D9752B6F9B7B1F734EEB5DD509F0B050662C46FFB8D27F797E37
   918F6270C5793F1FC63638970A0E4D51A3CEF7CFF6E92BFAFD73F530E0BDE27056E81F2525
   6D0883836FD8E68031B2C272FE2EA75C87734A7B8F85B8EBEB3BD51CC26916AF3B3FDC32C3
   42C142D41BB4884FEB0203010001
```

Table 7-2 Command output

Field	Description
Key name	Name of the peer host public key.
Key type	Key type: RSA, or DSA.
Key modulus	Key modulus length in bits.
Key code	Public key string.

Display brief information about all peer host public keys.

```
<Switch> display public-key peer brief
Type  Modulus  Name
---------------------------
RSA   1024    idrsa
DSA   1024    10.1.1.1
```

Table 7-3 Command output

Field	Description
Type	Key type: RSA, or DSA.
Modulus	Key modulus length in bits.
Name	Name of the peer host public key.

Related commands

public-key peer

public-key peer import sshkey

7.1.3. peer-public-key end

Use **peer-public-key end** to exit public key view to system view and save the configured peer host public key.

Syntax

peer-public-key end

Views

Public key view

Predefined user roles

network-admin

Usage guidelines

After you type the peer host public key on the local device, use this command to exit public key view and to save the peer host public key.

The system verifies the public key before saving it. If the key is not in the correct format, the system discards the key and displays an error message. If the key is valid, for example, the key was displayed by the **display public-key local public** command, the system saves the key.

Examples

Exit public key view and save the configured peer host public key.

```
<Switch> system-view
[Switch] public-key peer key1
Enter public key view. Return to system view with "peer-public-key end" command.
[Switch-pkey-public-key-key1]30819F300D06092A864886F70D010101050003818D00308189028181

[Switch-pkey-public-key-key1]0001
[Switch-pkey-public-key-key1] peer-public-key end
[Switch]
```

Related commands

display public-key local public

display public-key peer

public-key peer

7.1.4. public-key local create

Use **public-key local create** to create local key pairs.

Syntax

public-key local create { **dsa** | **rsa** } [**name** *key-name*]

Default

No local key pairs exist.

Views

System view

Predefined user roles

network-admin

Parameters

dsa: Specifies the DSA key pair type.

rsa: Specifies the RSA key pair type.

name *key-name*: Assigns a name to the key pair. The *key-name* argument is a case-insensitive string of 1 to 64 characters. Valid characters are letters, digits, and hyphens (-). If you do not assign a name to the key pair, the key pair takes the default name.

Table 7-4 Default local key pair names

Type	Default name
RSA	• Host key pair: **hostkey** • Server key pair: **serverkey**
DSA	**dsakey**

Usage guidelines

The key algorithm must be the same as required by the security application.

When you create an RSA or DSA key pair, enter an appropriate key modulus length at the prompt. The longer the key modulus length, the higher the security, and the longer the key generation time.

See Table 7-5 for more information about key modulus lengths and key lengths.

If you do not assign the key pair a name, the system assigns the default name to the key pair and marks the key pair as **default**. You can also assign the default name to another key pair, but the system does not mark the key pair as **default**. The name of a key pair must be unique among all manually named key pairs that use the same key algorithm. If a name conflict occurs, the system asks whether you want to overwrite the existing key pair.

The key pairs are automatically saved and can survive system reboots.

Table 7-5 A comparison of different types of asymmetric key algorithms

Type	Generated key pairs	Modulus/key length
RSA	• One host key pair, if you specify a key pair name. • One server key pair and one host key pair, if you do not specify a key pair name. Both key pairs use their default names. **NOTE:** Only SSH 1.5 uses the RSA server key pair.	512 to 2048 bits, 1024 bits by default. To ensure security, use a minimum of 768 bits.
DSA	One host key pair.	512 to 2048 bits, 1024 bits by default. To ensure security, use a minimum of 768 bits.

Examples

Create local RSA key pairs with default names.

```
<Switch> system-view
[Switch] public-key local create rsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...++++++
.++++++
..++++++++
....++++++++
```

```
Create the key pair successfully.
```

Create a local DSA key pair with the default name.

```
<Switch> system-view
[Switch] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.....................................+..+.............
.......+..........+............+............+...+.....+.............+..+...
...+.................+.........+...+....+.......+.....+............+.........+.
.........................+........+.........+............+.....+...+..........
..............+.........+.........+...........+........+....+..................
.....++++++++++++++++++++++++++++++++++++++++++++++++++*
Create the key pair successfully.
```

Create a local RSA key pair with the name **rsa1**.

```
<Switch> system-view
[Switch] public-key local create rsa name rsa1
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...++++++
.............................++++++
Create the key pair successfully.
```

Create a local DSA key pair with the name **dsa1**.

```
<Switch> system-view
[Switch] public-key local create dsa name dsa1
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.++++++++++++++++++++++++++++++++++++++++++++++++++*
........+......+.....+.....................................+..+.............
.......+..........+............+............+...+.....+.............+..+...
...+.................+.........+...+....+.......+.....+............+.........+.
.........................+........+.........+............+.....+...+..........
..............+.........+.........+...........+........+....+..................
.....++++++++++++++++++++++++++++++++++++++++++++++++++*
Create the key pair successfully.
```

Related commands

display public-key local public

public-key local destroy

7.1.5. public-key local destroy

Use **public-key local destroy** to destroy local key pairs.

Syntax

public-key local destroy { **dsa** | **rsa** } [**name** *key-name*]

Views

System view

Predefined user roles

network-admin

Parameters

dsa: Specifies the DSA key pair type.

rsa: Specifies the RSA key pair type.

name *key-name*: Specifies a local key pair by its name, a case-insensitive string of 1 to 64 characters. Valid characters are letters, digits, and hyphens (-). If you do not specify a key pair, this command destroys all key pairs of the specified type.

Usage guidelines

To avoid key compromise, destroy the local key pair and generate a new pair after any of the following conditions occurs:

- An intrusion event has occurred.
- The storage media of the device is replaced.
- The local certificate has expired. For more information about local certificates, see *Security Configuration Guide*.

Examples

Destroy the local RSA key pairs with the default names.

```
<Switch> system-view
[Switch] public-key local destroy rsa
Confirm to destroy the key pair? [Y/N]:y
```

Destroy the local DSA key pair with the default name.

```
<Switch> system-view
[Switch] public-key local destroy dsa
Confirm to destroy the key pair? [Y/N] :y
```

Destroy the local RSA key pair **rsa1**.

```
<Switch> system-view
[Switch] public-key local destroy rsa name rsa1
Confirm to destroy the key pair? [Y/N]:y
```

Destroy the local DSA key pair **dsa1**.

```
<Switch> system-view
[Switch] public-key local destroy dsa name dsa1
Confirm to destroy the key pair? [Y/N] :y
```

Related commands

public-key local create

7.1.6. public-key local export dsa

Use **public-key local export dsa** to export a local DSA host public key.

Syntax

public-key local export dsa [**name** *key-name*] { **openssh** | **ssh2** } [*filename*]

Views

System view

Predefined user roles

network-admin

Parameters

name *key-name*: Specifies a local DSA key pair by its name, a case-insensitive string of 1 to 64 characters. Valid characters are letters, digits, and hyphens (-). If you do not specify a key pair, this command exports the host public key of the local DSA key pair with the default name.

openssh: Exports the host public key in OpenSSH format.

ssh2: Exports the host public key in SSH 2.0 format.

filename: Specifies the name of the file for saving the DSA host public key. The file name is a case-insensitive string of 1 to 128 characters. The name cannot be all dots (.), hostkey, serverkey, or dsakey, and cannot start with a slash (/) or contain **./** and **../**. For more information about file names, see *Fundamentals Configuration Guide*. If you do not specify a file name, this command displays the key on the monitor screen.

Usage guidelines

You can use this command to export a local DSA host public key before distributing it to a peer device.

To distribute a local DSA host public key to a peer device:

1. Save the exported local host public key to a file by using one of the following methods:
   - Use the **public-key local export dsa** [**name** *key-name*] { **openssh** | **ssh2** } command to export the local host public key, and then copy and paste the key to a file.
   - Use the **public-key local export dsa** [**name** *key-name*] { **openssh** | **ssh2** } *filename* command to export the key to a file. You cannot export the key to the folder **pkey** or its subfolders.
2. Transfer a copy of the file to the peer device, for example, by using FTP in binary mode or TFTP. For more information about FTP and TFTP, see *Fundamentals Configuration Guide*.
3. On the peer device, use the **public-key peer import sshkey** command to import the host public key from the file.

SSH 2.0 and OpenSSH are different public key formats. Choose the correct format that is supported on the device where you import the host public key.

Examples

Export the host public key of the local DSA key pair with the default name in OpenSSH format to a file named **key.pub**.

```
<Switch> system-view
[Switch] public-key local export dsa openssh key.pub
```

Display the host public key of the local DSA key pair with the default name in SSH 2.0 format.

```
<Switch> system-view
[Switch] public-key local export dsa ssh2

Related commands

public-key local create

public-key peer import sshkey

7.1.7. public-key local export rsa

Use **public-key local export rsa** to export a local RSA host public key.

Syntax

public-key local export rsa [**name** *key-name*] { **openssh** | **ssh1** | **ssh2** } [*filename*]

Views

System view

Predefined user roles

network-admin

Parameters

name *key-name*: Specifies a local RSA key pair by its name, a case-insensitive string of 1 to 64 characters. Valid characters are letters, digits, and hyphens (-). If you do not specify a key pair, this command exports the host public key of the local RSA key pair with the default name.

openssh: Exports the host public key in OpenSSH format.

ssh1: Exports the host public key in SSH 1.5 format.

ssh2: Exports the host public key in SSH 2.0 format.

filename: Specifies the name of the file for saving the RSA host public key. The file name is a case-insensitive string of 1 to 128 characters. The name cannot be all dots (.), hostkey, serverkey, or dsakey, and cannot start with a slash (/) or contain **./** and **../**. For more information about file names, see *Fundamentals Configuration Guide*. If you do not specify a file name, this command displays the key on the monitor screen.

Usage guidelines

You can use this command to export a local RSA host public key before distributing it to a peer device.

To distribute a local RSA host public key to a peer device:

1. Save the exported local host public key to a file by using one of the following methods:
   - Use the **public-key local export rsa** [**name** *key-name*] { **openssh** | **ssh2** } command to export the key, and then copy and paste it to a file.
   - Use the **public-key local export rsa** [**name** *key-name*] { **openssh** | **ssh2** } *filename* command to export key to a file. You cannot export the key to the folder **pkey** or its subfolders.
2. Transfer a copy of the file to the peer device, for example, by using FTP in binary mode or TFTP. For more information about FTP and TFTP, see *Fundamentals Configuration Guide*.
3. On the peer device, use the **public-key peer import sshkey** command to import the host public key from the file.

Choose the correct public key format that is supported on the device where you import the host public key.

Examples

Export the host public key of the local RSA key pair with the default name in OpenSSH format to the file **key.pub**.

```
<Switch> system-view
[Switch] public-key local export rsa openssh key.pub
```

Display the host public key of the local RSA key pair with the default name in SSH 2.0 format.

```
<Switch> system-view
[Switch] public-key local export rsa ssh2
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "rsa-key-2011/05/12"
AAAAB3NzaC1yc2EAAAADAQABAAAAgQDapKr+/gTCyWZyabuCJuJjMeMPQaj/kixzOCCAl+hDMmEGMrSfddq/b

v4tlas+mLNloY0dImbwS2kwE71rgg1CQ==
---- END SSH2 PUBLIC KEY ----
```

Display the host public key of the local RSA key pair with the default name in OpenSSH format.

```
<Switch> system-view
[Switch] public-key local export rsa openssh
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAAAgQDapKr+/gTCyWZyabuCJuJjMeMPQaj/kixzOCCAl+hDMmEGMrSfddq/b
YcbgM7Buit1AgB3x0dFyTPi85DcCznTW4goPXAKFjuzCbGfj4chakSr+/aj1k3rM+XOvyvPJilneKJqhPT0xd
v4tlas+mLNloY0dImbwS2kwE71rgg1CQ== rsa-key
```

Export the host public key of the local RSA key pair **rsa1** in OpenSSH format to the file **rsa1.pub**.

```
<Switch> system-view
[Switch] public-key local export rsa name rsa1 openssh rsa1.pub
```

Display the host public key of the local RSA key pair **rsa1** in SSH 2.0 format.

```
<Switch> system-view
[Switch] public-key local export rsa name rsa1 ssh2
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "rsa-key-2011/05/12"

```

Related commands

public-key local create

public-key peer import sshkey

7.1.8. public-key peer

Use **public-key peer** to assign a name to a peer host public key and enter public key view, or enter the view of an existing peer host public key.

Use **undo public-key peer** to delete a peer host public key.

Syntax

public-key peer *keyname*

undo public-key peer *keyname*

Default

No peer host public keys exist.

Views

System view

Predefined user roles

network-admin

Parameters

keyname: Specifies a key name, a case-sensitive string of 1 to 64 characters.

Usage guidelines

After you execute this command to enter the public key view, type the public key. Spaces and carriage returns are allowed, but are not saved.

To configure a peer host public key on the local device, first obtain the peer public key in hexadecimal notation, and then perform the following tasks on the local device:

1. Execute the **public-key peer** command to enter public key view.
2. Type the public key.
3. Execute the **peer-public-key end** command to save the public key and return to system view.

The public key you type in the public key view must be in a correct format. If the peer device is an NEC device, use the **display public-key local public** command to display and record its public key.

Examples

Assign the name **key1** to the peer host public key and enter public key view.

```
<Switch> system-view
[Switch] public-key peer key1
Enter public key view. Return to system view with "peer-public-key end" command.
[Switch-pkey-public-key-key1]
```

Related commands

display public-key local public

display public-key peer

peer-public-key end

7.1.9. public-key peer import sshkey

Use **public-key peer import sshkey** to import a peer host public key from a public key file.

Use **undo public-key peer** to remove a peer host public key.

Syntax

public-key peer *keyname* **import sshkey** *filename*

undo public-key peer *keyname*

Default

No peer host public keys exist.

Views

System view

Predefined user roles

network-admin

Parameters

keyname: Specifies a name for a peer host public key, a case-sensitive string of 1 to 64 characters.

filename: Specifies a public key file by its name, a case-insensitive string of 1 to 128 characters. The name cannot be all dots (.), hostkey, serverkey, or dsakey, and cannot start with a slash (/) or contain **./** and **../**. For more information about file names, see *Fundamentals Configuration Guide*.

Usage guidelines

After you configure this command, the system automatically transforms the host public key to the PKCS format, and saves the key.

Before you use this command, make sure you have got a copy of the public key file from the peer device through FTP in binary mode or through TFTP.

The device supports importing public keys in the format of SSH 1.5, SSH 2.0, and OpenSSH.

Examples

Import the peer host public key **key2** from the public key file **key.pub**.

```
<Switch> system-view
[Switch] public-key peer key2 import sshkey key.pub
```

Related commands

display public-key peer

8. PKI commands

8.1. PKI commands

8.1.1. attribute

Use **attribute** to configure a rule to filter certificates based on an attribute in the certificate issuer name, subject name, or alternative subject name field.

Use **undo attribute** to remove an attribute rule.

Syntax

attribute *id* { **alt-subject-name** { **fqdn** | **ip** } | { **issuer-name** | **subject-name** } { **dn** | **fqdn** | **ip** } } { **ctn** | **equ** | **nctn** | **nequ** } *attribute-value*

undo attribute *id*

Default

No attribute rules exist.

Views

Certificate attribute group view

Predefined user roles

network-admin

Parameters

id: Specifies a rule ID in the range of 1 to 16.

alt-subject-name: Specifies the alternative subject name field.

fqdn: Specifies the FQDN attribute.

ip: Specifies the IP address attribute.

dn: Specifies the DN attribute.

issuer-name: Specifies the issuer name field.

subject-name: Specifies the subject name field.

ctn: Specifies the contain operation.

equ: Specifies the equal operation.

nctn: Specifies the not-contain operation.

nequ: Specifies the not-equal operation.

attribute-value: Sets an attribute value, a case-insensitive string of 1 to 128 characters.

Usage guidelines

Different certificate fields support different attributes.

- The subject name field and the issuer name field can contain a single DN, multiple FQDNs, and multiple IP addresses.
- The alternative subject name field can contain multiple FQDNs and IP addresses but zero DNs.

An attribute rule is a combination of an attribute-value pair with an operation keyword, as listed in Table 8-1 .

Table 8-1 Combinations of attribute-value pairs and operation keywords

Operation	DN	FQDN/IP
ctn	The DN contains the specified attribute value.	Any FQDN or IP address contains the specified attribute value.
nctn	The DN does not contain the specified attribute value.	None of the FQDNs or IP addresses contain the specified attribute value.
equ	The DN is the same as the specified attribute value.	Any FQDN or IP address is the same as the specified attribute value.
nequ	The DN is not the same as the specified attribute value.	None of the FQDNs or IP addresses are the same as the specified attribute value.

A certificate matches an attribute rule if it contains an attribute that matches the criterion defined in the rule. For example, a certificate matches the **attribute 1 subject-name dn ctn abc** rule if it meets the following conditions:

- The subject name field of the certificate contains the DN attribute.
- The DN attribute value contains the **abc** string.

A certificate matches an attribute group if it matches all attribute rules in the group.

Examples

Create a certificate attribute group and enter its view.

```
<Switch> system-view
[Switch] pki certificate attribute-group mygroup
```

Configure an attribute rule to match certificates that contain the **abc** string in the subject DN.

```
[Switch-pki-cert-attribute-group-mygroup] attribute 1 subject-name dn ctn abc
```

Configure an attribute rule to match certificates that do not contain FQDN **abc** in the issuer name field.

```
[Switch-pki-cert-attribute-group-mygroup] attribute 2 issuer-name fqdn nequ abc
```

Configure an attribute rule to match certificates that do not contain IP address **10.0.0.1** in the alternative subject name field.

```
[Switch-pki-cert-attribute-group-mygroup] attribute 3 alt-subject-name ip nequ 10.0.0.1
```

Related commands

display pki certificate attribute-group

8.1.2. ca identifier

Use **ca identifier** to specify the trusted CA.

Use **undo ca identifier** to restore the default.

Syntax

ca identifier *name*

undo ca identifier

Default

No trusted CA is specified.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

name: Specifies the trusted CA by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

To obtain a CA certificate in a PKI domain, you must specify the trusted CA name. The trusted CA name uniquely identifies the CA to be used if multiple CAs exist on the CA server specified for the PKI domain.

Make sure the specified CA name is consistent with the name of the CA that owns the CA certificate to be obtained.

Examples

Set the name of the trusted CA to **new-ca**.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] ca identifier new-ca
```

8.1.3. certificate request entity

Use **certificate request entity** to specify the PKI entity for certificate request.

Use **undo certificate request entity** to restore the default.

Syntax

certificate request entity *entity-name*

undo certificate request entity

Default

No PKI entity is specified for certificate request.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

entity-name: Specifies a PKI entity by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A PKI entity describes the identity attributes of an entity for certificate request, including the following information:

- Common name.
- Organization.
- Unit in the organization.

- Locality.
- State and country where the entity resides.
- FQDN.
- IP address.

You can specify only one PKI entity for a PKI domain. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify PKI entity **en1** for certificate request in PKI domain **aaa**.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] certificate request entity en1
```

Related commands

pki entity

8.1.4. certificate request from

Use **certificate request from** to specify the type of certificate request reception authority.

Use **undo certificate request from** to restore the default.

Syntax

certificate request from { **ca** | **ra** }

undo certificate request from

Default

The type of certificate request reception authority is not specified.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

ca: Sends certificate requests to the CA.

ra: Sends certificate requests to the RA.

Usage guidelines

The CA server determines whether the CA or RA accepts certificate requests. This authority setting must be consistent with the setting on the CA server.

Examples

Sends certificate requests to the RA.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] certificate request from ra
```

8.1.5. certificate request mode

Use **certificate request mode** to set the certificate request mode.

Use **undo certificate request mode** to restore the default.

Syntax

certificate request mode { **auto** [**password** { **cipher** | **simple** } *string*] | **manual** }

undo certificate request mode

Default

The certificate request mode is manual.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

auto: Specifies the auto certificate request mode.

password: Specifies a password for certificate revocation.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 31 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters.

manual: Specifies the manual certificate request mode.

Usage guidelines

A certificate request can be submitted to a CA in offline or online mode. In online mode, a certificate request can be automatically or manually submitted:

- **Auto request mode**—A PKI entity automatically obtains the CA certificate and submits a certificate request to the CA when both of the following conditions exist:
  - An associated application (IKE, for example) performs identity authentication.
  - No certificate is available for the application on the device.

  In auto request mode, specify the password for certificate revocation as required by the CA policy.
- **Manual request mode**—You must manually obtain the CA certificate and submit certificate requests.

Examples

Set the certificate request mode to **auto**.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] certificate request mode auto
```

Set the certificate request mode to **auto**, and set the certificate revocation password in plain text to **123456**.

```
<Switch> system-view
```

```
[Switch] pki domain aaa
[Switch-pki-domain-aaa] certificate request mode auto password simple 123456
```

Related commands

pki request-certificate

8.1.6. certificate request polling

Use **certificate request polling** to set the polling interval and the maximum number of attempts to query certificate request status.

Use **undo certificate request polling** to restore the defaults.

Syntax

certificate request polling { **count** *count* | **interval** *interval* }

undo certificate request polling { **count** | **interval** }

Default

The polling interval is 20 minutes, and the maximum number of attempts is 50.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

count *count*: Specifies the maximum number of query attempts. The value range is 1 to 100.

interval *interval*: Specifies a polling interval in minutes. The value range is 5 to 168.

Usage guidelines

After a PKI entity submits a certificate request, it might take the CA server a while to issue the certificate if the CA administrator must manually approve the certificate request. During this period, the PKI entity periodically queries the CA server for the certificate request status. The periodic query operation stops until the PKI entity obtains the certificate or the maximum number of query attempts is reached. If the maximum number of query attempts is reached, the certificate request fails.

If the CA server automatically approves certificate requests, the PKI entity can obtain the certificate immediately after it submits a certificate request. In this case, the PKI entity does not send queries to the CA server.

Examples

Set the polling interval to 15 minutes, and the maximum number of query attempts to 40.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] certificate request polling interval 15
[Switch-pki-domain-aaa] certificate request polling count 40
```

Related commands

display pki certificate request-status

8.1.7. certificate request url

Use **certificate request url** to specify the URL of the certificate request reception authority (CA or RA) to which the device should send SCEP certificate requests.

Use **undo certificate request url** to restore the default.

Syntax

certificate request url *url-string*

undo certificate request url

Default

The URL of the certificate request reception authority is not specified.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

url-string: Specifies the URL of the certificate request reception authority, a case-sensitive string of 1 to 511 characters. The URL length is restricted by the CLI string limitation or the *url-string* parameter, whichever is smaller.

Usage guidelines

The certificate request URL contains the location of the certificate request reception authority server and the path of the application script on the server, in the format http://*server_location/cgi_script_location*.

Examples

Set the certificate request URL to **http://169.254.0.1/certsrv/mscep/mscep.dll**.

```
<Switch> system-view
[Switch] pki domain a
[Switch-pki-domain-a] certificate request url
http://169.254.0.1/certsrv/mscep/mscep.dll
```

8.1.8. common-name

Use **common-name** to set the common name for a PKI entity.

Use **undo common-name** to restore the default.

Syntax

common-name *common-name-sting*

undo common-name

Default

No common name is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

common-name-sting: Specifies a common name, a case-sensitive string of 1 to 63 characters. No comma can be included. You can set the username of the PKI entity as the common name.

Examples

Set the common name to **test** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] common-name test
```

8.1.9. country

Use **country** to set the country code of a PKI entity.

Use **undo country** to restore the default.

Syntax

country *country-code-string*

undo country

Default

No country code is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

country-code-string: Specifies a country code, a case-sensitive string of two characters. For example, JP is the country code for Japan.

Examples

Set the country code to JP for PKI entity 1.

```
<Switch> system-view
[Switch] pki entity 1
[Switch-pki-entity-1] country JP
```

8.1.10. crl check enable

Use **crl check enable** to enable CRL checking.

Use **undo crl check enable** to disable CRL checking.

Syntax

crl check enable

undo crl check enable

Default

CRL checking is enabled.

Views

PKI domain view

Predefined user roles

network-admin

Usage guidelines

A CRL is a list of revoked certificates signed and published by a CA. Revoked certificates should no longer be trusted.

Enable CRL checking to ensure that the device only accepts certificates that have not been revoked by the issuing CA.

Examples

Disable CRL checking.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] undo crl check enable
```

Related commands

pki import

pki retrieve-certificate

pki validate-certificate

8.1.11. crl url

Use **crl url** to specify the URL of the CRL repository.

Use **undo crl url** to restore the default.

Syntax

crl url *url-string*

undo crl url

Default

The URL of the CRL repository is not specified.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

url-string: Specifies the URL of the CRL repository, a case-sensitive string of 1 to 511 characters. The URL format is ldap://*server_location* or http://*server_location*. The URL length is restricted by the CLI string limitation or the *url-string* parameter, whichever is smaller.

Usage guidelines

To use CRL checking, a CRL must be obtained from a CRL repository.

The device selects a CRL repository in the following order:

1. CRL repository specified in the PKI domain by using this command.
2. CRL repository in the certificate that is being verified.
3. CRL repository in the CA certificate or CRL repository in the upper-level CA certificate if the CA certificate is the certificate being verified.

After the previous selection process, if the CRL repository is not found, the device obtains the CRL through SCEP. In this scenario, the CA certificate and the local certificates must have been obtained.

Examples

Set the URL of the CRL repository to **http://169.254.0.30**.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] crl url http://169.254.0.30
```

Set the URL of the CRL repository to **ldap://169.254.0.30** in VPN instance **vpn1**.

```
<Switch> system-view
[Switch] pki domain 1
[Switch-pki-domain-1] crl url ldap://169.254.0.30 vpn-instance vpn1
```

Related commands

pki retrieve-crl

8.1.12. display pki certificate access-control-policy

Use **display pki certificate access-control-policy** to display information about certificate-based access control policies.

Syntax

display pki certificate access-control-policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Specifies a certificate-based access control policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify a policy name, this command displays information about all certificate-based access control policies.

Examples

Display information about certificate-based access control policy **mypolicy**.

```
<Switch> display pki certificate access-control-policy mypolicy
 Access control policy name: mypolicy
     Rule 1  deny    mygroup1
     Rule 2  permit  mygroup2
```

Display information about all certificate-based access control policies.

```
<Switch> display pki certificate access-control-policy
 Total PKI certificate access control policies: 2
 Access control policy name: mypolicy1
     Rule 1  deny    mygroup1
     Rule 2  permit  mygroup2
 Access control policy name: mypolicy2
     Rule 1  deny    mygroup3
     Rule 2  permit  mygroup4
```

Table 8-2 Command output

Field	Description
Total PKI certificate access control policies	Total number of certificate-based access control policies.
permit	Permit certificates that match the attribute group in the access control rule.
deny	Deny certificates that match the attribute group in the access control rule.

Related commands

pki certificate access-control-policy

8.1.13. display pki certificate attribute-group

Use **display pki certificate attribute-group** to display information about certificate attribute groups.

Syntax

display pki certificate attribute-group [*group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-name: Specifies a certificate attribute group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify a certificate attribute group, this command displays information about all certificate attribute groups.

Examples

Display information about certificate attribute group **mygroup**.

```
<Switch> display pki certificate attribute-group mygroup
 Attribute group name: mygroup
      Attribute  1 subject-name     dn    ctn   abc
      Attribute  2 issuer-name      fqdn  nctn  app
```

Display information about all certificate attribute groups.

```
<Switch> display pki certificate attribute-group
 Total PKI certificate attribute groups: 2.
 Attribute group name: mygroup1
      Attribute  1 subject-name     dn    ctn   abc
      Attribute  2 issuer-name      fqdn  nctn  app
Attribute group name: mygroup2
      Attribute  1 subject-name     dn    ctn   def
      Attribute  2 issuer-name      fqdn  nctn  fqd
```

Table 8-3 Command output

Field	Description
Total PKI certificate attribute groups	Total number of certificate attribute groups.
ctn	Contain operation.
nctn	Not-contain operation.
equ	Equal operation.
nequ	Not-equal operation.
Attribute 1 subject-name dn ctn abc	Attribute rule contents: • **alt-subject-name**—Alternative subject name. • **issuer-name**—Certificate issuer name. • **subject-name**—Certificate subject name. • **fqdn**—FQDN of the PKI entity. • **ip**—IP address of the PKI entity. • **dn**—DN of the PKI entity. • **ctn**—Indicates the contain operation. • **equ**—Indicates the equal operation. • **nctn**—Indicates the not-contain operation. • **nequ**—Indicates the not-equal operation.

8.1.14. display pki certificate domain

Use **display pki certificate domain** to display information about certificates.

Syntax

display pki certificate domain *domain-name* { **ca** | **local** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-4 .

Table 8-4 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

ca: Specifies the CA certificate.

local: Specifies the local certificates.

Usage guidelines

If you specify the **CA** keyword, this command displays information about all CA certificates in the domain. If the domain has RA certificates, the RA certificates are also displayed.

If you specify the **local** keyword, this command displays information about all local certificates in the domain.

Examples

Display information about the CA certificate in PKI domain **aaa**.

```
<Switch> display pki certificate domain aaa ca
Certificate:

8.1.15. display pki certificate request-status

Use **display pki certificate request-status** to display certificate request status.

Syntax

display pki certificate request-status

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

If you do not specify a PKI domain, this command displays the certificate request status for all PKI domains.

Examples

Display certificate request statuses for all PKI domains.

```
<Switch> display pki certificate request-status
Certificate Request Transaction 1
    Domain name: domain1
    Status: Pending
    Key usage: General
    Remain polling attempts: 10
    Next polling attempt after : 1191 seconds
Certificate Request Transaction 2
    Domain name: domain2
    Status: Pending
    Key usage: Signature
    Remain polling attempts: 10
    Next polling attempt after : 188 seconds
```

Table 8-5 Command output

Field	Description
Certificate Request Transaction *number*	Certificate request transaction number, starting from 1.
Status	Certificate request status, including only the pending status.
Key usage	Certificate purposes: • **General**—Signature and encryption. • **Signature**—Signature only. • **Encryption**—Encryption only.
Remain polling attempts	Remaining number of attempts to query certificate request status.
Next polling attempt after	Remaining seconds before the next request status polling.

8.1.16. display pki crl domain

Use **display pki crl domain** to display information about the CRL saved at the local for a PKI domain.

Syntax

display pki crl domain *domain-name*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-6 .

Table 8-6 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

Usage guidelines

Use this command to determine whether a certificate has been revoked.

Examples

Display information about the CRL saved at the local for PKI domain **aaa**.

```
<Switch> display pki crl domain aaa
Certificate Revocation List (CRL):

Table 8-7 Command output

Field	Description
Version	CRL version number.
Signature Algorithm	Signature algorithm used by the CA to sign the CRL.
Issuer	Name of the CA that issued the CRL.
Last Update	Most recent CRL update time.
Next Update	Next CRL update time.
X509v3 Authority Key Identifier	X509v3 ID of the CA that issues the CRL.
keyid	Key ID. This field identifies the key pair used to sign the CRL.
Signature Algorithm:	Signature algorithm and signature data.

Related commands

pki retrieve-crl

8.1.17. fqdn

Use **fqdn** to set the FQDN of an entity.

Use **undo fqdn** to restore the default.

Syntax

fqdn *fqdn-name-string*

undo fqdn

Default

No FQDN is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

fqdn-name-string: Specifies an FQDN, a case-sensitive string of 1 to 255 characters in the format *hostname*@*domainname*.

Usage guidelines

An FQDN uniquely identifies a PKI entity on a network.

Examples

Set the FQDN to **pki.domain-name.com** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] fqdn abc@pki.domain.com
```

8.1.18. ip

Use **ip** to assign an IP address to a PKI entity.

Use **undo ip** to restore the default.

Syntax

ip { *ip-address* | **interface** *interface-type interface-number* }

undo ip

Default

No IP address is assigned to the PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IPv4 address.

interface *interface-type interface-number*: Specifies an interface by its type and number. The primary IPv4 address of the interface will be used as the IP address of the PKI entity.

Usage guidelines

Use this command to assign an IP address to a PKI entity or specify an interface for the entity. The interface's primary IPv4 address will be used as the IP address of the PKI entity. If you specify an interface, make sure the interface is assigned an IP address before the PKI entity requests a certificate.

Examples

Assign IP address **192.168.0.2** to PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] ip 192.168.0.2
```

8.1.19. locality

Use **locality** to set the locality of a PKI entity.

Use **undo locality** to restore the default.

Syntax

locality *locality-name*

undo locality

Default

No locality is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

locality-name: Specifies a locality, a case-sensitive string of 1 to 63 characters. No comma can be included. You can set a city name as the locality.

Examples

Set the locality to **pukras** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] locality pukras
```

8.1.20. organization

Use **organization** to set an organization name for a PKI entity.

Use **undo organization** to restore the default.

Syntax

organization *org-name*

undo organization

Default

No organization name is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

org-name: Specifies an organization name, a case-sensitive string of 1 to 63 characters. No comma can be included.

Examples

Set the organization name to **abc** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] organization abc
```

8.1.21. organization-unit

Use **organization-unit** to set an organization unit name for a PKI entity.

Use **undo organization-unit** to restore the default.

Syntax

organization-unit *org-unit-name*

undo organization-unit

Default

No organization unit name is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

org-unit-name: Specifies an organization unit name, a case-sensitive string of 1 to 63 characters. No commas can be included.

Examples

Set the organization unit name to **rdtest** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] organization-unit rdtest
```

8.1.22. pki abort-certificate-request

Use **pki abort-certificate-request** to abort the certificate request for a PKI domain.

Syntax

pki abort-certificate-request domain *domain-name*

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-8 .

Table 8-8 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

Usage guidelines

You can abort a certificate request and change some parameters, such as common name, country code, or FQDN, in the certificate request before the CA issues the certificate. Use the **display pki certificate request-status** command to display the certificate request status.

Examples

Abort the certificate request for PKI domain **1**.

```
<Switch> system-view
[Switch] pki abort-certificate-request domain 1
The certificate request is in process.
Confirm to abort it? [Y/N]:y
```

Related commands

display pki certificate request-status

pki request-certificate domain

8.1.23. pki certificate access-control-policy

Use **pki certificate access-control-policy** to create a certificate-based access control policy and enter its view, or enter the view of an existing certificate-based access control policy.

Use **undo pki certificate access-control-policy** to remove a certificate-based access control policy.

Syntax

pki certificate access-control-policy *policy-name*

undo pki certificate access-control-policy *policy-name*

Default

No certificate-based access control policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A certificate-based access control policy contains a set of access control rules that permit or deny access to the device based on the attributes in the requesting client's certificate.

Examples

Create a certificate-based access control policy named **mypolicy** and enter its view.

```
<Switch> system-view
[Switch] pki certificate access-control-policy mypolicy
[Switch-pki-cert-acp-mypolicy]
```

Related commands

display pki certificate access-control-policy

8.1.24. pki certificate attribute-group

Use **pki certificate attribute-group** to create a certificate attribute group and enter its view, or enter the view of an existing certificate attribute group.

Use **undo pki certificate attribute-group** to remove a certificate attribute group.

Syntax

pki certificate attribute-group *group-name*

undo pki certificate attribute-group *group-name*

Default

No certificate attribute groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-name: Specifies a group name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A certificate attribute group is a set of attribute rules configured by using the **attribute** command. Each attribute rule defines a matching criterion for an attribute in the issuer name, subject name, or alternative subject name field of certificates.

A certificate attribute group must be associated with an access control rule. If a certificate attribute group does not have any attribute rules, the system determines that the all certificates match the associated access control rule.

Examples

Create a certificate attribute group named **mygroup** and enter its view.

```
<Switch> system-view
[Switch] pki certificate attribute-group mygroup
[Switch-pki-cert-attribute-group-mygroup]
```

Related commands

attribute

display pki certificate attribute-group

8.1.25. pki delete-certificate

Use **pki delete-certificate** to remove certificates from a PKI domain.

Syntax

pki delete-certificate domain *domain-name* { **ca** | **local** }

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-9 .

Table 8-9 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

ca: Specifies the CA certificate.

local: Specifies the local certificates.

Usage guidelines

When you remove the CA certificate in a PKI domain, the system also removes the local certificates, peer certificates, and the CRL in the PKI domain.

To delete a specific peer certificate in a PKI domain, perform the following steps:

1. Execute the **display pki certificate** command to determine the serial number of the peer certificate.

Examples

Remove the CA certificate in PKI domain **aaa**.

```
<Switch> system-view
[Switch] pki delete-certificate domain aaa ca
Local certificates, peer certificates and CRL will also be deleted while deleting the CA certificate.
Confirm to delete the CA certificate? [Y/N]:y
[Switch]
```

Remove the local certificates in PKI domain **aaa**.

```
<Switch> system-view
[Switch] pki delete-certificate domain aaa local
[Switch]
```

Related commands

display pki certificate

8.1.26. pki domain

Use **pki domain** to create a PKI domain and enter its view, or enter the view of an existing PKI domain.

Use **undo pki domain** to remove a PKI domain.

Syntax

pki domain *domain-name*

undo pki domain *domain-name*

Default

No PKI domains exist.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-10 .

Table 8-10 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

Usage guidelines

When you remove a PKI domain, the certificates and the CRL in the domain are also removed.

Examples

Create a PKI domain named **aaa** and enter its view.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa]
```

8.1.27. pki entity

Use **pki entity** to create a PKI entity and enter its view, or enter the view of an existing PKI entity.

Use **undo pki entity** to remove a PKI entity.

Syntax

pki entity *entity-name*

undo pki entity *entity-name*

Default

No PKI entities exist.

Views

System view

Predefined user roles

network-admin

Parameters

entity-name: Specifies a name for a PKI entity, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A PKI entity includes the identity information that can be used by a CA to identify a certificate applicant. You can configure multiple attributes for a PKI entity, such as common name, organization, organization unit, locality, state, country, FQDN, and IP address. The information will be included as subject contents in the certificate issued by the CA.

Examples

Create a PKI entity named **en** and enter its view.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en]
```

Related commands

pki domain

8.1.28. pki import

Use **pki import** to import the CA certificate, local certificates, or peer certificates for a PKI domain.

Syntax

pki import domain *domain-name* { **der** { **ca** | **local** | **peer** } **filename** *filename* | **p12 local filename** *filename* | **pem** { **ca** | **local** | **peer** } [**filename** *filename*] }

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-11 .

Table 8-11 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

der: Specifies the DER certificate file format, including PKCS#7.

p12: Specifies the PKCS#12 certificate file format.

pem: Specifies the PEM certificate file format.

ca: Specifies the CA certificate.

local: Specifies the local certificates.

peer: Specifies the peer certificates.

filename *filename*: Specifies a certificate file name, a case-insensitive string. For a certificate in PEM format, you can also choose to copy and paste the certificate contents on the terminal instead of importing from a file.

Usage guidelines

Use this command to import a certificate in the following situations:

- The CRL repository is not specified or the CA server does not support SCEP.
- The certificate is packed with the server generated key pair in a single file. Only certificate files in PKCS12 or PEM format can contain key pairs.

Before you import certificates, complete the following tasks:

- Use FTP or TFTP to upload the certificate files to the storage media of the device. If FTP or TFTP is not available, display and copy the contents of a certificate to a file on the device. Make sure the certificate is in PEM format because only certificates in PEM format can be imported by this means.
- For the local certificates or peer certificates to be imported, the correct CA certificate chain must exist. The CA certificate chain can be stored on the device, or carried in the local certificates or peer certificates. If the PKI domain, the local certificates, or the peer certificates do not have the CA certificate chain, you must import the CA certificate first. To import a local or peer certificate, a CA certificate chain must exist in the PKI domain, or be carried in the local or peer certificate. If not, obtain it first.

When you import the local or peer certificates:

- If the local or peer certificates contain the CA certificate chain, you can import the CA certificate and the local or peer certificates at the same time. If the CA certificate already exists in a PKI domain, the system prompts you whether to overwrite the existing CA certificate.
- If the local or peer certificates do not contain the CA certificate chain, but the CA certificate already exists in a PKI domain, you can directly import the certificates.

You can import the CA certificate to a PKI domain when either of the following conditions is met:

- The CA certificate to be imported is the root CA certificate or contains the certificate chain with the root certificate.
- The CA certificate contains a certificate chain without the root certificate, but can form a complete certificate chain with an existing CA certificate on the device.

Contact the CA administrator to get information as prompted in the following scenarios:

- The system prompts you to confirm the certificate's fingerprint in the following situation:
  - The certificate file to be imported contains the root certificate, but the root certificate does not exist in any PKI domains on the device.
  - The **root-certificate fingerprint** command is not configured in the PKI domain to which the certificate file is to be imported.
- The system prompts you to enter the challenge password used for encrypting the private key if the local certificate to be imported contains a key pair.

When you import a local certificate file that contains a key pair, you can choose to update the domain with the key pair. Depending on the purpose of the key pair, the following conditions might apply:

- If the purpose of the key pair is general, the device uses the key pair to replace the local key pair that is found in this order:
  a. General-purpose key pair.
  b. Signature key pair.
  c. Encryption key pair.
- If the purpose of the key pair is signature, the device uses the key pair to replace the local key pair that is found in this order:
  a. General-purpose key pair.
  b. Signature key pair.
- If the purpose of the key pair is encryption, the device searches the domain for an encryption key pair.

If a matching key pair is found, the device asks whether you want to overwrite the existing key pair on the device. If no match is found, the device asks you to enter a key pair name (defaulting to the PKI domain name). Then, it generates the key pair according to the key algorithm and the purpose defined in the certificate file.

The import operation automatically updates or generates the correct key pair. When you perform the import operation, be sure to save the configuration file to avoid data loss.

Examples

Import CA certificate file **rootca_pem.cer** in PEM format to PKI domain **aaa**. The certificate file contains the root certificate.

```
<Switch> system-view
[Switch] pki import domain aaa pem ca filename rootca_pem.cer
The trusted CA's finger print is:
    MD5  fingerprint:FFFF 3EFF FFFF 37FF FFFF 137B FFFF 7535
    SHA1 fingerprint:FFFF FF7F FF2B FFFF 7618 FF4C FFFF 0A7D FFFF FF69
Is the finger print correct?(Y/N):y
[Switch]
```

Import CA certificate file **aca_pem.cer** in PEM format to PKI domain **bbb**. The certificate file does not contain the root certificate.

```
<Switch> system-view
[Switch] pki import domain bbb pem ca filename aca_pem.cer
[Switch]
```

Import local certificate file **local-ca.p12** in PKCS12 format to PKI domain **bbb**. The certificate file contains a key pair.

```
<Switch> system-view
[Switch] pki import domain bbb p12 local filename local-ca.p12
Please input challenge password:
******
[Switch]
```

Import the local certificate in PEM format to PKI domain **bbb** by copying and pasting the contents of the certificate. The certificate contains the key pair and the CA certificate chain.

```
<Switch> system-view
[Switch] pki import domain bbb pem local
Enter PEM-formatted certificate.
End with a Ctrl+c on a line by itself.

8.1.29. pki request-certificate

Use **pki request-certificate** to submit a local certificate request or generate a certificate request in PKCS#10 format.

Syntax

pki request-certificate domain *domain-name* [**password** *password*] [**pkcs10** [**filename** *filename*]]

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-12 .

Table 8-12 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

password *password*: Sets the password for certificate revocation, a case-sensitive string of 1 to 31 characters. The password is contained in the certificate request and must be provided if the certificate is revoked.

pkcs10: Displays BASE64-encoded PKCS#10 certificate request information, which can be used to request a certificate by an out-of-band means, like phone, disk, or email.

filename *filename*: Specifies a local file for saving the certificate request in PKCS#10 format. The *filename* argument is case-insensitive.

Usage guidelines

If SCEP fails, you can perform one of the following tasks:

- Use the **pkcs10** keyword to print the BASE64-encoded request information.
- Use the **pkcs10 filename** *filename* option to save the request information to a local file and transfer the file to the CA by using an out-of-band means. The file name can contain an absolute path. If the specified path does exist, the request information cannot be saved.

This command is not saved in the configuration file.

Examples

Display information about the certificate request in PKCS#10 format.

```
<Switch> system-view
[Switch] pki request-certificate domain aaa pkcs10

*** Request for general certificate ***
```

```

display pki certificate

8.1.30. pki retrieve-certificate

Use **pki retrieve-certificate** to obtain a certificate from the certificate distribution server.

Syntax

pki retrieve-certificate domain *domain-name* { **ca** | **local** }

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-13 .

Table 8-13 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

ca: Specifies the CA certificate.

local: Specifies the local certificates.

Usage guidelines

In online mode:

- You can obtain the CA certificate through the SCEP protocol. If a CA certificate already exists locally, do not obtain the CA certificate again. To obtain a new CA certificate, use the **pki delete-certificate** command to remove the CA certificate and local certificates, and then obtain the CA certificate again.
- If a PKI domain already has local certificates, you can still perform the obtain operation and the obtained local certificates or peer certificates overwrite the existing ones. If RSA is used, a PKI domain can have two local certificates, one for signing and the other for encryption. Certificates for different purposes do not overwrite each other.

The obtained CA certificate, local certificates, and peer certificates are automatically verified before they are saved locally. If the verification fails, they are not saved.

This command is not saved in the configuration file.

Examples

Obtain the CA certificate from the certificate distribution server. (This operation requires the user to confirm the fingerprint of the root CA certificate.)

```
<Switch> system-view
[Switch] pki retrieve-certificate domain aaa ca
The trusted CA's finger print is:
    MD5  fingerprint:5C41 E657 A0D6 ECB4 6BD6 1823 7473 AABC
    SHA1 fingerprint:1616 E7A5 D89A 2A99 9419 1C12 D696 8228 87BC C266
Is the finger print correct?(Y/N):y
```

Obtain the local certificates from the certificate distribution server.

```
<Switch> system-view
[Switch] pki retrieve-certificate domain aaa local
```

Obtain the certificate of the peer entity **en1** from the certificate distribution server.

```
<Switch> system-view
[Switch] pki retrieve-certificate domain aaa peer en1
```

Related commands

display pki certificate

pki delete-certificate

8.1.31. pki retrieve-crl

Use **pki retrieve-crl** to obtain CRLs and save them locally.

Syntax

pki retrieve-crl domain *domain-name*

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-14 .

Table 8-14 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

Usage guidelines

CRLs are used to verify the validity of the local certificates and the peer certificates in a PKI domain. To obtain CRLs, a PKI domain must have the correct CA certificate.

The URL of the CRL repository is specified by using the **crl url** command.

The device can obtain CRLs from the CRL repository through the HTTP, or SCEP protocol. Which protocol is used depends on the configuration of the CRL repository in the PKI domain:

- If the specified URL of the CRL repository is in HTTP format, the device obtains CRLs through the HTTP protocol.
- If the PKI domain is not configured with the CRL repository, the device looks up the local certificates and then the CA certificate for the CRL repository. If a CRL repository is found, the device obtains CRLs from the CRL repository. If no CRL repository is found, the device obtains CRLs through the SCEP protocol.

Examples

Obtain CRLs from the CRL repository.

```
<Switch> system-view
[Switch] pki retrieve-crl domain aaa
```

Related commands

crl url

8.1.32. pki storage

Use **pki storage** to specify the storage path for the certificates or CRLs.

Use **undo pki storage** to restore the default.

Syntax

pki storage { **certificates** | **crls** } *dir-path*

undo pki storage { **certificates** | **crls** }

Default

Certificates and CRLs are stored in the **PKI** directory on the storage media of the device. The **PKI** directory is automatically created when a certificate is successfully requested, obtained, or imported for the first time.

Views

System view

Predefined user roles

network-admin

Parameters

certificates: Specifies a storage path for certificates.

crls: Specifies a storage path for CRLs.

dir-path: Specifies a storage path, a case-sensitive string, which cannot start with a slash (/) or contain two dots plus a slash (../). The *dir-path* argument specifies an absolute path or a relative path, and the path must exist.

Usage guidelines

The specified storage path must be on the master device.

If the path to be specified does not exist, use the **mkdir** command to create the path first.

Certificate files use the .cer or .p12 file extension. CRL files use the .crl file extension. After you change the storage path for certificates or CRLs, the certificate files and CRL files in the original path are moved to the new path.

Examples

Specifies **flash:/pki-new** as the storage path for certificates.

```
<Switch> system-view
[Switch] pki storage certificates flash:/pki-new
```

Specifies **pki-new** as the storage path for CRLs.

```
<Switch> system-view
[Switch] pki storage crls pki-new
```

8.1.33. pki validate-certificate

Use **pki validate-certificate** to verify the validity of certificates.

Syntax

pki validate-certificate domain *domain-name* { **ca** | **local** }

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters. The domain name cannot contain the special characters listed in Table 8-15 .

Table 8-15 Special characters

Character name	Symbol	Character name	Symbol
Tilde	~	Dot	.
Asterisk	*	Left angle bracket	<
Backslash	\	Right angle bracket	>
Vertical bar	|	Quotation marks	"
Colon	:	Apostrophe	'

ca: Specifies the CA certificate.

local: Specifies the local certificates.

Usage guidelines

Generally, certificates are automatically verified when you request, obtain, or import them, or when an application uses PKI.

You can also use this command to manually verify a certificate in the following aspects:

- Whether the certificate is issued by a trusted CA.
- Whether the certificate has expired.
- Whether the certificate is revoked. This check is performed only if CRL checking is enabled.

When CRL checking is enabled:

- To verify the local certificates, if the PKI domain has no CRLs, the device looks up the locally saved CRLs. If a correct CRL is found, the device loads the CRL to the PKI domain. If no correct CRL is found locally, the device obtains a correct CRL from the CA server and saves it locally.
- To verify the CA certificate, CRL checking is performed for the CA certificate chain from the current CA to the root CA.

Examples

Verify the validity of the CA certificate in PKI domain **aaa**.

```
<Switch> system-view
[Switch] pki validate-certificate domain aaa ca
Verifying certificate......
        Serial Number:
            f6:3c:15:31:fe:bb:ec:94:dc:3d:b9:3a:d9:07:70:e5
        Issuer:
            C=cn
            O=ccc
            OU=ppp
            CN=rootca
        Subject:
            C=cn
            O=abc
            OU=test
            CN=aca

Verify result: OK

Related commands

crl check

pki domain

8.1.34. public-key dsa

Use **public-key dsa** to specify a DSA key pair for certificate request.

Use **undo public-key** to restore the default.

Syntax

public-key dsa name *key-name* [**length** *key-length*]

undo public-key

Default

No key pair is specified for certificate request.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

name *key-name*: Specifies a key pair by its name, a case-insensitive string of 1 to 64 characters. The key pair name can contain only letters, digits, and hyphens (-).

length *key-length*: Specifies the key length, in bits. The value range is 512 to 2048, and the default is 1024. A longer key means higher security but more public key calculation time.

Usage guidelines

You can specify a nonexistent key pair in this command. A key pair can be obtained in any of the following ways:

- Use the **public-key local create** command to generate a key pair.
- An application, like IKE using digital signature authentication, triggers the device to generate a key pair.
- Use the **pki import** command to import a certificate containing a key pair.

A PKI domain can have key pairs using only one type of cryptographic algorithm (DSA, ECDSA, or RSA).

If you configure a DSA key pair for a PKI domain multiple times, the most recent configuration takes effect.

The **length** *key-length* option takes effect only if you specify a nonexistent key pair. The device will automatically create the key pair by using the specified name and length before submitting a certificate request. The **length** *key-length* option is ignored if the specified key pair already exists or is already contained in an imported certificate.

Examples

Specify 2048-bit DSA key pair **abc** for certificate request.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] public-key dsa name abc length 2048
```

Related commands

pki import

public-key local create

8.1.35. public-key ecdsa

Use **public-key ecdsa** to specify an ECDSA key pair for certificate request.

Use **undo public-key** to restore the default.

Syntax

public-key ecdsa name *key-name* [**secp192r1** | **secp256r1** | **secp384r1** | **secp521r1**]

undo public-key

Default

No key pair is specified for certificate request.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

name *key-name*: Specifies a key pair by its name, a case-insensitive string of 1 to 64 characters. The key pair name can contain only letters, digits, and hyphens (-).

secp192r1: Uses the secp192r1 curve to generate the key pair. The secp192r1 curve is used by default.

secp256r1: Uses the secp256r1 curve to generate the key pair.

secp384r1: Uses the secp384r1 curve to generate the key pair.

secp521r1: Uses the secp521r1 curve to generate the key pair.

Usage guidelines

You can specify a nonexistent key pair for a PKI domain.

A key pair can be obtained in any of the following ways:

- Use the **public-key local create** command to generate a key pair.
- An application, like IKE using digital signature authentication, triggers the device to generate a key pair.
- Use the **pki import** command to import a certificate containing a key pair.

A PKI domain can have key pairs using only one type of cryptographic algorithm (DSA, ECDSA, or RSA).

If you configure an ECDSA key pair for a PKI domain multiple times, the most recent configuration takes effect.

The specified elliptic curve takes effect only if you specify a nonexistent key pair. The device will automatically create the key pair by using the specified name and curve before submitting a certificate request. The curve parameter is ignored if the specified key pair already exists or is already contained in an imported certificate.

Examples

Specify 384-bit ECDSA key pair **abc** for certificate request.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] public-key ecdsa name abc secp384r1
```

Related commands

pki import

public-key local create

8.1.36. public-key rsa

Use **public-key rsa** to specify an RSA key pair for certificate request.

Use **undo public-key** to restore the default.

Syntax

public-key rsa { { **encryption name** *encryption-key-name* [**length** *key-length*] | **signature name** *signature-key-name* [**length** *key-length*] } * | **general name** *key-name* [**length** *key-length*] }

undo public-key

Default

No key pair is specified for certificate request.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

encryption: Specifies a key pair for encryption.

name *encryption-key-name*: Specifies a key pair name, a case-insensitive string of 1 to 64 characters. The key pair name can contain only letters, digits, and hyphens (-).

signature: Specifies a key pair for signing.

name *signature-key-name*: Specifies a key pair name, a case-insensitive string of 1 to 64 characters. The key pair name can contain only letters, digits, and hyphens (-).

general: Specifies a key pair for both signing and encryption.

name *key-name*: Specifies a key pair name, a case-insensitive string of 1 to 64 characters. The key pair name can contain only letters, digits, and hyphens (-).

length *key-length*: Specifies the key length, in bits. The value range is 512 to 2048, and the default is 1024. A longer key means higher security but more public key calculation time.

Usage guidelines

You can specify a nonexistent key pair in this command. You can get a key pair in any of the following ways:

- Use the **public-key local create** command to generate a key pair.
- An application, like IKE using digital signature authentication, triggers the device to generate a key pair.
- Use the **pki import** command to import a certificate containing a key pair.

A PKI domain can have key pairs using only one type of cryptographic algorithm (DSA, ECDSA, or RSA).

A PKI domain can have two RSA key pairs of different purposes: one is the signing key pair, and the other is the encryption key pair. If you configure an RSA signing key pair or RSA encryption key pair multiple times, the most recent configuration takes effect. The RSA signing key pair and encryption key pair do not overwrite each other.

If you specify a signing key pair and an encryption key pair separately, their key length can be different.

The **length** *key-length* option takes effect only if you specify a nonexistent key pair. The device will automatically create the key pair by using the specified name and length before submitting a certificate request. The **length** *key-length* option is ignored if the specified key pair already exists or is already contained in an imported certificate.

Examples

Specify 2048-bit general purpose RSA key pair **abc** for certificate request.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] public-key rsa general name abc length 2048
```

Specify the following RSA key pairs for certificate request:

- 2048-bit RSA encryption key pair **rsa1**.
- 2048-bit RSA signing key pair **sig1**.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] public-key rsa encryption name rsa1 length 2048
```

```
[Switch-pki-domain-aaa] public-key rsa signature name sig1 length 2048
```

Related commands

pki import

public-key local create

8.1.37. root-certificate fingerprint

Use **root-certificate fingerprint** to set the fingerprint for verifying the root CA certificate.

Use **undo root-certificate fingerprint** to restore the default.

Syntax

root-certificate fingerprint { **md5** | **sha1** } *string*

undo root-certificate fingerprint

Default

No fingerprint is set for verifying the root CA certificate.

Views

PKI domain view

Predefined user roles

network-admin

Parameters

md5: Sets an MD5 fingerprint.

sha1: Sets an SHA1 fingerprint.

string: Sets the fingerprint in hexadecimal notation. If you specify the **MD5** keyword, the fingerprint is a string of 32 characters. If you specify the **SHA1** keyword, the fingerprint is a string of 40 characters.

Usage guidelines

If you set the certificate request mode to auto for a PKI domain that does not have a CA certificate, you must configure the fingerprint for root CA certificate verification. When an application (for example, IKE) triggers the device to request local certificates, the device automatically performs the following operations:

1. Obtains the CA certificate from the CA server.
2. Compares the fingerprint contained in the root CA certificate with the fingerprint configured in the PKI domain, if either of the following conditions exists:
   - The obtained CA certificate is a root certificate.
   - The obtained CA certificate is a certificate chain and contains a root certificate that does not exist on the device.

   If the two fingerprints do not match, or if no fingerprint is configured in the PKI domain, the device rejects the CA certificate and the local certificate request fails.

The fingerprint configured by this command is also used for root CA certificate verification when the device performs the following operations:

- Imports the CA certificate as requested by the **pki import** command.
- Obtains the CA certificate as requested by the **pki retrieve-certificate** command.

The device compares the fingerprint contained in the root CA certificate with the fingerprint configured in the PKI domain, if either of the following conditions exists:

- The CA certificate to be imported or obtained is a root certificate that does not exist on the device.
- The CA certificate to be imported or obtained is a certificate chain and contains a root certificate that does not exist on the device.

If the two fingerprints do not match, the device rejects the CA certificate. If no fingerprint is configured in the PKI domain, the device prompts you to manually verify the fingerprint of the root CA certificate.

Examples

Specify an MD5 fingerprint for verifying the root CA certificate.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] root-certificate fingerprint md5
12EF53FA355CD23E12EF53FA355CD23E
```

Specify an SHA1 fingerprint for verifying the root CA certificate.

```
<Switch> system-view
[Switch] pki domain aaa
[Switch-pki-domain-aaa] root-certificate fingerprint sha1
D1526110AAD7527FB093ED7FC037B0B3CDDDAD93
```

8.1.38. state

Use **state** to set the state or province name for a PKI entity.

Use **undo state** to restore the default.

Syntax

state *state-name*

undo state

Default

No state name or province name is set for a PKI entity.

Views

PKI entity view

Predefined user roles

network-admin

Parameters

state-name: Specifies a state or province by its name, a case-sensitive string of 1 to 63 characters. No comma can be included.

Examples

Set the state name to **countryA** for PKI entity **en**.

```
<Switch> system-view
[Switch] pki entity en
[Switch-pki-entity-en] state countryA
```

9. SSH commands

9.1. SSH server commands

9.1.1. display ssh server

Use **display ssh server** on an SSH server to display the SSH server status or sessions.

Syntax

display ssh server { **session** | **status** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

session: Specifies the SSH server sessions.

status: Specifies the SSH server status.

Examples

Display the SSH server status.

```
<Switch> display ssh server status
 Stelnet server: Disable
 SSH version : 2.0
 SSH authentication-timeout : 60 second(s)
 SSH server key generating interval : 0 hour(s)
 SSH authentication retries : 3 time(s)
 SFTP server: Disable
 SFTP server Idle-Timeout: 10 minute(s)
 NETCONF server: Disable
 SCP server: Disable
 SSH Server PKI domain name: aaa
```

Table 9-1 Command output

Field	Description
Stelnet server	Whether the Stelnet server is enabled.
SSH version	SSH protocol version. When the SSH supports SSH1, the protocol version is 1.99. Otherwise, the protocol version is 2.
SSH authentication-timeout	Authentication timeout timer.
SSH server key generating interval	Minimum interval for updating the RSA server key pair.
SSH authentication retries	Maximum number of authentication attempts for SSH

Field	Description
	users.
SFTP server	Whether the SFTP server is enabled.
SFTP server Idle-Timeout	SFTP connection idle timeout timer.
NETCONF server	Whether NETCONF over SSH is enabled.
SCP server	Whether the SCP server is enabled.
SSH Server PKI domain name	Name of the PKI domain specified for the SSH server.

Display the SSH server sessions.

```
<Switch> display ssh server session
UserPid    SessID Ver    Encrypt    State          Retries  Serv     Username
 184         0     2.0    aes128-cbc Established    1        Stelnet  abc@123
```

Table 9-2 Command output

Field	Description
UserPid	User process ID.
SessID	Session ID.
Ver	Protocol version of the SSH server.
Encrypt	Encryption algorithm used on the SSH server.
State	Session state: • **Init**—Initialization. • **Ver-exchange**—Version negotiation. • **Keys-exchange**—Key exchange. • **Auth-request**—Authentication request. • **Serv-request**—Session service request. • **Established**—The session is established. • **Disconnected**—The session is terminated.
Retries	Number of authentication failures.
Serv	Service type: • SCP. • SFTP. • Stelnet. • NETCONF.
Username	Username that the client uses to log in to the server.

9.1.2. display ssh user-information

Use **display ssh user-information** to display information about SSH users on an SSH server.

Syntax

display ssh user-information [*username*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

username: Specifies an SSH username, a case-sensitive string of 1 to 80 characters. If you do not specify an SSH user, this command displays information about all SSH users.

Usage guidelines

This command displays information only about SSH users that are configured by using the **ssh user** command on the SSH server.

Examples

Display information about all SSH users.

```
<Switch> display ssh user-information
 Total ssh users:2
 Username            Authentication-type  User-public-key-name  Service-type
 yemx                password                                   Stelnet|SFTP
 test                publickey            pubkey                SFTP
```

Table 9-3 Command output

Field	Description
Total ssh users	Total number of SSH users.
Authentication-type	Authentication methods: • Password authentication. • Publickey authentication. • Password-publickey authentication. • Any authentication.
User-public-key-name	Public key name of the user. This field is empty if the authentication method is password authentication.
Service-type	Service types: • Stelnet. • SFTP. • SCP. • NETCONF. If multiple service types are available for an SSH user, they are separated by vertical bars (|).

Related commands

ssh user

9.1.3. free ssh

Use **free ssh** to disconnect SSH sessions.

Syntax

free ssh { **user-ip** { *ip-address* | **ipv6** *ipv6-address* } [**port** *port-number*] | **user-pid** *pid-number* | **username** *username* }

Views

User view

Predefined user roles

network-admin

Parameters

user-ip: Specifies the user IP address of the SSH sessions to be disconnected.

ip-address: Specifies the user IPv4 address of the SSH sessions to be disconnected.

ipv6 *ipv6-address:* Specifies the user IPv6 address of the SSH sessions to be disconnected.

port *port-number*: Specifies the source port of the SSH session to be disconnected, in the range of 1 to 65535. If you do not specify a source port, this command disconnects all SSH sessions using the specified IP address.

user-pid *pid-number*: Specifies the user process ID of the SSH session to be disconnected, in the range of 1 to 2147483647. To view the user process ID of an SSH session, use the **display ssh server session** command.

username *username*: Specifies the username of the SSH session to be disconnected. To view the username of an SSH session, use the **display ssh server session** command.

Examples

Disconnect the SSH sessions with user IPv4 address 192.168.15.45.

```
<Switch> free ssh user-ip 192.168.15.45
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH sessions with user IPv6 address 2000::11.

```
<Switch> free ssh user-ip ipv6 2000::11
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH session with user process ID 417.

```
<Switch> free ssh user-pid 417
Releasing SSH connection. Continue? [Y/N]:y
```

Disconnect the SSH session with username **sshuser**.

```
<Switch> free ssh username sshuser
Releasing SSH connection. Continue? [Y/N]:y
```

Related commands

display ssh server session

9.1.4. scp server enable

Use **scp server enable** to enable the SCP server.

Use **undo scp server enable** to disable the SCP server.

Syntax

scp server enable

undo scp server enable

Default

The SCP server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the SCP server.

```
<Switch> system-view
[Switch] scp server enable
```

Related commands

display ssh server

9.1.5. sftp server enable

Use **sftp server enable** to enable the SFTP server.

Use **undo sftp server enable** to disable the SFTP server.

Syntax

sftp server enable

undo sftp server enable

Default

The SFTP server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the SFTP server.

```
<Switch> system-view
[Switch] sftp server enable
```

Related commands

display ssh server

9.1.6. sftp server idle-timeout

Use **sftp server idle-timeout** to set the idle timeout timer for SFTP connections on an SFTP server.

Use **undo sftp server idle-timeout** to restore the default.

Syntax

sftp server idle-timeout *time-out-value*

undo sftp server idle-timeout

Default

The idle timeout timer is 10 minutes for SFTP connections.

Views

System view

Predefined user roles

network-admin

Parameters

time-out-value: Specifies an idle timeout timer in the range of 1 to 35791 minutes.

Usage guidelines

If an SFTP connection is idle when the idle timeout timer expires, the system automatically terminates the connection. To promptly release connection resources, set the idle timeout timer to a small value when many SFTP connections concurrently exist.

Examples

Set the idle timeout timer to 500 minutes for SFTP connections.

```
<Switch> system-view
[Switch] sftp server idle-timeout 500
```

Related commands

display ssh server

9.1.7. ssh server acl

Use **ssh server acl** to specify an ACL to control IPv4 SSH connections to the server.

Use **undo ssh server acl** to restore the default.

Syntax

ssh server acl { *advanced-acl-number* | *basic-acl-number* | **mac** *mac-acl-number* }

undo ssh server acl

Default

No ACLs are specified and all IPv4 SSH clients can initiate SSH connections to the server.

Views

System view

Predefined user roles

network-admin

Parameters

advanced-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

mac *mac-acl-number:* Specifies a Layer 2 ACL by its number in the range of 4000 to 4999.

Usage guidelines

The ACL specified in this command filters IPv4 SSH clients' connection requests. Only the IPv4 SSH clients that the ACL permits can access the device. If the specified ACL does not exist or contains no rules, all IPv4 SSH clients can access the device.

The ACL takes effect only on SSH connections that are initiated after the ACL configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure ACL 2001 and permit only the users at 1.1.1.1 to initiate SSH connections to the server.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[Switch-acl-ipv4-basic-2001] quit
[Switch] ssh server acl 2001
```

Related commands

display ssh server

9.1.8. ssh server acl-deny-log enable

Use **ssh server acl-deny-log enable** to enable logging for SSH login attempts that are denied by the SSH login control ACL.

Use **undo ssh server acl-deny-log enable** to disable logging for SSH login attempts that are denied by the SSH login control ACL.

Syntax

ssh server acl-deny-log enable

undo ssh server acl-deny-log enable

Default

Logging is disabled for SSH login attempts that are denied by the SSH login control ACL.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Only SSH clients permitted by the SSH login control ACL can access the SSH server. The logging feature generates log messages for SSH login attempts that are denied by the SSH login control ACL, and sends the messages to the information center.

For information about log message output, see the information center in *Network Management and Monitoring Configuration Guide*. For information about configuring an SSH login control ACL, see the **ssh server acl** or **ssh server ipv6 acl** command.

Examples

Enable logging for SSH login attempts that are denied by the SSH login control ACL.

```
<Switch> system-view
[Switch] ssh server acl-deny-log enable
```

Related commands

ssh server acl

ssh server ipv6 acl

9.1.9. ssh server authentication-retries

Use **ssh server authentication-retries** to set the maximum number of authentication attempts for SSH users.

Use **undo ssh server authentication-retries** to restore the default.

Syntax

ssh server authentication-retries *retries*

undo ssh server authentication-retries

Default

The maximum number of authentication attempts is 3 for SSH users.

Views

System view

Predefined user roles

network-admin

Parameters

retries: Specifies the maximum number of authentication attempts for SSH users, in the range of 1 to 5.

Usage guidelines

Setting the maximum number of authentication attempts prevents malicious hacking of usernames and passwords.

If the total number of authentication attempts exceeds the upper limit specified in this command, further authentication is not allowed.

- For **any** authentication, an authentication attempt is a publickey or password authentication process.
- For **password-publickey** authentication, an authentication attempt contains both a publickey authentication process and a password authentication process. The server first uses publickey authentication, and then uses password authentication to authenticate the SSH user.

This configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Set the maximum number of authentication attempts to 4 for SSH users.

```
<Switch> system-view
[Switch] ssh server authentication-retries 4
```

Related commands

display ssh server

9.1.10. ssh server authentication-timeout

Use **ssh server authentication-timeout** to set the SSH user authentication timeout timer on the SSH server.

Use **undo ssh server authentication-timeout** to restore the default.

Syntax

ssh server authentication-timeout *time-out-value*

undo ssh server authentication-timeout

Default

The SSH user authentication timeout timer is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-out-value: Specifies an authentication timeout timer in the range of 1 to 120 seconds.

Usage guidelines

If a user does not finish the authentication when the timeout timer expires, the connection cannot be established.

To prevent malicious occupation of TCP connections, set the authentication timeout timer to a small value.

Examples

Set the authentication timeout timer to 10 seconds for SSH users.

```
<Switch> system-view
[Switch] ssh server authentication-timeout 10
```

Related commands

display ssh server

9.1.11. ssh server compatible-ssh1x enable

Use **ssh server compatible-ssh1x enable** to enable the SSH server to support SSH1 clients.

Use **undo ssh server compatible-ssh1x** [**enable**] to restore the default.

Syntax

ssh server compatible-ssh1x enable

undo ssh server compatible-ssh1x [**enable**]

Default

The SSH server does not support SSH1 clients.

Views

System view

Predefined user roles

network-admin

network-operator

Usage guidelines

The **undo** form of this command restores the default setting whether you specify the **enable** keyword or not.

This configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Enable the SSH server to support SSH1 clients.

```
<Switch> system-view
[Switch] ssh server compatible-ssh1x enable
```

Related commands

display ssh server

9.1.12. ssh server dscp

Use **ssh server dscp** to set the DSCP value in the IPv4 SSH packets that the SSH server sends to SSH clients.

Use **undo ssh server dscp** to restore the default.

Syntax

ssh server dscp *dscp-value*

undo ssh server dscp

Default

The DSCP value is 48 in IPv4 SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the IPv4 SSH packets, in the range of 0 to 63. A bigger DSCP value represents a higher priority.

Usage guidelines

The DSCP value of a packet specifies the priority of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 30 for IPv4 SSH packets.

```
<Switch> system-view
[Switch] ssh server dscp 30
```

9.1.13. ssh server enable

Use **ssh server enable** to enable the Stelnet server.

Use **undo ssh server enable** to disable the Stelnet server.

Syntax

ssh server enable

undo ssh server enable

Default

The Stelnet server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the Stelnet server.

```
<Switch> system-view
[Switch] ssh server enable
```

Related commands

display ssh server

9.1.14. ssh server ipv6 acl

Use **ssh server ipv6 acl** to specify an ACL to control IPv6 SSH connections to the server.

Use **undo ssh server ipv6 acl** to restore the default.

Syntax

ssh server ipv6 acl { **ipv6** { *advanced-acl-number* | *basic-acl-number* } | **mac** *mac-acl-number* }

undo ssh server ipv6 acl

Default

No ACLs are specified and all IPv6 SSH clients can initiate SSH connections to the server.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

advanced-acl-number: Specifies an IPv6 advanced ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999.

mac *mac-acl-number:* Specifies a Layer 2 ACL by its number in the range of 4000 to 4999.

Usage guidelines

The ACL specified in this command filters IPv6 SSH clients' connection requests. Only the IPv6 SSH clients that the ACL permits can access the device. If the specified ACL does not exist or contains no rules, all IPv6 SSH clients can access the device.

The ACL takes effect only on SSH connections that are initiated after the ACL configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure ACL 2001 and permit only the users on the subnet 1::1/64 to initiate SSH connections to the server.

```
<Switch> system-view
[Switch] acl ipv6 basic 2001
[Switch-acl6-ipv6-basic-2001] rule permit source 1::1 64
[Switch-acl6-ipv6-basic-2001] quit
[Switch] ssh server ipv6 acl ipv6 2001
```

Related commands

display ssh server

9.1.15. ssh server ipv6 dscp

Use **ssh server ipv6 dscp** to set the DSCP value in the IPv6 SSH packets that the SSH server sends to SSH clients.

Use **undo ssh server ipv6 dscp** to restore the default.

Syntax

ssh server ipv6 dscp *dscp-value*

undo ssh server ipv6 dscp

Default

The DSCP value is 48 in IPv6 SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the IPv6 SSH packets, in the range of 0 to 63. A bigger DSCP value represents a higher priority.

Usage guidelines

The DSCP value of an IPv6 packet specifies the priority of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 30 for IPv6 SSH packets.

```
<Switch> system-view
[Switch] ssh server ipv6 dscp 30
```

9.1.16. ssh server rekey-interval

Use **ssh server rekey-interval** to set the minimum interval for updating the RSA server key pair.

Use **undo ssh server rekey-interval** to restore the default.

Syntax

ssh server rekey-interval *interval*

undo ssh server rekey-interval

Default

The minimum interval for updating the RSA server key pair is 0 hours. The system does not update the RSA server key pair.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for updating the RSA server key pair, in the range of 1 to 24 hours.

Usage guidelines

Periodically updating the RSA server key pair prevents malicious hacking to the key pair and enhances security of the SSH connections.

The system starts to count down the configured minimum update interval after the first SSH1 user logs in to the server. If a new SSH1 user logs in to the server after the interval, the system performs the following operations:

1. Updates the RSA server key pair.
2. Uses the updated RSA server key pair for key pair negotiation with the new user.
3. Resets the interval and starts to count down the interval again.

This command takes effect only on SSH1 clients.

Examples

Set the minimum interval to 3 hours for updating the RSA server key pair.

```
<Switch> system-view
[Switch] ssh server rekey-interval 3
```

Related commands

display ssh server

9.1.17. ssh user

Use **ssh user** to create an SSH user and specify the service type and authentication method.

Use **undo ssh user** to delete an SSH user.

Syntax

ssh user *username* **service-type** { **all** | **netconf** | **scp** | **sftp** | **stelnet** } **authentication-type** { **password** | { **any** | **password-publickey** | **publickey** } [**assign publickey** *keyname*&<1-6>] }

undo ssh user *username*

Default

No SSH users exist.

Views

System view

Predefined user roles

network-admin

Parameters

username: Specifies an SSH username, a case-sensitive string of 1 to 80 characters. The username cannot be **a**, **al**, or **all**. In addition, the username cannot include vertical bars (|), colons (:), asterisks (*), question marks (?), or angle brackets (< >). The at sign (@), slash (/), and backslash (\) can only be used to append ISP domain names to usernames in the *pureusername@domain*, *pureusername\domain*, and *pureusername/domain* format. Do not include hyphens (-) in the username of an SCP user. Otherwise, SCP logins using that username will fail.

service-type: Specifies a service type for the SSH user.

- **all**: Specifies service types Stelnet, SFTP, SCP, and NETCONF.
- **scp**: Specifies the service type SCP.
- **sftp**: Specifies the service type SFTP.
- **stelnet**: Specifies the service type Stelnet.
- **netconf**: Specifies the service type NETCONF.

authentication-type: Specifies an authentication method for the SSH user.

- **password**: Specifies password authentication. This authentication method provides easy and fast encryption, but it is vulnerable. It can work with AAA to implement user authentication, authorization, and accounting.
- **any**: Specifies either password authentication or publickey authentication.
- **password-publickey**: Specifies both password authentication and publickey authentication for SSH2 clients. In SSH2, the password-publickey authentication method provides higher security. If the client runs SSH1, this keyword specifies either password authentication or publickey authentication.
- **publickey**: Specifies publickey authentication. This authentication method has complicated and slow encryption, but it provides strong authentication that can defend against brute-force attacks. This authentication method is easy to use. If this method is configured, the authentication process completes automatically without entering any password.

assign: Specifies parameters used for client verification.

- **publickey** *keyname*&<1-6>: Specifies a space-separated list of up to six SSH client public keys. The *keyname* argument represents the SSH client's public key configured on the server. It is a case-sensitive string of 1 to 64 characters. The server uses the client's public key to check the validity of the client. If the public key file of the client is changed, you must update the client's public key on the server promptly. If you specify multiple client public keys, the device verifies the user identity by using the public keys in the order they are specified. The user is valid if the user passes one public key check.

Usage guidelines

Use this command to configure an SSH user depending on the authentication method.

- If the authentication method is **publickey**, you must create an SSH user and a local user on the SSH server. The two users must have the same username, so that the SSH user can be assigned the correct working directory and user role.
- If the authentication method is **password**, you must perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  You do not need to create an SSH user by using the **ssh user** command. However, if you want to display all SSH users, including the password-only SSH users, for centralized management, you can use this command to create them. If such an SSH user has been created, make sure you have specified the correct service type and authentication method.
- If the authentication method is **password-publickey** or **any**, you must create an SSH user on the SSH server and perform one of the following tasks:
  - For local authentication, configure a local user on the SSH server.
  - For remote authentication, configure an SSH user on a remote authentication server, for example, a RADIUS server.

  In either case, the local user or the SSH user configured on the remote authentication server must have the same username as the SSH user.

For an SFTP or SCP user, the working directory depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the working directory is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **password**, the working directory is authorized by AAA.

For an SSH user, the user role also depends on the authentication method.

- If the authentication method is **publickey** or **password-publickey**, the user role is specified by the **authorization-attribute** command in the associated local user view.
- If the authentication method is **password**, the user role is authorized by AAA.

If you use this command to specify a host public key for a user multiple times, the most recent configuration takes effect. If a host public key is not specified for the user, the user uses certificate authentication for login.

The command configuration does not affect logged-in users. It affects only users that attempt to log in after the configuration.

Examples

Create an SSH user named **user1**. Specify the service type as **sftp** and the authentication method as **password-publickey** for the user. Assign the host public key **key1** to the user.

```
<Switch> system-view
[Switch] ssh user user1 service-type sftp authentication-type password-publickey assign publickey key1
```

Create a local device management user named **user1**. Specify the password as **123456TESTplat&!** in plain text and the service type as **ssh** for the user. Assign the working directory **flash:** and the **network-admin** user role to the user.

```
[Switch] local-user user1 class manage
[Switch-luser-manage-user1] password simple 123456TESTplat&!
[Switch-luser-manage-user1] service-type ssh
[Switch-luser-manage-user1] authorization-attribute work-directory flash: user-role network-admin
```

Related commands

9.2. SSH client commands

9.2.1. bye

Use **bye** to terminate the connection with the SFTP server and return to user view.

Syntax

bye

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as the **exit** and **quit** commands.

Examples

Terminate the connection with the SFTP server.

```
sftp> bye
<Switch>
```

9.2.2. cd

Use **cd** to change the working directory on the SFTP server.

Syntax

cd [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies the name of a directory on the server.

Usage guidelines

You can use the **cd ..** command to return to the upper-level directory.

You can use the **cd /** command to return to the root directory of the system.

Examples

Change the working directory to **new1**.

```
sftp> cd new1
Current Directory is:/new1
sftp> pwd
Remote working directory: /new1
sftp>
```

9.2.3. cdup

Use **cdup** to return to the upper-level directory.

Syntax

cdup

Views

SFTP client view

Predefined user roles

network-admin

Example

Return to the upper-level directory from the current working directory **/test1**.

```
sftp> cd test1
Current Directory is:/test1
sftp> pwd
Remote working directory: /test1
sftp> cdup
Current Directory is:/
sftp> pwd
Remote working directory: /
sftp>
```

9.2.4. delete

Use **delete** to delete a file from the SFTP server.

Syntax

delete *remote-file*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies a file by its name.

Usage guidelines

This command has the same function as the **remove** command.

Examples

Delete file **temp.c** from the SFTP server.

```
sftp> delete temp.c
Removing /temp.c
```

9.2.5. delete ssh client server-public-key

Use **delete ssh client server-public-key** to delete server public key information saved in the public key file of the SSH client.

Syntax

delete ssh client server-public-key [**server-ip** *ip-address*]

Views

System view

Predefined user roles

network-admin

Parameters

server-ip *ip-address*: Specifies the IP address of the server whose public key information will be deleted. If you do not specify a server IP address, this command deletes the public keys of all servers from the client's public key file.

Examples

Delete all server public keys saved in the public key file of the SSH client.

```
<Switch> system-view
[Switch] delete ssh client server-public-key
Public keys of all SSH servers will be deleted. Continue? [Y/N]:y
```

Delete the public key of server 2.2.2.1 saved in the public key file of the SSH client.

```
<Switch> system-view
[Switch] delete ssh client server-public-key server-ip 2.2.2.1
```

9.2.6. dir

Use **dir** to display information about the files and subdirectories under a directory.

Syntax

dir [**-a** | **-l**] [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

-a: Displays detailed information about files and subdirectories under a directory in a list, including the files and subdirectories with names starting with dots (.).

-l: Displays detailed information about the files and subdirectories under a directory in a list, excluding the files and subdirectories with names starting with dots (.).

remote-path: Specifies the name of the directory to be queried. If you do not specify this argument, the command displays information about the files and subdirectories under the current working directory.

Usage guidelines

If you do not specify both of the **-a** and **-l** keywords, this command displays the names of the files and subdirectories under a directory.

This command has the same function as the **ls** command.

Examples

Display detailed information about the files and subdirectories under the current directory, including the files and subdirectories with names starting with dots (.).

```
sftp> dir -a
drwxrwxrwx    2 1        1               512 Dec 18 14:12 .
drwxrwxrwx    2 1        1               512 Dec 18 14:12 ..
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

Display detailed information about the files and subdirectories under the current directory, excluding the files and subdirectories with names starting with dots (.).

```
sftp> dir -l
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

9.2.7. display sftp client source

Use **display sftp client source** to display the source IP address configuration of the SFTP client.

Syntax

display sftp client source

Views

Any view

Predefined user roles

network-admin

9.2.9. exit

Use **exit** to terminate the SFTP connection and return to user view.

Syntax

exit

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as the **bye** and **quit** commands.

Examples

Terminate the SFTP connection.

```
sftp> exit
<Switch>
```

9.2.10. get

Use **get** to download a file from the SFTP server and save it locally.

Syntax

get *remote-file* [*local-file*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies the name of a file on the SFTP server.

local-file: Specifies the name for the local file. If you do not specify this argument, the file will be saved locally with the same name as the file on the SFTP server.

Examples

Download file **temp1.c** and save it as **temp.c** locally.

```
sftp> get temp1.c temp.c
Fetching /temp1.c to temp.c
/temp.c                                          100% 1424     1.4KB/s   00:00
```

9.2.11. help

Use **help** to display help information on the SFTP client.

Syntax

help

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as entering the question mark (?).

Examples

Display help information on the SFTP client.

```

```

9.2.12. ls

Use **ls** to display information about the files and subdirectories under a directory.

Syntax

ls [**-a** | **-l**] [*remote-path*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

-a: Displays detailed information about files and subdirectories under a directory in a list, including the files and subdirectories with names starting with dots (.).

-l: Displays detailed information about the files and subdirectories under a directory in a list, excluding the files and subdirectories with names starting with dots (.).

remote-path: Specifies the name of the directory to be queried. If you do not specify this argument, the command displays information about the files and subdirectories under the current working directory.

Usage guidelines

If you do not specify both of the **-a** and **-l** keywords, this command displays the names of the files and subdirectories under a directory.

This command has the same function as the **dir** command.

Examples

Display detailed information about the files and subdirectories under the current directory, including the files and subdirectories with names starting with dots (.).

```
sftp> ls -a
drwxrwxrwx    2 1        1               512 Dec 18 14:12 .
drwxrwxrwx    2 1        1               512 Dec 18 14:12 ..
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

Display detailed information about the files and subdirectories under the current working directory, excluding the files and subdirectories with names starting with dots (.).

```
sftp> ls -l
-rwxrwxrwx    1 1        1               301 Dec 18 14:11 010.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 011.pub
-rwxrwxrwx    1 1        1               301 Dec 18 14:12 012.pub
```

9.2.13. mkdir

Use **mkdir** to create a directory on the SFTP server.

Syntax

mkdir *remote-path*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies the name of a directory.

Examples

Create a directory named **test** on the SFTP server.

```
sftp> mkdir test
```

9.2.14. put

Use **put** to upload a local file to the SFTP server.

Syntax

put *local-file* [*remote-file*]

Views

SFTP client view

Predefined user roles

network-admin

Parameters

local-file: Specifies the name of a local file.

remote-file: Specifies the name of a file on an SFTP server. If you do not specify this argument, the file will be remotely saved with the same name as the local file.

Examples

Upload the local file **startup.bak** to the SFTP server and save it as **startup01.bak**.

```
sftp> put startup.bak startup01.bak
Uploading startup.bak to /startup01.bak
startup01.bak                                 100% 1424     1.4KB/s   00:00
```

9.2.15. pwd

Use **pwd** to display the current working directory of the SFTP server.

Syntax

pwd

Views

SFTP client view

Predefined user roles

network-admin

Examples

Display the current working directory of the SFTP server.

```
sftp> pwd
Remote working directory: /
```

The output shows that the current working directory is the root directory.

9.2.16. quit

Use **quit** to terminate the SFTP connection and return to user view.

Syntax

quit

Views

SFTP client view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command has the same function as the **bye** and **exit** commands.

Examples

Terminate the SFTP connection.

```
sftp> quit
<Switch>
```

9.2.17. remove

Use **remove** to delete a file from the SFTP server.

Syntax

remove *remote-file*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-file: Specifies a file by its name.

Usage guidelines

This command has the same function as the **delete** command.

Examples

Delete file **temp.c** from the SFTP server.

```
sftp> remove temp.c
Removing /temp.c
```

9.2.18. rename

Use **rename** to change the name of a file or directory on the SFTP server.

Syntax

rename *old-name new-name*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

oldname: Specifies the name of an existing file or directory.

newname: Specifies a new name for the existing file or directory.

Examples

Change the name of a file on the SFTP server from **temp1.c** to **temp2.c**.

```
sftp> dir
aa.pub  temp1.c
sftp> rename temp1.c temp2.c
sftp> dir
aa.pub  temp2.c
```

9.2.19. rmdir

Use **rmdir** to delete a directory from the SFTP server.

Syntax

rmdir *remote-path*

Views

SFTP client view

Predefined user roles

network-admin

Parameters

remote-path: Specifies a directory.

Examples

Delete subdirectory **temp1** under the current directory on the SFTP server.

```
sftp> rmdir temp1
```

9.2.20. scp

Use **scp** to establish a connection to an IPv4 SCP server and transfer files with the server.

Syntax

scp *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**public-key** *keyname* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv4 address or source interface for SCP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SCP packets. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify that interface's IPv4 address as the source IPv4 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv4 address of this interface is the source IPv4 address of the SCP packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Connect the SCP client to SCP server **200.1.1.1**. Specify the public key of the server as **svkey**, and download file **abc.txt** from the server. The SCP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> scp 200.1.1.1 get abc.txt prefer-kex dh-group14-sha1 prefer-stoc-cipher
aes128-cbc prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key
svkey
Username:
```

9.2.21. scp ipv6

Use **scp ipv6** to establish a connection to an IPv6 SCP server and transfer files with the server.

Syntax

scp ipv6 *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] [**-i** *interface-type interface-number*] { **put** | **get** } *source-file-name* [*destination-file-name*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**public-key** *keyname* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

-i *interface-type interface-number:* Specifies an output interface by its type and number for SCP packets. This option is used only when the server uses a link-local address to provide the SCP service for the client. The specified output interface on the SCP client must have a link-local address.

get: Downloads the file.

put: Uploads the file.

source-file-name: Specifies the name of the source file, a case-sensitive string of 1 to 255 characters.

destination-file-name: Specifies the name of the target file, a case-sensitive string of 1 to 255 characters. If you do not specify this argument, the target file uses the same file name as the source file.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv6 address or source interface for IPv6 SCP packets. By default, the device automatically selects a source address for IPv6 SCP packets in compliance with RFC 3484. As a best practice to ensure successful SCP connections, specify a loopback interface as the source interface or specify that interface's IPv6 address as the source IPv6 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SCP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

If you do not specify a username and password in the command, you must provide the username and password in an interactive way.

If the SCP server uses publickey authentication, the password specified by this command is ignored.

Examples

Connect an SCP client to SCP server **2000::1**. Specify the public key of the server as **svkey**, and download file **abc.txt** from the server. The SCP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> scp ipv6 2000::1 get abc.txt prefer-kex dh-group14-sha1 prefer-stoc-cipher
aes128-cbc prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key
svkey
Username:
```

9.2.22. sftp

Use **sftp** to establish a connection to an IPv4 SFTP server and enter SFTP client view.

Syntax

sftp *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**dscp** *dscp-value* | { **public-key** *keyname* } | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

public-key *keyname*: Specifies the server's host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv4 address or source interface for the SFTP packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SFTP packets. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify that interface's IPv4 address as the source IPv4 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SFTP packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Examples

Connect an SFTP client to SFTP server **10.1.1.2** and specify the public key of the server as **svkey**. The SFTP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> sftp 10.1.1.2 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
```

9.2.23. sftp client ipv6 source

Use **sftp client ipv6 source** to configure the source IPv6 address for SFTP packets that are sent by the SFTP client.

Use **undo sftp client ipv6 source** to restore the default.

Syntax

sftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo sftp client ipv6 source

Default

The source IPv6 address for outgoing SFTP packets is not configured. The SFTP client automatically selects an IPv6 address for outgoing SFTP packets in compliance with RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SFTP client selects the interface's address that most specifically matches the destination address of outgoing SFTP packets as the source address of the SFTP packets.

ipv6 *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

This command takes effect on all IPv6 SFTP connections. The source IPv6 address specified in the **sftp ipv6** command takes effect only on the current IPv6 SFTP connection. If you specify the source IPv6 address both in this command and the **sftp ipv6** command, the source IPv6 address specified in the **sftp ipv6** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **2:2::2:2** as the source IPv6 address for SFTP packets.

```
<Switch> system-view
[Switch] sftp client ipv6 source ipv6 2:2::2:2
```

Related commands

display sftp client source

9.2.24. sftp client source

Use **sftp client source** to configure the source IPv4 address for SFTP packets that are sent by the SFTP client.

Use **undo sftp client source** to restore the default.

Syntax

sftp client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo sftp client source

Default

The source IPv4 address for outgoing SFTP packets is not configured. The SFTP client uses the primary IPv4 address of the output interface in the matching routing entry as the source IPv4 address of outgoing SFTP packets.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The SFTP client uses the primary IPv4 address of the interface as the source address of outgoing SFTP packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command takes effect on all SFTP connections. The source IPv4 address specified in the **sftp** command takes effect only on the current SFTP connection. If you specify the source IPv4 address both in this command and the **sftp** command, the source IPv4 address specified in the **sftp** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **192.168.0.1** as the source IPv4 address for SFTP packets.

```
<Switch> system-view
[Switch] sftp client source ip 192.168.0.1
```

Related commands

display sftp client source

9.2.25. sftp ipv6

Use **sftp ipv6** to connect an SFTP client to an IPv6 SFTP server and enter SFTP client view.

Syntax

sftp ipv6 *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**dscp** *dscp-value* | **public-key** *keyname* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Views

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range of 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SFTP packets. This option is used only when the server uses a link-local address to provide the SFTP service for the client. The specified output interface on the SFTP client must have a link-local address.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.

- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SFTP packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

public-key *keyname*: Specifies the host public key of the server that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv6 address or source interface for IPv6 SFTP packets. By default, the device automatically selects a source address for IPv6 SFTP packets in compliance with RFC 3484. As a best practice to ensure successful SFTP connections, specify a loopback interface as the source interface or specify that interface's IPv6 address as the source IPv6 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SFTP packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Examples

Connect an SFTP client to SFTP server **2000::1** and specify the public key of the server as **svkey**. The SFTP client uses publickey authentication. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> sftp ipv6 2000::1 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
Username:
```

9.2.26. ssh client ipv6 source

Use **ssh client ipv6 source** to configure the source IPv6 address for SSH packets that are sent by the Stelnet client.

Use **undo ssh client ipv6 source** to restore the default.

Syntax

ssh client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

undo ssh client ipv6 source

Default

The source IPv6 address for outgoing SSH packets is not configured. The Stelnet client automatically selects an IPv6 address for outgoing SSH packets in compliance with RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The Stelnet client selects the interface's address that most specifically matches the destination address of outgoing SSH packets as the source address of the SSH packets.

ipv6 *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

This command takes effect on all IPv6 Stelnet connections. The source IPv6 address specified in the **ssh2 ipv6** command takes effect only on the current IPv6 Stelnet connection. If you specify the source IPv6 address both in this command and the **ssh2 ipv6** command, the source IPv6 address specified in the **ssh2 ipv6** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **2:2::2:2** as the source IPv6 address for SSH packets that are sent by the Stelnet client.

```
<Switch> system-view
[Switch] ssh client ipv6 source ipv6 2:2::2:2
```

Related commands

display ssh client source

9.2.27. ssh client source

Use **ssh client source** to configure the source IPv4 address for SSH packets that are sent by the Stelnet client.

Use **undo ssh client source** to restore the default.

Syntax

ssh client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo ssh client source

Default

The source IPv4 address for outgoing SSH packets is not configured. The Stelnet client uses the primary IPv4 address of the output interface in the matching routing entry as the source address of outgoing SSH packets.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface by its type and number. The Stelnet client uses the primary IPv4 address of the interface as the source address of outgoing SSH packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

This command takes effect on all Stelnet connections. The source IPv4 address specified in the **ssh2** command takes effect only on the current Stelnet connection. If you specify the source IPv4 address both in this command and the **ssh2** command, the source IPv4 address specified in the **ssh2** command takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **192.168.0.1** as the source IPv4 address for SSH packets.

```
<Switch> system-view
[Switch] ssh client source ip 192.168.0.1
```

Related commands

display ssh client source

9.2.28. ssh2

Use **ssh2** to establish a connection to an IPv4 Stelnet server.

Syntax

ssh2 *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**dscp** *dscp-value* | **escape** *character* | **public-key** *keyname* | **source** { **interface** *interface-type interface-number* | **ip** *ip-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

server: Specifies a server by its IPv4 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv4 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

public-key *keyname*: Specifies the host public key of the server that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv4 address or source interface for SSH packets. By default, the device uses the primary IPv4 address of the output interface in the routing entry as the source address of SSH packets. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify that interface's IPv4 address as the source IPv4 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The primary IPv4 address of this interface is the source IPv4 address of the SSH packets.
- **ip** *ip-address*: Specifies a source IPv4 address.

Usage guidelines

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line.

As a best practice, use the default escape character (~). Do not use any character in SSH usernames as the escape character.

Examples

Establish a connection to Stelnet server **3.3.3.3** and specify the public key of the server as **svkey**. The Stelnet client uses publickey authentication. Specify the dollar sign ($) as the escape character. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> ssh2 3.3.3.3 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
escape $
```

9.2.29. ssh2 ipv6

Use **ssh2 ipv6** to establish a connection to an IPv6 Stelnet server.

Syntax

ssh2 ipv6 *server* [*port-number*] [**vpn-instance** *vpn-instance-name*] [**-i** *interface-type interface-number*] [**identity-key** { **dsa** | **rsa** } | **prefer-compress zlib** | **prefer-ctos-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-ctos-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** } | **prefer-kex** { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** } | **prefer-stoc-cipher** { **3des-cbc** | **aes128-cbc** | **des-cbc** } | **prefer-stoc-hmac** { **md5** | **md5-96** | **sha1** | **sha1-96** }] * [**dscp** *dscp-value* | **escape** *character* | **public-key** *keyname* | **source** { **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }] *

Views

Parameters

server: Specifies a server by its IPv6 address or host name, a case-insensitive string of 1 to 253 characters.

port-number: Specifies the port number of the server, in the range 1 to 65535. The default is 22.

vpn-instance *vpn-instance-name:* Specifies the VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

-i *interface-type interface-number:* Specifies an output interface by its type and number for IPv6 SSH packets. This option is used only when the server uses a link-local address to provide the Stelnet service for the client. The specified output interface on the Stelnet client must have a link-local address.

identity-key: Specifies a public key algorithm for publickey authentication of the client. If the server uses publickey authentication, you must specify this keyword. The client generates the digital signature or certificate by using the local private key that is associated with the specified algorithm.

- **dsa**: Specifies public key algorithm DSA.
- **rsa**: Specifies public key algorithm RSA.

prefer-compress: Specifies the preferred compression algorithm for data compression between the server and the client. By default, compression is not supported.

zlib: Specifies compression algorithm zlib.

prefer-ctos-cipher: Specifies the preferred client-to-server encryption algorithm. Supported algorithms are DES-CBC, 3DES-CBC, and AES128-CBC, in ascending order of security strength and computation time.

- **3des-cbc**: Specifies encryption algorithm 3DES-CBC.
- **aes128-cbc**: Specifies encryption algorithm AES128-CBC.
- **des-cbc**: Specifies encryption algorithm DES-CBC.

prefer-ctos-hmac: Specifies the preferred client-to-server HMAC algorithm. Supported algorithms are MD5, MD5-96, SHA1, and SHA1-96, in ascending order of security strength and computation time.

- **md5**: Specifies HMAC algorithm HMAC-MD5.
- **md5-96**: Specifies HMAC algorithm HMAC-MD5-96.
- **sha1**: Specifies HMAC algorithm HMAC-SHA1.
- **sha1-96**: Specifies HMAC algorithm HMAC-SHA1-96.

prefer-kex: Specifies the preferred key exchange algorithm. Supported algorithms are diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1, and diffie-hellman-group14-sha1, in ascending order of security strength and computation time.

- **dh-group-exchange-sha1**: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.
- **dh-group1-sha1**: Specifies key exchange algorithm diffie-hellman-group1-sha1.
- **dh-group14-sha1**: Specifies key exchange algorithm diffie-hellman-group14-sha1.

prefer-stoc-cipher: Specifies the preferred server-to-client encryption algorithm. Supported algorithms are the same as the client-to-server encryption algorithms (see the **prefer-ctos-cipher** keyword).

prefer-stoc-hmac: Specifies the preferred server-to-client HMAC algorithm. Supported algorithms are the same as the client-to-server HMAC algorithms (see the **prefer-ctos-hmac** keyword).

dscp *dscp-value*: Specifies the DSCP value in the IPv6 SSH packets. The value range for the *dscp-value* argument is 0 to 63, and the default value is 48. The DSCP value determines the transmission priority of the packet.

escape *character*: Specifies a case-sensitive escape character. By default, the escape character is a tilde (~).

public-key *keyname*: Specifies the server by its host public key that the client uses to authenticate the server. The *keyname* argument is a case-insensitive string of 1 to 64 characters.

source: Specifies a source IPv6 address or source interface for IPv6 SSH packets. By default, the device automatically selects a source address for IPv6 SSH packets in compliance with RFC 3484. As a best practice to ensure successful Stelnet connections, specify a loopback interface as the source interface or specify that interface's IPv6 address as the source IPv6 address.

- **interface** *interface-type interface-number*: Specifies a source interface by its type and number. The IPv6 address of this interface is the source IPv6 address of the IPv6 SSH packets.
- **ipv6** *ipv6-address*: Specifies a source IPv6 address.

Usage guidelines

The combination of an escape character and a dot (.) works as an escape sequence. This escape sequence is typically used to quickly terminate an SSH connection when the server reboots or malfunctions.

For the escape sequence to take effect, you must enter it at the very beginning of a line. If you have entered other characters or performed operations in a line, enter the escape sequence in the next line.

As a best practice, use the default escape character (~). Do not use any characters in SSH usernames as the escape character.

Examples

Establish a connection to Stelnet server **2000::1** and specify the public key of the server as **svkey**. The SSH client uses publickey authentication. Specify the dollar sign ($) as the escape character. Use the following algorithms:

- Preferred key exchange algorithm: **dh-group14-sha1**.
- Preferred server-to-client encryption algorithm: **aes128-cbc**.
- Preferred client-to-server HMAC algorithm: **sha1**.
- Preferred server-to-client HMAC algorithm: **sha1-96**.
- Preferred compression algorithm: **zlib**.

```
<Switch> ssh2 ipv6 2000::1 prefer-kex dh-group14-sha1 prefer-stoc-cipher aes128-cbc
prefer-ctos-hmac sha1 prefer-stoc-hmac sha1-96 prefer-compress zlib public-key svkey
escape $
```

9.3. SSH2 commands

9.3.1. display ssh2 algorithm

> 🕮 **MEMO :**
>
> **display ssh 2 algorithm** command is supported from later software, including Version 7.2.17.

Use **display ssh2 algorithm** to display algorithms used by SSH2 in the algorithm negotiation stage.

Syntax

display ssh2 algorithm

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display algorithms used by SSH2 in the algorithm negotiation stage.

```
<Switch> display ssh2 algorithm
 Key exchange algorithms: ecdh-sha2-nistp256 ecdh-sha2-nistp384 dh-group-exchange-sha1
dh-group14-sha1 dh-group1-sha1
 Public key algorithms: x509v3-ecdsa-sha2-nistp256 x509v3-ecdsa-sha2-nistp384
ecdsa-sha2-nistp256 ecdsa-sha2-nistp384 rsa dsa
 Encryption algorithms: aes128-ctr aes192-ctr aes256-ctr aes128-gcm aes256-gcm aes128-cbc
3des-cbc aes256-cbc des-cbc
 MAC algorithms: sha2-256 sha2-512 sha1 md5 sha1-96 md5-96
```

Table 9-4 Command output

Field	Description
Key exchange algorithms	Key exchange algorithms in descending order of priority for algorithm negotiation.
Public key algorithms	Public key algorithms in descending order of priority for algorithm negotiation.
Encryption algorithms	Encryption algorithms in descending order of priority for algorithm negotiation.
MAC algorithms	HMAC algorithms in descending order of priority for algorithm negotiation.

ssh2 algorithm public-key

9.3.2. ssh2 algorithm cipher

> 🕮 **MEMO :**
>
> **ssh2 algorithm cipher** command is supported from later software, including Version 7.2.17.

Use **ssh2 algorithm cipher** to specify encryption algorithms for SSH2.

Use **undo ssh2 algorithm cipher** to restore the default.

Syntax

ssh2 algorithm cipher { **3des-cbc** | **aes128-cbc** | **aes128-ctr** | **aes128-gcm** | **aes192-ctr** | **aes256-cbc** | **aes256-ctr** | **aes256-gcm** | **des-cbc** } *

undo ssh2 algorithm cipher

Default

SSH2 uses encryption algorithms AES128-CTR, AES192-CTR, AES256-CTR, AES128-GCM, AES256-GCM, AES128-CBC, 3DES-CBC, AES256-CBC, and DES-CBC in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

3des-cbc: Specifies encryption algorithm 3DES-CBC.

aes128-cbc: Specifies encryption algorithm AES128-CBC.

aes128-ctr: Specifies encryption algorithm AES128-CTR.

aes128-gcm: Specifies encryption algorithm AES128-GCM.

aes192-ctr: Specifies encryption algorithm AES192-CTR.

aes256-cbc: Specifies encryption algorithm AES256-CBC.

aes256-ctr: Specifies encryption algorithm AES256-CTR.

aes256-gcm: Specifies encryption algorithm AES256-GCM.

des-cbc: Specifies encryption algorithm DES-CBC.

Usage guidelines

If you specify the encryption algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **aes256-cbc** as the encryption algorithm for SSH2.

```
<Switch> system-view
[Switch] ssh2 algorithm cipher aes256-cbc
```

Related commands

ssh2 algorithm public-key

9.3.3. ssh2 algorithm key-exchange

> 🕮 **MEMO :**
>
> **ssh2 algorithm key-exchange** command is supported from later software, including Version 7.2.17.

Use **ssh2 algorithm key-exchange** to specify key exchange algorithms for SSH2.

Use **undo ssh2 algorithm key-exchange** to restore the default.

Syntax

ssh2 algorithm key-exchange { **dh-group-exchange-sha1** | **dh-group1-sha1** | **dh-group14-sha1** | **ecdh-sha2-nistp256** | **ecdh-sha2-nistp384** } *

undo ssh2 algorithm key-exchange

Default

SSH2 uses key exchange algorithms ecdh-sha2-nistp256, ecdh-sha2-nistp384, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, and diffie-hellman-group1-sha1 in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

dh-group-exchange-sha1: Specifies key exchange algorithm diffie-hellman-group-exchange-sha1.

dh-group1-sha1: Specifies key exchange algorithm diffie-hellman-group1-sha1.

dh-group14-sha1: Specifies key exchange algorithm diffie-hellman-group14-sha1.

ecdh-sha2-nistp256: Specifies key exchange algorithm ecdh-sha2-nistp256.

ecdh-sha2-nistp384: Specifies key exchange algorithm ecdh-sha2-nistp384.

Usage guidelines

If you specify the key exchange algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **dh-group1-sha1** as the key exchange algorithm for SSH2.

```
<Switch> system-view
[Switch] ssh2 algorithm key-exchange dh-group1-sha1
```

9.3.4. ssh2 algorithm mac

> 🕮 **MEMO :**
>
> **ssh2 algorithm mac** command is supported from later software, including Version 7.2.17.

Use **ssh2 algorithm mac** to specify HMAC algorithms for SSH2.

Use **undo ssh2 algorithm mac** to restore the default.

Syntax

ssh2 algorithm mac { **md5** | **md5-96** | **sha1** | **sha1-96** | **sha2-256** | **sha2-512** } *

undo ssh2 algorithm mac

Default

SSH2 uses HMAC algorithms SHA2-256, SHA2-512, SHA1, MD5, SHA1-96, and MD5-96 in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

md5: Specifies HMAC algorithm HMAC-MD5.

md5-96: Specifies HMAC algorithm HMAC-MD5-96.

sha1: Specifies HMAC algorithm HMAC-SHA1.

sha1-96: Specifies HMAC algorithm HMAC-SHA1-96.

sha2-256: Specifies HMAC algorithm HMAC-SHA2-256.

sha2-512: Specifies HMAC algorithm HMAC-SHA2-512.

Usage guidelines

If you specify the HMAC algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **md5** as the HMAC algorithm for SSH2.

```
<Switch> system-view
[Switch] ssh2 algorithm mac md5
```

ssh2 algorithm public-key

9.3.5. ssh2 algorithm public-key

> 🕮 **MEMO :**
>
> **ssh2 algorithm public-key** command is supported from later software, including Version 7.2.17.

Use **ssh2 algorithm public-key** to specify public key algorithms for SSH2.

Use **undo ssh2 algorithm public-key** to restore the default.

Syntax

ssh2 algorithm public-key { **dsa** | **ecdsa-sha2-nistp256** | **ecdsa-sha2-nistp384** | **rsa** | **x509v3-ecdsa-sha2-nistp256** | **x509v3-ecdsa-sha2-nistp384** } *

undo ssh2 algorithm public-key

Default

SSH2 uses public key algorithms x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, RSA, and DSA in descending order of priority for algorithm negotiation.

Views

System view

Predefined user roles

network-admin

Parameters

dsa: Specifies public key algorithm DSA.

ecdsa-sha2-nistp256: Specifies public key algorithm ecdsa-sha2-nistp256.

ecdsa-sha2-nistp384: Specifies public key algorithm ecdsa-sha2-nistp384.

rsa: Specifies public key algorithm RSA.

x509v3-ecdsa-sha2-nistp256: Specifies public key algorithm x509v3-ecdsa-sha2-nistp256.

x509v3-ecdsa-sha2-nistp384: Specifies public key algorithm x509v3-ecdsa-sha2-nistp384.

Usage guidelines

If you specify the public key algorithms, SSH2 uses only the specified algorithms for algorithm negotiation. The algorithm specified earlier has a higher priority during negotiation.

Examples

Specify algorithm **dsa** as the public key algorithm for SSH2.

```
<Switch> system-view
```

```
[Switch] ssh2 algorithm public-key dsa
```

10.1.1. display ssl server-policy

Use **display ssl server-policy** to display SSL server policy information.

Syntax

display ssl server-policy [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy-name: Specifies an SSL server policy by its name, a case-insensitive string of 1 to 31 characters. If you do not specify a policy name, this command displays information about all SSL server policies.

Examples

Display information about the SSL server policy **policy1**.

```
<Switch> display ssl server-policy policy1
 SSL server policy: policy1
     PKI domain: server-domain
     Ciphersuites:
         DHE_RSA_AES_128_CBC_SHA
         RSA_AES_128_CBC_SHA
     Session cache size: 600
     Caching timeout: 3600 seconds
     Client-verify: Enabled
```

Table 10-1 Command output

Field	Description
Caching timeout	Session cache timeout time in seconds.
Client-verify	SSL client authentication mode, including: • **Disabled**—SSL client authentication is disabled. • **Enabled**—SSL client authentication is mandatory. • **Optional**—SSL client authentication is optional.

10.1.2. pki-domain (SSL client policy view)

Use **pki-domain** to specify a PKI domain for an SSL client policy.

Use **undo pki-domain** to restore the default.

Syntax

pki-domain *domain-name*

undo pki-domain

Default

No PKI domain is specified for an SSL client policy.

Views

SSL client policy view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a PKI domain for an SSL client policy, the SSL client that uses the SSL client policy will obtain its digital certificate through the specified PKI domain.

Examples

Specify PKI domain **client-domain** for SSL client policy **policy1**.

```
<Switch> system-view
[Switch] ssl client-policy policy1
[Switch-ssl-client-policy-policy1] pki-domain client-domain
```

Related commands

pki domain

10.1.3. pki-domain (SSL server policy view)

Use **pki-domain** to specify a PKI domain for an SSL server policy.

Syntax

pki-domain *domain-name*

undo pki-domain

Default

No PKI domain is specified for an SSL server policy.

Views

SSL server policy view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a PKI domain for an SSL server policy, the SSL server that uses the SSL server policy will obtain its digital certificate through the specified PKI domain.

Examples

Specify PKI domain **server-domain** for SSL server policy **policy1**.

```
<Switch> system-view
[Switch] ssl server-policy policy1
[Switch-ssl-server-policy-policy1] pki-domain server-domain
```

Related commands

display ssl server-policy

pki domain

10.1.4. security-enhanced level

Use **security-enhanced level** to specify a security enhanced level for the device.

Use **undo security-enhanced level** to restore the default.

Syntax

security-enhanced level 1

undo security-enhanced level

Default

The security enhanced level is 1 for the device.

Views

System view

Predefined user roles

network-admin

Parameters

level-value: Specifies the security enhanced level. QX-S5600G series supports only level 1.

Usage guidelines

The security enhanced level for the device can be 1.

- SSL client policies and SSL server policies support cipher suites that contain DES, 3DES, MD5, RC4, and RC2.
- SSL client policies and SSL server policies support SSL protocol versions lower than TLS 1.1.
- SSL session renegotiation can be enabled.

Examples

Set the security enhanced level to 1 for the device.

```
<Sysname> system-view
[Sysname] security-enhanced level 1
```

MEMO:

security-enhanced level command is supported from later software, including Version 7.4.30. The security level specifications are the same as before Version 7.4.27.

10.1.5. ssl server-policy

Use **ssl server-policy** to create an SSL server policy and enter its view, or enter the view of an existing SSL server policy.

Use **undo ssl server-policy** to delete an SSL server policy.

Syntax

ssl server-policy *policy-name*

undo ssl server-policy *policy-name*

Default

No SSL server policies exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a name for the SSL server policy, a case-insensitive string of 1 to 31 characters.

Usage guidelines

This command creates an SSL server policy for which you can configure SSL parameters such as a PKI domain and supported cipher suits. An SSL server policy takes effect only after it is associated with an application such as HTTPS.

Examples

Create an SSL server policy named **policy1** and enter its view.

```
<Switch> system-view
[Switch] ssl server-policy policy1
[Switch-ssl-server-policy-policy1]
```

Related commands

display ssl server-policy

10.1.6. ssl version disable

Use **ssl version disable** to disable the SSL server from using specific SSL protocol versions for session negotiation.

Use **undo ssl version disable** restore the default.

Syntax

ssl version ssl3.0 disable

undo ssl version ssl3.0 disable

Default

The SSL server supports SSL 3.0, TLS 1.0, TLS 1.1, and TLS 1.2.

Views

System view

Predefined user roles

network-admin

Parameters

ssl3.0: Specifies SSL 3.0.

Usage guidelines

To enhance system security, you can disable the SSL server from using specific SSL protocol versions (SSL 3.0, TLS 1.0, and TLS 1.1) for session negotiation.

Examples

Disable SSL 3.0 for the SSL server.

```
<Switch> system-view
[Switch] ssl version ssl3.0 disable
```

11. Attack detection and prevention commands

11.1. Attack detection and prevention commands

11.1.1. attack-defense tcp fragment enable

Use **attack-defense tcp fragment enable** to enable TCP fragment attack prevention.

Use **undo attack-defense tcp fragment enable** to disable TCP fragment attack prevention.

Syntax

attack-defense tcp fragment enable

undo attack-defense tcp fragment enable

Default

TCP fragment attack prevention is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to drop attack TCP fragments to prevent TCP fragment attacks that the packet filter cannot detect. As defined in RFC 1858, attack TCP fragments refer to the following TCP fragments:

- First fragments in which the TCP header is smaller than 20 bytes.
- Non-first fragments with a fragment offset of 8 bytes (FO=1).

The device supports verifying only TCP fragments forwarded through the CPU.

Examples

Enable TCP fragment attack prevention.

```
<Switch> System-view
[Switch] attack-defense tcp fragment enable
```

12. IP source guard commands

12.1. IP source guard commands

12.1.1. display ip source binding

Use **display ip source binding** to display IPv4SG bindings.

Syntax

display ip source binding [**static** | [**vpn-instance** *vpn-instance-name*] [**arp-suppression** | **dhcp-relay** | **dhcp-server** | **dhcp-snooping**]] [**ip-address** *ip-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

static: Displays static IPv4SG bindings.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To display dynamic IPv4SG bindings for the public network, do not specify a VPN instance.

arp-suppression: Specifies the ARP flood suppression module.

dhcp-relay: Specifies the DHCP relay agent module.

dhcp-server: Specifies the DHCP server module.

dhcp-snooping: Specifies the DHCP snooping module.

ip-address *ip-address*: Specifies an IPv4 address.

mac-address *mac-address*: Specifies a MAC address in H-H-H format.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

interface *interface-type interface-number*: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv4SG bindings for the master device.

Examples

Display all IPSG bindings on the public network.

```
<Switch> display ip source binding
Total entries found: 5
IP Address      MAC Address    Interface               VLAN Type
10.1.0.5        040a-0000-4000 GE1/0/1                 1    DHCP snooping
10.1.0.6        040a-0000-3000 GE1/0/1                 1    DHCP snooping
```

```
10.1.0.7        040a-0000-2000 GE1/0/1                1    DHCP snooping
10.1.0.8        040a-0000-1000 GE1/0/2                N/A  DHCP relay
10.1.0.9        040a-0000-2000 GE1/0/2                N/A  Static
```

Table 12-1 Command output

Field	Description
Total entries found	Total number of IPv4SG bindings.
IP Address	IPv4 address in the IPv4SG binding. If no IP address is bound in the binding, this field displays **N/A**.
MAC Address	MAC address in the IPv4SG binding. If no MAC address is bound in the binding, this field displays **N/A**.
Interface	Interface of the binding. This field displays **N/A** for a global IPv4SG binding.
VLAN	VLAN information in the IPv4SG binding. If the binding contains no VLAN information, this field displays **N/A**.
Type	IPSG binding type: • **Static**—Manually configured by using the **ip source binding** command. Static bindings are for packet filtering in IPSG or used by other modules to provide security services. • **ARP snooping**—Dynamically generated based on ARP snooping. The binding is for packet filtering in IPSG. • **ARP suppression**—Dynamically generated based on ARP flood suppression. The binding is for packet filtering in IPSG. • **802.1X**—Dynamically generated based on 802.1X. The binding is for packet filtering in IPSG. • **DHCP relay**—Dynamically generated based on DHCP relay agent. The binding is for packet filtering in IPSG. • **DHCP server**—Dynamically generated based on DHCP server. The binding is used by other modules to provide security services. • **DHCP snooping**—Dynamically generated based on DHCP snooping. The binding is for packet filtering in IPSG.

Related commands

ip source binding

ip verify source

12.1.2. display ipv6 source binding

Use **display ipv6 source binding** to display IPv6SG address bindings.

Syntax

display ipv6 source binding [**static** | [**vpn-instance** *vpn-instance-name*] [**dhcpv6-snooping**]] [**ip-address** *ipv6-address*] [**mac-address** *mac-address*] [**vlan** *vlan-id*] [**interface** *interface-type interface-number*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

static: Displays static IPv6SG address bindings.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To display dynamic IPv6SG address bindings for the public network, do not specify a VPN instance.

dhcpv6-snooping: Specifies the DHCPv6 snooping module.

ip-address *ipv6-address*: Specifies an IPv6 address.

mac-address *mac-address*: Specifies a MAC address in H-H-H format.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

interface *interface-type interface-number*: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6SG address bindings for the master device.

Examples

Display all IPv6SG address bindings on the public network.

```
<Switch> display ipv6 source binding
Total entries found: 2
IPv6 Address          MAC Address    Interface              VLAN Type
2012:1222:2012:1222:  000f-2202-0435 GE1/0/1                 1    DHCPv6 snooping
2012:1222:2012:1222
2012:1222:2012:1222:  000f-2202-0436 GE1/0/1                 N/A  Static
2012:1222:2012:1223
```

Table 12-2 Command output

Field	Description
Total entries found	Total number of IPv6SG address bindings.
IPv6 Address	IPv6 address in the IPv6SG address binding. If no IPv6 address is bound in the binding, this field displays **N/A**.
MAC Address	MAC address in the IPv6SG address binding. If no MAC address is bound in the binding, this field displays **N/A**.
Interface	Interface of the IPv6SG address binding. This field displays **N/A** for a global IPv6SG binding.
VLAN	VLAN information in the IPv6SG address binding. If the binding contains no VLAN information, this field displays **N/A**.
Type	Type of the IPv6SG address binding: • **Static**—Manually configured by using the **ipv6 source binding** command. Static bindings are for packet filtering in IPv6SG or used by other modules to provide security services.

Field	Description
	• **DHCPv6 relay**—Dynamically generated based on DHCPv6 relay agent. The binding is for packet filtering in IPv6SG. • **DHCPv6 snooping**—Dynamically generated based on DHCPv6 snooping. The binding is for packet filtering in IPv6SG. • **802.1X**—Dynamically generated based on 802.1X. The binding is for packet filtering in IPv6SG. • **ND suppression**—Dynamically generated based on ND suppression. The binding is for packet filtering in IPv6SG.

Related commands

ipv6 source binding

ipv6 verify source

12.1.3. ip source binding (interface view)

Use **ip source binding** to configure a static IPv4SG binding on an interface.

Use **undo ip source binding** to delete the static IPv4SG bindings configured on an interface.

Syntax

ip source binding { **ip-address** *ip-address* | **ip-address** *ip-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

undo ip source binding { **all** | **ip-address** *ip-address* | **ip-address** *ip-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

Default

No static IPv4SG bindings exist on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

all: Removes all static IPv4SG bindings on the interface.

ip-address *ip-address*: Specifies an IPv4 address for the static binding. The IPv4 address must be a class A, B, or C address, and cannot be 127.x.x.x or 0.0.0.0.

mac-address *mac-address*: Specifies a MAC address for the static binding. The MAC address must be in H-H-H format, and cannot be all 0s, all Fs (a broadcast MAC address), or a multicast MAC address.

vlan *vlan-id*: Specifies a VLAN ID for the static binding. The value range is 1 to 4094. This option is supported only in Layer 2 Ethernet interface view.

Usage guidelines

Static IPv4SG bindings on an interface implement the following functions:

- Filter incoming IPv4 packets on the interface.
- Check user validity by cooperating with the ARP attack detection feature.

Examples

Configure a static IPv4SG binding on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ip source binding ip-address 192.168.0.1 mac-address
0001-0001-0001
```

Related commands

display ip source binding

12.1.4. ip verify source

Use **ip verify source** to enable IPv4SG on an interface.

Use **undo ip verify source** to disable IPv4SG on an interface.

Syntax

ip verify source { **ip-address** | **ip-address mac-address** | **mac-address** }

undo ip verify source

Default

The IPv4SG feature is disabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

VLAN interface view

VLAN view

MEMO:

VLAN View became practicable after v7.2.16.

Predefined user roles

network-admin

Parameters

ip-address: Filters incoming packets by source IPv4 addresses.

ip-address mac-address: Filters incoming packets by source IPv4 addresses and source MAC addresses.

mac-address: Filters incoming packets by source MAC addresses.

Usage guidelines

After you enable IPv4SG on an interface, this feature uses static and dynamic IPv4SG bindings to match incoming packets on the interface. Packets that match an IPv4SG binding are forwarded and packets that do not match any IPv4SG binding are discarded.

The matching criterion specified by this command applies only to dynamic IPSG. Static IPv4SG uses static bindings configured by using the **ip source binding** command.

Examples

Enable IPv4SG on Layer 2 Ethernet interface GigabitEthernet 1/0/1 and verify the source IPv4 address and MAC address for dynamic IPSG.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ip verify source ip-address mac-address
```

Enable IPv4SG on VLAN-interface 100 and verify the source IPv4 address and MAC address for dynamic IPSG.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ip verify source ip-address mac-address
```

Enable IPv4SG on Layer 3 Ethernet interface GigabitEthernet 1/0/2 and verify the source IPv4 address and MAC address for dynamic IPSG.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] ip verify source ip-address mac-address
```

Enable IPv4SG on Layer 3 Ethernet interface GigabitEthernet 1/0/2 and verify the source MAC address for dynamic IPSG.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] ip verify source mac-address
```

Related commands

display ip source binding

12.1.5. ipv6 source binding (interface view)

Use **ipv6 source binding** to configure a static IPv6SG binding.

Use **undo ipv6 source binding** to delete the static IPv6SG bindings configured on an interface.

Syntax

ipv6 source binding { **ip-address** *ipv6-address* | **ip-address** *ipv6-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

undo ipv6 source binding { **all** | **ip-address** *ipv6-address* | **ip-address** *ipv6-address* **mac-address** *mac-address* | **mac-address** *mac-address* } [**vlan** *vlan-id*]

Default

No static IPv6SG bindings exist on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

all: Removes all the static IPv6SG bindings on the interface.

ip-address *ipv6-address*: Specifies an IPv6 address for the static binding. The IPv6 address cannot be an all-zero address, a multicast address, or a loopback address.

mac-address *mac-address*: Specifies a MAC address for the static binding. The MAC address must be in H-H-H format, and cannot be all 0s, all Fs (a broadcast MAC address), or a multicast MAC address.

vlan *vlan-id*: Specifies a VLAN ID for the static binding. The value range is 1 to 4094. This option is supported only in Layer 2 Ethernet interface view.

Usage guidelines

Static IPv6SG bindings on an interface filter incoming IPv6 packets.

Examples

Configure a static IPv6SG binding on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ipv6 source binding ip-address 2001::1 mac-address
0002-0002-0002
```

Related commands

display ipv6 source binding

12.1.6. ipv6 verify source

Use **ipv6 verify source** to enable IPv6SG on an interface.

Use **undo ipv6 verify source** to disable IPv6SG on an interface.

Syntax

ipv6 verify source { **ip-address** | **ip-address mac-address** | **mac-address** }

undo ipv6 verify source

Default

The IPv6SG feature is disabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

VLAN interface view

VLAN view

MEMO:

VLAN View became practicable after v7.2.16.

Predefined user roles

network-admin

Parameters

ip-address: Filters incoming packets by source IPv6 addresses.

ip-address mac-address: Filters incoming packets by source IPv6 addresses and source MAC addresses.

mac-address: Filters incoming packets by source MAC addresses.

Usage guidelines

After you enable IPv6SG on an interface, this feature uses static and dynamic IPv6SG bindings to match incoming packets on the interface. Packets that match an IPv6SG binding are forwarded and packets that do not match any IPv6SG binding are discarded.

The matching criterion specified by this command applies only to dynamic IPv6SG. Static IPv6SG uses static bindings configured by using the **ipv6 source binding** command.

Examples

Enable IPv6SG on Layer 2 Ethernet interface GigabitEthernet 1/0/1 and verify the source IPv6 address and MAC address for dynamic IPv6SG.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] ipv6 verify source ip-address mac-address
```

arp resolving-route probe-count

arp resolving-route probe-interval

13.1.2. arp resolving-route probe-count

Use **arp resolving-route probe-count** to set the number of ARP blackhole route probes for each unresolved IP address.

Use **undo arp resolving-route probe-count** to restore the default.

Syntax

arp resolving-route probe-count *count*

undo arp resolving-route probe-count

Default

The device performs three ARP blackhole route probes for each unresolved IP address.

Views

System view

Predefined user roles

network-admin

Parameters

count: Sets the number of probes, in the range of 1 to 25.

Examples

Configure the device to perform five ARP blackhole route probes for each unresolved IP address.

```
<Switch> system-view
[Switch] arp resolving-route probe-count 5
```

Related commands

arp resolving-route enable

arp resolving-route probe-interval

13.1.3. arp resolving-route probe-interval

Use **arp resolving-route probe-interval** to set the interval at which the device probes ARP blackhole routes.

Use **undo arp resolving-route probe-interval** to restore the default.

Syntax

arp resolving-route probe-interval *interval*

undo arp resolving-route probe-interval

Default

The device probes ARP blackhole routes every 1 second.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the probe interval in the range of 1 to 5 seconds.

Examples

Configure the device to probe ARP blackhole routes every 3 seconds.

```
<Switch> system-view
[Switch] arp resolving-route probe-interval 3
```

Related commands

arp resolving-route enable

13.1.4. arp source-suppression enable

Use **arp source-suppression enable** to enable the ARP source suppression feature.

Use **undo arp source-suppression enable** to disable the ARP source suppression feature.

Syntax

arp source-suppression enable

undo arp source-suppression enable

Default

The ARP source suppression feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Configure this feature on the gateways.

Examples

Enable the ARP source suppression feature.

```
<Switch> system-view
[Switch] arp source-suppression enable
```

Related commands

display arp source-suppression

13.1.5. arp source-suppression limit

Use **arp source-suppression limit** to set the maximum number of unresolvable packets that can be processed per source IP address within 5 seconds.

Use **undo arp source-suppression limit** to restore the default.

Syntax

arp source-suppression limit *limit-value*

undo arp source-suppression limit

Default

The device can process a maximum of 10 unresolvable packets per source IP address within 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

limit-value: Specifies the limit in the range of 2 to 1024.

Usage guidelines

If unresolvable packets received from an IP address within 5 seconds exceed the limit, the device stops processing the packets from that IP address until the 5 seconds elapse.

Examples

Configure the device to process a maximum of 100 unresolvable packets per source IP address within 5 seconds.

```
<Switch> system-view
[Switch] arp source-suppression limit 100
```

Related commands

display arp source-suppression

13.1.6. display arp source-suppression

Use **display arp source-suppression** to display information about the current ARP source suppression configuration.

Syntax

display arp source-suppression

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about the current ARP source suppression configuration.

```
<Switch> display arp source-suppression
 ARP source suppression is enabled
 Current suppression limit: 100
```

Table 13-1 Command output

Field	Description
Current suppression limit	Maximum number of unresolvable packets that can be processed per source IP address within 5 seconds.

13.2. ARP packet rate limit commands

13.2.1. arp rate-limit

Use **arp rate-limit** to enable the ARP packet rate limit feature on an interface.

Use **undo arp rate-limit** to disable the ARP packet rate limit feature on an interface.

Syntax

arp rate-limit [*pps*]

undo arp rate-limit

Default

The ARP packet rate limit feature is enabled on an interface.

Before v7.1.6 100pps

After v7.2.16 600pps

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

Before v7.1.6

pps: Specifies the upper limit for ARP packet rate in pps. The value range for this argument is 5 to 200.

After v7.2.16

pps: Specifies the upper limit for ARP packet rate in pps. The value range for this argument is 5 to 600.

Usage guidelines

If you do not specify a value for the *pps* argument in the **arp rate-limit** command, the default rate limit value applies. Packets that exceed the rate limit are discarded.

Examples

Enable the ARP packet rate limit feature on GigabitEthernet 1/0/1, and set the maximum ARP packet rate to 50 pps.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] arp rate-limit 50
```

NOTE:

QX-S5600G series can be certified up to 100PPS.

13.2.2. arp rate-limit log enable

Use **arp rate-limit log enable** to enable logging for ARP packet rate limit.

Use **undo arp rate-limit log enable** to disable logging for ARP packet rate limit.

Syntax

arp rate-limit log enable

undo arp rate-limit log enable

Default

Logging for ARP packet rate limit is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When logging for ARP packet rate limit is enabled, the device sends the highest threshold-crossed ARP packet rate within the sending interval in a log message to the information center. You can configure the information center module to set the log output rules. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable logging for ARP packet rate limit.

```
<Switch> system-view
[Switch] arp rate-limit log enable
```

13.2.3. arp rate-limit log interval

Use **arp rate-limit log interval** to set the notification and log message sending interval for ARP packet rate limit.

Use **undo arp rate-limit log interval** to restore the default.

Syntax

arp rate-limit log interval *interval*

undo arp rate-limit log interval

Default

The device sends notifications or log messages every 60 seconds when the rate of ARP packets received on an interface exceeds the limit.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies an interval in the range of 1 to 86400 seconds.

Usage guidelines

To change the default interval and activate it, you must enable ARP packet rate limit and enable sending notifications or log messages for ARP packet rate limit.

Examples

Set the device to send notifications and log messages every 120 seconds when the rate of ARP packets received on an interface exceeds the limit.

```
<Switch> system-view
[Switch] arp rate-limit log interval 120
```

Related commands

arp rate-limit

arp rate-limit log enable

snmp-agent trap enable arp

13.2.4. snmp-agent trap enable arp

Use **snmp-agent trap enable arp** to enable SNMP notifications for ARP.

Use **undo snmp-agent trap enable arp** to disable SNMP notifications for ARP.

Syntax

snmp-agent trap enable arp [**rate-limit**]

undo snmp-agent trap enable arp [**rate-limit**]

Default

SNMP notifications for ARP is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

rate-limit: Specifies the ARP packet rate limit feature.

Usage guidelines

After you enable SNMP notifications for ARP, the device generates a notification that includes the highest threshold-crossed ARP packet rate within the sending interval.

For ARP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Enable SNMP notifications for ARP packet rate limit.

```
<Switch> system-view
[Switch] snmp-agent trap enable arp rate-limit
```

13.3. Source MAC-based ARP attack detection commands

13.3.1. arp source-mac

Use **arp source-mac** to enable the source MAC-based ARP attack detection feature and specify a handling method.

Use **undo arp source-mac** to disable the source MAC-based ARP attack detection feature.

Syntax

arp source-mac { **filter** | **monitor** }

undo arp source-mac [**filter** | **monitor**]

Default

The source MAC-based ARP attack detection feature is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

filter: Specifies the filter handling method.

monitor: Specifies the monitor handling method.

Usage guidelines

Configure this feature on the gateways.

This feature checks the number of ARP packets delivered to the CPU. If the number of packets from the same MAC address within 5 seconds exceeds a threshold, the device generates an ARP attack entry for the MAC address. Before the entry ages out, the device handles the attack by using either of the following methods:

- **Monitor**—Only generates log messages.
- **Filter**—Generates log messages and filters out subsequent ARP packets from the MAC address.

Make sure you have enabled the ARP logging feature before enabling the source MAC-based ARP attack detection feature. For information about the ARP logging feature, see *Layer 3—IP Services Configuration Guide*.

If you do not specify any handling method in the **undo arp source-mac** command, the command disables this feature.

Examples

Enable the source MAC-based ARP attack detection feature and specify the filter handling method.

```
<Switch> system-view
[Switch] arp source-mac filter
```

13.3.2. arp source-mac aging-time

Use **arp source-mac aging-time** to set the aging time for ARP attack entries.

Use **undo arp source-mac aging-time** to restore the default.

Syntax

arp source-mac aging-time *time*

undo arp source-mac aging-time

Default

The aging time for ARP attack entries is 300 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time: Sets the aging time for ARP attack entries, in the range of 60 to 6000 seconds.

Examples

Set the aging time for ARP attack entries to 60 seconds.

```
<Switch> system-view
[Switch] arp source-mac aging-time 60
```

13.3.3. arp source-mac exclude-mac

Use **arp source-mac exclude-mac** to exclude specific MAC addresses from source MAC-based ARP attack detection.

Use **undo arp source-mac exclude-mac** to remove the excluded MAC addresses from source MAC-based ARP attack detection.

Syntax

arp source-mac exclude-mac *mac-address*&<1-10>

undo arp source-mac exclude-mac [*mac-address*&<1-10>]

Default

No MAC addresses are excluded from source MAC-based ARP attack detection.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address&<1-10>: Specifies a MAC address list. The *mac-address* argument indicates an excluded MAC address in the format of H-H-H. &<1-10> indicates that you can configure a maximum of 10 excluded MAC addresses.

Usage guidelines

If you do not specify a MAC address, the **undo arp source-mac exclude-mac** command removes all excluded MAC addresses.

Examples

Exclude a MAC address from source MAC-based ARP attack detection.

```
<Switch> system-view
[Switch] arp source-mac exclude-mac 001e-1200-0213
```

13.3.4. arp source-mac threshold

Use **arp source-mac threshold** to set the threshold for source MAC-based ARP attack detection. If the number of ARP packets sent from a MAC address within 5 seconds exceeds this threshold, the device recognizes this as an attack.

Use **undo arp source-mac threshold** to restore the default.

Syntax

arp source-mac threshold *threshold-value*

undo arp source-mac threshold

Default

The threshold for source MAC-based ARP attack detection is 30.

Views

System view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the threshold for source MAC-based ARP attack detection. The value range for this argument is 1 to 5000.

Examples

Set the threshold for source MAC-based ARP attack detection to 30.

```
<Switch> system-view
[Switch] arp source-mac threshold 30
```

13.3.5. display arp source-mac

Use **display arp source-mac** to display ARP attack entries detected by source MAC-based ARP attack detection.

Syntax

display arp source-mac { **interface** *interface-type interface-number* | **slot** *slot-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify a member device, this command displays ARP attack entries for the master device.

Examples

Display the ARP attack entries detected by source MAC-based ARP attack detection on GigabitEthernet 1/0/1.

```
<Switch> display arp source-mac interface gigabitethernet 1/0/1
Source-MAC          VLAN ID  Interface               Aging-time
23f3-1122-3344      4094     GE1/0/1                 10
```

Table 13-2 Command output

Field	Description
Source-MAC	Source MAC address of the attack.

Field	Description
VLAN ID	ID of the VLAN in which the attack was detected.
Interface	Interface on which the attack was detected.
Aging-time	Aging time for the ARP attack entry, in minutes.

13.4. ARP packet source MAC consistency check commands

13.4.1. arp valid-check enable

Use **arp valid-check enable** to enable ARP packet source MAC address consistency check.

Use **undo arp valid-check enable** to disable ARP packet source MAC address consistency check.

Syntax

arp valid-check enable

undo arp valid-check enable

Default

ARP packet source MAC address consistency check is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Configure this feature on gateways. The gateways can filter out ARP packets whose source MAC address in the Ethernet header is different from the sender MAC address in the message body.

Examples

Enable ARP packet source MAC address consistency check.

```
<Switch> system-view
[Switch] arp valid-check enable
```

13.5. ARP active acknowledgement commands

13.5.1. arp active-ack enable

Use **arp active-ack enable** to enable the ARP active acknowledgement feature.

Use **undo arp active-ack enable** to disable the ARP active acknowledgement feature.

Syntax

arp active-ack enable

undo arp active-ack enable

Default

The ARP active acknowledgement feature is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Configure this feature on gateways to prevent user spoofing.

Examples

Enable the ARP active acknowledgement feature.

```
<Switch> system-view
[Switch] arp active-ack enable
```

13.6. ARP attack detection commands

13.6.1. arp detection enable

Use **arp detection enable** to enable ARP attack detection.

Use **undo arp detection enable** to disable ARP attack detection.

Syntax

arp detection enable

undo arp detection enable

Default

ARP attack detection is disabled.

Views

VLAN view

VSI view

Predefined user roles

network-admin

Examples

Enable ARP attack detection for VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] arp detection enable
```

Enable ARP attack detection for VSI **vsi1**.

```
<Switch> system-view
[Switch] vsi vsi1
[Switch-vsi-vsi1] arp detection enable
```

Related commands

display arp detection statistics attack-source

reset arp detection statistics attack-source

13.6.2. arp detection trust

Use **arp detection trust** to configure an interface as an ARP trusted interface or configure an AC as an ARP trusted AC.

Use **undo arp detection trust** to restore the default.

Syntax

arp detection trust

undo arp detection trust

Default

An interface is an ARP untrusted interface. An AC is an ARP untrusted AC.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Ethernet service instance view

Predefined user roles

network-admin

Examples

Configure GigabitEthernet 1/0/1 as an ARP trusted interface.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] arp detection trust
```

Configure Ethernet service instance 1 on Layer 2 Ethernet interface GigabitEthernet 1/0/1 as an ARP trusted AC.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] service-instance 1
[Switch-GigabitEthernet1/0/1-srv1] arp detection trust
```

13.6.3. arp detection validate

Use **arp detection validate** to enable ARP packet validity check.

Use **undo arp detection validate** to disable ARP packet validity check.

Syntax

arp detection validate { **dst-mac** | **ip** | **src-mac** } *

undo arp detection validate [**dst-mac** | **ip** | **src-mac**] *

Default

ARP packet validity check is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

dst-mac: Checks the target MAC address of ARP responses. If the target MAC address is all-zero, all-one, or inconsistent with the destination MAC address in the Ethernet header, the packet is considered invalid and discarded.

ip: Checks the sender and target IP addresses of ARP replies, and the sender IP address of ARP requests. All-one or multicast IP addresses are considered invalid and the corresponding packets are discarded.

src-mac: Checks whether the sender MAC address in the message body is identical to the source MAC address in the Ethernet header. If they are identical, the packet is forwarded. Otherwise, the packet is discarded.

Usage guidelines

You can specify more than one object to be checked in one command line.

If no keyword is specified, the **undo arp detection validate** command disables ARP packet validity check for all objects.

Examples

Enable ARP packet validity check by checking the MAC addresses and IP addresses of ARP packets.

```
<Switch> system-view
[Switch] arp detection validate dst-mac ip src-mac
```

13.6.4. arp restricted-forwarding enable

Use **arp restricted-forwarding enable** to enable ARP restricted forwarding.

Use **undo arp restricted-forwarding enable** to disable ARP restricted forwarding.

Syntax

arp restricted-forwarding enable

undo arp restricted-forwarding enable

Default

ARP restricted forwarding is disabled.

Views

VLAN view

Predefined user roles

network-admin

Examples

Enable ARP restricted forwarding in VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] arp restricted-forwarding enable
```

13.6.5. display arp detection

Use **display arp detection** to display the VLANs and VSIs that are enabled with ARP attack detection.

Syntax

display arp detection

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the VLANs and VSIs that are enabled with ARP attack detection.

```
<Switch> display arp detection
ARP detection is enabled in the following VLANs:
1-2, 4-5
 ARP detection is enabled in the following VSIs:
 vpna
 vsi-0000-0000-0031
 vpnb
 vpnc-vsi-0000-0000-00aa
```

Related commands

arp detection enable

13.6.6. display arp detection statistics attack-source

Use **display arp detection statistics attack-source** to display statistics for ARP attack sources.

Syntax

display arp detection statistics attack-source slot *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify a member device, this command displays ARP attack source statistics for the master device.

Examples

Display statistics for ARP attack sources.

```
<Switch> display arp detection attack statistics attack-source
Interface              VLAN  MAC address    IP address      Number     Time
```

```
GE1/0/1                 1      0005-0001-0001 10.1.1.14       24          17:09:56
03-27-2017
```

Table 13-3 Command output

Field	Description
Interface	Receiving interface of ARP attack packets.
VLAN	VLAN to which ARP attack packets belong.
MAC address	Sender MAC address in ARP attack packets.
IP address	Sender IP address in ARP attack packets.
Number	Number of ARP attack packets dropped by ARP attack detection.
Time	The most recent time when ARP attack detection dropped an ARP attack packet.

Related commands

arp detection enable

13.6.7. display arp detection statistics packet-drop

Use **display arp detection statistics packet-drop** to display statistics for packets dropped by ARP attack detection.

Syntax

display arp detection statistics packet-drop [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays dropped packet statistics for all interfaces and all Ethernet service instances on the interfaces.

Usage guidelines

This command displays numbers of packets discarded by user validity check and ARP packet validity check on interfaces or Ethernet service instances on the interfaces.

Examples

Display statistics for packets dropped by ARP attack detection.

```
<Switch> display arp detection statistics packet-drop
State: U-Untrusted  T-Trusted
ARP packets dropped by ARP inspect checking:
Interface(State)            IP        Src-MAC   Dst-MAC   Inspect
GE1/0/1(U)                  40        0         0         78
GE1/0/2(U)                  0         0         0         0
```

```
GE1/0/3(T)                0          0          0          0
GE1/0/4(U)                0          0          30         0
GE1/0/5-srv1(U)           0          10         20         0
GE1/0/5-srv2(T)           10         0          20         22
```

Table 13-4 Command output

Field	Description
State	State of an interface: • **U**—ARP untrusted interface or AC. • **T**—ARP trusted interface or AC.
Interface(State)	Inbound interface or AC of ARP packets. State specifies the port state, **trusted** or **untrusted**.
IP	Number of ARP packets discarded due to invalid sender and target IP addresses.
Src-MAC	Number of ARP packets discarded due to invalid source MAC address.
Dst-MAC	Number of ARP packets discarded due to invalid destination MAC address.
Inspect	Number of ARP packets that failed to pass user validity check.

Related commands

reset arp detection statistics packet-drop

13.6.8. reset arp detection statistics attack-source

Use **reset arp detection statistics attack-source** to clear statistics for ARP attack sources.

Syntax

reset arp detection statistics attack-source [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify a member device, this command clears ARP attack source statistics for the master device.

Examples

Clear statistics for ARP attack sources.

```
<Switch> reset arp detection attack statistics attack-source
```

Related commands

arp detection enable

display arp detection statistics attack-source

13.6.9. reset arp detection statistics packet-drop

Use **reset arp detection statistics packet-drop** to clear statistics for packets dropped by ARP attack detection.

Syntax

reset arp detection statistics packet-drop [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears dropped packet statistics for all interfaces and all Ethernet service instances on the interfaces.

Examples

Clear statistics for packets dropped by ARP attack detection.

```
<Switch> reset arp detection statistics packet-drop
```

Related commands

display arp detection statistics packet-drop

13.7. ARP scanning commands

13.7.1. arp scan

Use **arp scan** to trigger an ARP scanning in an address range.

Syntax

arp scan [*start-ip-address* **to** *end-ip-address*] [**send-rate** { **ppm** *ppm* | *pps* }]

Views

Layer 3 Ethernet interface view

Layer 3 aggregate interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address of the scanning range.

end-ip-address: Specifies the end IP address of the scanning range. The end IP address must be higher than or equal to the start IP address.

send-rate: Specifies the rate at which the device sends ARP requests for ARP scanning.

ppm *ppm*: Specifies the ARP packet sending rate, in packets per minute (ppm). The value range for the *ppm* argument is 10 to 600, and the value must be a multiple of 10.

ppm *pps*: Specifies the ARP packet sending rate, in packets per second (pps). The value range for the *pps* argument is 10 to 1000, and the value must be a multiple of 10.

Usage guidelines

ARP scanning automatically creates ARP entries for devices in the specified address range. IP addresses already in existing ARP entries are not scanned.

If the interface's primary and secondary IP addresses are in the address range, the sender IP address in the ARP request is the address on the smallest network segment.

If no address range is specified, the device learns ARP entries for devices on the subnet where the primary IP address of the interface resides. The sender IP address in the ARP requests is the primary IP address of the interface.

The start and end IP addresses must be on the same subnet as the primary IP address or secondary IP addresses of the interface.

ARP scanning will take some time. To stop an ongoing scan, press **Ctrl** + **C**. Dynamic ARP entries are created based on ARP replies received before the scan is terminated.

You can set the ARP packet sending rate if the scanning range has a large number of IP addresses. This setting can avoid high CPU usage and heavy network load caused by a burst of ARP traffic.

When you set the sending rate to a large value, the device might use a rate lower than the specified rate to ensure the device performance.

If you do not set the ARP packet sending rate, the device sends ARP requests to all IP addresses in the specified scanning range simultaneously.

Examples

Configure the device to scan the neighbors on the network where the primary IP address of VLAN-interface 2 resides.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] arp scan
```

Configure the device to scan neighbors in an address range.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] arp scan 1.1.1.1 to 1.1.1.20
```

Configure the device to scan neighbors in an address range on VLAN-interface 2 and set the ARP packet sending rate to 10 pps.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] arp scan 1.1.1.1 to 1.1.1.20 send-rate 10
```

MEMO:

arp scan command is supported from later software, including Version 7.2.23.

13.8. ARP gateway protection commands

13.8.1. arp filter source

Use **arp filter source** to enable ARP gateway protection for a gateway.

Use **undo arp filter source** to disable ARP gateway protection for a gateway.

Syntax

arp filter source *ip-address*

undo arp filter source *ip-address*

Default

ARP gateway protection is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a protected gateway.

Usage guidelines

You can enable ARP gateway protection for a maximum of eight gateways on an interface.

You cannot configure both the **arp filter source** and **arp filter binding** commands on the same interface.

Examples

Enable ARP gateway protection for the gateway with IP address 1.1.1.1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] arp filter source 1.1.1.1
```

13.9. ARP filtering commands

13.9.1. arp filter binding

Use **arp filter binding** to enable ARP filtering and configure an ARP permitted entry.

Use **undo arp filter binding** to remove an ARP permitted entry.

Syntax

arp filter binding *ip-address mac-address*

undo arp filter binding *ip-address*

Default

ARP filtering is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a permitted sender IP address.

mac-address: Specifies a permitted sender MAC address.

Usage guidelines

If the sender IP and MAC addresses of an ARP packet match an ARP permitted entry, the ARP packet is permitted. If the sender IP and MAC addresses of an ARP packet do not match an ARP permitted entry, the ARP packet is discarded.

You can configure a maximum of eight ARP permitted entries on an interface.

You cannot configure both the **arp filter source** and **arp filter binding** commands on the same interface.

Examples

Enable ARP filtering and configure an ARP permitted entry.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] arp filter binding 1.1.1.1 0e10-0213-1023
```

14. IPv4 uRPF commands

14.1. IPv4 uRPF commands

14.1.1. display ip urpf

Use **display ip urpf** to display uRPF configuration.

Syntax

display ip urpf [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays uRPF configuration for all member devices.

Examples

Display uRPF configuration for the specified slot.

```
<Switch> display ip urpf slot 1
Global uRPF configuration information(failed):
   Check type: strict
   Allow default route
```

Table 14-1 Command output

Field	Description
(failed)	The system failed to deliver the uRPF configuration to the forwarding chip because of insufficient chip resources. This field is not displayed if the delivery is successful.
Check type	uRPF check mode: loose or strict.
Allow default route	Using the default route is allowed.

14.1.2. ip urpf

Use **ip urpf** to enable uRPF.

Use **undo ip urpf** to disable uRPF.

Syntax

ip urpf { **loose** | **strict** }

undo ip urpf

Default

uRPF is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

loose: Enables loose uRPF check. To pass loose uRPF check, the source address of a packet must match the destination address of a FIB entry.

strict: Enables strict uRPF check. To pass strict uRPF check, the source address and receiving interface of a packet must match the destination address and output interface of a FIB entry.

Usage guidelines

uRPF can be deployed on a PE connected to a CE or an ISP, or on a CE.

Examples

Enable strict uRPF check globally.

```
<Switch> system-view
[Switch] ip urpf strict
```

1. Ethernet OAM commands

1.1. Ethernet OAM commands

1.1.1. display oam

Use **display oam** to display Ethernet OAM connection information.

Syntax

display oam { **local** | **remote** } [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies the local end.

remote: Specifies the remote end.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays Ethernet OAM connection information for all interfaces.

Examples

Display Ethernet OAM connection information for all local interfaces.

```
<Switch> display oam local
----------- [GigabitEthernet1/0/1] -----------
 Enable status      : Enable
 Loopback status    : No loopback
 Link status        : UP
 OAM mode           : Active
 PDU                : ANY
 Mux action         : FWD
 Par action         : FWD
```

Display Ethernet OAM connection information for the local interface GigabitEthernet 1/0/1.

```
<Switch> display oam local interface gigabitethernet 1/0/1
 Enable status      : Enable
 Loopback status    : No loopback
 Link status        : UP
 OAM mode           : Active
 PDU                : ANY
 Mux action         : FWD
 Par action         : FWD
 Flags
```

```
  Link fault        : Not occurred
  Dying gasp        : Not occurred
  Critical event    : Not occurred
  Local evaluating  : COMPLETE
  Remote evaluating : COMPLETE
Packets statistics
  Packet type                        Sent                    Received
  ------------------------------------------------------------------
  OAMPDU                              100                      80
  OAMInformation                     64                       60

  OAMUniqueEventNotification      36                       10
  OAMDuplicateEventNotification   0                        10
```

Table 1-1 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Enable status	Ethernet OAM state: • **Enable**. • **Disable**.
Loopback status	Ethernet OAM loopback state: • **No loopback**—Remote loopback is disabled. • **Remote loopback**—Controlling end of remote loopback. • **Local loopback**—Controlled end of remote loopback.
Link status	Link physical state: • **UP** • **DOWN**.
OAM mode	Local Ethernet OAM mode: • **Active**—The interface operates in active Ethernet OAM mode. • **Passive**—The interface operates in passive Ethernet OAM mode.
PDU	The way in which the local end processes Ethernet OAMPDUs: • **RX_INFO**—The interface receives only Information OAMPDUs and does not send any Ethernet OAMPDUs. • **LF_INFO**—The interface sends only Information OAMPDUs without Information TLV triplets and with their link error flag bits being set. • **INFO**—The interface sends and receives only Information OAMPDUs. • **ANY**—The interface sends and receives Ethernet OAMPDUs of any type.
Mux action	Operating mode of the local transmitter: • **FWD**—The interface can send any packets. • **DISCARD**—The interface only sends Ethernet OAMPDUs.

Field	Description
Par action	Operating mode of the local receiver: • **FWD**—The interface can receive any packets. • **DISCARD**—The interface only receives Ethernet OAMPDUs. • **LB**—The local receiver is in loopback state. All the packets, other than Ethernet OAMPDUs, received on the local receiver are returned to their sources along their original routes.
Flags	Local flags inserted in the local flag fields of the sent Ethernet OAMPDUs.
Link fault	Indicates whether an Ethernet OAM link error is present.
Dying gasp	Indicates whether a fatal error is present.
Critical event	Indicates whether a critical error is present.
Local evaluating	Indicates whether the local-to-remote configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted.
Remote evaluating	Indicates whether the remote-to-local configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **RESERVED**—The field is reserved and the negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.
Packets statistics	Statistics about Ethernet OAMPDUs.
OAMPDU	Total number of sent or received Ethernet OAMPDUs.
OAMInformation	Number of sent or received Information OAMPDUs.
OAMEventNotification	Number of sent or received Event notification OAMPDUs.
OAMUniqueEventNotification	Number of unduplicated sent or received Event notification OAMPDUs.
OAMDuplicateEventNotification	Number of duplicate sent or received Event notification OAMPDUs.

Display Ethernet OAM connection information for all remote interfaces.

```
<Switch> display oam remote
---------- [GigabitEthernet1/0/1] ----------
 OAM mode           : Active
 MAC address        : 3822-d6a2-a800
 MTU size           : 1500
 Mux action         : FWD
 Par action         : FWD
```

Display Ethernet OAM connection information for the peer interface GigabitEthernet 1/0/1.

```
<Switch> display oam remote interface gigabitethernet 1/0/1
 OAM mode           : Active
```

```
MAC address       : 3822-d6a2-a800
MTU size          : 1500
Mux action        : FWD
Par action        : FWD
Configuration
  Unidirectional    : Not supported
  Remote loopback   : Supported
  Link events       : Supported
  MIB retrieval     : Not supported
Flags
  Link fault        : Not occurred
  Dying gasp        : Not occurred
  Critical event    : Not occurred
  Local evaluating  : COMPLETE
  Remote evaluating : COMPLETE
```

Table 1-2 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
OAM mode	Ethernet OAM mode on the remote end: • **Active**—The interface operates in active Ethernet OAM mode. • **Passive**—The interface operates in passive Ethernet OAM mode.
MAC address	MAC address of the remote end.
MTU size	MTU size, in bytes.
Mux action	Operating mode of the remote transmitter: • **FWD**—The interface can send any packets. • **DISCARD**—The interface only sends Ethernet OAMPDUs.
Par action	Operating mode of the remote receiver: • **FWD**—The interface can receive any packets. • **DISCARD**—The interface only receives Ethernet OAMPDUs. • **LB**—The local receiver is in loopback state. All the packets, other than Ethernet OAMPDUs, received on the local receiver are returned to their sources along their original routes.
Configuration	Configuration of the remote Ethernet OAM entity.
Unidirectional	Indicates whether unidirectional transmission is supported.
Remote loopback	Indicates whether Ethernet OAM remote loopback is supported.
Link events	Indicates whether Ethernet OAM link error events are supported.
MIB retrieval	Indicates whether MIB variable retrieval is supported.
Flags	Values of the peer Ethernet OAM flag fields in OAM packets.
Link fault	Indicates whether an Ethernet OAM link error is present.

Field	Description
Dying gasp	Indicates whether a fatal error is present.
Critical event	Indicates whether a critical error is present.
Local evaluating	Indicates whether the local-to-remote configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **RESERVED**—The field is reserved and the negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.
Remote evaluating	Indicates whether the remote-to-local configuration negotiation is complete: • **COMPLETE**—The negotiation is completed. • **NOTCOMPLETE**—The negotiation is uncompleted. • **UNSATISFIED**—The remote end is not satisfied with the local configuration and the negotiation is uncompleted.

Related commands

reset oam

1.1.2. display oam configuration

Use **display oam configuration** to display Ethernet OAM configuration information.

Syntax

display oam configuration [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays Ethernet OAM configuration globally and for interfaces that do not use the default configuration.

Examples

Display Ethernet OAM configuration globally and for interfaces that do not use the default configuration.

```
<Switch> display oam configuration
---------------- [Global] ----------------
 OAM timers
   Hello timer         : 1000 milliseconds
   Keepalive timer     : 5000 milliseconds
 Link monitoring
   Errored symbol period
```

```
    Window           : 100 x 1000000 symbols
    Threshold        : 1 error symbols
  Errored frame
    Window           : 10 x 100 milliseconds
    Threshold        : 1 error frames
  Errored frame period
    Window           : 1000 x 10000 frames
    Threshold        : 1 error frames
  Errored frame seconds
    Window           : 600 x 100 milliseconds
    Threshold        : 1 error seconds

----------- [GigabitEthernet1/0/1] -----------
 OAM timers
   Hello timer       : 500 milliseconds
   Keepalive timer   : 5000 milliseconds
 Link monitoring
   Errored symbol period
     Window          : 100 x 1000000 symbols
     Threshold       : 1 error symbols
   Errored frame
     Window          : 10 x 100 milliseconds
     Threshold       : 1 error frames
   Errored frame period
     Window          : 1000 x 10000 frames
     Threshold       : 1 error frames
   Errored frame seconds
     Window          : 600 x 100 milliseconds
     Threshold       : 1 error seconds
```

Table 1-3 Command output

Field	Description
Global	Global information.
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
OAM timers	Ethernet OAM connection detection timers.
Hello timer	Ethernet OAM handshake packet transmission interval.
Keepalive timer	Ethernet OAM connection timeout timer.
Link monitoring	Link event detection window and threshold.
Errored symbol period	Errored symbol event.
Errored frame	Errored frame event.
Errored frame period	Errored frame period event.
Errored frame seconds	Errored frame seconds event.
Window	Detection window configured for link events.
Threshold	Triggering threshold configured for link events.

1.1.3. display oam critical-event

Use **display oam critical-event** to display statistics for critical Ethernet OAM link events.

Syntax

display oam critical-event [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays statistics for the critical Ethernet OAM link events for all interfaces.

Examples

Display statistics for critical Ethernet OAM link events on all interfaces.

```
<Switch> display oam critical-event
---------- [GigabitEthernet1/0/1] ----------
 Local link status   : UP
 Event statistics
   Link fault        : Not occurred
   Dying gasp        : Not occurred
   Critical event    : Not occurred
```

Table 1-4 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Local link status	Local link status, up or down.
Event statistics	Statistics for critical Ethernet OAM link events.
Link fault	Indicates whether a link fault is present.
Dying Gasp	Indicates whether a fatal fault is present.
Critical Event	Indicates whether a critical fault is present.

1.1.4. display oam link-event

Use **display oam link-event** to display statistics for Ethernet OAM link error events for local or peer interfaces.

Syntax

display oam link-event { **local** | **remote** } [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies the local end.

remote: Specifies the peer end.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays statistics for Ethernet OAM link error events for all local or peer interfaces.

Usage guidelines

Ethernet OAM link error events include errored symbol events, errored frame events, errored frame period events, and errored frame seconds events.

Examples

Display statistics for Ethernet OAM link error events for all local interfaces.

```
<Switch> display oam link-event local
----------- [GigabitEthernet1/0/1] -----------
 Link status: UP
 OAM local errored symbol event
   Event time stamp         : 35498 x 100 milliseconds
   Errored symbol window    : 100000000 symbols
   Errored symbol threshold : 1 error symbols
   Errored symbol           : 1 error symbols
   Error running total      : 4 error symbols
   Event running total      : 4 events
 OAM local errored frame event
   Event time stamp        : 49582 x 100 milliseconds
   Errored frame window    : 10 x 100 milliseconds
   Errored frame threshold : 1 error frames
   Errored frame           : 1 error frames
   Error running total     : 6 error frames
   Event running total     : 6 events
 OAM local errored frame period event
   Event time stamp                : 16382 x 100 milliseconds
   Errored frame period window     : 10000000 frames
   Errored frame period threshold  : 1 error frames
   Errored frame period            : 1 error frames
   Error running total             : 5 error frames
   Event running total             : 5 events
 OAM local errored frame seconds summary event
   Event time stamp                : 50022 x 100 milliseconds
   Errored frame seconds window    : 600 x 100 milliseconds
   Errored frame seconds threshold : 1 error seconds
   Errored frame seconds           : 1 error seconds
```

```
  Error running total             : 1 error seconds
  Event running total             : 1 events
```

Display statistics for Ethernet OAM link error events for all peer interfaces.

```
<Switch> display oam link-event remote
---------- [GigabitEthernet1/0/1] ----------
 Link status: UP
 OAM remote errored symbol event
   Event time stamp         : 35498 x 100 milliseconds
   Errored symbol window    : 100000000  symbols
   Errored symbol threshold : 1 error symbols
   Errored symbol           : 1 error symbols
   Error running total      : 4 error symbols
   Event running total      : 4 events
 OAM remote errored frame event
   Event time stamp         : 49582 x 100 milliseconds
   Errored frame window     : 10 x 100 milliseconds
   Errored frame threshold  : 1 error frames
   Errored frame            : 1 error frames
   Error running total      : 6 error frames
   Event running total      : 6 events
 OAM remote errored frame period event
   Event time stamp                 : 16382 x 100 milliseconds
   Errored frame period window      : 10000000 frames
   Errored frame period threshold   : 1 error frames
   Errored frame period             : 1 error frames
   Error running total              : 5 error frames
   Event running total              : 5 events
 OAM remote errored frame seconds summary event
   Event time stamp                 : 50022 x 100 milliseconds
   Errored frame seconds window     : 600 x 100 milliseconds
   Errored frame seconds threshold  : 1 error seconds
   Errored frame seconds            : 1 error seconds
   Error running total              : 1 error seconds
   Event running total              : 1 events
```

Table 1-5 Command output

Field	Description
GigabitEthernet1/0/1	Information on GigabitEthernet 1/0/1.
Link status	Link status, up or down.
OAM local/remote errored symbol event	Information about local/remote errored symbol events (available only when remote errored symbol events occur): • **Event time stamp**—Time when an errored symbol event occurred. • **Errored symbol window**—Errored symbol detection interval. • **Errored symbol threshold**—Errored threshold that triggers an errored symbol event. • **Errored symbol**—Number of detected errored symbols in the

Field	Description
	most recent errored symbol event. • **Error running total**—Total number of errored symbols. • **Event running total**—Total number of errored symbol events that have occurred.
OAM local/remote errored frame event	Information about local/remote end errored frame events (available only when local/remote end errored frame events occur): • **Event time stamp**—Time when an errored frame event occurred. • **Errored frame window**—Errored frame detection interval. • **Errored frame threshold**—Errored threshold that triggers an errored frame event. • **Errored frame**—Number of detected errored frames in the most recent errored frame event. • **Error running total**—Total number of errored frames. • **Event running total**—Total number of errored frame events that have occurred.
OAM local/remote errored frame period event	Information about local or remote errored frame period events (available only when local/remote errored frame period events occur): • **Event time stamp**—Time when an errored frame period event occurred. • **Errored frame period window**—Errored frame period detection interval. • **Errored frame period threshold**—Errored threshold that triggers an errored frame period event. • **Errored frame period**—Number of detected errored frames in the most recent errored frame period event. • **Error running total**—Total number of errored frames that have detected. • **Event running total**—Total number of errored frame period events.
OAM local/remote errored frame seconds summary event	Information about local/remote end errored frame seconds events (available only when local/remote end errored frame seconds events occur): • **Event time stamp**—Time when an errored frame seconds event occurred. • **Errored frame second window**—Errored frame second detection interval. • **Errored Frame seconds threshold**—Errored threshold that triggers an errored frame seconds event. • **Errored frame seconds**—Number of detected errored frame seconds in the most recent errored frame seconds event. • **Error running total**—Total number of errored frame seconds. • **Event running total**—Total number of errored frame seconds events that have occurred.

Related commands

`reset oam`

1.1.5. oam enable

Use **`oam enable`** to enable Ethernet OAM.

Use **undo oam enable** to disable Ethernet OAM.

Syntax

oam enable

undo oam enable

Default

Ethernet OAM is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable OAM on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam enable
```

1.1.6. oam errored-frame threshold

Use **oam errored-frame threshold** to set the errored frame event triggering threshold for an interface.

Use **undo oam errored-frame threshold** to restore the default.

Syntax

oam errored-frame threshold *threshold-value*

undo oam errored-frame threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame event triggering threshold in number of errored frame events, in the range of 0 to 4294967295.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam errored-frame threshold 100
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame threshold

1.1.7. oam errored-frame window

Use **oam errored-frame window** to set the errored frame event detection window.

Use **undo oam errored-frame window** to restore the default.

Syntax

oam errored-frame window *window-value*

undo oam errored-frame window

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

window-value: Specifies the errored frame event detection window in the range of 10 to 600, in steps of 10, in 100 milliseconds.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame event detection window to 2000 milliseconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam errored-frame window 20
```

1.1.8. oam errored-frame-period threshold

Use **oam errored-frame-period threshold** to set the errored frame period event triggering threshold on an interface.

Use **undo oam errored-frame-period threshold** to restore the default.

Syntax

oam errored-frame-period threshold *threshold-value*

undo oam errored-frame-period threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame period event triggering threshold in the range of 0 to 4294967295.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame period event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam errored-frame-period threshold 100
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame-period threshold

1.1.9. oam errored-frame-period window

Use **oam errored-frame-period window** to set the errored frame period event detection window.

Use **undo oam errored-frame-period window** to restore the default.

Syntax

oam errored-frame-period window *window-value*

undo oam errored-frame-period window

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

window-value: Specifies the errored frame period event detection window in the range of 1 to 65535. The value of this argument must be a multiple of 10000.

Usage guidelines

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame period event detection window to 20000000 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam errored-frame-period window 2000
```

Related commands

display oam configuration

display oam link-event

oam global errored-frame-period window

1.1.10. oam errored-frame-seconds threshold

Use **oam errored-frame-seconds threshold** to set the errored frame seconds event triggering threshold on an interface.

Use **undo oam errored-frame-seconds threshold** to restore the default.

Syntax

oam errored-frame-seconds threshold *threshold-value*

undo oam errored-frame-seconds threshold

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame seconds event triggering threshold in the range of 0 to 900.

Usage guidelines

The value of the errored frame seconds event triggering threshold cannot be greater than the value of the errored frame seconds event detection window (in seconds). Otherwise, errored frame seconds events cannot be generated.

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the errored frame seconds event triggering threshold to 100 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam errored-frame-seconds threshold 100

network-admin

Parameters

window-value: Specifies the errored frame event detection window in the range of 10 to 600, in steps of 10, in 100 milliseconds.

Usage guidelines

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the errored frame event detection window to 2000 milliseconds.

```
<Switch> system-view
[Switch] oam global errored-frame window 20
```

Related commands

1.1.16. oam global errored-frame-period threshold

Use **oam global errored-frame-period threshold** to set the global errored frame period event triggering threshold.

Use **undo oam global errored-frame-period threshold** to restore the default.

Syntax

oam global errored-frame-period threshold *threshold-value*

undo oam global errored-frame-period threshold

Default

The errored frame period event triggering threshold is 1.

Views

System view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame period event triggering threshold in the range of 0 to 4294967295.

Usage guidelines

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the errored frame period event triggering threshold to 100.

```
<Switch> system-view
[Switch] oam global errored-frame-period threshold 100
```

Related commands

1.1.18. oam global errored-frame-seconds threshold

Use **oam global errored-frame-seconds threshold** to set the global errored frame seconds event triggering threshold.

Use **undo oam global errored-frame-seconds threshold** to restore the default.

Syntax

oam global errored-frame-seconds threshold *threshold-value*

undo oam global errored-frame-seconds threshold

Default

The global errored frame seconds event detection interval is 1.

Views

System view

Predefined user roles

network-admin

Parameters

threshold-value: Specifies the errored frame seconds event triggering threshold in the range of 0 to 900.

Usage guidelines

The value of the errored frame seconds event triggering threshold cannot be greater than the value of the errored frame seconds event detection window (in seconds). Otherwise, errored frame seconds events cannot be generated.

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the errored frame seconds event triggering threshold to 100.

```
<Switch> system-view
[Switch] oam global errored-frame-seconds threshold 100
```

1.1.22. oam global timer hello

Use **oam global timer hello** to configure the global Ethernet OAM handshake packet transmission interval.

Use **undo oam global timer hello** to restore the default.

Syntax

oam global timer hello *interval*

undo oam global timer hello

Default

The global Ethernet OAM handshake packet transmission interval is 1000 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the Ethernet OAM handshake packet transmission interval, in steps of 100, in milliseconds. The value range for the *interval* argument is 500 to 5000.

Usage guidelines

After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be a minimum of five times the handshake packet transmission interval.

The configuration in system view takes effect on all interfaces, but has a lower precedence than the configuration in interface view.

Examples

Set the Ethernet OAM handshake packet transmission interval to 600 milliseconds.

```
<Switch> system-view
[Switch] oam global timer hello 600
```

1.1.24. oam mode

Use **oam mode** to set the Ethernet OAM mode.

Use **undo oam mode** to restore the default.

Syntax

oam mode { **active** | **passive** }

undo oam mode

Default

An Ethernet OAM-enabled Ethernet interface operates in active Ethernet OAM mode.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

active: Specifies the active Ethernet OAM mode.

passive: Specifies the passive Ethernet OAM mode.

Usage guidelines

To change the Ethernet OAM mode of an Ethernet OAM-enabled Ethernet interface, first disable Ethernet OAM on the interface.

Examples

Disable Ethernet OAM on GigabitEthernet 1/0/1, and then configure GigabitEthernet 1/0/1 to operate in passive Ethernet OAM mode.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo oam enable
[Switch-GigabitEthernet1/0/1] oam mode passive
```

Related commands

oam enable

1.1.25. oam remote-failure action

Use **oam remote-failure action** to configure the action an interface takes after it receives an Ethernet OAM event from the remote end.

Use **undo oam remote-failure action** to remove the configuration.

Syntax

oam remote-failure { **connection-expired** | **critical-event** | **dying-gasp** | **link-fault** } **action error-link-down**

undo oam remote-failure { **connection-expired** | **critical-event** | **dying-gasp** | **link-fault** } **action error-link-down**

Default

An interface only logs the Ethernet OAM event it receives from the remote end.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

connection-expired: Specifies a connection timeout event.

critical-event: Specifies a critical event.

dying-gasp: Specifies a fatal event.

link-fault: Specifies a link fault event.

error-link-down: Terminates the OAM connection, and sets the link state of the interface to down.

Examples

Configure GigabitEthernet 1/0/1 to terminate the OAM connection after it receives a critical event from the remote end, and set the link state of the interface to down.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam remote-failure critical-event action error-link-down
```

1.1.26. oam remote-loopback

Use **oam remote-loopback start** to enable Ethernet OAM remote loopback on an interface.

Use **oam remote-loopback stop** to disable Ethernet OAM remote loopback on an interface.

Syntax

oam remote-loopback start

oam remote-loopback stop

Default

Ethernet OAM remote loopback is disabled on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Ethernet OAM remote loopback is available only after the Ethernet OAM connection is established. It can be performed only by the Ethernet OAM entities operating in active Ethernet OAM mode.

You can enable Ethernet OAM remote loopback on a specified interface in user view or system view. You can also enable it on the current interface in interface view. The configurations have the same effect.

Examples

Configure active Ethernet OAM mode and enable Ethernet OAM on GigabitEthernet 1/0/1. Enable Ethernet OAM remote loopback on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam mode active
[Switch-GigabitEthernet1/0/1] oam enable
[Switch-GigabitEthernet1/0/1] oam remote-loopback start
```

Related commands

oam enable

oam mode

oam remote-loopback

1.1.28. oam remote-loopback reject-request

Use **oam remote-loopback reject-request** to configure an interface to reject the Ethernet OAM remote loopback request from a remote interface.

Use **undo oam remote-loopback reject-request** to restore the default.

Syntax

oam remote-loopback reject-request

undo oam remote-loopback reject-request

Default

An interface does not reject the Ethernet OAM remote loopback request from a remote interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

If an interface is in loopback state when you execute the **oam remote-loopback reject-request** command, the configuration takes effect when the next loopback starts.

Examples

Configure GigabitEthernet 1/0/1 to reject the Ethernet OAM remote loopback request from a remote interface.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam remote-loopback reject-request
```

1.1.29. oam timer hello

Use **oam timer hello** to configure the Ethernet OAM handshake packet transmission interval.

Use **undo oam timer hello** to restore the default.

Syntax

oam timer hello *interval*

undo oam timer hello

Default

An interface uses the global setting.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the Ethernet OAM handshake packet transmission interval, in steps of 100, in milliseconds. The value range for the *interval* argument is 500 to 5000.

Usage guidelines

After the timeout timer of an Ethernet OAM connection expires, the local OAM entity ages out and terminates its connection with the peer OAM entity. To keep the Ethernet OAM connections stable, set the connection timeout timer to be at least five times the handshake packet transmission interval.

The configuration in interface view takes effect only on the specified interface. For an interface, the configuration in interface view takes precedence.

Examples

Set the Ethernet OAM handshake packet transmission interval to 600 milliseconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] oam timer hello 600
```

2. CFD commands

2.1. CFD commands

2.1.1. cfd cc enable

Use **cfd cc enable** to enable CCM sending on a specified MEP.

Use **undo cfd cc enable** to disable CCM sending on a specified MEP.

Syntax

cfd cc service-instance *instance-id* **mep** *mep-id* **enable**

undo cfd cc service-instance *instance-id* **mep** *mep-id* **enable**

Default

The CCM sending feature is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies the Ethernet service instance ID in the range of 1 to 32767.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

Usage guidelines

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- If the MEP belongs to an MA that does not carry the VLAN attribute, configurations on a member port of an aggregation group view take effect only on the current member port.
- If the MEP belongs to an MA that carries the VLAN attribute, configurations on a member port of an aggregation group take effect only when the member port leaves the aggregation group.

Examples

On port GigabitEthernet 1/0/1, enable CCM sending on MEP 3 in Ethernet service instance 5.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] cfd cc service-instance 5 mep 3 enable
```

Related commands

cfd cc interval

2.1.2. cfd cc interval

Use **cfd cc interval** to set the value of the interval field in the CCM messages.

Use **undo cfd cc interval** to remove the value of the interval field in the CCM messages.

Syntax

cfd cc interval *interval-value* **service-instance** *instance-id*

undo cfd cc interval [*interval-value*] **service-instance** *instance-id*

Default

The value of this field is 4 for all CCM messages sent.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval-value*: Specifies the value of the interval field in CCM messages. The value range for the interval field is 1 to 7. If you set the value to 1 or 2, the continuity check might work incorrectly due to hardware restrictions.

service-instance *instance-id*: Specifies the Ethernet service instance ID in the range of 1 to 32767.

Usage guidelines

When setting the CCM interval, use the settings described in Table 2-1 .

Table 2-1 CCM interval field encoding

CCM interval field	Transmission interval	Maximum CCM lifetime
1	10/3 milliseconds	35/3 milliseconds
2	10 milliseconds	35 milliseconds
3	100 milliseconds	350 milliseconds
4	1 second	3.5 seconds
5	10 seconds	35 seconds
6	60 seconds	210 seconds
7	600 seconds	2100 seconds

Examples

Set the value of the interval field to 3 in CCM messages sent by MEPs in Ethernet service instance 2.

```
<Switch> system-view
[Switch] cfd cc interval 3 service-instance 2
```

Related commands

cfd cc enable

2.1.3. cfd enable

Use **cfd enable** to enable CFD.

Use **undo cfd enable** to disable CFD.

Syntax

cfd enable

undo cfd enable

Default

CFD is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable CFD.

```
<Switch> system-view
[Switch] cfd enable
```

2.1.4. cfd linktrace

Use **cfd linktrace** to identify the path between the source MEP and target MP.

Syntax

cfd linktrace service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**ttl** *ttl-value*] [**hw-only**]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the destination MAC address, in the format of H-H-H.

target-map *target-mep-id*: Specifies the destination MEP by its ID in the range of 1 to 8191.

ttl *ttl-value*: Specifies the TTL value in the range of 1 to 255. The default value is 64.

hw-only: Sets the hw-only bits of the LTMs sent. If you specify this keyword, the MIP does not flood LTMs that have an unknown destination MAC address.

Usage guidelines

This command identifies the path between the source MEP and target MP by using LTMs and LTRs.

Examples

Identify the path between source MEP 1101 and target MEP 2001 in Ethernet service instance 1.

```
<Switch> cfd linktrace service-instance 1 mep 1101 target-mep 2001
Linktrace to MEP 2001 with the sequence number 1101-43361:
MAC address               TTL     Last MAC         Relay action
0010-fc00-6512            63      0010-fc00-6500   Hit
```

Table 2-2 Command output

Field	Description
Linktrace to MEP 2001 with the sequence number 1101-43361	Linktrace to target MEP 2001 with the sequence number 1101-43361.
MAC address	Source MAC address in the LTRs.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

Related commands

cfd linktrace auto-detection

display cfd linktrace-reply

2.1.5. cfd linktrace auto-detection

Use **cfd linktrace auto-detection** to enable automatic sending of LTMs.

Use **undo cfd linktrace auto-detection** to disable automatic sending of LTMs.

Syntax

cfd linktrace auto-detection [**size** *size-value*]

undo cfd linktrace auto-detection

Default

Automatic sending of LTMs is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

size *size-value*: Specifies the size of the buffer used to store the auto-detection result, in the range of 1 to 100 (in terms of auto-detection times). The default value is 5, which means the buffer stores the results of the recent five auto-detections.

Usage guidelines

This command enables the source MEP to send LTMs when it fails to receive CCMs from the target MEP within 3.5 times the sending interval. The destination of the LTMs is the target MEP, and the TTL field value is 255. Based on the returned LTRs, the fault source can be located on the faulty link.

If you disable automatic LTM sending, the content stored in the buffer will be removed.

Examples

Enable automatic LTM sending, and set the size of the buffer used to store the auto-detection result to 100 (in terms of auto-detection times).

```
<Switch> system-view
[Switch] cfd linktrace auto-detection size 100
```

Related commands

cfd linktrace

display cfd linktrace-reply auto-detection

2.1.6. cfd loopback

Use **cfd loopback** to enable loopback (LB).

Syntax

cfd loopback service-instance *instance-id* **mep** *mep-id* { **target-mac** *mac-address* | **target-mep** *target-mep-id* } [**number** *number*]

Views

Any view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies the source MEP by its ID in the range of 1 to 8191.

target-mac *mac-address*: Specifies the destination MAC address of the MP, in the format of H-H-H.

target-mep *target-mep-id*: Specifies the target MEP by its ID in the range of 1 to 8191.

number *number*: Specifies the number of the sent LBMs packets. The value is in the range of 1 to 10. The default value is 5.

Usage guidelines

The LB function verifies link connectivity between the source MEP and the target MP by using LBMs and LBRs.

Examples

Enable LB for the link between MEP 1101 and MEP 2001 in Ethernet service instance 1 (assume that the link status is normal).

```
<Switch> cfd loopback service-instance 1 mep 1101 target-mep 2001
Loopback to MEP 2001 with the sequence number start from 1101-43404:
Reply from 0010-fc00-6512: sequence number=1101-43404 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43405 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43406 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43407 Time=5ms
Reply from 0010-fc00-6512: sequence number=1101-43408 Time=5ms
Sent: 5        Received: 5        Lost: 0
```

Enable LB for the link between MEP 1101 and MEP 2001 in Ethernet service instance 1 (assume that the link status is abnormal).

```
<Switch> cfd loopback service-instance 1 mep 1101 target-mep 2001
Loopback to MEP 2001 with the sequence number start from 1101-43404:
Sent: 5        Received: 0        Lost: 5
```

Table 2-3 Command output

Field	Description
Loopback to MEP 2001 with the sequence number start from 1101-43404	Sends LBMs to remote MEP 2001 with the sequence number starting with 1101-43404.
Reply from 0010-fc00-6512	Reply from the MP with the MAC address 0010-FC00-6512.
sequence number	Sequence number in the LBR messages.
Time=5ms	The interval between the sending of LBMs and receiving of LBRs is 5 milliseconds.
Sent	Number of sent LBMs.
Received	Number of received LBRs.
Lost	Number of lost LBRs.

2.1.7. cfd md

Use **cfd md** to create an MD.

Use **undo cfd md** to delete an MD.

Syntax

cfd md *md-name* [**index** *index-value*] **level** *level-value* [**md-id** { **dns** *dns-name* | **mac** *mac-address subnumber* | **none** }]

undo cfd md *md-name*

Default

No MDs exist.

Views

System view

Predefined user roles

network-admin

Parameters

md *md-name*: Specifies the name of an MD, which is a string of 1 to 43 characters that can contain letters, numbers, and special characters such as grave accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ } , ( ), [ ] , < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark ('), comma (,), period (.), and slash (/).

index *index-value*: Specifies an MD index in the range of 1 to 4294967295. If you do not specify this option, the system automatically assigns the smallest index number that is not in use. As a best practice, use the index automatically assigned by the system.

level *level-value*: Specifies an MD level in the range of 0 to 7.

md-id: Specifies the MD name carried by packets sent by the MEP. If you do not provide this keyword, the MD name is represented by *md-name*.

dns *dns-name*: Specifies an MD name in the format of DNS name, where *dns-name* represents the DNS name.

mac *mac-address subnumber*: Specifies an MD name containing the MAC address and an integer. The *mac-address* argument represents the MAC address of the MD, and the *subnumber* argument is in the range of 0 to 65535.

none: Specifies that no MD name is carried in the packets sent by the MEP.

Usage guidelines

An MD name must be in compliant with the specifications in IEEE802.1ag-2007.

You can create only one MD with a specific level. MD cannot be created if you enter an invalid MD name or an existing MD name or the MD index is in use.

When deleting an MD, you will also delete the configurations related to that MD.

Examples

Create an MD named **test_md1**, with its level being 3.

```
<Switch> system-view
[Switch] cfd md test_md1 level 3
```

Create an MD named **test_md2**, and the MD name carried in the packet sent by the MEP comprises the MAC address 1-1-1 and integer 1.

```
<Switch> system-view
[Switch] cfd md test_md2 level 5 md-id mac 1-1-1 1
```

2.1.8. cfd mep

Use **cfd mep** to create a MEP.

Use **undo cfd mep** to delete a MEP.

Syntax

cfd mep *mep-id* **service-instance** *instance-id* { **inbound** | **outbound** }

undo cfd mep *mep-id* **service-instance** *instance-id*

Default

No MEPs exist.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

mep *mep-id*: Specifies the MEP ID, in the range of 1 to 8191.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

inbound: Creates an inward-facing MEP.

outbound: Creates an outward-facing MEP.

Usage guidelines

In creating a MEP, the Ethernet service instance you specified defines the MD and MA to which the MEP belongs.

You cannot create a MEP if the MEP ID is not included in the MEP list of the relevant Ethernet service instance.

Follow these guidelines when you use the command:

- Configurations in Ethernet interface view take effect only on the current interface.
- Configurations in aggregate interface view take effect only on the current aggregate interface.
- If the MEP belongs to an MA that does not carry the VLAN attribute, configurations on a member port of an aggregation group take effect only on the current member port.
- If the MEP belongs to an MA that carries the VLAN attribute, configurations on a member port of an aggregation group take effect only when the member port leaves the aggregation group.

Examples

Configure a MEP list in Ethernet service instance 5, and create inward-facing MEP 3 in Ethernet service instance 5 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] cfd md test_md level 3
[Switch] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
[Switch] cfd meplist 3 service-instance 5
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] cfd mep 3 service-instance 5 outbound
```

Related commands

cfd meplist

2.1.9. cfd meplist

Use **cfd meplist** to create a MEP list.

Use **undo cfd meplist** to delete a MEP list.

Syntax

cfd meplist *mep-list* **service-instance** *instance-id*

undo cfd meplist *mep-list* **service-instance** *instance-id*

Default

No MEP list is created.

Views

System view

Predefined user roles

network-admin

Parameters

meplist *mep-list*: Specifies a space-separated list of up to 10 MEP items. Each item specifies a MEP ID or a range of MEP IDs in the form of *mep-id 1* **to** *mep-id 2*. The value range for the MEP ID is 1 to 8191. The *mep-id 2* must be equal to or greater than *mep-id 1*.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

Usage guidelines

A MEP list is a collection of local MEPs allowed to be configured and the remote MEPs to be monitored in the same MA.

Before creating a MEP list, create the relevant MD and Ethernet service instance.

After you delete a MEP list, all local MEP configurations based on this list are deleted.

Examples

Create a MEP list that includes MEP 9 through MEP 15 in Ethernet service instance 5.

```
<Switch> system-view
[Switch] cfd md test_md level 3
[Switch] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
[Switch] cfd meplist 9 to 15 service-instance 5
```

Related commands

cfd md

cfd service-instance

2.1.10. cfd mip-rule

Use **cfd mip-rule** to configure the rules for generating MIPs.

Use **undo cfd mip-rule** to remove the rules for generating MIPs and the MIPs created in a service instance.

Syntax

cfd mip-rule { **default** | **explicit** } **service-instance** *instance-id*

undo cfd mip-rule [**default** | **explicit**] **service-instance** *instance-id*

Default

No rules for generating MIPs are configured and the system does not automatically generate any MIPs.

Views

System view

Predefined user roles

network-admin

Parameters

default: Specifies the default rule. If no lower-level MIP exists on an interface, a MIP is created on the current level. A MIP can be created even if no MEP is configured on the interface.

explicit: Specifies the explicit rule. If no lower-level MIP exists and a lower-level MEP exists on an interface, a MIP is created at the current level. A MIP can be created only when a lower-level MEP is created on the interface.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

Usage guidelines

The system automatically generates MIPs on each port according to the rules configured.

Examples

Configure the MIP generation rule as default in Ethernet service instance 5.

```
<Switch> system-view
[Switch] cfd mip-rule default service-instance 5
```

2.1.11. cfd service-instance

Use **cfd service-instance** to create an Ethernet service instance.

Use **undo cfd service-instance** to remove an Ethernet service instance.

Syntax

cfd service-instance *instance-id* **ma-id** { **icc-based** *ma-name* | **integer** *ma-num* | **string** *ma-name* | **vlan-based** [*vlan-id*] } [**ma-index** *index-value*] **md** *md-name* **vlan** *vlan-id*

undo cfd service-instance *instance-id*

Default

No Ethernet service instances exist.

Views

System view

Predefined user roles

network-admin

Parameters

service-instance *instance-id*: Specifies the Ethernet service instance ID in the range of 1 to 32767.

ma-id: Creates an MA.

icc-based *ma-name*: Specifies that an MA is identified by an ICC. The *ma-name* argument is a string of 1 to 13 characters.

integer *ma-num*: Specifies that an MA is identified by an integer, where the *ma-num* argument is in the range of 0 to 65535.

string *ma-name*: Specifies that an MA is identified by a string, where the *ma-name* argument is string of 1 to 45 characters that can contain letters, numbers, and special characters such as grave

accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ }, ( ), [ ], < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark ('), comma (,), period (.), and slash (/).

vlan-based [*vlan-id*]: Specifies that an MA is identified by a VLAN ID, where the *vlan-id* argument is in the range of 1 to 4094. If you do not provide the *vlan-id* argument, the VLAN ID specified by **vlan** *vlan-id* is used. If the **vlan** *vlan-id* option is not provided, you must specify the *vlan-id* argument for the **vlan-based** [*vlan-id*] option.

ma-index *index-value*: Specifies an MA index in the range of 1 to 4294967295. If you do not specify this option, the system automatically assigns the smallest index number that is not in use. As a best practice, use the index automatically assigned by the system.

md *md-name*: Specifies the name of an MD. The *md-name* argument is a string of 1 to 43 characters that can contain letters, numbers, and special characters such as grave accent (`), tilde (~), exclamation mark (!), at sign (@), number sign (#), dollar sign ($), percent (%), caret (^), ampersand (&), asterisk (*), brackets ({ }, ( ), [ ], < >), hyphen (-), underscore (_), plus (+), equal sign (=), vertical bar (|), colon (:), semicolon (;), quotation mark (’), comma (,), period (.), and slash (/).

vlan *vlan-id*: Specifies the VLAN that the MA serves. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

An Ethernet service instance is indicated by an integer to represent an MA in an MD. An MA index uniquely identifies a specific MA in an MD. An MA index can be used in different MDs.

An MD name must be in compliant with the specifications in IEEE802.1ag-2007.

With the **vlan-based** [*vlan-id*] or **vlan** *vlan-id* option, the command creates an MA carrying the VLAN attribute. If you do not specify the option, the command creates an MA carrying no VLAN attribute.

You must create the relevant MD before creating an Ethernet service instance with the MD name.

Deleting an Ethernet service instance also deletes the configurations related to that Ethernet service instance.

Deleting an Ethernet service instance not only removes the connection between the Ethernet service instance and the relevant MA, but also deletes the MA.

Examples

Create a level-3 MD named **test_md** and create Ethernet service instance 5, in which the MA is identified by a VLAN and serves VLAN 100.

```
<Switch> system-view
[Switch] cfd md test_md level 3
[Switch] cfd service-instance 5 ma-id vlan-based md test_md vlan 100
```

Related commands

cfd md

2.1.12. display cfd linktrace-reply

Use **display cfd linktrace-reply** to display information about the LTRs received by a MEP.

Syntax

display cfd linktrace-reply [**service-instance** *instance-id* [**mep** *mep-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies the Ethernet service instance ID in the range of 1 to 32767. If you do not specify this option, the command displays the LTR information for all Ethernet service instances.

mep *mep-id*: Specifies the ID of a MEP, in the range of 1 to 8191. If you do not specify this option, the command displays the LTR information for all MEPs.

Usage guidelines

This command displays only information about LTRs received by execution of the **cfd linktrace** command.

Examples

Display the LTR information saved on all the MEPs in every Ethernet service instance.

```
[Switch] display cfd linktrace-reply
Service instance: 1       MEP ID: 1003
MAC address               TTL     Last MAC          Relay action
0000-fc00-6505            63      0000-fc00-6504    MPDB
000f-e269-a852            62      0000-fc00-6505    FDB
0000-fc00-6508            61      000f-e269-a852    Hit
Service instance: 2       MEP ID: 1023
MAC address               TTL     Last MAC          Relay action
0000-fc00-6508            61      000f-e269-a852    Hit
```

Table 2-4 Command output

Field	Description
Service instance	Ethernet service instance to which the MEPs that send LTMs belong.
MEP ID	ID of the MEP that sends LTMs.
MAC address	Source MAC address in the LTR.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

Related commands

cfd linktrace

2.1.13. display cfd linktrace-reply auto-detection

Use **display cfd linktrace-reply auto-detection** to display information about the LTRs received as responses to the automatically sent LTMs.

Syntax

display cfd linktrace-reply auto-detection [**size** *size-value*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

size *size-value*: Specifies the times of recent auto-detections, in the range of 1 to 100. If you do not specify this option, the command displays all information in the buffer.

Usage guidelines

This command displays only information about LTRs received by execution of the **cfd linktrace auto-detection** command.

Examples

Display the contents of the LTRs received as responses to the LTMs automatically sent.

```
<Switch> display cfd linktrace-reply auto-detection
Service instance: 1       MEP ID: 1003    Time: 2013/05/22 10:43:57
Target MEP ID: 2005       TTL: 64
MAC address               TTL     Last MAC          Relay action
0000-fc00-6505            63      0000-fc00-6504    MPDB
000f-e269-a852            62      0000-fc00-6505    FDB
0000-fc00-6508            61      000f-e269-a852    Hit
Service instance: 2       MEP ID: 1023    Time: 2013/05/22 10:44:06
Target MEP ID: 2025       TTL: 64
MAC address               TTL     Last MAC          Relay action
0000-fc00-6508            61      000f-e269-a852    Hit
```

Table 2-5 Command output

Field	Description
Service instance	Ethernet service instance to which the MEPs that sent LTMs belong.
MEP ID	ID of the MEP that sends LTMs.
Time	Time of the LTMs automatically sent.
Target MEP ID	ID of the target MEP.
TTL	Initial TTL of the automatically sent LTMs.

Field	Description
MAC address	Source MAC address in the LTRs.
TTL	TTL of the LTM when it passes the device.
Last MAC	MAC address of the last-hop device the LTM passes.
Relay action	Indicates whether the forwarding device found the destination MAC address in its MAC address table. When the standard version (IEEE 802.1ag) of CFD is used: • **Hit**—The current device is the destination device. • **FDB**—The forwarding device found the destination MAC address. • **MPDB**—The destination MAC address is not found, or the destination MAC address is found in the MEP or MIP database.

2.1.14. display cfd md

Use **display cfd md** to display the MD configuration information.

Syntax

display cfd md

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the MD configuration information.

```
<Switch> display cfd md
CFD is enabled.
Maintenance domains configured: 4 in total
Level   Index      Maintenance domain                          MD format  MD ID
0       1          md_0                                        CHARSTRING md_0
1       2          md_1                                        DNS        dns1
2       3          md_2                                        MAC        0001-00
01-0001-1
3       4          md_3                                        NONE       Without
 ID
```

Table 2-6 Command output

Field	Description
Maintenance domains configured	Number of MDs configured.
Level	Level of MD.

Field	Description
Index	MD index.
Maintenance domain	Name of MD.
MD format	MD name format: • **CHARSTRING**—Character string. • **DNS**—DNS name. • **MAC**—MAC address and an integer. • **NONE**—No MD name is carried.
MD ID	MD ID value: • A character string if the MD format is **CHARSTRING**. • A DNS name if the MD format is **DNS**. • A MAC address-subnumber if the MD format is **MAC**. • No ID if the MD format is **NONE**.

2.1.15. display cfd mep

Use **display cfd mep** to display the attribute and operating information for a MEP.

Syntax

display cfd mep *mep-id* **service-instance** *instance-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

Examples

Display the attribute and operating information for MEP 50 in Ethernet service instance 1.

```
<Switch> display cfd mep 50 service-instance 1
Interface: GigabitEthernet1/0/2
Maintenance domain: md_0
Maintenance domain index: 1
Maintenance association: ma_0
Maintenance association index: 1
Level: 0        VLAN: 1         Direction: Outbound
Current state: Active          CCM send: Enabled
FNG state: FNG_DEFECT_REPORTED

CCM:
```

```
Current state: CCI_WAITING
Interval: 1s        SendCCM: 12018

Loopback:
NextSeqNumber: 8877
SendLBR: 0          ReceiveInOrderLBR: 0          ReceiveOutOrderLBR: 0

Linktrace:
NextSeqNumber: 8877
SendLTR: 0          ReceiveLTM: 0

No CCM received from some remote MEPs.

One or more streams of error CCMs is received. The last received CCM:
Maintenance domain: (Without ID)
Maintenance association: matest1
MEP ID: 5      Sequence Number:0x50A
MAC Address: 0011-2233-4402
Received Time: 2013/03/06 13:01:34

One or more streams of cross-connect CCMs is received. The last received CCM:
Maintenance domain: mdtest1
Maintenance association:matest1
MEP ID: 6      Sequence Number:0x63A
MAC Address: 0011-2233-4401
Received Time: 2013/03/06 13:01:34

Some other MEPs are transmitting the RDI bit.
```

Table 2-7 Command output

Field	Description
Interface	Interface on which the MEP is configured.
Maintenance domain	MD to which the MEP belongs. (If the MD does not have a name, this field is displayed as **Without ID**.)
Maintenance domain index	Index of the MD to which the MEP belongs..
Maintenance association	MA to which the MEP belongs.
Maintenance association index	Index of the MA to which the MEP belongs.
Level	Level of the MD.
VLAN	VLAN to which the MA belongs.
Direction	Direction of the MEPs.
Current state	State of MEP: • **Active**. • **Inactive**.
CCM send	Whether the MEP sends CCM.

Field	Description
FNG state	State of FNG (Fault Notification Generator): • **FNG_RESET**—A fault has been cleared. • **FNG_DEFECT**—A fault has been detected. • **FNG_REPORT_DEFECT**—Report a fault. • **FNG_DEFECT_REPORTED**—A fault has been reported. • **FNG_DEFECT_CLEARING**—A fault is being cleared. If this field is not supported, a hyphen (-) is displayed.
CCM	Information related to CCM.
Current state	State of CCMs sent: • **CCI_IDLE**—Initial state. • **CCI_WAITING**—Sending state. If this field is not supported, a hyphen (-) is displayed.
Interval	Interval to send CCM. **Not supported** means the MEP does not support CCM sending.
SendCCM	Number of CCMs that have been sent by the MEPs. If this field is not supported, a hyphen (-) is displayed.
Loopback	Information related to Loopback.
NextSeqNumber	Sequence number of the next LBM to be sent.
SendLBR	Number of LBRs that have been sent. If the MEP is inward-facing, the number of LBRs will not be counted.
ReceiveInOrderLBR	Number of LBRs received in correct sequence.
ReceiveOutOrderLBR	Number of LBRs received out of order.
Linktrace	Information related to linktrace.
NextSeqNumber	Sequence number of the next LTM to be sent.
SendLTR	Number of LTRs sent. If the MEP is inward-facing, the number of LTRs will not be counted.
ReceiveLTM	Number of LTMs received.
No CCM received from some remote MEPs.	Failure to receive CCMs from some remote MEPs. (This information is displayed only when some CCMs are lost.)
One or more streams of error CCMs is received. The last received CCM:	Display the content of the last error CCM when one or more error CCMs are received. (This information is displayed only when error CCMs are received.)
Maintenance domain	MD of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Maintenance association	MA of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
MEP	ID of the MEP that sent the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Sequence Number	Sequence number of the last error CCM. If this field is not supported, a hyphen (-) is displayed.
Received Time	Time when the last error CCM is received.

Field	Description
	If this field is not supported, a hyphen (-) is displayed.
One or more streams of cross-connect CCMs is received. The last received CCM:	Cross-connect CCMs are received, and the content of the last cross-connect CCM is displayed. (This information is displayed only when cross-connect CCMs are received.)
Some other MEPs are transmitting the RDI bit.	CCMs with the RDI flag bits set are received from other MEPs. (This information is displayed only when this type of CCMs are received.)

2.1.16. display cfd meplist

Use **display cfd meplist** to display the MEP list in an Ethernet service instance.

Syntax

display cfd meplist [**service-instance** *instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767. If you do not specify this option, the command displays MEP lists in all Ethernet service instances.

Examples

Display the MEP list in Ethernet service instance 5.

```
<Switch> display cfd meplist service-instance 5
Service instance: 5
MEP list: 1 to 20, 30, 50.
```

2.1.17. display cfd mp

Use **display cfd mp** to display the MP information.

Syntax

display cfd mp [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays MP information for all ports.

Usage guidelines

The output is arranged by port name. On a port, the output shows MPs that serve VLANs, and then shows MPs that do not serve any VLANs. The MPs that serve VLANs are displayed in the ascending VLAN ID order. Within the same VLAN, the output is in the order of MIPs and MEPs (from high to low level). The MEPs that do not serve any VLANs are displayed by level (from high to low).

Examples

Display the MP information on all ports.

```
<Switch> display cfd mp
Interface GigabitEthernet1/0/1   VLAN 100
MIP              Level: 2    Service instance: 102
Maintenance domain: md_2
Maintenance domain index: 3
Maintenance association: ma_2
Maintenance association index: 3

MEP ID: 101      Level: 1    Service instance: 101    Direction: Inbound
Maintenance domain: md_1
Maintenance domain index: 2
Maintenance association: ma_1
Maintenance association index: 2

MEP ID: 100      Level: 0    Service instance: 100    Direction: Outbound
Maintenance domain: md_0
Maintenance domain index: 1
Maintenance association: ma_0
Maintenance association index: 1
```

Table 2-8 Command output

Field	Description
Interface GigabitEthernet1/0/1 VLAN 100	MP configuration of VLAN 100 on GigabitEthernet 1/0/1.
MIP	A MIP in the MP.
Level	MD level to which the MP belongs.
Service instance	Ethernet service instance to which the MP belongs.
Maintenance domain	MD to which the MP belongs.
Maintenance domain index	Index of the MD to which the MP belongs.
Maintenance association	MA to which the MP belongs.
Maintenance association index	Index of the MA to which the MP belongs.
Direction	Direction of the MEP, inbound or outbound.

2.1.18. display cfd remote-mep

Use **display cfd remote-mep** to display information about a remote MEP.

Syntax

display cfd remote-mep service-instance *instance-id* **mep** *mep-id*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 32767.

mep *mep-id*: Specifies a MEP by its ID in the range of 1 to 8191.

Examples

Display remote MEP information for MEP 10 in Ethernet service instance 4.

```
<Switch> display cfd remote-mep service-instance 4 mep 10
MEP ID   MAC address      State        Time                 MAC status
20       f474-8800-6565   OK           2013/03/06 02:36:38  UP
30       f474-8827-6502   OK           2013/03/06 02:36:38  DOWN
40       f474-8800-6510   FAILED       2013/03/06 02:36:39  DOWN
50       f474-8852-baa0   OK           2013/03/06 02:36:44  DOWN
60       0010-fc00-6502   OK           2013/03/06 02:36:42  DOWN
```

Table 2-9 Command output

Field	Description
MEP ID	ID of the remote MED.
MAC address	MAC address of the remote MEP device. If this field is not supported, a hyphen (-) is displayed.
State	Running state of the remote MEP: • **OK**. • **FAILED**.
Time	Time when the remote MEP entered the **FAILED** or **OK** state for the last time. If this field is not supported, a hyphen (-) is displayed.
MAC status	State of the interface indicated by the last CCM received from the remote MEP: • **UP**—The interface is ready to pass packets. • **DOWN**—The interface cannot pass packets. • **TESTING**—The interface is in some test mode. • **UNKNOWN**—The interface status cannot be determined. • **DORMANT**—The interface is not in a state to pass packets. Instead, it is in a pending state, waiting for some external event.

Field	Description
	• **NOT-PRESENT**—Some component of the interface is missing. • **LLD**—The interface is down due to state of the lower layer interfaces. If this field is not supported, a hyphen (-) is displayed.

2.1.19. display cfd service-instance

Use **display cfd service-instance** to display the configuration information of Ethernet service instance.

Syntax

display cfd service-instance [*instance-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance-id: Specifies an Ethernet service instance ID in the range of 1 to 32767. If you do not specify this argument, the command displays configuration information for all Ethernet service instances.

Examples

Display the configuration information of all Ethernet service instances.

```
<Switch> display cfd service-instance
Service instances configured (2 in total):
Service instance 5:
Maintenance domain: md_5
Maintenance domain index: 5
Maintenance association: ma_5
Maintenance association index: 5
Level: 5  VLAN: 5   MIP rule: NONE   CCM interval: 1s   Direction: Inbound
MEP ID: 730  Interface: GigabitEthernet1/0/1

Service instance 6:
Maintenance domain: (Without ID)
Maintenance domain index: 6
Maintenance association: ma_6
Maintenance association index: 6
Level: 6  VLAN: 6   MIP rule: NONE   CCM interval: 1s   Direction: Outbound
MEP ID: 731  Interface: GigabitEthernet1/0/2
```

Table 2-10 Command output

Field	Description
Service instances are configured.	Number of Ethernet service instances configured.
Service instance	Ethernet service instance ID.
Maintenance domain	MD of the Ethernet service instances. (If the MD does not have a name, this field displays **Without ID**.)
Maintenance domain index	Index of the MD to which the Ethernet service instances belong.
Maintenance association:	MA of the Ethernet service instances.
Maintenance association index	Index of the MA to which the Ethernet service instances belong.
Level	MD level.
VLAN	VLAN to which the MA belongs.
MIP rule	MIP generation rules configured on Ethernet service instance.
CCM interval	Interval to send CCMs.
Direction	Direction of the MEPs configured on the Ethernet service instance.
MEP ID	ID of MEPs configured on the Ethernet service instance.
Interface	Interface of the MEP configured on the Ethernet service instance.

2.1.20. display cfd status

Use **display cfd status** to display the CFD and AIS status.

Syntax

display cfd status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the CFD and AIS status.

```
<Switch> display cfd status
CFD is enabled.
AIS is disabled.
```

3. DLDP commands

3.1. DLDP commands

3.1.1. display dldp

Use **display dldp** to display DLDP configuration.

Syntax

display dldp [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays global and port-specific DLDP configuration.

Examples

Display global and port-specific DLDP configuration.

```
<Switch> display dldp
 DLDP global status: Enabled
 DLDP advertisement interval: 5s
 DLDP authentication-mode: Simple
 DLDP authentication-password: ******
 DLDP unidirectional-shutdown mode: Auto
 DLDP delaydown-timer value: 1s
 Number of enabled ports: 2

Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 Number of the port's neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 79
  Neighbor state: Confirmed
  Neighbor aged time: 13s

Interface GigabitEthernet1/0/2
 DLDP port state: Inactive
 DLDP port unidirectional-shutdown mode: None
 Number of the port's neighbors: 0 (Maximum number ever detected: 1)
```

Display the DLDP configuration of GigabitEthernet 1/0/1.

```
<Switch> display dldp interface gigabitethernet 1/0/1
Interface GigabitEthernet1/0/1
 DLDP port state: Bidirectional
 DLDP port unidirectional-shutdown mode: None
 Number of the port's neighbors: 1
  Neighbor MAC address: 0023-8956-3600
  Neighbor port index: 79
  Neighbor state: Confirmed
  Neighbor aged time: 13s
```

Table 3-1 Command output

Field	Description
DLDP global status	Global DLDP state (Enabled or Disabled).
DLDP advertisement interval	Interval for sending Advertisement packets (in seconds) to maintain neighbor relations.
DLDP authentication-mode	DLDP authentication mode (None, Simple, or MD5).
DLDP authentication-password	Password for DLDP authentication: • ******—The password has been configured. • **Not configured**—The authentication mode has been configured but no password is configured.
DLDP unidirectional-shutdown mode	Global port shutdown mode (auto, manual, or hybrid) after unidirectional links are detected.
DLDP port unidirectional-shutdown mode	Port shutdown mode for the interface (auto, manual, or hybrid) after unidirectional links are detected. If no port shutdown mode is configured for an interface, this field displays **None**.
DLDP delaydown-timer value	Setting of the DelayDown timer, in seconds.
Number of enabled ports	Number of the DLDP-enabled ports.
Interface	Index of a DLDP-enabled port.
DLDP port state	DLDP state on a port: • **Bidirectional.** • **Inactive.** • **Initial.** • **Unidirectional.**
Number of the port's neighbors	Current number of neighbors.
Maximum number ever detected	Maximum number of neighbors once detected on the port. This field appears only when the current number of neighbors is different from the maximum number of neighbors once detected.
Neighbor MAC address	MAC address of the neighbor.
Neighbor port index	Neighbor port index.
Neighbor state	Neighbor state (Confirmed or Unconfirmed).
Neighbor aged time	Neighbor aging time.

3.1.2. display dldp statistics

Use **display dldp statistics** to display DLDP packet statistics.

Syntax

display dldp statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays DLDP packet statistics for all interfaces.

Examples

Display DLDP packet statistics for all interfaces.

```
<Switch> display dldp statistics
Interface GigabitEthernet1/0/1
 Packets sent: 6
 Packets received: 5
 Invalid packets received: 2
 Loopback packets received: 0
 Authentication-failed packets received: 0
 Valid packets received: 3

Interface GigabitEthernet1/0/2
 Packets sent: 7
 Packets received: 7
 Invalid packets received: 3
 Loopback packets received: 0
 Authentication-failed packets received: 0
 Valid packets received: 4
```

Table 3-2 Command output

Field	Description
Interface	Port index.
Packets sent	Total number of DLDP packets sent.
Packets received	Total number of DLDP packets received.
Invalid packets received	Number of the invalid packets received.
Loop packets received	Number of the loopback packets received.
Authentication failed packets received	Number of the received packets that failed to pass the authentication.
Valid packets received	Number of the valid packets received.

Related commands

reset dldp statistics

3.1.3. dldp authentication-mode

Use **dldp authentication-mode** to configure DLDP authentication.

Use **undo dldp authentication-mode** to restore the default.

Syntax

dldp authentication-mode { **md5** | **none** | **simple** }

undo dldp authentication-mode

Default

DLDP authentication mode is **none**.

Views

System view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5 authentication mode.

none: Specifies not to perform authentication.

simple: Specifies the plaintext authentication mode.

Usage guidelines

To enable DLDP to operate correctly, make sure the DLDP authentication modes and the passwords configured on the two ends of a link are the same.

If you do not configure the authentication password after you configure the authentication mode, the authentication mode is **none** no matter which authentication mode you configure.

Examples

Configure to perform plaintext authentication and set the password to **abc** (assuming that Device A and Device B are connected by a DLDP link).

- Configure Device A:

```
<DeviceA> system-view
[DeviceA] dldp authentication-mode simple
[DeviceA] dldp authentication-password simple abc
```

- Configure Device B:

```
<DeviceB> system-view
[DeviceB] dldp authentication-mode simple
[DeviceB] dldp authentication-password simple abc
```

Related commands

display dldp

dldp authentication-password

3.1.4. dldp authentication-password

Use **dldp authentication-password** to configure the password for DLDP authentication.

Use **undo dldp authentication-password** to restore the default.

Syntax

dldp authentication-password { **cipher** | **simple** } *string*

undo dldp authentication-password

Default

No DLDP authentication password is configured.

Views

System view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 1 to 53 characters.

Usage guidelines

To enable DLDP to operate correctly, make sure the DLDP authentication modes and the passwords configured on the two ends of a link are the same.

If you do not configure the authentication password after you configure the authentication mode, the authentication mode is **none** no matter which authentication mode you configure.

Examples

Configure to perform plaintext authentication and set the password to **abc** (assuming that Device A and Device B are connected by a DLDP link).

- Configure Device A:

```
<DeviceA> system-view
[DeviceA] dldp authentication-mode simple
[DeviceA] dldp authentication-password simple abc
```

- Configure Device B:

```
<DeviceB> system-view
[DeviceB] dldp authentication-mode simple
[DeviceB] dldp authentication-password simple abc
```

Related commands

display dldp

dldp authentication-mode

3.1.5. dldp delaydown-timer

Use **dldp delaydown-timer** to set the DelayDown timer.

Use **undo dldp delaydown-timer** to restore the default.

Syntax

dldp delaydown-timer *time*

undo dldp delaydown-timer

Default

The setting of the DelayDown timer is 1 second.

Views

System view

Predefined user roles

network-admin

Parameters

time: Specifies the DelayDown timer in the range of 1 to 5 seconds.

Usage guidelines

The DelayDown timer configured by using this command applies to all DLDP-enabled ports.

Examples

Set the DelayDown timer to 2 seconds.

```
<Switch> system-view
[Switch] dldp delaydown-timer 2
```

Related commands

display dldp

3.1.6. dldp enable

Use **dldp enable** to enable DLDP on a port.

Use **undo dldp enable** to disable DLDP on a port.

Syntax

dldp enable

undo dldp enable

Default

DLDP is disabled on a port.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

DLDP can take effect only after you enable it globally and on a port.

Examples

Enable DLDP globally, and then enable DLDP on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] dldp global enable
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dldp enable
```

Related commands

display dldp

dldp global enable

3.1.7. dldp global enable

Use **dldp global enable** to enable DLDP globally.

Use **undo dldp global enable** to disable DLDP globally.

Syntax

dldp global enable

undo dldp global enable

Default

DLDP is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DLDP can take effect only after you enable it globally and on a port.

Examples

Enable DLDP globally.

```
<Switch> system-view
[Switch] dldp global enable
```

Related commands

display dldp

dldp enable

3.1.8. dldp interval

Use **dldp interval** to set the interval for sending Advertisement packets.

Use **undo dldp interval** to restore the default.

Syntax

dldp interval *interval*

undo dldp interval

Default

The interval for sending Advertisement packets is 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies Advertisement packets sending interval in the range of 1 to 100 seconds.

Usage guidelines

This command applies to all DLDP-enabled ports.

To enable DLDP to operate correctly, make sure the intervals for sending Advertisement packets configured on the two ends of a link are the same.

Examples

Set the interval for sending Advertisement packets to 20 seconds.

```
<Switch> system-view
[Switch] dldp interval 20
```

Related commands

display dldp

3.1.9. dldp port unidirectional-shutdown

Use **dldp port unidirectional-shutdown** to set the port shutdown mode for an interface.

Use **undo dldp port unidirectional-shutdown** to restore the default.

Syntax

dldp port unidirectional-shutdown { **auto** | **hybrid**|**manual** }

undo dldp port unidirectional-shutdown

Default

The global setting is used.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Specifies the auto mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port. When the link becomes bidirectional, DLDP brings up the port that was shut down.

hybrid: Specifies the hybrid mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port and stops link detection. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

manual: Specifies the manual mode. In this mode, when DLDP detects a unidirectional link, it does not shut down the involved port. You must manually shut it down. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

Usage guidelines

If DLDP detects a unidirectional link, you must troubleshoot the interface and cabling faults.

The port shutdown mode setting for an interface takes effect only on the current interface and has priority over the global port shutdown mode setting.

Examples

Set the port shutdown mode to **manual** for GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dldp port unidirectional-shutdown manual
```

Related commands

display dldp

dldp unidirectional-shutdown

3.1.10. dldp unidirectional-shutdown

Use **dldp unidirectional-shutdown** to set the global port shutdown mode.

Use **undo dldp unidirectional-shutdown** to restore the default.

Syntax

dldp unidirectional-shutdown { **auto** | **manual** }

undo dldp unidirectional-shutdown

Default

The global port shutdown mode is auto mode.

Views

System view

Predefined user roles

network-admin

Parameters

auto: Specifies the auto mode. In this mode, when DLDP detects a unidirectional link, it shuts down the unidirectional port. When the link becomes bidirectional, DLDP brings up the port that was shut down.

manual: Specifies the manual mode. In this mode, when DLDP detects a unidirectional link, it does not shut down the involved port. You must manually shut it down. To verify the link status, use the **undo shutdown** command to bring up the port. If the link becomes bidirectional, the port becomes bidirectional.

Usage guidelines

If DLDP detects a unidirectional link, you must troubleshoot the interface and cabling faults.

The global port shutdown mode setting takes effect on all interfaces and has lower priority than the port shutdown mode setting for an interface.

Examples

Set the global port shutdown mode to manual mode.

```
<Switch> system-view
[Switch] dldp unidirectional-shutdown manual
```

Related commands

display dldp

dldp port unidirectional-shutdown

3.1.11. reset dldp statistics

Use **reset dldp statistics** to clear DLDP packet statistics.

Syntax

reset dldp statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command clears DLDP packet statistics for all interfaces.

Examples

Clear DLDP packet statistics for all interfaces.

```
<Switch> reset dldp statistics
```

Related commands

display dldp statistics

4. RRPP commands

4.1. RRPP commands

4.1.1. control-vlan

Use **control-vlan** to configure the primary control VLAN for an RRPP domain.

Use **undo control-vlan** to restore the default.

Syntax

control-vlan *vlan-id*

undo control-vlan

Default

No control VLANs exist in an RRPP domain.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies the primary control VLAN by its ID in the range of 2 to 4093.

Usage guidelines

When you configure control VLANs for an RRPP domain, you only need to configure the primary control VLAN. The system automatically configures the secondary control VLAN. It uses the primary control VLAN ID plus 1 as the secondary control VLAN ID. For the control VLAN configuration to succeed, make sure the IDs of the two control VLANs are consecutive and have not been assigned yet.

Do not configure the default VLAN of a port accessing an RRPP ring as the control VLAN.

To ensure correct forwarding of RRPPDUs, do not enable QinQ or VLAN mapping on the control VLANs.

After you configure RRPP rings for an RRPP domain, you cannot delete or modify the primary control VLAN of the domain. To do so, use the **undo control-vlan** command.

Examples

Configure VLAN 100 as the primary control VLAN of RRPP domain 1 (assume that VLAN 100 and VLAN 101 have not been created yet).

```
<Switch> system-view
[Switch] rrpp domain 1
[Switch-rrpp-domain1] control-vlan 100
```

4.1.2. display rrpp brief

Use **display rrpp brief** to display brief RRPP information.

Syntax

display rrpp brief

Views

Any view

Predefined user roles

Table 4-1 Command output

Field	Description
Flags for node mode	RRPP node mode: • **M**—Master node. • **T**—Transit node.

Field	Description
	• **E**—Edge node. • **A**—Assistant edge node.
RRPP protocol status	RRPP status: • **Enabled**—Globally enabled. • **Disabled**—Globally disabled.
Domain ID	RRPP domain ID.
Control VLAN	Primary and secondary control VLANs of the RRPP domain.
Protected VLAN	MSTIs corresponding to the VLANs protected by the RRPP domain. To view the VLAN-to-instance mappings, use the **display stp region-configuration** command (see *Layer 2—LAN Switching Command Reference*).
Hello timer	Hello timer value in seconds.
Fail timer	Fail timer value in seconds.
Fast detection status	This field is not supported in the current software version. Fast detection status: **Enabled** or **Disabled**.
Fast-Hello timer	This field is not supported in the current software version. Fast-Hello timer value in milliseconds.
Fast-Fail timer	This field is not supported in the current software version. Fast-Fail timer value in milliseconds.
Fast-Edge-Hello timer	This field is not supported in the current software version. Fast-Edge-Hello timer value in milliseconds.
Fast-Edge-Fail timer	This field is not supported in the current software version. Fast-Edge-Fail timer value in milliseconds.
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Primary/Common port	This field displays primary ports when the node mode is master node or transit node. This field displays common ports when the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Secondary/Edge port	This field displays secondary ports when the node mode is master node or transit node. This field displays edge ports when the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.

Field	Description
Enable status	RRPP ring status: • **Yes**—Enabled. • **No**—Disabled.

4.1.3. display rrpp ring-group

Use **display rrpp ring-group** to display the RRPP ring group configuration.

Syntax

display rrpp ring-group [*ring-group-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ring-group-id: Specifies an RRPP ring group by its ID in the range of 1 to 64 If you do not specify this argument, the command displays the configuration of all ring groups.

Usage guidelines

For an edge node RRPP ring group, this command also displays the subring sending Edge-Hello packets.

Examples

Display the configuration of all RRPP ring groups.

```
<Switch> display rrpp ring-group
 Ring group 1:
  Domain 1 ring 1 to 3, 5
  Domain 2 ring 1 to 3, 5
  Domain 1 ring 1 is the sending ring

 Ring group 2:
  Domain 1 ring 4, 6 to 7
  Domain 2 ring 4, 6 to 7
```

Table 4-2 Command output

Field	Description
Ring group 1	RRPP ring group 1.
Domain 1 ring 1 to 3, 5	Subrings in the ring group, including rings 1, 2, 3, and 5 in RRPP domain 1.
Domain 1 ring 1 is the sending ring	The sending ring of the ring group is ring 1 in RRPP domain 1.

4.1.4. display rrpp statistics

Use **display rrpp statistics** to display RRPPDU statistics.

Syntax

display rrpp statistics domain *domain-id* [**ring** *ring-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command displays the RRPPDU statistics for all rings in the specified RRPP domain.

Usage guidelines

If a port belongs to more than one ring, this command collects and displays RRPPDU statistics of the port by ring.

When a ring transits from inactive status to active status, packet counting for the ring restarts.

Examples

Display RRPPDU statistics for all rings in RRPP domain 2.

```
<Switch> display rrpp statistics domain 2
 Ring ID       : 1
 Ring level    : 0
 Node mode     : Master
 Active status : Yes
 Primary port  : GE1/0/3
 Fast-Hello packets: 0 Sent, 0 Received
 Fast-Edge-Hello packets: 0 Sent, 0 Received
  Direct Hello     Link      Common     Complete   Edge      Major     Total
                   down      flush FDB  flush FDB  hello     fault
 ------------------------------------------------------------------------------
  Out    16924     0         0          1          0         0         16925
  In     0         0         0          0          0         0         0
 Secondary port: GE1/0/4
 Fast-Hello packets: 0 Sent, 0 Received
 Fast-Edge-Hello packets: 0 Sent, 0 Received
  Direct Hello     Link      Common     Complete   Edge      Major     Total
                   down      flush FDB  flush FDB  hello     fault
 ------------------------------------------------------------------------------
  Out    0         0         0          0          0         0         0
  In     16878     0         0          1          0         0         16879

 Ring ID       : 2
```

```
Ring level    : 1
Node mode     : Edge
Active status : No
Common port   : GE1/0/3
Fast-Hello packets: 0 Sent, 0 Received
Fast-Edge-Hello packets: 0 Sent, 0 Received
 Direct Hello     Link     Common     Complete   Edge      Major     Total
                  down     flush FDB  flush FDB  hello     fault
--------------------------------------------------------------------------------
 Out    0         0        0          0          0         0         0
 In     0         0        0          0          0         0         0
Common port   : GE1/0/4
Fast-Hello packets: 0 Sent, 0 Received
Fast-Edge-Hello packets: 0 Sent, 0 Received
 Direct Hello     Link     Common     Complete   Edge      Major     Total
                  down     flush FDB  flush FDB  hello     fault

 Out    0         0        0          0          0         0         0
 In     0         0        0          0          0         0         0
Edge port     : GE1/0/5
 Direct Hello     Link     Common     Complete   Edge      Major     Total
                  down     flush FDB  flush FDB  hello     fault
--------------------------------------------------------------------------------
 Out    0         0        0          0          0         0         0
 In     0         0        0          0          0         0         0
```

Table 4-3 Command output

Field	Description
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Node mode	Node mode: • Master node. • Transit node. • Edge node. • Assistant edge node.
Active status	RRPP ring status: • **Yes**—Active. • **No**—Inactive.
Primary port	The primary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.

Field	Description
Secondary port	The secondary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Common port	The common port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Edge port	The edge port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Fast-Hello packets	This field is not supported in the current software version. Fast-Hello packet statistics on the port: • **Sent**—Number of Fast-Hello packets sent out of the port. • **Received**—Number of Fast-Hello packets received on the port.
Fast-Edge-Hello packets	This field is not supported in the current software version. Fast-Edge-Hello packet statistics on the port: • **Sent**—Number of Fast-Edge-Hello packets sent out of the port. • **Received**—Number of Fast-Edge-Hello packets received on the port.
Packet direct	Packet transmission direction on the port: • **Out**—Packet sending direction. • **In**—Packet receiving direction.
Hello	Statistics of Hello packets received/sent on the port.
Link down	Statistics of Link-Down packets received/sent on the port.
Common flush FDB	Statistics of Common-Flush-FDB packets received/sent on the port.
Complete flush FDB	Statistics of Complete-Flush-FDB packets received/sent on the port.
Edge hello	Statistics of Edge-Hello packets received/sent on the port.
Major fault	Statistics of Major-Fault packets received/sent on the port.
Total	Total number of packets received/sent on the port. Only Hello, Link-Down, Common-Flush-FDB, Complete-Flush-FDB, Edge-Hello, and Major-Fault packets of RRPP are counted.

Related commands

reset rrpp statistics

4.1.5. display rrpp verbose

Use **display rrpp verbose** to display detailed RRPP information.

Syntax

display rrpp verbose domain *domain-id* [**ring** *ring-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command displays detailed information for all rings in the specified RRPP domain.

Examples

Display detailed information for all rings in RRPP domain 2.

```
<Switch> display rrpp verbose domain 2
 Domain ID      : 2
 Control VLAN   : Primary 10, Secondary 11
 Protected VLAN: Reference instance 3, 5 to 7
 Hello timer    : 1 seconds, Fail timer: 3 seconds
 Fast detection status: Disabled
 Fast-Hello timer: 20 ms, Fast-Fail timer: 60 ms
 Fast-Edge-Hello timer: 10 ms, Fast-Edge-Fail timer: 30 ms

 Ring ID        : 1
 Ring level     : 0
 Node mode      : Master
 Ring state     : Completed
 Enable status  : Yes, Active status: Yes
 Primary port   : GE1/0/4                    Port status: UP
 Secondary port: GE1/0/5                     Port status: BLOCKED

 Ring ID        : 2
 Ring level     : 1
 Node mode      : Edge
 Ring state     : -
 Enable status  : No, Active status: No
 Common port    : GE1/0/4                    Port status: -
                  GE1/0/5                    Port status: -
 Edge port      : GE1/0/3                    Port status: -
```

Table 4-4 Command output

Field	Description
Domain ID	RRPP domain ID.
Control VLAN	Control VLANs of the RRPP domain: • **Primary**—Primary control VLAN. • **Secondary**—Secondary control VLAN.
Protected VLAN	MSTIs corresponding to the VLANs protected by the RRPP domain. To view the VLAN-to-instance mappings, use the **display stp region-configuration** command (see *Layer 2—LAN Switching Command Reference*).
Hello timer	Hello timer value in seconds.
Fail timer	Fail timer value in seconds.
Fast detection status	This field is not supported in the current software version. Fast detection mechanism status: **Enabled** or **Disabled**.
Fast-Hello timer	This field is not supported in the current software version. Fast-Hello timer value in milliseconds.
Fast-Fail timer	This field is not supported in the current software version. Fast-Fail timer value in milliseconds.
Fast-Edge-Hello timer	This field is not supported in the current software version. Fast-Edge-Hello timer value in milliseconds.
Fast-Edge-Fail timer	This field is not supported in the current software version. Fast-Edge-Fail timer value in milliseconds.
Ring ID	RRPP ring ID.
Ring level	RRPP ring level: • **0**—Primary ring. • **1**—Subring.
Node mode	Node mode: • Master node. • Transit node. • Edge node. • Assistant edge node.
Ring state	RRPP ring state: • **Completed**—The ring is healthy. • **Failed**—The ring is not closed. If the ring is not enabled on the device operating as the master node or the device is not the master node of the ring, a hyphen (-) is displayed.
Enable status	RRPP ring status: • **Yes**—Enabled. • **No**—Disabled.
Active status	RRPP ring status: • **Yes**—Active. • **No**—Inactive. An RRPP ring can be active only when RRPP and the RRPP ring are both enabled. This field also helps you identify whether RRPP is

Field	Description
	enabled.
Primary port	The primary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Secondary port	The secondary port field means the node mode is master node or transit node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Common port	The common port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Edge port	The edge port field means the node mode is edge node or assistant edge node. A hyphen (-) appears when one of the following cases occurs: • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.
Port status	Port status: Down, up, or blocked. A hyphen (-) appears when one of the following cases occurs: • The ring is inactive. • The port is not configured on the ring. • The interface expansion card to which the port belongs has not started up. • The port is a member of a link aggregation group.

4.1.6. domain ring

Use **domain ring** to configure subrings for an RRPP ring group.

Use **undo domain ring** to remove subrings from the RRPP ring group.

Syntax

domain *domain-id* **ring** *ring-id-list*

undo domain *domain-id* [**ring** *ring-id-list*]

Default

No subrings exist in an RRPP ring group.

Views

RRPP ring group view

Predefined user roles

network-admin

Parameters

domain-id: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id-list*: Specifies a space-separated list of up to 10 RRPP subring ID items. Each item specifies an RRPP subring ID or a range of RRPP subring IDs. The value range for RRPP subring IDs is 1 to 128. If you do not specify this option, the command removes all subrings from the ring group in the specified domain.

Usage guidelines

Follow these guidelines when you configure an RRPP ring group on the edge node and the assistant edge node:

- When you assign an active ring to a ring group, assign it on the assistant edge node first and then on the edge node.
- To remove an active ring from a ring group, remove it on the edge node first and then on the assistant edge node.
- To remove a ring group, remove it on the edge node first and then on the assistant edge node.
- When you activate rings in a ring group, activate them on the edge node first and then on the assistant edge node.
- When you deactivate rings in a ring group, deactivate them on the assistant edge node first and then on the edge node.

If you do not follow these guidelines, the assistant edge node might fail to receive Edge-Hello packets and consider the primary ring failed even if it did not.

Examples

Create RRPP ring group 1, and add subrings 1, 2, 3, and 5 to domain 1 and domain 2.

```
<Switch> system-view
[Switch] rrpp ring-group 1
[Switch-ring-group1] domain 1 ring 1 to 3 5
[Switch-ring-group1] domain 2 ring 1 to 3 5
```

Related commands

display rrpp ring-group

rrpp ring-group

4.1.7. fast-detection enable

NOTE:

This command is only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

Use **fast-detection enable** to enable fast detection for the RRPP domain.

Use **undo fast-detection enable** to disable fast detection for the RRPP domain.

Syntax

fast-detection enable

undo fast-detection enable

Default

Fast detection is disabled for an RRPP domain.

Views

RRPP domain view

Predefined user roles

network-admin

Usage guidelines

To make fast detection take effect in an RRPP domain, enable fast detection, RRPP, and the RRPP rings in the RRPP domain.

Examples

Enable fast detection for RRPP domain 1.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] fast-detection enable
```

Related commands

ring enable

rrpp enable

4.1.8. fast-timer

NOTE:

This command is only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

Use **fast-timer** to set the Fast-Hello timer and the Fast-Fail timer.

Use **undo fast-timer** to restore the default.

Syntax

fast-timer hello-timer *hello-value* **fail-timer** *fail-value*

undo fast-timer

Default

The Fast-Hello timer is 20 milliseconds and the Fast-Fail timer is 60 milliseconds.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

hello-timer *hello-value*: Specifies the Fast-Hello timer in the range of 10 to 500 milliseconds.

fail-timer *fail-value*: Specifies the Fast-Fail timer in the range of 30 to 1500 milliseconds.

Usage guidelines

The Fast-Fail timer must be greater than or equal to three times the Fast-Hello timer.

Examples

Set the Fast-Hello timer to 20 milliseconds and the Fast-Fail timer to 70 milliseconds for RRPP domain 1.

```
<Sysname> system-view
[Sysname] rrpp domain 1
[Sysname-rrpp-domain1] fast-timer hello-timer 20 fail-timer 70
```

4.1.9. protected-vlan

Use **protected-vlan** to configure the protected VLANs for an RRPP domain.

Use **undo protected-vlan** to remove the protected VLANs from an RRPP domain.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

No protected VLANs exist in an RRPP domain.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

reference-instance *instance-id-list*: Specifies the Multiple Spanning Tree Instances (MSTIs) you want to reference in the form of *instance-id-list* = { *instance-id* [**to** *instance-id*] }&<1-10>. The *instance-id* argument is an MSTI ID in the range of 0 to 4094. You can specify up to 10 MSTI IDs or ID ranges. You can use the **display stp region-configuration** command to display the VLAN-to-instance mappings. If you do not specify this option, the command removes all MSTIs referenced by the RRPP domain.

Usage guidelines

When the device's spanning tree operation mode is PVST mode, the MSTI ID value is only 0.

You can delete or modify the protected VLANs configured for an RRPP domain before and after you configure rings for the domain. However, after you configure rings for the RRPP domain, you cannot delete configurations of all the protected VLANs configured for the domain.

When the VLAN-to-instance mappings change, the protected VLANs of an RRPP domain also change.

Examples

Map VLANs 1 through 30 to MSTI 1, and activate the MST region configuration. Configure VLAN 100 as the control VLAN of RRPP domain 1. Configure VLANs mapped to MSTI 1 as the primary control VLANs of RRPP domain 1.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] instance 1 vlan 1 to 30
```

```
[Switch-mst-region] active region-configuration
[Switch-mst-region] quit
[Switch] rrpp domain 1
[Switch-rrpp-domain1] control-vlan 100
[Switch-rrpp-domain1] protected-vlan reference-instance 1
```

Related commands

display stp region-configuration (*Layer 2—LAN Switching Command Reference*)

rrpp domain

4.1.10. reset rrpp statistics

Use **reset rrpp statistics** to clear RRPPDU statistics.

Syntax

reset rrpp statistics domain *domain-id* [**ring** *ring-id*]

Views

User view

Predefined user roles

network-admin

Parameters

domain *domain-id*: Specifies an RRPP domain by its ID in the range of 1 to 128.

ring *ring-id*: Specifies an RRPP ring by its ID in the range of 1 to 128. If you do not specify this option, the command clears RRPPDU statistics of all RRPP rings in the specified RRPP domain.

Examples

Clear the RRPPDU statistics of ring 10 in RRPP domain 1.

```
<Switch> reset rrpp statistics domain 1 ring 10
```

Related commands

display rrpp statistics

4.1.11. ring

Use **ring** to configure the node mode of the device, the role of the specified RRPP port, and the level of the RRPP ring.

Use **undo ring** to delete the RRPP ring.

Syntax

ring *ring-id* **node-mode** { { **master** | **transit** } [**primary-port** *interface-type interface-number*] [**secondary-port** *interface-type interface-number*] **level** *level-value* | { **assistant-edge** | **edge** } [**edge-port** *interface-type interface-number*] }

undo ring *ring-id*

Default

The device is not a node of the RRPP ring.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

ring-id: Specifies an RRPP ring by its ID in the range of 1 to 128.

master: Specifies the device as the master node of the RRPP ring.

transit: Specifies the device as the transit node of the RRPP ring.

primary-port: Specifies the port as a primary port.

interface-type interface-number: Specifies a port by its type and number.

secondary-port: Specifies the port as a secondary port.

level *level-value*: Specifies an RRPP ring level, 0 for the primary ring and 1 for the subring.

assistant-edge: Specifies the device as the assistant edge node of the RRPP ring.

edge: Specifies the device as the edge node of the RRPP ring.

edge-port: Specifies the edge port for the node.

Usage guidelines

The ID of an RRPP ring in a domain must be unique.

When an RRPP ring is activated, you cannot configure its RRPP ports.

When you configure the edge node and the assistant edge node, first configure the primary ring, and then the subrings.

The node mode, RRPP port role, and ring level settings of an RRPP ring cannot be modified after they are configured. To modify the settings, first remove the current settings.

Remove all subring configurations before you delete the primary ring configuration of the edge node or the assistant edge node. However, an active RRPP ring cannot be deleted.

When RRPP is enabled on a device, you must disable the RRPP ring before you can delete it. When RRPP is disabled on the device, you can directly delete the RRPP ring, as well as the setting of the **ring enable** command.

Examples

Specify the device as the master node of primary ring 10 in RRPP domain 1. Specify GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port.

```
<Switch> system-view
[Switch] rrpp domain 1
[Switch-rrpp-domain1] control-vlan 100
[Switch-rrpp-domain1] protected-vlan reference-instance 0 1 2
[Switch-rrpp-domain1] ring 10 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
```

Specify the device as the transit node of primary ring 10 in RRPP domain 1. Specify GigabitEthernet 1/0/1 as the primary port and GigabitEthernet 1/0/2 as the secondary port. Specify the device as the edge node of subring 20 in RRPP domain 1, and specify GigabitEthernet 1/0/3 as the edge port.

```
<Switch> system-view
[Switch] rrpp domain 1
```

```
[Switch-rrpp-domain1] control-vlan 100
[Switch-rrpp-domain1] protected-vlan reference-instance 0 1 2
[Switch-rrpp-domain1] ring 10 node-mode transit primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[Switch-rrpp-domain1] ring 20 node-mode edge edge-port gigabitethernet 1/0/3
```

Related commands

ring enable

4.1.12. ring enable

Use **ring enable** to enable an RRPP ring.

Use **undo ring enable** to disable the RRPP ring.

Syntax

ring *ring-id* **enable**

undo ring *ring-id* **enable**

Default

An RRPP ring is disabled.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

ring-id: Specifies an RRPP ring by its ID in the range of 1 to 128.

Usage guidelines

To activate an RRPP ring, you must enable RRPP and the RRPP ring.

Before you enable subrings on a device, you must enable the primary ring. Before you disable the primary ring on the device, you must disable all subrings. Otherwise, the system displays error prompts.

Examples

Enable RRPP ring 10 in RRPP domain 1.

```
<Switch> system-view
[Switch] rrpp domain 1
[Switch-rrpp-domain1] control-vlan 100
[Switch-rrpp-domain1] protected-vlan reference-instance 0 1 2
[Switch-rrpp-domain1] ring 10 node-mode master primary-port gigabitethernet 1/0/1
secondary-port gigabitethernet 1/0/2 level 0
[Switch-rrpp-domain1] ring 10 enable
```

Related commands

rrpp enable

4.1.13. rrpp domain

Use **rrpp domain** to create an RRPP domain and enter its view, or enter the view of an existing RRPP domain.

Use **undo rrpp domain** to remove an RRPP domain.

Syntax

rrpp domain *domain-id*

undo rrpp domain *domain-id*

Default

No RRPP domains exist.

Views

System view

Predefined user roles

network-admin

Parameters

domain-id: Specifies an RRPP domain by its ID in the range of 1 to 128.

Usage guidelines

When you delete an RRPP domain, configurations of the control VLANs and protected VLANs are deleted at the same time.

To delete an RRPP domain successfully, make sure it has no RRPP rings.

Examples

Create RRPP domain 1, and enter RRPP domain 1 view.

```
<Switch> system-view
[Switch] rrpp domain 1
[Switch-rrpp-domain1]
```

Related commands

control-vlan

protected-vlan

4.1.14. rrpp enable

Use **rrpp enable** to enable RRPP.

Use **undo rrpp enable** to disable RRPP.

Syntax

rrpp enable

undo rrpp enable

Default

RRPP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To activate an RRPP domain, enable RRPP and the RRPP rings for the RRPP domain.

Examples

Enable RRPP.

```
<Switch> system-view
[Switch] rrpp enable
```

Related commands

ring enable

4.1.15. rrpp ring-group

Use **rrpp ring-group** to create an RRPP ring group and enter its view, or enter the view of an existing RRPP ring group.

Use **undo rrpp ring-group** to remove an RRPP ring group.

Syntax

rrpp ring-group *ring-group-id*

undo rrpp ring-group *ring-group-id*

Default

No RRPP ring groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

ring-group-id: Specifies an RRPP ring group ID in the range of 1 to 64.

Usage guidelines

When you remove a ring group, remove it on the edge node first and then on the assistant edge node. Otherwise, the assistant edge node might fail to receive Edge-Hello packets and consider the primary ring failed even if it is not.

After a ring group is removed, all subrings in the ring group do not belong to any ring group.

Examples

Create RRPP ring group 1 and enter its view.

```
<Switch> system-view
[Switch] rrpp ring-group 1
[Switch-ring-group1]
```

Related commands

display rrpp ring-group

domain ring

4.1.16. snmp-agent trap enable rrpp

Use **snmp-agent trap enable rrpp** to enable SNMP notifications for RRPP.

Use **undo snmp-agent trap enable rrpp** to disable SNMP notifications for RRPP.

Syntax

snmp-agent trap enable rrpp [**major-fault** | **multi-master** | **ring-fail** | **ring-recover**] *

undo snmp-agent trap enable rrpp [**major-fault** | **multi-master** | **ring-fail** | **ring-recover**] *

Default

SNMP notifications for RRPP are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

major-fault: Generates notifications when an SRPT between the assistant edge node and edge node is disconnected.

multi-master: Generates notifications when multiple master nodes are configured for the RRPP ring.

ring-fail: Generates notifications when the state of the RRPP ring changes from Health to Disconnect.

ring-recover: Generates notifications when the state of the RRPP ring changes from Disconnect to Health.

Usage guidelines

To report critical RRPP events to an NMS, enable SNMP notifications for RRPP. For RRPP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

If you do not specify any keyword, this command enables or disables all SNMP notifications for RRPP.

Examples

Generate notifications when the state of the RRPP ring changes from Disconnect to Health.

```
<Switch> system-view
[Switch] snmp-agent trap enable rrpp ring-recover
```

4.1.17. timer

Use **timer** to set the Hello timer and the Fail timer.

Use **undo timer** to restore the default.

Syntax

timer hello-timer *hello-value* **fail-timer** *fail-value*

undo timer

Default

The Hello timer is 1 second and the Fail timer is 3 seconds.

Views

RRPP domain view

Predefined user roles

network-admin

Parameters

hello-timer *hello-value*: Specifies the Hello timer in the range of 1 to 10 seconds.

fail-timer *fail-value*: Specifies the Fail timer in the range of 3 to 30 seconds.

Usage guidelines

The Fail timer must be greater than or equal to three times the Hello timer.

Examples

Set the Hello timer to 2 seconds and the Fail timer to 7 seconds for RRPP domain 1.

```
<Switch> system-view
[Switch] rrpp domain 1
[Switch-rrpp-domain1] timer hello-timer 2 fail-timer 7
```

5. Smart Link commands

5.1. Smart Link commands

5.1.1. display smart-link flush

Use **display smart-link flush** to display information about the received flush messages.

Syntax

display smart-link flush

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about the received flush messages.

```
<Switch> display smart-link flush
 Received flush packets                          : 10
 Receiving interface of the last flush packet    : GigabitEthernet1/0/1
 Receiving time of the last flush packet         : 19:19:03 2012/04/21
 Device ID of the last flush packet              : 000f-e200-8500
 Control VLAN of the last flush packet           : 1
```

Table 5-1 Command output

Field	Description
Received flush packets	Total number of received flush messages.
Receiving interface of the last flush packet	Port that received the last flush message.
Receiving time of the last flush packet	Time when the last flush message was received.
Device ID of the last flush packet	Device ID carried in the last flush message.
Control VLAN of the last flush packet	Control VLAN ID carried in the last flush message.

Related commands

reset smart-link statistics

5.1.2. display smart-link group

Use **display smart-link group** to display information about the specified or all smart link groups.

Syntax

display smart-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

all: Displays information about all smart link groups.

Examples

Display information about smart link group 1.

```
<Switch> display smart-link group 1
Smart link group 1 information:
  Device ID       : 0011-2200-0001
  Preemption mode : None
  Preemption delay: 1(s)
  Control VLAN    : 1
  Protected VLAN  : Reference Instance 2, 4

  Member                  Role      State    Flush-count     Last-flush-time
  ------------------------------------------------------------------------------
  GE1/0/1                 PRIMARY   ACTIVE   1               16:45:20 2012/04/21
  GE1/0/2                 SECONDARY STANDBY  2               16:37:20 2012/04/21
```

Table 5-2 Command output

Field	Description
Preemption mode	Preemption mode: • **None**—Preemption disabled. • **Role**—Role preemption mode. • **Speed**—**Speed preemption mode.**
Preemption delay	Preemption delaytime, in seconds.
Control-VLAN	Control VLAN ID.
Protected VLAN	Protected VLANs of the smart link group. Referenced Multiple Spanning Tree Instances (MSTIs) are displayed. To view the VLANs mapped to the referenced MSTIs, use the **display stp region-configuration** command.
Member	Member port of the smart link group.
Role	Port role: primary or secondary.
State	Port state: active, down, or standby.
Flush-count	Number of transmitted flush messages.
Last-flush-time	Time when the last flush message was transmitted (NA indicates that no flush message has been transmitted).

5.1.3. flush enable

Use **flush enable** to enable flush update.

Use **undo flush enable** to disable flush update.

Syntax

flush enable [**control-vlan** *vlan-id*]

undo flush enable

Default

Flush update is enabled for smart link groups, and VLAN 1 is used for flush message transmission.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

control-vlan *vlan-id*: Specifies the control VLAN used for transmitting flush messages. The *vlan-id* argument represents the control VLAN ID and is in the range of 1 to 4094.

Usage guidelines

You must configure different control VLANs for different smart link groups.

- Make sure the configured control VLAN already exists, and assign the smart link group member ports to the control VLAN.
- The control VLAN of a smart link group must also be one of its protected VLANs. Do not remove the control VLAN. Otherwise, flush messages cannot be sent correctly.

Examples

Disable flush update for smart link group 1.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1] undo flush enable
```

Related commands

smart-link flush enable

5.1.4. port

Use **port** to assign a port to a smart link group and specify the port role.

Use **undo port** to remove a port from a smart link group.

Syntax

port *interface-type interface-number* { **primary** | **secondary** }

undo port *interface-type interface-number*

Default

No member ports exist in a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a port by its type and number, which can be a Layer 2 Ethernet interface or Layer 2 aggregate interface.

primary: Specifies a port as the primary port.

secondary: Specifies a port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature, and RRPP on the ports you want to add to the smart link group. You cannot enable the spanning tree feature, or RRPP on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can also assign a port to a smart link group by using the **port smart-link group** command in interface view.

Examples

Configure GigabitEthernet 1/0/1 as the secondary port of smart link group 1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo stp enable
[Switch-GigabitEthernet1/0/1] quit
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 0
[Switch-smlk-group1] port gigabitethernet 1/0/1 secondary
```

Related commands

port smart-link group

5.1.5. port smart-link group

Use **port smart-link group** to assign a port to a smart link group and specify the port role.

Use **undo port smart-link group** to remove a port from a smart link group.

Syntax

port smart-link group *group-id* { **primary** | **secondary** }

undo port smart-link group *group-id*

Default

A port is not a smart link group member.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

primary: Specifies the port as the primary port.

secondary: Specifies the port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature, and RRPP on the ports you want to add to the smart link group. You cannot enable the spanning tree feature, or RRPP on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can assign a port to a smart link group by using the **port** command in smart link group view.

Examples

Configure GigabitEthernet 1/0/1 as the primary port of smart link group 1.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 0
[Switch-smlk-group1] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo stp enable
[Switch-GigabitEthernet1/0/1] port smart-link group 1 primary
```

Configure Layer 2 aggregate interface 1 as the primary port of smart link group 1.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 0
[Switch-smlk-group1] quit
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] undo stp enable
[Switch-Bridge-Aggregation1] port smart-link group 1 primary
```

Related commands

port

5.1.6. port smart-link group track

Use **port smart-link group track** to configure the collaboration between a smart link group member port and a track entry.

Use **undo port smart-link group track** to remove the collaboration between a smart link group member port and a track entry.

Syntax

port smart-link group *group-id* **track** *track-entry-number*

undo port smart-link group *group-id* **track** *track-entry-number*

Default

Smart link group member ports do not collaborate with track entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

track-entry-number: Specifies the ID of a track entry that has been associated with the CC function of CFD.

Usage guidelines

Smart Link collaborates with link detection protocols through track entries. It supports only the CC function of CFD to implement link detection. To associate the CC function of CFD with a track entry, use the **track cfd** command.

Before configuring the collaboration between Smart Link and Track on a port, make sure the port has been added to the specified smart link group.

Examples

Configure the collaboration between GigabitEthernet 1/0/1, the primary port of smart link group 1, and the CC function of CFD through track entry 1 to detect the link status.

```
<Switch> system-view
[Switch] track 1 cfd cc service-instance 100 mep 2
[Switch-track-1] quit
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 0
[Switch-smlk-group1] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo stp enable
[Switch-GigabitEthernet1/0/1] port smart-link group 1 primary
[Switch-GigabitEthernet1/0/1] port smart-link group 1 track 1
```

Configure the collaboration between bridge-aggregation 1, the primary port of smart link group 1, and the CC function of CFD through track entry 1 to detect the link status.

```
<Switch> system-view
[Switch] track 1 cfd cc service-instance 100 mep 2
[Switch-track-1] quit
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 0
[Switch-smlk-group1] quit
```

```
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] undo stp enable
[Switch-Bridge-Aggregation1] port smart-link group 1 primary
[Switch-Bridge-Aggregation1] port smart-link group 1 track 1
```

Related commands

track cfd

5.1.7. preemption delay

Use **preemption delay** to set the preemption delay.

Use **undo preemption delay** to restore the default.

Syntax

preemption delay *delay*

undo preemption delay

Default

The preemption delay is 1 second.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

delay: Specifies the preemption delay in the range of 0 to 300 seconds.

Usage guidelines

Preemption delay is the period of time that the primary port waits before taking over to collaborate with the switchover of upstream devices.

The preemption delay configuration takes effect only after a preemption mode is configured.

Examples

Enable role preemption and set the preemption delay to 10 seconds.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1] preemption mode role
[Switch-smlk-group1] preemption delay 10
```

Related commands

preemption mode

5.1.8. preemption mode

Use **preemption mode** to configure a preemption mode for a smart link group.

Use **undo preemption mode** to restore the default.

Syntax

preemption mode role

undo preemption mode

Default

No preemption mode is configured for a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

role: Specifies the role preemption mode, which enables the primary port to transition to forwarding state after the primary link recovers.

Examples

Configure the role preemption mode.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1] preemption mode role
```

5.1.9. protected-vlan

Use **protected-vlan** to configure protected VLANs for a smart link group.

Use **undo protected-vlan** to remove the protected VLAN of a smart link group.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

A smart link group does not have protected VLANs.

Views

Smart link group view

Predefined user roles

network-admin

Parameters

reference-instance *instance-id-list*: Specifies a protected VLANs.

- When the spanning tree mode is MSTP, the *instance-id-list* argument is space-separated list of up to 10 MSTI items. Each item specifies an MSTI ID or a range of MSTI IDs in the form of *instance-id 1* **to** *instance-id 2*. The value range for MSTI IDs is 0 to 4094. 0 represents the common internal spanning tree (CIST). The *instance-id 2* must be equal to or greater than *instance-id 1*. You can use the **display stp region-configuration** command to display instance-to-VLAN mappings.
- When the spanning tree mode is PVST, the instance-id-list argument is a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of instance-id 1 to instance-id 2. The value range for VLAN IDs is 1 to 4094.

Usage guidelines

You must configure all VLANs to which the member ports of a smart link group belongs as protected VLANs.

If the VLAN-to-MSTI mappings change, the protected VLANs change.

To remove protected VLAN configuration, follow these restrictions and guidelines:

- In MSTP mode, if you specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command removes configuration of VLANs mapped to the specified MSTIs. If you do not specify the **reference-instance** *instance-id-list* option, the command removes configuration of all protected VLANs.
- In PVST mode, if you specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command removes configuration of the specified VLANs. If you do not specify the **reference-instance** *instance-id-list* option, the command removes configuration of all protected VLANs.
- If a smart link group has member ports, you cannot remove protected VLAN configuration. If a smart link group does not have member ports, you can remove protected VLAN configuration.

Examples

Map VLANs 1 through 30 to MSTI 1, and activate the MST region configuration. Configure the VLANs mapped to MSTI 1 as the protected VLANs of smart link group 1.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] instance 1 vlan 1 to 30
[Switch-mst-region] active region-configuration
[Switch-mst-region] quit
[Switch] smart-link group 1
[Switch-smlk-group1] protected-vlan reference-instance 1
```

Related commands

display stp region-configuration (*Layer 2—LAN Switching Command Reference*)

smart-link group

5.1.10. reset smart-link statistics

Use **reset smart-link statistics** to clear statistics about flush messages.

Syntax

reset smart-link statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear statistics about flush messages.

```
<Switch> reset smart-link statistics
```

Related commands

display smart-link flush

5.1.11. smart-link flush enable

Use **smart-link flush enable** to enable flush message receiving.

Use **undo smart-link flush enable** to disable flush message receiving.

Syntax

smart-link flush enable [**control-vlan** *vlan-id-list*]

undo smart-link flush enable [**control-vlan** *vlan-id-list*]

Default

Flush message receiving is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

control-vlan *vlan-id-list*: Specifies a space-separated list of up to 10 control VLAN items. Each item specifies a control VLAN ID or a range of control VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for the *vlan-id* argument is 1 to 4094. The *vlan-id2* must be equal to or greater than *vlan-id1*. The default value for the *vlan-id-list* argument is 1.

Examples

Enable GigabitEthernet 1/0/1 to receive flush messages.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] smart-link flush enable
```

Enable Layer 2 aggregate interface 1 to receive flush messages.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] smart-link flush enable
```

Related commands

flush enable

5.1.12. smart-link group

Use **smart-link group** to create a smart link group and enter its view, or enter the view of an existing smart link group.

Use **undo smart-link group** to remove a smart link group.

Syntax

smart-link group *group-id*

undo smart-link group *group-id*

Default

No smart link groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a smart link group ID. The value range for this argument is 1 to 48.

Usage guidelines

You cannot remove a smart link group with member ports.

Examples

Create smart link group 1 and enter its view.

```
<Switch> system-view
[Switch] smart-link group 1
[Switch-smlk-group1]
```

6. Monitor Link commands

6.1. Monitor Link commands

6.1.1. display monitor-link group

Use **display monitor-link group** to display information about monitor link groups.

Syntax

display monitor-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a monitor link group by its ID. The value range for the *group-id* argument is 1 to 16.

all: Specifies all monitor link groups.

Usage guidelines

This command does not display information about ports that belong to a link aggregation group.

Examples

Display information about all monitor link groups.

```
<Switch> display monitor-link group all
Monitor link protocol status: Disabled
Monitor link group 1 information:
  Group status     : N/A
  Downlink up-delay: 0(s)
  Last-up-time     : -
  Last-down-time   : -
  Up-port-threshold: 1

  Member                    Role       Status
  ------------------------------------------
  GE1/0/1                   UPLINK     UP
  GE1/0/2                   DOWNLINK   UP
```

Table 6-1 Command output

Field	Description
Monitor link protocol status	Whether Monitor Link is enabled: • Enabled. • Disabled.

Field	Description
Group status	Monitor link group status: • **DOWN**. • **UP**. • **N/A**—Monitor Link is disabled globally. The monitor link group does not operate.
Downlink up-delay	Switchover delay of the downlink interfaces in the monitor link group, in seconds.
Last-up-time	Last time when the monitor link group came up.
Last-down-time	Last time when the monitor link group went down.
Up-port-threshold	Uplink interface threshold for triggering monitor link group state switchover.
Member	Member interfaces of the monitor link group.
Role	Interface role, which can be uplink interface or downlink interface.
Status	Member interface state, which can be up or down.

6.1.2. monitor-link group

Use **monitor-link group** to create a monitor link group and enter its view, or enter the view of an existing monitor link group.

Use **undo monitor-link group** to remove a monitor link group.

Syntax

monitor-link group *group-id*

undo monitor-link group *group-id*

Default

No monitor link groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a monitor link group ID. The value range for the *group-id* argument is 1 to 16.

Examples

Create monitor link group 1 and enter its view.

```
<Switch> system-view
[Switch] monitor-link group 1
[Switch-mtlk-group1]
```

6.1.3. port

Use **port** to assign an interface to a monitor link group.

Use **undo port** to remove an interface from a monitor link group.

Syntax

port *interface-type interface-number* { **downlink** | **uplink** }

undo port *interface-type interface-number*

Default

No member interfaces exist in a monitor link group.

Views

Monitor link group view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface by its type.

interface-number: Specifies an interface by its number.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port monitor-link group** command in interface view.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Switch> system-view
[Switch] monitor-link group 1
[Switch-mtlk-group1] port gigabitethernet 1/0/1 uplink
[Switch-mtlk-group1] port gigabitethernet 1/0/2 downlink
```

Related commands

port monitor-link group

6.1.4. port monitor-link group

Use **port monitor-link group** to assign an interface to a monitor link group.

Use **undo port monitor-link group** to remove an interface from a monitor link group.

Syntax

port monitor-link group *group-id* { **downlink** | **uplink** }

undo port monitor-link group *group-id*

Default

An interface is not a monitor link group member.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a monitor link group by its ID. The value range for the *group-id* argument is 1 to 16.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port** command in monitor link group view.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Switch> system-view
[Switch] monitor-link group 1
[Switch-mtlk-group1] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port monitor-link group 1 uplink
[Switch-GigabitEthernet1/0/1] quit
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] port monitor-link group 1 downlink
```

7. VRRP commands

VRRP does not take effect on member ports of aggregation groups.

7.1. IPv4 VRRP commands

7.1.1. display vrrp

Use **display vrrp** to display the states of IPv4 VRRP groups.

Syntax

display vrrp [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

verbose: Displays detailed IPv4 VRRP group information. If you do not specify the **verbose** keyword, the command displays brief IPv4 VRRP group information.

Usage guidelines

If no interface or VRRP group is specified, this command displays the states of all IPv4 VRRP groups.

If only an interface is specified, this command displays the states of all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command displays the states of the specified IPv4 VRRP group on the specified interface.

Examples

Display brief information about all IPv4 VRRP groups on the device when VRRP operates in standard mode.

```
<Switch> display vrrp
IPv4 Virtual Router Information:
 Running Mode      : Standard
 Gratuitous ARP sending interval : 120 sec
 Total number of virtual routers : 1
 Interface          VRID  State        Running Adver   Auth     Virtual
                                        Pri     Timer   Type        IP
 ------------------------------------------------------------------------
```

```
Vlan2              1      Master       150      100      Simple    1.1.1.1
```

Table 7-1 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
Gratuitous ARP sending interval	Sending interval for gratuitous ARP packets.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Adver Timer	VRRP advertisement sending interval in centiseconds.
Auth Type	Authentication type: • **None**—No authentication. • **Simple**—Simple text authentication. • **MD5**—MD5 authentication.
Virtual IP	Virtual IP address of the VRRP group.

Display detailed information about all IPv4 VRRP groups on the device when VRRP operates in standard mode.

```
<Switch> display vrrp verbose
IPv4 Virtual Router Information:
 Running Mode      : Standard
 Gratuitous ARP sending interval : 120 sec
 Total number of virtual routers : 2

  Config Role      : Subordinate
  Follow Name      : abc
```

Table 7-2 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
Gratuitous ARP sending interval	Sending interval for gratuitous ARP packets.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using

Field	Description
	the **vrrp vrid priority** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.
Auth Type	Authentication type: • **None**—No authentication. • **Simple**—Simple text authentication. • **MD5**—MD5 authentication.
Key	Authentication key, which is not displayed if no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.
Virtual MAC	Virtual MAC address of the VRRP group's virtual IP address, which is displayed when the router is the master.
Master IP	Primary IP address of the interface where the master resides.
Config Role	The configured role of the VRRP group to which the router belongs. • **Master**. • **Subordinate**.
Name	Master group name assigned to the VRRP group.
Follow Name	Name of the master VRRP group that the VRRP group follows.
VRRP Track Information	Track entry information. This field is displayed only after you configure the **vrrp vrid track** command.
Track Object	Track entry which is associated with the VRRP group.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the status of the associated track entry changes to the Negative state.
Switchover	Switchover mode. When the status of the associated track entry changes to the Negative state, the backup immediately becomes the master.

7.1.2. display vrrp statistics

Use **display vrrp statistics** to display statistics for IPv4 VRRP groups.

Syntax

display vrrp statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command displays statistics for all IPv4 VRRP groups.

If only an interface is specified, this command displays statistics for all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command displays statistics for the specified IPv4 VRRP group on the specified interface.

Examples

Display statistics for all IPv4 VRRP groups when VRRP operates in standard mode.

```
<Switch> display vrrp statistics
 Interface               : Vlan-interface2
 VRID                    : 1
 CheckSum Errors         : 0          Version Errors               : 0
 Invalid Pkts Rcvd  :      0          Unexpected Pkts Rcvd         : 0
 IP TTL Errors           : 0          Advertisement Interval Errors : 0
 Invalid Auth Type       : 0          Auth Failures                : 0
 Packet Length Errors    : 0          Auth Type Mismatch           : 0
 Become Master           : 1          Address List Errors          : 0
 Adver Rcvd              : 0          Priority Zero Pkts Rcvd      : 0
 Adver Sent              : 807        Priority Zero Pkts Sent      : 0
IP Owner Conflicts      : 0

 Global statistics
 CheckSum Errors         : 0
 Version Errors          : 0
 VRID Errors             : 0
```

Table 7-3 Command output (in standard mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.

Field	Description
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
IP TTL Errors	Number of packets with TTL errors.
Auth Failures	Number of packets with authentication failures.
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
Adver Rcvd	Number of received advertisements.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
Adver Sent	Number of sent advertisements.
IP Owner Conflicts	Number of VRRP packets that the local router (IP address owner) has received from conflicting IP address owners.
Global statistics	Global statistics for all VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Related commands

reset vrrp statistics

7.1.3. reset vrrp statistics

Use **reset vrrp statistics** to clear statistics for IPv4 VRRP groups.

Syntax

reset vrrp statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command clears statistics for all IPv4 VRRP groups.

If only an interface is specified, this command clears statistics for all IPv4 VRRP groups on the specified interface.

If both an interface and an IPv4 VRRP group are specified, this command clears statistics for the specified IPv4 VRRP group on the specified interface.

Examples

Clear statistics for all IPv4 VRRP groups on all interfaces.

```
<Switch> reset vrrp statistics
```

Related commands

display vrrp statistics

7.1.4. snmp-agent trap enable vrrp

Use **snmp-agent trap enable vrrp** to enable SNMP notifications for VRRP.

Use **undo snmp-agent trap enable vrrp** to disable SNMP notifications for VRRP.

Syntax

snmp-agent trap enable vrrp [**auth-failure** | **new-master**]

undo snmp-agent trap enable vrrp [**auth-failure** | **new-master**]

Default

SNMP notifications for VRRP are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

auth-failure: Generates notifications as defined in RFC 2787 when the device in a VRRP group receives a VRRP advertisement with the authentication type or key not matching the local configuration.

new-master: Generates notifications as defined in RFC 2787 when the state of a device in a VRRP group changes from Initialize or Backup to Master.

Usage guidelines

To report critical VRRP events to an NMS, enable SNMP notifications for VRRP. For VRRP event notifications to be sent correctly, you must also configure SNMP on the device. For more information

about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Generate notifications as defined in RFC 2787 when the device in a VRRP group receives a VRRP advertisement with the authentication type or key not matching the local configuration.

```
<Switch> system-view
[Switch] snmp-agent trap enable vrrp auth-failure
```

7.1.5. vrrp check-ttl enable

Use **vrrp check-ttl enable** to enable TTL check for IPv4 VRRP packets.

Use **undo vrrp check-ttl enable** to disable TTL check for IPv4 VRRP packets.

Syntax

vrrp check-ttl enable

undo vrrp check-ttl enable

Default

TTL check for IPv4 VRRP packets is enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The master in an IPv4 VRRP group periodically sends VRRP advertisements to declare its presence. The VRRP advertisements are multicast in the local subnet and cannot be forwarded by routers, so the TTL value is not changed. When the master sends VRRP advertisements, it sets the TTL value to 255. If you enable TTL check, the backups drop the VRRP advertisements with TTL other than 255, preventing attacks from other subnets.

Devices from different vendors might implement VRRP differently. When the device is interoperating with devices of other vendors, TTL check on VRRP packets might result in unexpected dropping of packets. In this scenario, use the **undo vrrp check-ttl enable** command to disable TTL check on VRRP packets.

Examples

Disable TTL check for IPv4 VRRP packets.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] undo vrrp check-ttl enable
```

7.1.6. vrrp dscp

Use **vrrp dscp** to set a DSCP value for VRRP packets.

Use **undo vrrp dscp** to restore the default.

Syntax

vrrp dscp *dscp-value*

undo vrrp dscp

Default

The DSCP value for VRRP packets is 48.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value for VRRP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value identifies the packet priority during transmission. A greater DSCP value means a higher packet priority.

Examples

Set the DSCP value to 30 for VRRP packets.

```
<Switch> system-view
[Switch] vrrp dscp 30
```

7.1.7. vrrp state-transition-delay

Use **vrrp state-transition-delay** to set the delay time for the IPv4 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

Use **undo vrrp state-transition-delay** to restore the default.

Syntax

vrrp state-transition-delay *delay-value*

undo vrrp state-transition-delay

Default

The delay time is 0 seconds for the IPv4 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay-value: Specifies delay time for the IPv4 VRRP group to transition from **Initialize** to **Master** or **Backup** state, in the range of 0 to 60 seconds.

Usage guidelines

Typically, an IPv4 VRRP group immediately transitions from **Initialize** to **Master** or **Backup** state when the interface where the IPv4 VRRP group resides comes up. If the device restarts or the interface state changes frequently, the IPv4 VRRP group state might be unstable, and the VRRP group operation might be affected. After you configure this command, a state transition delay timer is started when the interface comes up. If the interface goes down before the timer expires, the timer is stopped, and the IPv4 VRRP group stays in **Initialize** state. The timer is restarted when the interface

comes up again. When the timer expires, the IPv4 VRRP group transitions from **Initialize** to **Master** or **Backup** state.

Examples

On VLAN-interface 2, set the delay time to 5 seconds for the IPv4 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] vrrp state-transition-delay 5
```

7.1.8. vrrp version

Use **vrrp version** to specify the version of IPv4 VRRP on an interface.

Use **undo vrrp version** to restore the default.

Syntax

vrrp version *version-number*

undo vrrp version

Default

VRRPv3 is used.

Views

Interface view

Predefined user roles

network-admin

Parameters

version-number: Specifies a VRRP version. The version number is 2 or 3, where 2 indicates VRRPv2 (described in RFC 3768), and 3 indicates VRRPv3 (described in RFC 5798).

Usage guidelines

The version of VRRP on all routers in an IPv4 VRRP group must be the same.

Examples

Specify VRRPv2 to run on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] vrrp version 2
```

7.1.9. vrrp vrid

Use **vrrp vrid** to create an IPv4 VRRP group and assign a virtual IP address to it, or to assign a virtual IP address to an existing IPv4 VRRP group.

Use **undo vrrp vrid** to remove all configurations of an IPv4 VRRP group, or to remove a virtual IP address from an IPv4 VRRP group.

Syntax

vrrp vrid *virtual-router-id* **virtual-ip** *virtual-address*

undo vrrp vrid *virtual-router-id* [**virtual-ip** [*virtual-address*]]

Default

No IPv4 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IP address. You cannot specify the virtual IP address as any of the following IP addresses:

- All-zero address (0.0.0.0).
- Broadcast address (255.255.255.255).
- Loopback address.
- IP address of other than Class A, Class B, and Class C.
- Invalid IP address (for example, 0.0.0.1).

If you do not specify the *virtual-address* argument, the **undo vrrp vrid** command removes all virtual IP addresses from the specified IPv4 VRRP group.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IP addresses to an IPv4 VRRP group. An IPv4 VRRP group can have a maximum of 16 virtual IP addresses.

An IPv4 VRRP group without virtual IP addresses configured can exist on a device provided that other settings (for example, priority and preemption mode) are available. Such a VRRP group stays in inactive state and does not function.

The virtual IP address of an IPv4 VRRP group and the downlink interface IP addresses of the VRRP group members must be in the same subnet. Otherwise, the hosts in the subnet might fail to access external networks.

Examples

Create IPv4 VRRP group 1 and assign virtual IP address 10.10.10.10 to the VRRP group. Then assign virtual IP address 10.10.10.11 to the VRRP group.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 virtual-ip 10.10.10.10
[Switch-Vlan-interface2] vrrp vrid 1 virtual-ip 10.10.10.11
```

Related commands

display vrrp

7.1.10. vrrp vrid authentication-mode

Use **vrrp vrid authentication-mode** to configure the authentication mode and the authentication key for an IPv4 VRRP group to send and receive VRRP packets.

Use **undo vrrp vrid authentication-mode** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **authentication-mode** { **md5** | **simple** } { **cipher** | **plain** } *string*

undo vrrp vrid *virtual-router-id* **authentication-mode**

Default

Authentication is disabled when a VRRP group sends and receives VRRP packets.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

md5: Specifies the MD5 authentication mode.

simple: Specifies the simple authentication mode.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 8 characters. Its encrypted form is a case-sensitive string of 1 to 41 characters.

Usage guidelines

To avoid attacks from unauthorized users, VRRP member routers add authentication keys in VRRP packets to authenticate one another. VRRP provides the following authentication modes:

- **simple**—Simple text authentication.

  The sender fills an authentication key into the VRRP packet, and the receiver compares the received authentication key with its local authentication key. If the two authentication keys are the same, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate.
- **md5**—MD5 authentication.

  The sender computes a digest for the VRRP packet by using the authentication key and MD5 algorithm, and saves the result to the authentication header. The receiver performs the same operation by using the authentication key and MD5 algorithm, and it compares the result with the content in the authentication header. If the results are the same, the received VRRP packet is legitimate. Otherwise, the received packet is illegitimate.

The MD5 authentication is more secure than the simple text authentication, but it costs more resources.

IMPORTANT:

- You can configure different authentication modes and authentication keys for the VRRP groups on an interface. However, members of the same VRRP group must use the same authentication mode and authentication key.
- For VRRPv3, this command does not take effect because VRRPv3 does not support authentication.

Examples

Set the authentication mode to **simple** and the authentication key to **Sysname** for VRRP group 1 on VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 authentication-mode simple plain Sysname
```

Related commands

display vrrp

vrrp version

7.1.11. vrrp vrid preempt-mode

Use **vrrp vrid preempt-mode** to enable the preemptive mode for the device in an IPv4 VRRP group and set the preemption delay.

Use **undo vrrp vrid preempt-mode** to disable the preemptive mode for the device in an IPv4 VRRP group.

Use **undo vrrp vrid preempt-mode delay** to restore the default preemption delay.

Syntax

vrrp vrid *virtual-router-id* **preempt-mode** [**delay** *delay-value*]

undo vrrp vrid *virtual-router-id* **preempt-mode** [**delay**]

Default

The device operates in preemptive mode and the preemption delay is 0 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

delay *delay-value*: Specifies the preemption delay in the range of 0 to 180000 in centiseconds.

Usage guidelines

In non-preemptive mode, the master router acts as the master as long as it operates correctly, even if a backup is assigned a higher priority later. The non-preemptive mode helps avoid frequent switchover between the master and backups.

In preemptive mode, a backup sends VRRP advertisements when it detects that it has a higher priority than the master. Then the backup takes over as the master and the previous master becomes a backup. This mechanism ensures that the master is always the device with the highest priority.

You can configure the VRRP preemption delay for the following purposes:

- Avoid frequent state changes among members in a VRRP group.
- Provide the backups with enough time to collect information (such as routing information).

A backup does not immediately become the master after it receives an advertisement with a lower priority than the local priority. Instead, it waits for a period of time before taking over as the master.

Examples

Enable the preemptive mode for the device in VRRP group 1, and set the preemption delay to 5000 centiseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 preempt-mode delay 5000
```

Related commands

display vrrp

7.1.12. vrrp vrid priority

Use **vrrp vrid priority** to set the priority of the device in an IPv4 VRRP group.

Use **undo vrrp vrid priority** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **priority** *priority-value*

undo vrrp vrid *virtual-router-id* **priority**

Default

The priority of a device in an IPv4 VRRP group is 100.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

priority-value: Specifies a priority value in the range of 1 to 254. A higher value indicates a higher priority.

Usage guidelines

VRRP determines the role (master or backup) of each device in a VRRP group by priority. A device with a higher priority is more likely to become the master.

Priorities 1 to 254 are configurable. Priority 0 is reserved for special uses, and priority 255 is for the IP address owner. The IP address owner in a VRRP group always has a running priority of 255 and acts as the master as long as it operates correctly.

Examples

Set the priority of the switch to 150 in VRRP group 1 on VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 priority 150
```

vrrp vrid track

7.1.13. vrrp vrid timer advertise

Use **vrrp vrid timer advertise** to set the interval at which the master in an IPv4 VRRP group sends VRRP advertisements.

Use **undo vrrp vrid timer advertise** to restore the default.

Syntax

vrrp vrid *virtual-router-id* **timer advertise** *adver-interval*

undo vrrp vrid *virtual-router-id* **timer advertise**

Default

The master in an IPv4 VRRP group sends VRRP advertisements at an interval of 100 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

adver-interval: Specifies an interval for the master in the specified IPv4 VRRP group to send VRRP advertisements. The value range for this argument is 10 to 4095 centiseconds. For VRRPv2, the value of the *adver-interval* argument can only be a multiple of 100. For example, if you configure values in the range of 10 to 100, 101 to 200, and 4001 to 4095, the actual values are 100, 200, and 4100, respectively. For VRRPv3, the configured value for the *adver-interval* argument takes effect.

Usage guidelines

The master in an IPv4 VRRP group periodically sends VRRP advertisements to declare its presence. You can use this command to configure the interval at which the master sends VRRP advertisements.

As a best practice to maintain system stability, set the VRRP advertisement interval to be greater than 100 centiseconds.

In VRRPv2, all routers in an IPv4 VRRP group must have the same interval for sending VRRP advertisements.

In VRRPv3, the routers in an IPv4 VRRP group can have different intervals for sending VRRP advertisements. The master in the VRRP group sends VRRP advertisements at the specified interval and carries the interval attribute in the advertisements. After a backup receives the advertisement, it records the interval in the advertisement. If the backup does not receive any VRRP advertisement when the timer (3 × recorded interval + Skew_Time) expires, it regards the master as failed and takes over.

Large network traffic might disable a backup from receiving VRRP advertisements from the master within the specified timer and trigger an unexpected master switchover. To solve this problem, you can use this command to set a larger interval.

Examples

Configure the master in IPv4 VRRP group 1 to send VRRP advertisements at an interval of 500 centiseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 timer advertise 500
```

Related commands

display vrrp

7.1.14. vrrp vrid track

Use **vrrp vrid track** to associate a VRRP group in a VRRP group with a track entry.

Use **undo vrrp vrid track** to remove the association between a VRRP group in a VRRP group and a track entry.

Syntax

vrrp vrid *virtual-router-id* **track** *track-entry-number* { **priority reduced** [*priority-reduced*] | **switchover** }

undo vrrp vrid *virtual-router-id* **track** [*track-entry-number*] [**priority reduced** | **switchover**]

Default

A VRRP group in a VRRP group are not associated with any track entries.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group number in the range of 1 to 255.

track-entry-number: Specifies a track entry by its number in the range of 1 to 1024.

priority reduced [*priority-reduced*]: Reduces the priority of the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *priority-reduced* argument is 1 to 255, and the default value is 10.

switchover: Enables the router in backup state to take over as the master immediately after the specified track entry changes to the Negative state.

Usage guidelines

When the associated track entry changes to the Negative state, one of the following events occurs depending on your configuration:

- The priority of the router in the VRRP group decreases by a specified value.
- The router immediately takes over as the master if it is a backup.

When the track entry changes from Negative to Positive or NotReady, one of the following events occurs:

- The router automatically restores its priority.
- The failed master router becomes the master again.

Before executing this command, create a VRRP group on the interface and assign a virtual IP address to the VRRP group.

You can create a track entry by using the **track** command before or after you associate it with a VRRP group in a VRRP group. For more information about configuring track entries, see *High Availability Configuration Guide*.

If no track entry is specified, the **undo vrrp vrid track** command removes all associations between track entries and the VRRP group in the VRRP group.

The **vrrp vrid track priority reduced** command and the **vrrp vrid track switchover** command do not take effect on an IP address owner. If you configure the command on an IP address owner, the configuration takes effect after the router changes to be a non-IP address owner.

Examples

Associate VRRP group 1 on VLAN-interface 2 with track entry 1 and decrease the router priority by 50 when the state of track entry 1 changes to Negative.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp vrid 1 track 1 priority reduced 50
```

7.2. IPv6 VRRP commands

7.2.1. display vrrp ipv6

Use **display vrrp ipv6** to display the states of IPv6 VRRP groups.

Syntax

display vrrp ipv6 [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

verbose: Displays detailed IPv6 VRRP group information. If you do not specify the **verbose** keyword, the command displays brief IPv6 VRRP group information.

Usage guidelines

If no interface or VRRP group is specified, this command displays the states of all IPv6 VRRP groups.

If only an interface is specified, this command displays the states of all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command displays the states of the specified IPv6 VRRP group on the specified interface.

Examples

Display brief information about all IPv6 VRRP groups on the device when VRRP operates in standard mode.

```
<Switch> display vrrp ipv6
IPv6 Virtual Router Information:
 Running Mode      : Standard
 ND sending interval : 120 sec
 Total number of virtual routers : 1
 Interface          VRID  State        Running Adver   Auth     Virtual
                                        Pri     Timer   Type       IP
 ------------------------------------------------------------------------
 Vlan2              1     Master       150     100     None     FE80::1
```

Table 7-4 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
ND sending interval	Sending interval for ND packets.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Adver Timer	VRRP advertisement sending interval in centiseconds.
Auth Type	Authentication type. Only **none** is available, which means no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.

Display detailed information about all IPv6 VRRP groups on the device when VRRP operates in standard mode.

```
<Switch> display vrrp ipv6 verbose
IPv6 Virtual Router Information:
 Running Mode      : Standard
 ND sending interval : 120 sec
 Total number of virtual routers : 2

  Config Role      : Subordinate
  Follow Name      : abc
```

Table 7-5 Command output (in standard mode)

Field	Description
Running Mode	VRRP operating mode (standard mode).
ND sending interval	Sending interval for ND packets. This field is displayed only after you configure the **vrrp ipv6 send-nd** command.
Total number of virtual routers	Total number of VRRP groups.
Interface	Interface where the VRRP group is configured.
VRID	Virtual router ID (VRRP group number).
Adver Timer	VRRP advertisement sending interval in centiseconds.

Field	Description
Admin Status	Administrative status: **Up** or **Down**.
State	State of the router in the VRRP group: • **Master**—The router is the master in the VRRP group. • **Backup**—The router is the backup in the VRRP group. • **Initialize**—The router is in **Initialize** state. • **Inactive**—The router is in **Inactive** state, for example, when the router is not assigned a virtual IP address by using the **vrrp vrid** command.
Config Pri	Configured priority of the router, which is configured by using the **vrrp ipv6 vrid priority** command.
Running Pri	Current priority of the router. When a track entry is associated with a VRRP group on the router, the router's priority changes when the track entry's status changes.
Preempt Mode	Preemptive mode: • **Yes**. • **No**.
Delay Time	Preemption delay in centiseconds.
Become Master	Time (in milliseconds) that a backup router has to wait before it becomes the master. This field is displayed only when the router is a backup.
Auth Type	Authentication type. Only **none** is available, which means no authentication is required.
Virtual IP	Virtual IP address of the VRRP group.
Virtual MAC	Virtual MAC address of the VRRP group's virtual IP address, which is displayed when the router is the master.
Master IP	Link-local address of the interface where the master resides.
Config Role	The configured role of the IPv6 VRRP group to which the router belongs. • **Master**. • **Subordinate**.
Name	Master group name assigned to the IPv6 VRRP group.
Follow Name	Name of the master VRRP group that the IPv6 VRRP group follows.
VRRP Track Information	Track entry information. This field is displayed only after you configure the **vrrp ipv6 vrid track** command.
Track Object	Track entry which is associated with the VRRP group.
State	Track entry state: • **Negative**. • **Positive**. • **NotReady**.
Pri Reduced	Value by which the priority decreases when the state of the associated track entry becomes Negative.
Switchover	Switchover mode. When the state of the associated track entry becomes Negative, the backup immediately becomes the

Field	Description
	master.

7.2.2. display vrrp ipv6 statistics

Use **display vrrp ipv6 statistics** to display statistics for IPv6 VRRP groups.

Syntax

display vrrp ipv6 statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command displays statistics for all IPv6 VRRP groups.

If only an interface is specified, this command displays statistics for all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command displays statistics for the specified IPv6 VRRP group on the specified interface.

Examples

Display statistics for all IPv6 VRRP groups when VRRP operates in standard mode.

```
<Switch> display vrrp ipv6 statistics
 Interface              : Vlan-interface2
 VRID                   : 1
 CheckSum Errors        : 0          Version Errors               : 0
 Invalid Pkts Rcvd      : 0          Unexpected Pkts Rcvd         : 0
 Hop Limit Errors       : 0          Advertisement Interval Errors : 0
 Invalid Auth Type      : 0          Auth Failures                : 0
 Packet Length Errors   : 0          Auth Type Mismatch           : 0
 Become Master          : 1          Address List Errors          : 0
 Adver Rcvd             : 0          Priority Zero Pkts Rcvd      : 0
 Adver Sent             : 425        Priority Zero Pkts Sent      : 0
IP Owner Conflicts     : 0

 Global statistics
 CheckSum Errors        : 0
```

```
Version Errors          : 0
VRID Errors             : 0
```

Table 7-6 Command output (in standard mode)

Field	Description
Interface	Interface where the VRRP group is configured.
VRID	VRRP group number.
CheckSum Errors	Number of packets with checksum errors.
Version Errors	Number of packets with version errors.
Invalid Pkts Rcvd	Number of received packets of invalid packet types.
Unexpected Pkts Rcvd	Number of received unexpected packets.
Advertisement Interval Errors	Number of packets with advertisement interval errors.
Hop Limit Errors	Number of packets with hop limit errors.
Auth Failures	Number of packets with authentication failures.
Invalid Auth Type	Number of packets with authentication failures because of invalid authentication types.
Auth Type Mismatch	Number of packets with authentication failures because of mismatching authentication types.
Packet Length Errors	Number of packets with VRRP packet length errors.
Address List Errors	Number of packets with virtual IP address list errors.
Become Master	Number of times that the router has been elected as the master.
Priority Zero Pkts Rcvd	Number of received advertisements with the router priority of 0.
Adver Rcvd	Number of received advertisements.
Priority Zero Pkts Sent	Number of sent advertisements with the router priority of 0.
Adver Sent	Number of sent advertisements.
IP Owner Conflicts	Number of VRRP packets that the local router (IP address owner) has received from conflicting IP address owners.
Global statistics	Global statistics for all IPv6 VRRP groups.
CheckSum Errors	Total number of packets with checksum errors.
Version Errors	Total number of packets with version errors.
VRID Errors	Total number of packets with VRID errors.

Related commands

`reset vrrp ipv6 statistics`

7.2.3. reset vrrp ipv6 statistics

Use **`reset vrrp ipv6 statistics`** to clear statistics for IPv6 VRRP groups.

Syntax

reset vrrp ipv6 statistics [**interface** *interface-type interface-number* [**vrid** *virtual-router-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

vrid *virtual-router-id*: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

Usage guidelines

If no interface or VRRP group is specified, this command clears statistics for all IPv6 VRRP groups.

If only an interface is specified, this command clears statistics for all IPv6 VRRP groups on the specified interface.

If both an interface and an IPv6 VRRP group are specified, this command clears statistics for the specified IPv6 VRRP group on the specified interface.

Examples

Clear statistics for all IPv6 VRRP groups on all interfaces.

```
<Switch> reset vrrp ipv6 statistics
```

Related commands

display vrrp ipv6 statistics

7.2.4. vrrp ipv6 dscp

Use **vrrp ipv6 dscp** to set a DSCP value for IPv6 VRRP packets.

Use **undo vrrp ipv6 dscp** to restore the default.

Syntax

vrrp ipv6 dscp *dscp-value*

undo vrrp ipv6 dscp

Default

The DSCP value for IPv6 VRRP packets is 56.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value for IPv6 VRRP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value identifies the packet priority during transmission. A greater DSCP value means a higher packet priority.

Examples

Set the DSCP value to 30 for IPv6 VRRP packets.

```
<Switch> system-view
[Switch] vrrp ipv6 dscp 30
```

7.2.5. vrrp ipv6 state-transition-delay

Use **vrrp ipv6 state-transition-delay** to set the delay time for the IPv6 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

Use **undo vrrp ipv6 state-transition-delay** to restore the default.

Syntax

vrrp ipv6 state-transition-delay *delay-value*

undo vrrp ipv6 state-transition-delay

Default

The delay time is 0 seconds for the IPv6 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

Views

Interface view

Predefined user roles

network-admin

Parameters

delay-value: Specifies delay time for the IPv6 VRRP group to transition from **Initialize** to **Master** or **Backup** state, in the range of 0 to 60 seconds.

Usage guidelines

Typically, an IPv6 VRRP group immediately transitions from **Initialize** to **Master** or **Backup** state when the interface where the IPv6 VRRP group resides comes up. If the device restarts or the interface state changes frequently, the IPv6 VRRP group state might be unstable, and the VRRP group operation might be affected. After you configure this command, a state transition delay timer is started when the interface comes up. If the interface goes down before the timer expires, the timer is stopped, and the IPv6 VRRP group stays in **Initialize** state. The timer is restarted when the interface comes up again. When the timer expires, the IPv6 VRRP group transitions from **Initialize** to **Master** or **Backup** state.

Examples

Set the delay time to 5 seconds for the IPv6 VRRP group to transition from **Initialize** to **Master** or **Backup** state.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] vrrp ipv6 state-transition-delay 5
```

7.2.6. vrrp ipv6 vrid

Use **vrrp ipv6 vrid** to create an IPv6 VRRP group and assign a virtual IPv6 address to it, or to assign a virtual IPv6 address to an existing IPv6 VRRP group.

Use **undo vrrp ipv6 vrid** to remove all configurations of an IPv6 VRRP group, or to remove a virtual IPv6 address from an IPv6 VRRP group.

Syntax

vrrp ipv6 vrid *virtual-router-id* **virtual-ip** *virtual-address* [**link-local**]

undo vrrp ipv6 vrid *virtual-router-id* [**virtual-ip** [*virtual-address* [**link-local**]]]

Default

No IPv6 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IPv6 address. If you do not specify this option, the **undo vrrp ipv6 vrid** command removes all virtual IPv6 addresses from the specified IPv6 VRRP group.

link-local: Specifies a link-local address as the virtual IPv6 address.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IPv6 addresses to an IPv6 VRRP group. An IPv6 VRRP group can have a maximum of 16 virtual IPv6 addresses.

The first virtual IPv6 address that you assign to an IPv6 VRRP group must be a link-local address, and it must be removed last.

An IPv6 VRRP group can have only one link-local address as its virtual IPv6 address.

An IPv6 VRRP group without virtual IPv6 addresses configured can exist on a device provided that other settings (for example, priority and preemption mode) are available. Such a VRRP group stays in inactive state and does not function.

The virtual IPv6 address of an IPv6 VRRP group and the downlink interface IPv6 address of the VRRP group members must be in the same subnet. Otherwise, the hosts in the subnet might fail to access external networks.

Examples

Create IPv6 VRRP group 1 and assign virtual IPv6 address fe80::10 to the VRRP group. Then assign virtual IPv6 address 1::10 to the VRRP group.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp ipv6 vrid 1 virtual-ip fe80::10 link-local
[Switch-Vlan-interface2] vrrp ipv6 vrid 1 virtual-ip 1::10
```

Related commands

display vrrp ipv6

7.2.7. vrrp ipv6 vrid preempt-mode

Use **vrrp ipv6 vrid preempt-mode** to enable the preemptive mode for the router in an IPv6 VRRP group and set the preemption delay.

Use **undo vrrp ipv6 vrid preempt-mode** to disable the preemptive mode for the router in an IPv6 VRRP group.

Use **undo vrrp ipv6 vrid preempt-mode delay** to restore the default preemption delay.

Syntax

vrrp ipv6 vrid *virtual-router-id* **preempt-mode** [**delay** *delay-value*]

undo vrrp ipv6 vrid *virtual-router-id* **preempt-mode** [**delay**]

Default

The router operates in preemptive mode and the preemption delay is 0 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

delay *delay-value*: Specifies the preemption delay in the range of 0 to 180000 in centiseconds.

Usage guidelines

In non-preemptive mode, the master router acts as the master as long as it operates correctly, even if a backup is assigned a higher priority later. The non-preemptive mode helps avoid frequent switchover between the master and backups.

In preemptive mode, a backup sends VRRP advertisements when it detects that it has a higher priority than the master. Then the backup takes over as the master and the previous master becomes a backup. This mechanism ensures that the master is always the router with the highest priority.

You can configure the VRRP preemption delay for the following purposes:

- Avoid frequent state changes among members in a VRRP group.
- Provide the backups with enough time to collect information (such as routing information).

A backup does not immediately become the master after it receives an advertisement with a lower priority than the local priority. Instead, it waits for a period of time before taking over.

Examples

Enable the preemptive mode for VRRP group 1, and set the preemption delay to 5000 centiseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp ipv6 vrid 10 preempt-mode delay 5000
```

Related commands

display vrrp ipv6

7.2.8. vrrp ipv6 vrid priority

Use **vrrp ipv6 vrid priority** to set the priority of the router in an IPv6 VRRP group.

Use **undo vrrp ipv6 vrid priority** to restore the default.

Syntax

vrrp ipv6 vrid *virtual-router-id* **priority** *priority-value*

undo vrrp ipv6 vrid *virtual-router-id* **priority**

Default

The priority of a router in an IPv6 VRRP group is 100.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

priority-value: Specifies a priority value in the range of 1 to 254. A higher value indicates a higher priority.

Usage guidelines

VRRP determines the role (master or backup) of each router in a VRRP group by priority. A router with a higher priority is more likely to become the master.

Priorities 1 to 254 are configurable. Priority 0 is reserved for special uses, and priority 255 is for the IP address owner. The IP address owner in a VRRP group always has a running priority of 255 and acts as the master as long as it operates correctly.

Examples

Set the priority of the switch to 150 in VRRP group 1 on VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp ipv6 vrid 1 priority 150
```

Related commands

display vrrp ipv6

7.2.9. vrrp ipv6 vrid timer advertise

Use **vrrp ipv6 vrid timer advertise** to set the interval at which the master in an IPv6 VRRP group sends VRRP advertisements.

Use **undo vrrp ipv6 vrid timer advertise** to restore the default.

Syntax

vrrp ipv6 vrid *virtual-router-id* **timer advertise** *adver-interval*

undo vrrp ipv6 vrid *virtual-router-id* **timer advertise**

Default

The master in an IPv6 VRRP group sends VRRP advertisements at an interval of 100 centiseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

adver-interval: Specifies an interval for the master in the specified IPv6 VRRP group to send VRRP advertisements, in the range of 100 to 4095 centiseconds.

Usage guidelines

The master in an IPv6 VRRP group periodically sends VRRP advertisements to declare its presence. You can use this command to set the interval at which the master sends VRRP advertisements.

As a best practice to maintain system stability, set the VRRP advertisement interval to be greater than 100 centiseconds.

The routers in an IPv6 VRRP group can have different intervals for sending VRRP advertisements. The master in the VRRP group sends VRRP advertisements at the specified interval and carries the interval attribute in the advertisements. After a backup receives the advertisement, it records the interval in the advertisement. If the backup does not receive any VRRP advertisement when the timer (3 × VRRP advertisement sending interval + Skew_Time) expires, it regards the master as failed and takes over.

Large network traffic might disable a backup from receiving VRRP advertisements from the master within the specified timer and trigger an unexpected master switchover. To solve this problem, you can use this command to configure a larger interval.

Examples

Configure the master in IPv6 VRRP group 1 to send VRRP advertisements at an interval of 500 centiseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp ipv6 vrid 1 timer advertise 500
```

Related commands

display vrrp ipv6

7.2.10. vrrp ipv6 vrid track

Use **vrrp ipv6 vrid track** to associate an IPv6 VRRP group in an IPv6 VRRP group with a track entry.

Use **undo vrrp ipv6 vrid track** to remove the association between an IPv6 VRRP group in an IPv6 VRRP group and a track entry.

Syntax

vrrp ipv6 vrid *virtual-router-id* **track** *track-entry-number* { **priority reduced** [*priority-reduced*] | **switchover** }

undo vrrp ipv6 vrid *virtual-router-id* **track** [*track-entry-number*] [**priority reduced** | **switchover**]

Default

An IPv6 VRRP group in an IPv6 VRRP group are not associated with any track entries.

Views

Interface view

Predefined user roles

network-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group number in the range of 1 to 255.

track-entry-number: Specifies a track entry by its number in the range of 1 to 1024.

priority reduced [*priority-reduced*]: Reduces the priority of the router in the VRRP group by the specified value when the state of the specified track entry changes to Negative. The value range for the *priority-reduced* argument is 1 to 255, and the default value is 10.

switchover: Enables the router in backup state to take over as the master immediately after the specified track entry changes to the Negative state.

Usage guidelines

When the associated track entry changes to the Negative state, one of the following events occurs depending on your configuration:

- The priority of the router in the VRRP group decreases by a specified value.
- The router immediately takes over as the master if it is a backup.

When the track entry changes from Negative to Positive or NotReady, one of the following events occurs:

- The router automatically restores its priority.
- The failed master router becomes the master again.

Before executing this command, create an IPv6 VRRP group on the interface and assign a virtual IPv6 address to the IPv6 VRRP group.

You can create a track entry by using the **track** command before or after you associate it with an IPv6 VRRP group in an IPv6 VRRP group. For more information about configuring track entries, see *High Availability Configuration Guide*.

If no track entry is specified, the **undo vrrp ipv6 vrid track** command removes all associations between track entries and the IPv6 VRRP group in the IPv6 VRRP group.

The **vrrp ipv6 vrid track priority reduced** command and the **vrrp ipv6 vrid track switchover** command do not take effect on an IP address owner. If you configure the command on an IP address owner, the configuration takes effect after the router changes to be a non-IP address owner.

Examples

Associate IPv6 VRRP group 1 on VLAN-interface 2 with track entry 1 and decrease the router priority by 50 when the state of track entry 1 changes to Negative.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] vrrp ipv6 vrid 1 track 1 priority reduced 50
```

8. BFD commands

8.1. BFD commands

8.1.1. bfd authentication-mode

Use **bfd authentication-mode** to configure the BFD authentication mode for single-hop BFD control packets.

Use **undo bfd authentication-mode** to restore the default.

Syntax

bfd authentication-mode { **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd authentication-mode

Default

Single-hop BFD control packets are not authenticated.

Views

Interface view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure VLAN-interface 11 to perform simple authentication for single-hop BFD control packets, setting the authentication key ID to **1** and plaintext key to **123456**.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd authentication-mode simple 1 plain 123456
```

8.1.2. bfd demand enable

Use **bfd demand enable** to enable the Demand BFD session mode.

Use **undo bfd demand enable** to restore the default.

Syntax

bfd demand enable

undo bfd demand enable

Default

The BFD session is in Asynchronous mode.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

In Demand mode, the device periodically sends BFD control packets. If the peer end is operating in Asynchronous mode (default), the peer end stops sending BFD control packets. If the peer end is operating in Demand mode, both ends stop sending BFD control packets. When the connectivity to another system needs to be verified explicitly, a system sends several BFD control packets with the Poll (P) bit set at the negotiated transmit interval. If no response is received within the detection interval, the session is considered down. If the connectivity is found to be up, no more BFD control packets are sent until the next command is issued.

In Asynchronous mode, the device periodically sends BFD control packets. The device considers that the session is down if it does not receive any BFD control packets within a specific interval.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the Demand BFD session mode on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd demand enable
```

8.1.3. bfd detect-multiplier

Use **bfd detect-multiplier** to set the single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode.

Use **undo bfd detect-multiplier** to restore the default.

Syntax

bfd detect-multiplier *value*

undo bfd detect-multiplier

Default

Up to Software Version v7.4.37： The multihop detection time multiplier is 5.

Software Version v7.4.40 or later： The multihop detection time multiplier is 3.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Specifies a single-hop detection time multiplier in the range of 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD packets (including control packets and echo packets) that can be discarded.

Table 8-1 Detection interval calculation method

Mode	Detection interval
Echo packet mode	Detection time multiplier of the sender × actual packet sending interval of the sender
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × actual packet sending interval of the receiver
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × actual packet sending interval of the sender

Examples

Set the single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode to 6 on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd detect-multiplier 6
```

8.1.4. bfd echo enable

Use **bfd echo enable** to enable the echo packet mode.

Use **undo bfd echo enable** to disable the echo packet mode.

Syntax

bfd echo enable

undo bfd echo enable

Default

The echo packet mode is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

If you enable the echo packet mode for a BFD session in which control packets are sent and the session comes up, BFD performs the following operations:

- Periodically sends echo packets to detect link connectivity.
- Decreases the control packet receiving rate at the same time.

The command enables both the echo packet receiving and sending capabilities.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the echo packet mode on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd echo enable
```

8.1.5. bfd echo-source-ip

Use **bfd echo-source-ip** to configure the source IP address of BFD echo packets.

Use **undo bfd echo-source-ip** to remove the configured source IP address of BFD echo packets.

Syntax

bfd echo-source-ip *ip-address*

undo bfd echo-source-ip

Default

No source IP address is configured for BFD echo packets.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address of BFD echo packets.

Usage guidelines

The source IP address cannot be on the same network segment as any local interface's IP address. Otherwise, a large number of ICMP redirect packets might be sent from the peer, resulting in link congestion.

Examples

Configure the source IP address of BFD echo packets as 8.8.8.8.

```
<Switch> system-view
[Switch] bfd echo-source-ip 8.8.8.8
```

8.1.6. bfd min-echo-receive-interval

Use **bfd min-echo-receive-interval** to set the minimum interval for receiving BFD echo packets.

Use **undo bfd min-echo-receive-interval** to restore the default.

Syntax

bfd min-echo-receive-interval *interval*

undo bfd min-echo-receive-interval

Default

The minimum interval for receiving BFD echo packets is 400 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for receiving BFD echo packets, in milliseconds. The value takes 0 or is in the range of 100 to 1000.

Usage guidelines

This command sets the BFD echo packet receiving interval, which is the actual BFD echo packet sending interval.

The local end stops sending echo packets after autonegotiation with the remote end if the following conditions are met:

- The echo packet mode is enabled on the local end.
- The minimum interval for receiving BFD echo packets is set to 0 milliseconds on the remote end.

Examples

Set the minimum interval for receiving BFD echo packets to 500 milliseconds on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd min-echo-receive-interval 500
```

8.1.7. bfd min-receive-interval

Use **bfd min-receive-interval** to set the minimum interval for receiving single-hop BFD control packets.

Use **undo bfd min-receive-interval** to restore the default.

Syntax

bfd min-receive-interval *interval*

undo bfd min-receive-interval

Default

The minimum interval for receiving single-hop BFD control packets is 400 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

Before V7.1.6

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 100 to 1000.

After v7.2.16

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 3 to 1000.

Usage guidelines

Use this command to prevent the control packet sending rate of the peer end from exceeding the control packet receiving rate of the local end.

The actual control packet sending interval of the peer end takes the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the peer end.
- Minimum interval for receiving BFD control packets on the local end.

Examples

Set the minimum interval for receiving single-hop BFD control packets to 500 milliseconds on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd min-receive-interval 500
```

8.1.8. bfd min-transmit-interval

Use **bfd min-transmit-interval** to set the minimum interval for transmitting single-hop BFD control packets.

Use **undo bfd min-transmit-interval** to restore the default.

Syntax

bfd min-transmit-interval *interval*

undo bfd min-transmit-interval

Default

The minimum interval for transmitting single-hop BFD control packets is 400 milliseconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

Before V7.1.6

interval: Specifies the minimum interval for transmitting single-hop BFD control packets, in milliseconds. The value range is 100 to 1000.

After v7.2.16

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 3 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

Examples

Set the minimum interval for transmitting single-hop BFD control packets to 500 milliseconds on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] bfd min-transmit-interval 500
```

8.1.9. bfd multi-hop authentication-mode

Use **bfd multi-hop authentication-mode** to configure the authentication mode for multihop BFD control packets.

Use **undo bfd multi-hop authentication-mode** to restore the default.

Syntax

bfd multi-hop authentication-mode { **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd multi-hop authentication-mode

Default

No authentication is performed.

Views

System view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the simple authentication mode for multihop BFD control packets, setting the authentication key ID to 1 and key to **123456**.

```
<Switch> system-view
[Switch] bfd multi-hop authentication-mode simple 1 plain 123456
```

8.1.10. bfd multi-hop destination-port

Use **bfd multi-hop destination-port** to configure the destination port number for multihop BFD control packets.

Use **undo bfd multi-hop destination-port** to restore the default.

Syntax

bfd multi-hop destination-port *port-number*

undo bfd multi-hop destination-port

Default

The destination port number for multihop BFD control packets is 4784.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the destination port number of multihop BFD control packets, 3784 or 4784.

Examples

Specify the destination port number for multihop BFD control packets as 3784.

```
<Switch> system-view
[Switch] bfd multi-hop destination-port 3784
```

8.1.11. bfd multi-hop detect-multiplier

Use **bfd multi-hop detect-multiplier** to set the multihop detection time multiplier for control packet mode.

Use **undo bfd multi-hop detect-multiplier** to restore the default.

Syntax

bfd multi-hop detect-multiplier *value*

undo bfd multi-hop detect-multiplier

Default

Up to Software Version v7.4.37 : The multihop detection time multiplier is 5.

Software Version v7.4.40 or later : The multihop detection time multiplier is 3.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the multihop detection time multiplier in the range of 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD control packets that can be discarded.

Table 8-2 Detection interval calculation method

Mode	Detection interval
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × actual packet sending interval of the receiver
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × actual packet sending interval of the sender

Examples

Set the multihop detection time multiplier to 6.

```
<Switch> system-view
[Switch] bfd multi-hop detect-multiplier 6
```

8.1.12. bfd multi-hop min-receive-interval

Use **bfd multi-hop min-receive-interval** to set the minimum interval for receiving multihop BFD control packets.

Use **undo bfd multi-hop min-receive-interval** to restore the default.

Syntax

bfd multi-hop min-receive-interval *interval*

undo bfd multi-hop min-receive-interval

Default

The minimum interval for receiving multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

Before V7.1.6

interval: Specifies the minimum interval for receiving multihop BFD control packets, in milliseconds. The value range is 100 to 1000.

After v7.2.16

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 3 to 1000.

Usage guidelines

Use this command to prevent the packet sending rate of the peer end from exceeding the packet receiving capability (minimum control packet receiving interval) of the local end. If the receiving capability is exceeded, the peer end dynamically adjusts the BFD control packet sending interval to the minimum control packet receiving interval of the local end.

Examples

Set the minimum interval for receiving multihop BFD control packets to 500 milliseconds.

```
<Switch> system-view
[Switch] bfd multi-hop min-receive-interval 500
```

8.1.13. bfd multi-hop min-transmit-interval

Use **bfd multi-hop min-transmit-interval** to set the minimum interval for transmitting multihop BFD control packets.

Use **undo bfd multi-hop min-transmit-interval** to restore the default.

Syntax

bfd multi-hop min-transmit-interval *interval*

undo bfd multi-hop min-transmit-interval

Default

The minimum interval for transmitting multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

Before V7.1.6

interval: Specifies the minimum interval for transmitting multihop BFD control packets, in milliseconds. The value range is 100 to 1000.

After v7.2.16

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range is 3 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

Examples

Set the minimum interval for transmitting multihop BFD control packets to 500 milliseconds.

```
<Switch> system-view
[Switch] bfd multi-hop min-transmit-interval 500
```

8.1.14. bfd session init-mode

Use **bfd session init-mode** to configure the mode for establishing a BFD session.

Use **undo bfd session init-mode** to restore the default.

Syntax

bfd session init-mode { **active** | **passive** }

undo bfd session init-mode

Default

BFD uses the **active** mode.

Views

System view

Predefined user roles

network-admin

Parameters

active: Specifies the active mode. In active mode, BFD actively transmits BFD control packets to the remote device, regardless of whether it receives a BFD control packet from the remote device.

passive: Specifies the passive mode. In passive mode, BFD does not actively transmit a BFD control packet to the remote end; it transmits a BFD control packet only after receiving a BFD control packet from the remote end.

Usage guidelines

A minimum of one end must operate in active mode for a BFD session to be established.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the session establishment mode as **passive**.

```
<Switch> system-view
[Switch] bfd session init-mode passive
```

8.1.15. display bfd session

Use **display bfd session** to display BFD session information.

Syntax

display bfd session [**discriminator** *value* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

discriminator *value*: Specifies a local ID in the range of 1 to 4294967295. If this option is not specified, the command displays brief information about all BFD sessions.

verbose: Displays detailed BFD session information. If this keyword is not specified, the command displays brief BFD session information.

Examples

Display all IPv4 BFD session information.

```
<Switch> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working in control packet mode:

 LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
 513/513        1.1.1.1         1.1.1.2         Up       2297ms      Vlan100
```

Display detailed IPv4 BFD session information.

```
<Switch> display bfd session verbose

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 session working in control packet mode:

      Local Discr: 513                 Remote Discr: 513

        Diag Info: No Diagnostic
```

Table 8-3 Command output

Field	Description
Total Session Num	Total number of BFD sessions.
Up Session Num	Total number of active BFD sessions.
Init Mode	BFD operating mode: Active or passive.
IPv4 session working in control packet mode	BFD session type and operating mode: • **IPv4 session working in control packet mode**. • **IPv4 session working in echo mode**. • **IPv6 session working in control packet mode**. • **IPv6 session working in echo mode**.
Local Discr/LD	Local ID of the session.
Remote Discr/RD	Remote ID of the session.
Source IP/SourceAddr	Source IP address of the session.
Destination IP/DestAddr	Destination IP address of the session.
Session State/State	Session state: **Down**, **Init**, or **Up**.
Interface	Name of the interface of the session.
Min Tx Inter	Minimum transmit interval.
Min Rx Inter	Minimum receive interval.
Act Tx Inter	Actual transmit interval.
Detect Inter	Actual session detection timer.
Rx Count	Number of packets received.
Tx Count	Number of packets sent.
Hold Time/Holdtime	Length of time before session detection timer expires. For a BFD session in **Down** state, this field displays **0ms**.
Auth mode	Session authentication mode.

Field	Description
Connect Type	Connection type of the interface: Direct or indirect.
Running up for	Time period for which the session has been up.
Detect Mode	Detection mode: • **Async**—Asynchronous mode. • **Demand**—Demand mode. • **Async/Echo**—Asynchronous mode with echo detection enabled. • **Demand/Echo**—Demand mode with echo detection enabled.
Slot	Slot number.
Diag Info	Diagnostic information about the session: • **No Diagnostic**—The BFD session is in up state or receives no BFD packets. • **Control Detection Time Expired**—A control packet mode BFD session goes down because local detection times out. • **Echo Function Failed**—An echo packet mode BFD session goes down, because local detection times out or the source IP address of echo packets is deleted. • **Neighbor Signaled Session Down**—The remote end notifies the local end of BFD session down. • **Administratively Down**—The local system prevents a BFD session from being established.

8.1.16. reset bfd session statistics

Use **reset bfd session statistics** to clear the BFD session statistics.

Syntax

reset bfd session statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear the BFD session statistics.

```
<Switch> reset bfd session statistics
```

8.1.17. snmp-agent trap enable bfd

Use **snmp-agent trap enable bfd** to enable SNMP notifications for BFD.

Use **undo snmp-agent trap enable bfd** to disable SNMP notifications for BFD.

Syntax

snmp-agent trap enable bfd

undo snmp-agent trap enable bfd

Default

All SNMP notifications are enabled for BFD.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To report critical BFD events to an NMS, enable SNMP notifications for BFD. For BFD event notifications to be sent correctly, you must also configure SNMP as described in the network management and monitoring configuration guide for the device.

Examples

Disable SNMP notifications for BFD.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable bfd
```

9.1.1. display track

Use **display track** to display track entry information.

Syntax

display track { *track-entry-number* | **all** [**negative** | **positive**] } [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

all: Specifies all track entries.

negative: Specifies track entries in Negative state.

positive: Specifies track entries in Positive state.

brief: Displays brief information about track entries.

Examples

Display information about all track entries.

```
<Switch> display track all
Track ID: 1
  State: Positive
  Duration: 0 days 0 hours 0 minutes 7 seconds
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    NQA entry: admin test
    Reaction: 10
    Remote IP/URL: --
    Local IP: --
    Interface: --
Track ID: 2
  State: NotReady
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    BFD session mode: Echo
    Outgoing interface: Vlan-interface2
    VPN instance name: --
```

```
    Remote IP: 192.168.40.1
    Local IP: 192.168.40.2
Track ID: 3
  State: Negative
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    Interface:  Vlan-interface3
    Protocol: IPv4
Track ID: 4
  State: Negative
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    CFD service instance: MEP 2 in Ethernet service instance 1
Track ID: 5
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    IP route: 0.0.0.0/0 reachability
    VPN instance name: --
    Protocol: BGP
    Nexthop interface : Vlan-Interface4
```

Display information about track entries in Negative state.

```
<Switch> display track all negative brief
ID   Status   Type      Remote IP/URL   Local IP        Interface
1    Negative Interface --              --              Vlan2
10   Negative Interface --              --              Vlan3
```

Table 9-1 Command output

Field	Description
Track ID	ID of a track entry.
State	States of a track entry: • **Positive**—The tracked object operates correctly. • **NotReady**—The tracked object is invalid. • **Negative**—The tracked object is abnormal.
Duration	Time period during which the track entry stays in the state.
Notification delay: Positive 20, Negative 30 (in seconds)	• The Track module notifies the application modules that the status of the track entry changes to Positive after a delay time of 20 seconds. • The Track module notifies the application modules that the status of the track entry changes to Negative after a delay time of 30 seconds.
Tracked object	Tracked object associated with the track entry.
NQA entry	NQA operation associated with the track entry.

Field	Description
Reaction	Reaction entry associated with the track entry.
BFD session mode	BFD session mode. Only echo mode is supported.
Outgoing interface	Outgoing interface of BFD echo packets.
VPN instance name	Name of the VPN instance to which BFD session packets belong. If the packets belong to the public network, two consecutive hyphens (--) are displayed.
Remote IP/URL	Remote IP address or URL. If no remote IP address or URL exists, two consecutive hyphens (--) are displayed.
Local IP	Local IP address. If no local IP address exists, two consecutive hyphens (--) are displayed.
Interface	Interface to be monitored. If no interface is to be monitored, two consecutive hyphens (--) are displayed.
Protocol	Link states or Layer 3 protocol states of the monitored interface: • **None**—Link status of the monitored interface. • **IPv4**—IPv4 protocol status of the monitored Layer 3 interface. • **IPv6**—IPv6 protocol status of the monitored Layer 3 interface.
IP route	Route associated with the track entry.
VPN instance name	Name of the VPN instance to which the route belongs. If the route belongs to the public network, two consecutive hyphens (--) are displayed.
Protocol	Protocol type of the route. If the route does not exist, **N/A** is displayed.
Nexthop interface	Next hop of the route. If the route does not exist, **N/A** is displayed.
LLDP interface	Monitored LLDP interface.
Type	Monitored object type: • BFD. • CFD. • Interface. • LLDP. • NQA. • Route.

`track bfd`

`track interface`

`track interface protocol`

`track nqa`

9.1.2. track bfd

Use **`track bfd`** to create a track entry and associate it with a BFD session.

Use **undo track** to remove the track entry.

Syntax

track *track-entry-number* **bfd echo interface** *interface-type interface-number* **remote ip** *remote-ip-address* **local ip** *local-ip-address* [**delay** { **negative** *negative-time* | **positive** *positive-time* } *]

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface *interface-type interface-number*: Specifies the outgoing interface by its type and number of the BFD echo packets.

remote ip *remote-ip-address*: Specifies the destination IP address of the BFD echo packets.

local ip *local-ip-address*: Specifies the source IP address of the BFD echo packets.

delay: Specifies the delay before the Track module notifies the application modules of the track entry state change. If you do not specify this keyword, the Track module notifies the application modules immediately when the track entry state changes.

negative *negative-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Negative. The *negative-time* argument represents the notification delay in the range of 1 to 300 seconds.

positive *positive-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Positive. The *positive-time* argument represents the notification delay in the range of 1 to 300 seconds.

Usage guidelines

After a track entry is created, you can only use the **track bfd delay** command to modify its notification delay settings. If you execute the **track bfd delay** command multiple times, the most recent configuration takes effect.

To modify other settings for the track entry, execute the **undo track** command to remove the track entry, and then execute the **track bfd** command again.

When you associate Track with BFD, the virtual IP address of a VRRP group cannot be the local or remote address of a BFD session.

Examples

Associate track entry 1 with BFD to monitor the link between local IP address 1.1.1.2 and remote IP address 1.1.1.1 by sending BFD echo packets through VLAN-interface 2.

```
<Switch> system-view
[Switch] track 1 bfd echo interface vlan-interface 2 remote ip 1.1.1.1 local ip 1.1.1.2
```

Related commands

display track

9.1.3. track interface

Use **track interface** to create a track entry and associate it with the link state of an interface.

Use **undo track** to remove the track entry.

Syntax

track *track-entry-number* **interface** *interface-type interface-number* [**delay** { **negative** *negative-time* | **positive** *positive-time* } *]

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

delay: Specifies the delay before the Track module notifies the application modules of the track entry state change. If you do not specify this keyword, the Track module notifies the application modules immediately when the track entry state changes.

negative *negative-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Negative. The *negative-time* argument represents the notification delay in the range of 1 to 300 seconds.

positive *positive-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Positive. The *positive-time* argument represents the notification delay in the range of 1 to 300 seconds.

Usage guidelines

When you associate Track with interface management to monitor the link status of an interface, the track entry state changes as follows:

- The track entry state is Positive if the link state of the interface is up.
- The track entry state is Negative if the link state of the interface is down.

To display the link state of an interface, use the **display ip interface brief** command.

After a track entry is created, you can only use the **track interface delay** command to modify its notification delay settings. If you execute the **track interface delay** command multiple times, the most recent configuration takes effect.

To modify other settings for the track entry, execute the **undo track** command to remove the track entry, and then execute the **track interface** command again.

Examples

Create track entry 1 and associate it with the link state of interface VLAN-interface 10.

```
<Switch> system-view
[Switch] track 1 interface vlan-interface 10
```

Related commands

display ip interface brief (*Layer 3—IP Services Command Reference*)

display track

9.1.4. track interface protocol

Use **track interface protocol** to create a track entry and associate it with the protocol state of an interface.

Use **undo track** to remove the track entry.

Syntax

track *track-entry-number* **interface** *interface-type interface-number* **protocol** { **ipv4** | **ipv6** } [**delay** { **negative** *negative-time* | **positive** *positive-time* } *]

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

ipv4: Monitors the IPv4 protocol state. When the IPv4 protocol state of an interface is up, the state of the track object is Positive. When the IPv4 protocol state of an interface is down, the state of the track object is Negative. To display the IPv4 protocol state of an interface, use the **display ip interface brief** command.

ipv6: Monitors the IPv6 protocol state. When the IPv6 protocol state of an interface is up, the state of the track object is Positive. When the IPv6 protocol state of an interface is down, the state of the track object is Negative. To display the IPv6 protocol state of an interface, use the **display ipv6 interface brief** command.

delay: Specifies the delay before the Track module notifies the application modules of the track entry state change. If you do not specify this keyword, the Track module notifies the application modules immediately when the track entry state changes.

negative *negative-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Negative. The *negative-time* argument represents the notification delay in the range of 1 to 300 seconds.

positive *positive-time*: Specifies the delay before the Track module notifies the application modules that the track entry state has changed to Positive. The *positive-time* argument represents the notification delay in the range of 1 to 300 seconds.

Usage guidelines

After a track entry is created, you can only use the **track interface protocol delay** command to modify its notification delay settings. If you execute the **track interface protocol delay** command multiple times, the most recent configuration takes effect.

To modify other settings for the track entry, execute the **undo track** command to remove the track entry, and then execute the **track interface protocol** command again.

Examples

Create track entry 1 and associate it with the IPv4 protocol state of interface VLAN-interface 2.

```
<Switch> system-view
[Switch] track 1 interface vlan-interface 2 protocol ipv4
```

display track

9.1.5. track nqa

Use **track nqa** to create a track entry and associate it with the reaction entry of an NQA operation.

Use **undo track** to remove the track entry.

Syntax

track *track-entry-number* **nqa entry** *admin-name operation-tag* **reaction** *item-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

entry *admin-name operation-tag*: Specifies the NQA operation to be associated with the track entry. The *admin-name* argument specifies the name of the NQA operation administrator who creates the NQA operation, and is a case-insensitive string of 1 to 32 characters. The *operation-tag* argument specifies the NQA operation tag, and is a case-insensitive string of 1 to 32 characters.

reaction *item-number*: Specifies the reaction entry to be associated with the track entry. The *item-number* argument is the reaction entry ID in the range of 1 to 10.

Usage guidelines

To modify the track entry, execute the **undo track** command to remove the track entry, and then execute the **track nqa** command again.

Examples

Create track entry 1 and associate it with reaction entry 3 of the NQA operation **admin-test**.

```
<Switch> system-view
[Switch] track 1 nqa entry admin test reaction 3
```

1. Ping, tracert, and system debugging commands

1.1. Ping, tracert, and system debugging commands

1.1.1. debugging

Use **debugging** to enable debugging for a module.

Use **undo debugging** to disable debugging for a module or for all modules.

Syntax

debugging *module-name* [*option*]

undo debugging { **all** | *module-name* [*option*] }

Default

Debugging is disabled for all modules.

Views

User view

Predefined user roles

network-admin

Parameters

module-name: Specifies a module by its name, such as **arp** or **device**. For a list of supported modules, use the **debugging ?** command.

option: Specifies the debugging option for a module. Available options vary by module. To display the debugging options supported by a module, use the **debugging** *module-name* **?** command.

all: Specifies all modules.

Usage guidelines

Output from debugging commands is memory intensive. To guarantee system performance, enable debugging only for modules that are in an exceptional condition.

The system sends generated debug messages to the device information center, which then sends the messages to appropriate destinations based on the log output configuration. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable debugging for the device management module.

```
<Switch> debugging dev
```

Related commands

display debugging

1.1.2. display debugging

Use **display debugging** to display the enabled debugging features for a module or for all modules.

Syntax

display debugging [*module-name*]

network-operator

Parameters

module-name: Specifies a module by its name. For a list of supported modules, use the **display debugging ?** command. If you do not specify a module name, this command displays the enabled debugging features for all modules.

Examples

Display all enabled debugging features.

```
<Switch> display debugging
DEV debugging switch is on
```

Related commands

debugging

1.1.3. ping

Use **ping** to test the reachability of the destination IP address and display ping statistics.

Syntax

ping [**ip**] [**-a** *source-ip* | **-c** *count* | **-f** | **-h** *ttl* | **-i** *interface-type interface-number* | **-m** *interval* | **-n** | **-p** *pad* | **-q** | **-r** | **-s** *packet-size* | **-t** *timeout* | **-tos** *tos* | **-v** | **-vpn-instance** *vpn-instance-name*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

ip: Distinguishes between a destination host name and the **ping** command keywords if the name of the destination host is **i**, **ip**, **ipv**, **ipv6**, **l**, **ls**, or **lsp**. For example, you must use the command in the form of **ping ip ip** instead of **ping ip** if the destination host name is **ip**.

-a *source-ip*: Specifies an IP address of the device as the source IP address of ICMP echo requests. If this option is not specified, the source IP address of ICMP echo requests is the primary IP address of the outbound interface.

-c *count*: Specifies the number of ICMP echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-f: Sets the "do-not-fragment" bit in the IP header.

-h *ttl*: Specifies the TTL value of ICMP echo requests. The value range is 1 to 255, and the default is 255.

-i *interface-type interface-number*: Specifies the source interface for ICMP echo requests. If you do not specify this option, the system uses the primary IP address of the matching route's egress interface as the source interface for ICMP echo requests.

-m *interval*: Specifies the interval (in milliseconds) to send ICMP echo requests. The value range is 1 to 65535, and the default is 200.

-n: Disables domain name resolution for the *host* argument. If the *host* argument represents the host name of the destination, and if this keyword is not specified, the device translates *host* into an address.

-p *pad*: Specifies the value of the **pad** field in an ICMP echo request, in hexadecimal format, 1 to 8 bits. The *pad* argument is in the range of 0 to ffffffff. If the specified value is less than 8 bits, 0s are added in front of the value to extend it to 8 bits. For example, if *pad* is configured as 0x2f, then the packets are padded with 0x0000002f to make the total length of the packet meet the requirements of the device. By default, the padded value starts from 0x01 up to 0xff, where another round starts again if necessary, such as 0x010203…feff01….

-q: Displays only the summary statistics. If this keyword is not specified, the system displays all the ping statistics.

-r: Records the addresses of the hops (up to 9) the ICMP echo requests passed. If this keyword is not specified, the addresses of the hops that the ICMP echo requests passed are not recorded.

-s *packet-size*: Specifies the length (in bytes) of ICMP echo requests (excluding the IP packet header and the ICMP packet header). The value range is 20 to 8100, and the default is 56.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMP echo reply. The value range is 0 to 65535, and the default is 2000. If the source does not receive an ICMP echo reply within the timeout, it considers the ICMP echo reply timed out.

-tos *tos*: Specifies the ToS value of ICMP echo requests. The value range is 0 to 255, and the default is 0.

-v: Displays non-ICMP echo reply packets. If this keyword is not specified, the system does not display non-ICMP echo reply packets.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the ping operation fails.

To abort the ping operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the device with an IP address of 1.1.2.2 is reachable.

```
<Switch> ping 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=2.137 ms
```

```
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=2.051 ms
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=1.996 ms
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=1.963 ms
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=1.991 ms

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.963/2.028/2.137/0.062 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. Only results are displayed.

```
<Switch> ping -q 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.962/2.196/2.665/0.244 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. The IP addresses of the hops that the ICMP packets passed in the path are displayed.

```
<Switch> ping -r 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms
RR:      1.1.2.1
         1.1.2.2
         1.1.1.2
         1.1.1.1
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=4.834 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=4.770 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=4.812 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=4.704 ms  (same route)

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms
```

The output shows the following information:

- The destination is reachable.
- The route is 1.1.1.1 <-> {1.1.1.2; 1.1.2.1} <-> 1.1.2.2.

Table 1-1 Command output

Field	Description
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL_C to break	Test whether the device with IP address 1.1.2.2 is reachable. There are 56 bytes in each ICMP echo request. Press **Ctrl+C** to abort the ping operation.
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms	Received ICMP echo replies from the device whose IP address is 1.1.2.2. If no echo reply is received within the timeout period, no information is displayed. • **bytes**—Number of bytes in the ICMP echo reply. • **icmp_seq**—Packet sequence, used to determine whether a segment is lost, disordered or repeated. • **ttl**—TTL value in the ICMP echo reply.

Field	Description
	• **time**—Response time.
RR:	Routers through which the ICMP echo request passed. They are displayed in inversed order, which means the router with a smaller distance to the destination is displayed first.
--- Ping statistics for 1.1.2.2 ---	Statistics on data received and sent in the ping operation.
--- Ping statistics for 1.1.2.2 in VPN instance vpn1 ---	Ping statistics for a device in a VPN instance.
5 packet(s) transmitted	Number of ICMP echo requests sent.
5 packet(s) received	Number of ICMP echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

1.1.4. ping ipv6

Use **ping ipv6** to test the reachability of the destination IPv6 address and display IPv6 ping statistics.

Syntax

ping ipv6 [**-a** *source-ipv6* | **-c** *count* | **-i** *interface-type interface-number* | **-m** *interval* | **-q** | **-s** *packet-size* | **-t** *timeout* | **-v** | **-vpn-instance** *vpn-instance-name*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

-a *source-ipv6*: Specifies an IPv6 address of the device as the source IP address of ICMP echo requests. If this option is not specified, the source IPv6 address of ICMP echo requests is the IPv6 address of the outbound interface. See RFC 3484 for information about the address selection rule.

-c *count*: Specifies the number of ICMPv6 echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-i *interface-type interface-number*: Specifies the source interface for ICMPv6 echo requests. This option must be specified when the destination address is a multicast address or a link local address. If you do not specify this option, the system uses the primary IP address of the matching route's egress interface as the source interface for ICMPv6 echo requests.

-m *interval*: Specifies the interval (in milliseconds) to send an ICMPv6 echo reply. The value range is 1 to 65535, and the default is 1000.

-q: Displays only the summary statistics. If you do not specify this keyword, the system displays all the ping statistics.

-s *packet-size*: Specifies the length (in bytes) of ICMPv6 echo requests (excluding the IPv6 packet header and the ICMPv6 packet header). The value range is 20 to 8100, and the default is 56.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMPv6 echo reply. The value range is 0 to 65535, and the default is 2000.

-v: Displays detailed information (including the **dst** field and the **idx** field) about ICMPv6 echo replies. If this keyword is not specified, the system only displays brief information (not including the **dst** field and the **idx** field) about ICMPv6 echo replies.

-vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the ping ipv6 operation fails.

To abort the ping ipv6 operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the IPv6 address (2001::2) is reachable.

```
<Switch> ping ipv6 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Only the statistics are displayed.

```
<Switch> ping ipv6 -q 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Detailed ping information is displayed.

```
<Switch> ping ipv6 -v 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 dst=2001::1 idx=3 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 dst=2001::1 idx=3 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 dst=2001::1 idx=3 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 dst=2001::1 idx=3 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
```

```
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Table 1-2 Command output

Field	Description
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL_C to break	An ICMPv6 echo reply with a data length of 56 bytes is sent from 2001::1 to 2001::2. Press **Ctrl+C** to abort the ping IPv6 operation.
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=62.000 ms	Received ICMPv6 echo replies from the device whose IPv6 address is 2001::2. • The number of data bytes is 56. • The packet sequence is 1. • The hop limit value is 64. • The destination address is 2001::1. Specify the **-v** keyword to display this field. • The index for the packet inbound interface is 3. Specify the **-v** keyword to display this field. • The response time is 62 milliseconds.
--- Ping6 statistics for 2001::2 ------	Statistics on data received and sent in an IPv6 ping operation.
5 packet(s) transmitted	Number of ICMPv6 echo requests sent.
5 packet(s) received	Number of ICMPv6 echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/ std-dev =4.000/25.000/62.000/20.000 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

1.1.5. tracert

Use **tracert** to trace the path that the packets traverse from source to destination.

Syntax

tracert [**-a** *source-ip* | **-f** *first-ttl* | **-m** *max-ttl* | **-p** *port* | **-q** *packet-number* || **-t** *tos* | **-vpn-instance** *vpn-instance-name* [**-resolve-as** { **global** | **none** | **vpn** }] | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

-a *source-ip*: Specifies an IP address of the device as the source IP address of probe packets. If this option is not specified, the source IP address of probe packets is the primary IP address of the outbound interface.

-f *first-ttl*: Specifies the TTL of the first packet sent to the destination. The value range is 1 to 255, and the default is 1. It must be no greater than the value of the *max-ttl* argument.

-m *max-ttl*: Specifies the maximum number of hops allowed for a probe packet. The value range is 1 to 255, and the default is 30. It must be no smaller than the value of the *first-ttl* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets to send per hop. The value range is 1 to 65535, and the default is 3.

-t *tos*: Specifies the ToS value of probe packets. The value range is 0 to 255, and the default is 0.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

-resolve-as: Specifies a routing table for autonomous system (AS) resolution. Tracert searches the specified routing table for the AS that each hop along the path belongs to. If you do not specify this keyword, the global routing table is used. If the AS information is found, this command displays the AS number next to the address of the hop in the probe result.

- **global**: Specifies the global routing table.
- **none**: Disables AS resolution.

vpn: Specifies the VPN routing table.

-w *timeout*: Specifies the timeout time in milliseconds of the reply packet for a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping** command, use the **tracert** command to locate failed nodes.

If the destination address is on a private network, address information of intermediate hops might be stored in either the global routing table.

The output from the **tracert** command includes IP addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (1.1.2.2).

```
<Switch> tracert 1.1.2.2
traceroute to 1.1.2.2 (1.1.2.2), 30 hops at most, 40 bytes each packet, press CTRL_C to
break
 1  1.1.1.2 (1.1.1.2) 673 ms 425 ms 30 ms
 2  1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms
```

Table 1-3 Command output

Field	Description
traceroute to 1.1.2.2 (1.1.2.2)	Display the route that the IP packets traverse from the current device to the device whose IP address is 1.1.2.2.

Field	Description
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
bytes each packet	Number of bytes of a probe packet.
press CTRL_C to break	During the execution of the command, press **Ctrl+C** to abort the tracert operation.
2 1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms	Probe result of the probe packets that contain a TTL value of 2, including the following information about the second hop: • Domain name of the hop. If no domain name is configured, the IP address is displayed as the domain name. • IP address of the hop. The IP address is displayed in parentheses. • Number of the AS that the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

1.1.6. tracert ipv6

Use **tracert ipv6** to display the path that the IPv6 packets traverse from source to destination.

Syntax

tracert ipv6 [**-f** *first-hop* | **-m** *max-hops* | **-p** *port* | **-q** *packet-number* | **-t** *traffic-class* | **-vpn-instance** *vpn-instance-name* | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

Parameters

-f *first-hop*: Specifies the TTL value of the first packet. The value range is 1 to 255, and the default is 1. The value must be no greater than the value of the *max-hops* argument.

-m *max-hops*: Specifies the maximum number of hops allowed for a packet. The value range is 1 to 255, and the default is 30. The value must be no smaller than the value of the *first-hop* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets sent each time. The value range is 1 to 65535, and the default is 3.

-t *traffic-class*: Specifies the traffic class value in an IPv6 probe packet. The value range is 0 to 255, and the default is 0.

-vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

-w *timeout*: Specifies the timeout time (in milliseconds) of the reply packet of a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping ipv6** command, you can use the **tracert ipv6** command to locate failed nodes.

If the destination address is on a private network, address information of intermediate hops might be stored in either the global routing table or the VPN routing table.

The output from the **tracert ipv6** command includes IPv6 addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (2001:3::2).

```
<Switch> tracert ipv6 2001:3::2
traceroute to 2001:3::2(2001:3::2), 30 hops at most, 60 byte packets, press CTRL_C to break
 1  2001:1::2  0.661 ms  0.618 ms  0.579 ms
 2  2001:2::2 [AS 100]  0.861 ms  0.718 ms  0.679 ms
 3  2001:3::2 [AS 200]  0.822 ms  0.731 ms  0.708 ms
```

Table 1-4 Command output

Field	Description
traceroute to 2001:3::2	Display the route that the IPv6 packets traverse from the current device to the device whose IP address is 2001:3:2.
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
byte packets	Number of bytes of a probe packet.
2 2001:2::2 [AS 100] 0.861 ms 0.718 ms 0.679 ms	Probe result of the probe packets that contain a hoplimit value of 2, including the following information about the second hop: • IPv6 address of the hop. • Number of the AS the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

2. NQA commands

2.1. NQA client commands

2.1.1. advantage-factor

Use **advantage-factor** to set the advantage factor to be used for calculating Mean Opinion Scores (MOS) and Calculated Planning Impairment Factor (ICPIF) values.

Use **undo advantage-factor** to restore the default.

Syntax

advantage-factor *factor*

undo advantage-factor

Default

The advantage factor is 0.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

factor: Specifies the advantage factor in the range of 0 to 20.

Usage guidelines

The evaluation of voice quality depends on users' tolerance for voice quality. For users with higher tolerance for voice quality, use the **advantage-factor** command to set an advantage factor. When the system calculates the ICPIF value, it subtracts the advantage factor to modify ICPIF and MOS values for voice quality evaluation.

Examples

Set the advantage factor to 10 for the voice operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type voice
[Switch-nqa-admin-test-voice] advantage-factor 10
```

2.1.2. codec-type

Use **codec-type** to configure the codec type for the voice operation.

Use **undo codec-type** to restore the default.

Syntax

codec-type { **g711a** | **g711u** | **g729a** }

undo codec-type

Default

The codec type for the voice operation is G.711 A-law.

Views

Voice operation view

Predefined user roles

network-admin

Parameters

g711a: Specifies G.711 A-law codec type.

g711u: Specifies G.711 μ-law codec type

g729a: Specifies G.729 A-law codec type.

Examples

Set the codec type to **g729a** for the voice operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type voice
[Switch-nqa-admin-test-voice] codec-type g729a
```

2.1.3. data-fill

Use **data-fill** to configure the payload fill string for probe packets.

Use **undo data-fill** to restore the default.

Syntax

data-fill *string*

undo data-fill

Default

The default payload fill string is the hexadecimal string 00010203040506070809.

Views

ICMP/UDP echo operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

string: Specifies a case-sensitive string of 1 to 200 characters.

Usage guidelines

If the payload length is smaller than the string length, only the first part of the string is filled. For example, if you configure the string as **abcd** and set the payload size to 3 bytes, **abc** is filled.

If the payload length is greater than the string length, the system fills the payload with the string cyclically until the payload is full. For example, if you configure the string as **abcd** and the payload size as 6 bytes, **abcdab** is filled.

How the string is filled depends on the operation type.

- For the ICMP echo operation, the string fills the whole payload of an ICMP echo request.
- For the UDP echo operation, the first five bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of payload.
- For the UDP jitter operation, the first 68 bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.
- For the voice operation, the first 16 bytes of the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.

Examples

Specify **abcd** as the payload fill string for ICMP echo requests.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] data-fill abcd
```

2.1.4. data-size

Use **data-size** to set the payload size for each probe packet.

Use **undo data-size** to restore the default.

Syntax

data-size *size*

undo data-size

Default

The default payload size of a probe packet for different operations is described in Table 2-1 .

Table 2-1 Default payload size of a probe packet

Operation type	Codec type	Default size (bytes)
ICMP echo	N/A	100
UDP echo	N/A	100
UDP jitter	N/A	100
Voice	G.711 A-law	172
Voice	G.711 μ-law	172
Voice	G.729 A-law	32

Views

ICMP/UDP echo operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

size: Specifies the payload size. Available value ranges include:

- 20 to 65507 bytes for the ICMP echo, or UDP echo operation.
- 68 to 65507 bytes for the UDP jitter operation.

- 16 to 65507 bytes for the voice operation.

Usage guidelines

In ICMP echo operations, the command sets the payload size for each ICMP echo request.

In UDP echo, UDP jitter, and voice operations, the command sets the payload size for each UDP packet.

Examples

Set the payload size to 80 bytes for each ICMP echo request.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] data-size 80
```

2.1.5. description

Use **description** to configure a description for an NQA operation, such as the operation type or purpose.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an NQA operation.

Views

Any NQA operation view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 200 characters.

Examples

Configure the description as **icmp-probe** for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] description icmp-probe
```

2.1.6. destination ip

Use **destination ip** to configure the destination IPv4 address for the operation.

Use **undo destination ip** to restore the default.

Syntax

destination ip *ip-address*

undo destination ip

Default

No destination IPv4 address is configured for an operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IPv4 address for the operation.

Examples

Specify 10.1.1.1 as the destination IPv4 address for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] destination ip 10.1.1.1
```

2.1.7. destination port

Use **destination port** to configure the destination port number for the operation.

Use **undo destination port** to restore the default.

Syntax

destination port *port-number*

undo destination port

Default

No destination port number is configured for other types of operations.

Views

TCP/UDP echo operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

port-number: Specifies the destination port number for the operation, in the range of 1 to 65535.

Examples

Set the destination port number to 9000 for the UDP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type udp-echo
[Switch-nqa-admin-test-udp-echo] destination port 9000
```

2.1.8. display nqa history

Use **display nqa history** to display the history records of NQA operations.

Syntax

display nqa history [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the history records of all NQA operations.

Usage guidelines

The **display nqa history** command does not display the results or statistics of the following operations:

- UDP jitter.
- Voice.

To view the results or statistics of the UDP jitter, and voice operations, use the **display nqa result** or **display nqa statistics** command.

Examples

Display the history records of the NQA operation with administrator name **administrator** and operation tag **test**.

```
<Switch> display nqa history administrator test
NQA entry (admin administrator, tag test) history records:
  Index      Response     Status           Time
  10         329          Succeeded        2011-04-29 20:54:26.5
  9          344          Succeeded        2011-04-29 20:54:26.2
  8          328          Succeeded        2011-04-29 20:54:25.8
  7          328          Succeeded        2011-04-29 20:54:25.5
  6          328          Succeeded        2011-04-29 20:54:25.1
  5          328          Succeeded        2011-04-29 20:54:24.8
  4          328          Succeeded        2011-04-29 20:54:24.5
  3          328          Succeeded        2011-04-29 20:54:24.1
  2          328          Succeeded        2011-04-29 20:54:23.8
  1          328          Succeeded        2011-04-29 20:54:23.4
```

Table 2-2 Command output

Field	Description
Index	History record ID.

Field	Description
TTL	TTL value in the probe packet.
Response	Round-trip time if the operation succeeds, timeout time upon timeout, or 0 if the operation cannot be completed, in milliseconds.
Hop IP	IP address of the node that sent the reply packet.
Status	Status of the operation result: • Succeeded. • Unknown error. • Internal error. • Timeout.
Time	Time when the operation was completed.

2.1.9. display nqa result

Use **display nqa result** to display the most recent result of an NQA operation.

Syntax

display nqa result [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the most recent results of all NQA operations.

Examples

Display the most recent result of the TCP operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 35/35/35
    Square-Sum of round trip time: 1225
    Last succeeded probe time: 2011-05-29 10:50:33.2
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the most recent result of the UDP jitter operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 10             Receive response times: 10
    Min/Max/Average round trip time: 15/46/26
    Square-Sum of round trip time: 8103
    Last packet received time: 2011-05-29 10:56:38.7
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  UDP-jitter results:
   RTT number: 10
    Min positive SD: 8                   Min positive DS: 8
    Max positive SD: 18                  Max positive DS: 8
    Positive SD number: 5                Positive DS number: 2
    Positive SD sum: 75                  Positive DS sum: 32
    Positive SD average: 15              Positive DS average: 16
    Positive SD square-sum: 1189         Positive DS square-sum: 640
    Min negative SD: 8                   Min negative DS: 1
    Max negative SD: 24                  Max negative DS: 30
    Negative SD number: 4                Negative DS number: 7
    Negative SD sum: 56                  Negative DS sum: 99
    Negative SD average: 14              Negative DS average: 14
    Negative SD square-sum: 946          Negative DS square-sum: 1495
  One way results:
    Max SD delay: 22                     Max DS delay: 23
    Min SD delay: 7                      Min DS delay: 7
    Number of SD delay: 10               Number of DS delay: 10
    Sum of SD delay: 125                 Sum of DS delay: 132
    Square-Sum of SD delay: 1805         Square-Sum of DS delay: 1988
    SD lost packets: 0                   DS lost packets: 0
    Lost packets for unknown reason: 0
```

Display the most recent result of the voice operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 1000           Receive response times: 0
    Min/Max/Average round trip time: 0/0/0
    Square-Sum of round trip time: 0
    Last packet received time: 0-00-00 00:00:00.0
  Extended results:
    Packet loss ratio: 100%
    Failures due to timeout: 1000
```

```
  Failures due to internal error: 0
  Failures due to other errors: 0
  Packets out of sequence: 0
  Packets arrived late: 0
Voice results:
 RTT number: 0
  Min positive SD: 0                    Min positive DS: 0
  Max positive SD: 0                    Max positive DS: 0
  Positive SD number: 0                 Positive DS number: 0
  Positive SD sum: 0                    Positive DS sum: 0
  Positive SD average: 0                Positive DS average: 0
  Positive SD square-sum: 0             Positive DS square-sum: 0
  Min negative SD: 0                    Min negative DS: 0
  Max negative SD: 0                    Max negative DS: 0
  Negative SD number: 0                 Negative DS number: 0
  Negative SD sum: 0                    Negative DS sum: 0
  Negative SD average: 0                Negative DS average: 0
  Negative SD square-sum: 0             Negative DS square-sum: 0
One way results:
  Max SD delay: 0                       Max DS delay: 0
  Min SD delay: 0                       Min DS delay: 0
  Number of SD delay: 0                 Number of DS delay: 0
  Sum of SD delay: 0                    Sum of DS delay: 0
  Square-Sum of SD delay: 0             Square-Sum of DS delay: 0
  SD lost packets: 0                    DS lost packets: 0
  Lost packets for unknown reason: 1000
Voice scores:
  MOS value: 0.99                       ICPIF value: 87
```

Table 2-3 Command output

Field	Description
Data collecting in progress	The operation is in progress.
Send operation times	Number of operations.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.
Square-Sum of round trip time	Square sum of round-trip time.
Last succeeded probe time	Time when the last successful probe was completed. If no probes are successful in an operation, the field displays **0**. This field is not available for UDP jitter, and voice operations.
Last packet received time	Time when the last response packet was received. If no response packets in a probe were received, the field displays **0**. This field is available only for UDP jitter and voice operations.

Field	Description
Packet loss ratio	Average packet loss ratio.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
Packets arrived late	Number of response packets received after a probe times out.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.
Positive DS number	Number of positive jitters from destination to source.
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from

Field	Description
	destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
One way results	Unidirectional delay. This field is available only for the UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.
Sum of SD delay	Sum of delays from source to destination.
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.
Voice scores	Voice parameters. This field is available only for the voice operation.
MOS value	MOS value calculated for the voice operation.
ICPIF value	ICPIF value calculated for the voice operation.
TTL	TTL value in the received reply packet.
Hop IP	IP address of the node that sent the reply packet.
Time	Time when the NQA client received the reply packet.

2.1.10. display nqa statistics

Use **display nqa statistics** to display NQA operation statistics.

Syntax

display nqa statistics [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays statistics for all NQA operations.

Usage guidelines

The statistics are generated after the NQA operation completes. If you execute the **display nqa statistics** command before the operation completes, the statistics are displayed as all 0s.

If a reaction entry is configured, the command displays the monitoring results of the reaction entry in the period specified by the **statistics interval** command. The result fields display hyphens (-) in one of the following conditions:

- The threshold type is average value.
- The monitored performance metric is ICPIF or MOS for the voice operation.

Examples

Display the statistics for the TCP operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:30:20.0
    Life time: 2 seconds
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 13/13/13
    Square-Sum of round trip time: 169
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the statistics for the UDP jitter operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:33:22.3
    Life time: 23 seconds
    Send operation times: 100            Receive response times: 100
    Min/Max/Average round trip time: 1/11/5
```

```
    Square-Sum of round trip time: 24360
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  UDP-jitter results:
   RTT number: 550
    Min positive SD: 1                    Min positive DS: 1
    Max positive SD: 7                    Max positive DS: 1
    Positive SD number: 220               Positive DS number: 97
    Positive SD sum: 283                  Positive DS sum: 287
    Positive SD average: 1                Positive DS average: 2
    Positive SD square-sum: 709           Positive DS square-sum: 1937
    Min negative SD: 2                    Min negative DS: 1
    Max negative SD: 10                   Max negative DS: 1
    Negative SD number: 81                Negative DS number: 94
    Negative SD sum: 556                  Negative DS sum: 191
    Negative SD average: 6                Negative DS average: 2
    Negative SD square-sum: 4292          Negative DS square-sum: 967
  One way results:
    Max SD delay: 5                       Max DS delay: 5
    Min SD delay: 1                       Min DS delay: 1
    Number of SD delay: 550               Number of DS delay: 550
    Sum of SD delay: 1475                 Sum of DS delay: 1201
    Square-Sum of SD delay: 5407          Square-Sum of DS delay: 3959
    SD lost packets: 0                    DS lost packets: 0
    Lost packets for unknown reason: 0
  Reaction statistics:
    Index  Checked Element  Threshold Type  Checked Num  Over-threshold Num
    1      jitter-DS        accumulate      90           25
    2      jitter-SD        average         -            -
    3      OWD-DS           -               100          24
    4      OWD-SD           -               100          13
    5      packet-loss      accumulate      0            0
    6      RTT              accumulate      100          52
```

Display the statistics for the voice operation with administrator name **admin** and operation tag **test**.

```
<Switch> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:33:45.3
    Life time: 120 seconds
    Send operation times: 10              Receive response times: 10
    Min/Max/Average round trip time: 1/12/7
    Square-Sum of round trip time: 620
```

```
Extended results:
  Packet loss ratio: 0%
  Failures due to timeout: 0
  Failures due to internal error: 0
  Failures due to other errors: 0
  Packets out of sequence: 0
  Packets arrived late: 0
Voice results:
 RTT number: 10
  Min positive SD: 3                    Min positive DS: 1
  Max positive SD: 10                   Max positive DS: 1
  Positive SD number: 3                 Positive DS number: 2

```

Table 2-4 Command output

Field	Description
No.	Statistics group ID.
Start time	Time when the operation started.
Life time	Duration of the operation in seconds.
Send operation times	Number of probe packets sent.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.

Field	Description
Square-Sum of round trip time	Square sum of round-trip time.
Packet loss ratio	Average packet loss ratio.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
Packets arrived late	Number of response packets received after a probe times out.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.
Positive DS number	Number of positive jitters from destination to source.
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.

Field	Description
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
One way results	Unidirectional delay result. This field is available only for the UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.
Sum of SD delay	Sum of delays from source to destination.
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.
Voice scores	Voice parameters. This field is available only for the voice operation.
Max MOS value	Maximum MOS value.
Min MOS value	Minimum MOS value.
Max ICPIF value	Maximum ICPIF value.
Min ICPIF value	Minimum ICPIF value.
Reaction statistics	Statistics about the reaction entry in the counting interval.
Index	ID of a reaction entry.
Checked Element	Monitored element.
Threshold Type	Threshold type.

Field	Description
Checked Num	Number of targets that have been monitored for data collection.
Over-threshold Num	Number of threshold violations.

Table 2-5 Monitored performance metrics for DHCP/DLSw/DNS/FTP/HTTP/ICMP echo/SNMP/TCP/UDP echo operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
probe-duration	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
	average	N/A	N/A	N/A
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
probe-fail	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probe failures.
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probe failures.

Table 2-6 Monitored performance metrics for UDP jitter/voice operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
RTT	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the round-trip time exceeds the threshold.
	average	N/A	N/A	N/A
jitter-DS/jitter-SD	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way jitter exceeds the threshold.
	average	N/A	N/A	N/A
OWD-DS/OWD-SD	N/A	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way delay exceeds the threshold.
packet-loss	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packet loss.
ICPIF/MOS	N/A	N/A	N/A	N/A

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
(available only for the voice operation)

network-admin

Parameters

filename: Specifies the name of a file, a case-sensitive string of 1 to 200 characters that cannot contain slashes (/).

Examples

Specify **config.txt** as the file to be transferred between the FTP server and the FTP client for the FTP operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type ftp
[Switch-nqa-admin-test-ftp] filename config.txt
```

2.1.12. frequency

Use **frequency** to specify the interval at which the NQA operation repeats.

Use **undo frequency** to restore the default.

Syntax

frequency *interval*

undo frequency

Default

The interval between two consecutive voice operations is 60000 milliseconds. The interval between two consecutive operations of other types is 0 milliseconds.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval between two consecutive operations, in the range of 0 to 604800000 milliseconds. An interval of 0 milliseconds configures NQA to perform the operation only once, and not to generate any statistics.

Usage guidelines

If an operation is not completed when the interval is reached, the next operation does not start.

Examples

Configure the ICMP echo operation to repeat every 1000 milliseconds.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] frequency 1000
```

2.1.13. history-record enable

Use **history-record enable** to enable the saving of history records for the NQA operation.

Use **undo history-record enable** to disable the saving of history records.

Syntax

history-record enable

undo history-record enable

Default

The saving of history records is disabled.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Usage guidelines

To display the history records of the NQA operation, use the **display nqa history** command.

The **undo** form of the command also removes existing history records of an NQA operation.

Examples

Enable the saving of history records for the NQA operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] history-record enable
```

Related commands

display nqa history

2.1.14. history-record keep-time

Use **history-record keep-time** to set the lifetime of history records for an NQA operation.

Use **undo history-record keep-time** to restore the default.

Syntax

history-record keep-time *keep-time*

undo history-record keep-time

Default

The history records of an NQA operation are kept for 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

keep-time: Specifies how long the history records can be saved. The value range is 1 to 1440 minutes.

Usage guidelines

When an NQA operation completes, the timer starts. All records are removed when the lifetime is reached.

Examples

Set the lifetime of the history records to 100 minutes for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] history-record keep-time 100
```

2.1.15. history-record number

Use **history-record number** to set the maximum number of history records that can be saved for an NQA operation.

Use **undo history-record number** to restore the default.

Syntax

history-record number *number*

undo history-record number

Default

A maximum of 50 history records can be saved for an NQA operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of history records that can be saved for an NQA operation. The value range is 0 to 50.

Usage guidelines

If the number of history records for an NQA operation exceeds the maximum number, earliest history records are removed.

Examples

Set the maximum number of history records to 10 for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] history-record number 10
```

2.1.16. next-hop ip

Use **next-hop ip** to specify the next hop IPv4 address for probe packets.

Use **undo next-hop ip** to restore the default.

Syntax

next-hop ip *ip-address*

undo next-hop ip

Default

No next hop IPv4 address is specified for probe packets.

Views

ICMP echo operation view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of the next hop.

Usage guidelines

If the next hop IPv4 address is not configured, the device searches the routing table to determine the next hop IPv4 address for the probe packets.

Examples

Specify 10.1.1.1 as the next hop IPv4 address for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] next-hop ip 10.1.1.1
```

2.1.17. nqa

Use **nqa** to create an NQA operation and enter its view, or enter the view of an existing NQA operation.

Use **undo nqa** to remove the operation.

Syntax

nqa entry *admin-name operation-tag*

undo nqa { **all** | **entry** *admin-name operation-tag* }

Default

No NQA operations exist.

Views

System view

Predefined user roles

network-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

all: Removes all NQA operations.

Examples

Create an NQA operation with administrator name **admin** and operation tag **test**, and enter NQA operation view.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test]
```

2.1.18. nqa agent enable

Use **nqa agent enable** to enable the NQA client.

Use **undo nqa agent enable** to disable the NQA client and stop all operations being performed.

Syntax

nqa agent enable

undo nqa agent enable

Default

The NQA client is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the NQA client.

```
<Switch> system-view
[Switch] nqa agent enable
```

Related commands

nqa server enable

2.1.19. nqa schedule

Use **nqa schedule** to configure scheduling parameters for an NQA operation.

Use **undo nqa schedule** to stop the operation.

Syntax

nqa schedule *admin-name operation-tag* **start-time** { *hh*:*mm*:*ss* [*yyyy/mm/dd* | *mm/dd/yyyy*] | **now** } **lifetime** { *lifetime* | **forever** } [**recurring**]

undo nqa schedule *admin-name operation-tag*

Default

No schedule is configured for an NQA operation.

Views

System view

Predefined user roles

network-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

start-time: Specifies the start time and date of the NQA operation.

hh:*mm*:*ss*: Specifies the start time of an NQA operation.

yyyy/mm/dd: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

mm/dd/yyyy: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

now: Starts the operation immediately.

lifetime: Specifies the duration of an operation.

lifetime: Specifies the duration of an operation in seconds. The value range is 1 to 2147483647.

forever: Performs the operation until you stop it by using the **undo nqa schedule** command.

recurring: Runs the operation automatically at the start time and for the specified duration. If you do not specify this keyword, the NQA operation is performed only once at the specified date and time.

Usage guidelines

The NQA operation works between the specified start time and the end time (the start time plus operation duration). If the specified start time is ahead of the system time, the operation starts immediately. If both the specified start time and end time are ahead of the system time, the operation does not start. To display the current system time, use the **display clock** command.

You cannot enter the view of a scheduled NQA operation. If you want to enter such view, use the **undo nqa schedule** command to stop the NQA operation first.

Specify a lifetime long enough for an operation to complete.

Examples

Schedule the operation with administrator name **admin** and operation tag **test** to start on 08:08:08 2008/08/08 and last 1000 seconds.

```
<Switch> system-view
[Switch] nqa schedule admin test start-time 08:08:08 2008/08/08 lifetime 1000 recurring
```

Related commands

destination ip

display clock (*Fundamentals Command Reference*)

nqa entry

type

2.1.20. operation (FTP operation view)

Use **operation** to specify the operation type for the FTP operation.

Use **undo operation** to restore the default.

Syntax

operation { **get** | **put** }

undo operation

Default

The FTP operation type is **get**.

Views

FTP operation view

Predefined user roles

network-admin

Parameters

get: Gets a file from the FTP server.

put: Transfers a file to the FTP server.

Usage guidelines

When you perform the **put** operation with the **filename** command configured, make sure the file exists on the NQA client.

If you get a file from the FTP server, make sure the file specified in the URL exists on the FTP server. The NQA client does not save the file obtained from the FTP server.

Use a small file for the FTP operation. A big file might result in transfer failure because of timeout, or might affect other services for occupying much network bandwidth.

Examples

Set the operation type to **put** for the FTP operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type ftp
[Switch-nqa-admin-test-ftp] operation put
```

Related commands

password

username

2.1.21. operation (HTTP operation view)

Use **operation** to specify the operation type for the HTTP operation.

Use **undo operation** to restore the default.

Syntax

operation { **get** | **post** }

undo operation

Default

The HTTP operation type is **get**.

Views

HTTP operation view

Predefined user roles

network-admin

Parameters

get: Gets data from the HTTP server.

post: Transfers data to the HTTP server.

Usage guidelines

The HTTP operations use HTTP requests as probe packets.

For the **get** or **post** operation, the content in the request is obtained from the URL specified by the **url** command.

Examples

Set the operation type to **get** for the HTTP operation.

```
<Switch> system-view
```

```
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type http
[Switch-nqa-admin-test-http] operation get
```

Related commands

password

username

2.1.22. password

Use **password** to specify a password.

Use **undo password** to restore the default.

Syntax

password { **cipher** | **simple** } *string*

undo password

Default

No password is specified.

Views

FTP/HTTP operation view

Predefined user roles

network-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. For FTP, HTTP, and HTTPS operations, the plaintext form of the password is a case-sensitive string of 1 to 32 characters. The encrypted form of the password is a case-sensitive string of 1 to 73 characters.

Examples

Set the FTP login password to **ftpuser**.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type ftp
[Switch-nqa-admin-test-ftp] password simple ftpuser
```

Related commands

operation

username

2.1.23. probe count

Use **probe count** to specify the probe times.

Use **undo probe count** to restore the default.

Syntax

probe count *times*

undo probe count

Default

The NQA client performs one probe to the destination per operation.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter operation view

Predefined user roles

network-admin

Parameters

times: Specifies the probe times. This argument specifies the times of probes to the destination per operation. The value range for this argument is 1 to 15.

Usage guidelines

The following describes how NQA performs different types of operations:

- A TCP or DLSw operation sets up a connection.
- A UDP jitter operation sends a number of probe packets. The number of probe packets is set by using the **probe packet-number** command.
- An FTP operation uploads or downloads a file.
- An HTTP operation gets a Web page.
- A DHCP operation gets an IP address through DHCP.
- A DNS operation translates a domain name to an IP address.
- An ICMP echo sends an ICMP echo request.
- A UDP echo operation sends a UDP packet.
- An SNMP operation sends one SNMPv1 packet, one SNMPv2c packet, and one SNMPv3 packet.
- A frame loss, latency, or throughput operation sends probe frames to the destination device to test the frame loss ratio, latency, or throughput of the network.

If an operation is to perform multiple probes, the NQA client starts a new probe in one of the following conditions:

- The NQA client receives responses to packets sent in the last probe.
- The probe timeout time expires.

This command is not available for the voice operations. Each of these operations performs only one probe.

Examples

Configure the ICMP echo operation to perform 10 probes.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] probe count 10
```

2.1.24. probe packet-interval

Use **probe packet-interval** to configure the packet sending interval in the probe.

Use **undo probe packet-interval** to restore the default.

Syntax

probe packet-interval *interval*

undo probe packet-interval

Default

The packet sending interval is 20 milliseconds.

Views

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

interval: Specifies the sending interval in the range of 10 to 60000 milliseconds.

Examples

Configure the UDP jitter operation to send packets every 100 milliseconds.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type udp-jitter
[Switch-nqa-admin-test-udp-jitter] probe packet-interval 100
```

2.1.25. probe packet-number

Use **probe packet-number** to set the number of packets to be sent in a UDP jitter, or voice probe.

Use **undo probe packet-number** to restore the default.

Syntax

probe packet-number *packet-number*

undo probe packet-number

Default

A UDP jitter probe sends 10 packets and a voice probe sends 1000 packets.

Views

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

packet-number: Specifies the number of packets to be sent per probe. Available value ranges include:

- 10 to 1000 for the UDP jitter operations.

- 10 to 60000 for the voice operation.

Examples

Configure the UDP jitter probe to send 100 packets.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type udp-jitter
[Switch-nqa-admin-test-udp-jitter] probe packet-number 100
```

2.1.26. probe packet-timeout

Use **probe packet-timeout** to set the timeout time for waiting for a response in the UDP jitter, or voice operation.

Use **undo probe packet-timeout** to restore the default.

Syntax

probe packet-timeout *timeout*

undo probe packet-timeout

Default

The response timeout time in the UDP jitter operation is 3000 milliseconds.

The response timeout time in the voice operation is 5000 milliseconds.

Views

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

timeout: Specifies the timeout time in milliseconds. The value range is 10 to 3600000.

Examples

Set the response timeout time to 100 milliseconds in the UDP jitter operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type udp-jitter
[Switch-nqa-admin-test-udp-jitter] probe packet-timeout 100
```

2.1.27. probe timeout

Use **probe timeout** to set the probe timeout time.

Use **undo probe timeout** to restore the default.

Syntax

probe timeout *timeout*

undo probe timeout

Default

The timeout time of a probe is 3000 milliseconds.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

timeout: Specifies the probe timeout time in milliseconds. The value range for this argument varies as follows:

- For FTP and HTTP operations, the value range is 10 to 86400000.
- For DHCP, DNS, DLSw, ICMP echo, SNMP, TCP, and UDP echo operations, the value range is 10 to 3600000.

Usage guidelines

If a probe does not complete within the period, the probe is timed out.

Examples

Set the probe timeout time to 10000 milliseconds for the DHCP operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type dhcp
[Switch-nqa-admin-test-dhcp] probe timeout 10000
```

2.1.28. reaction checked-element probe-fail (for trap)

Use **reaction checked-element probe-fail** to configure a reaction entry for monitoring the probe failures of the operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-fail threshold-type** { **accumulate** *accumulate-occurrences* | **consecutive** *consecutive-occurrences* } [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring probe failures exist.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of probe failures. The value range is 1 to 15.

consecutive *consecutive-occurrences*: Checks the maximum number of consecutive probe failures. The value range is 1 to 16.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS. This keyword is not available for the DNS operation.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1 for monitoring the probe failures in ICMP echo operation. Before the NQA operation starts, the initial state of the reaction entry is invalid. If the total number of probe failures reaches or exceeds 10, the state of the entry is set to over-threshold. If it is below the threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] reaction 1 checked-element probe-fail threshold-type
accumulate 10 action-type trap-only
```

Create reaction entry 2 for monitoring the probe failures in ICMP echo operation. Before the NQA operation starts, the initial state of the reaction entry is invalid. If the number of consecutive probe failures reaches or exceeds 10, the state of the entry is set to over-threshold. If it is below the threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] reaction 2 checked-element probe-fail threshold-type
consecutive 10 action-type trap-only
```

2.1.29. reaction checked-element probe-fail (for trigger)

Use **reaction checked-element probe-fail** to configure a reaction entry for monitoring probe failures.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-fail threshold-type consecutive** *consecutive-occurrences* **action-type trigger-only**

undo reaction *item-number*

Default

No reaction entries for monitoring probe failures exist.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

consecutive *consecutive-occurrences*: Checks the maximum number of consecutive probe failures, in the range of 1 to 16.

action-type: Specifies what action to be triggered.

trigger-only: Triggers other modules to react to certain conditions.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1. If the number of consecutive probe failures reaches 3, collaboration is triggered.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type tcp
[Switch-nqa-admin-test-tcp] reaction 1 checked-element probe-fail threshold-type
consecutive 3 action-type trigger-only
```

Related commands

track (*High Availability Command Reference*)

2.1.30. reaction trap

Use **reaction trap** to configure the sending of traps to the NMS under specific conditions.

Use **undo reaction trap** to restore the default.

Syntax

reaction trap { **probe-failure** *consecutive-probe-failures* | **test-complete** | **test-failure** [*accumulate-probe-failures*] }

undo reaction trap { **probe-failure** | **test-complete** | **test-failure** }

Default

No traps are sent to the NMS.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

probe-failure *consecutive-probe-failures*: Sends a trap to the NMS if the number of consecutive probe failures in an operation is greater than or equal to *consecutive-probe-failures.* The value range for the *consecutive-probe-failures* argument is 1 to 15. The system counts the number of consecutive probe failures for each operation, so multiple traps might be sent.

test-complete: Sends a trap to indicate that the operation is completed.

test-failure: Sends a trap when an operation fails. the system counts the total number of probe failures in an operation. If the number reaches or exceeds the value for the *accumulate-probe-failures* argument, a trap is sent for the operation failure.

accumulate-probe-failures: Specifies the total number of probe failures in an operation. The value range is 1 to 15.

Usage guidelines

The UDP jitter, and voice operations support only the **test-complete** keyword.

Examples

Configure the system to send a trap if five or more consecutive probe failures occur in an ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] reaction trap probe-failure 5
```

2.1.31. resolve-target

Use **resolve-target** to specify the domain name to be resolved in the DNS operation.

Use **undo resolve-target** to restore the default.

Syntax

resolve-target *domain-name*

undo resolve-target

Default

The domain name to be resolved in the DNS operation is not specified.

Views

DNS operation view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the domain name to be resolved. It is a dot-separated case-sensitive string of 1 to 255 characters including letters, digits, hyphens (-), and underscores (_) (for example, aabbcc.com). Each part consists of 1 to 63 characters, and consecutive dots (.) are not allowed.

Examples

Specify **domain1** as the domain name to be resolved.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type dns
[Switch-nqa-admin-test-dns] resolve-target domain1
```

2.1.32. route-option bypass-route

Use **route-option bypass-route** to enable the routing table bypass feature to test the connectivity to the direct destination.

Use **undo route-option bypass-route** to disable the routing table bypass feature.

Syntax

route-option bypass-route

undo route-option bypass-route

Default

The routing table bypass feature is disabled.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Usage guidelines

When the routing table bypass feature is enabled, the following events occur:

- The routing table is not searched. Packets are sent to the destination on a directly connected network.
- The TTL value in the probe packet is set to 1. The TTL set in the **ttl** command does not take effect.

Examples

Enable the routing table bypass feature.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] route-option bypass-route
```

2.1.33. source interface (ICMP echo operation view)

Use **source interface** to specify the IP address of an interface as the source IP address of probe packets.

Use **undo source interface** to restore the default.

Syntax

source interface *interface-type interface-number*

undo source interface

Default

The probe packets take the primary IP address of the outgoing interface as their source IP address.

Views

ICMP echo operation view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The specified interface must be up. If the interface is down, no probe requests can be sent out.

If you execute this command and the **source ip** command for an ICMP echo operation multiple times, the most recent configuration takes effect.

Examples

Specify the IP address of the interface VLAN-interface 1 as the source IP address of ICMP echo request packets.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] source interface vlan-interface 1
```

Related commands

source ip

2.1.34. source ip

Use **source ip** to configure the source IPv4 address for probe packets.

Use **undo source ip** to restore the default.

Syntax

source ip *ip-address*

undo source ip

Default

The probe packets takes the primary IP address of their output interface as the source IP address.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IPv4 address for probe packets.

Usage guidelines

The specified source IPv4 address must be the IPv4 address of a local interface, and the local interface must be up. Otherwise, no probe packets can be sent out.

If you execute the **source interface** and **source ip** commands multiple times for an ICMP echo operation, the most recent configuration takes effect.

Examples

Specify 10.1.1.1 as the source IPv4 address for ICMP echo requests.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] source ip 10.1.1.1
```

Related commands

source interface

2.1.35. source port

Use **source port** to configure the source port number for probe packets.

Use **undo source port** to restore the default.

Syntax

source port *port-number*

undo source port

Default

The source port number is not specified.

Views

UDP echo operation view

SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

port-number: Specifies the source port number in the range of 1 to 65535.

Examples

Set the source port number to 8000 for probe packets in the UDP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type udp-echo
[Switch-nqa-admin-test-udp-echo] source port 8000
```

2.1.36. statistics hold-time

Use **statistics hold-time** to set the hold time of statistics groups for an NQA operation.

Use **undo statistics hold-time** to restore the default.

Syntax

statistics hold-time *hold-time*

undo statistics hold-time

Default

The hold time of statistics groups for an NQA operation is 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

hold-time: Specifies the hold time in minutes, in the range of 1 to 1440.

Usage guidelines

A statistics group is deleted when its hold time expires.

Examples

Set the hold time to 3 minutes for statistics groups of the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] statistics hold-time 3
```

2.1.37. statistics interval

Use **statistics interval** to set the statistics collection interval for an NQA operation.

Use **undo statistics interval** to restore the default.

Syntax

statistics interval *interval*

undo statistics interval

Default

The statistics collection interval is 60 minutes.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval in minutes, in the range of 1 to 35791394.

Usage guidelines

NQA forms statistics within the same collection interval as a statistics group. To display information about the statistics groups, use the **display nqa statistics** command.

Examples

Configure NQA to collect the ICMP echo operation statistics every 2 minutes.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] statistics interval 2
```

2.1.38. statistics max-group

Use **statistics max-group** to set the maximum number of statistics groups that can be saved.

Use **undo statistics max-group** to restore the default.

Syntax

statistics max-group *number*

undo statistics max-group

Default

A maximum of two statistics groups can be saved.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of statistics groups, in the range of 0 to 100. To disable statistics collection, set the value to 0.

Usage guidelines

When the maximum number of statistics groups is reached and a new statistics group is to be saved, the earliest statistics group is deleted.

Examples

Configure NQA to save a maximum of five statistics groups for the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] statistics max-group 5
```

2.1.39. tos

Use **tos** to set the ToS value in the IP header for probe packets.

Use **undo tos** to restore the default.

Syntax

tos *value*

undo tos

Default

The ToS value in the IP header of probe packets is 0.

Views

Any operation view

Predefined user roles

network-admin

Parameters

value: Specifies the ToS value in the range of 0 to 255.

Examples

In ICMP echo operation view, set the ToS value to 1 in the IP header for probe packets.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] tos 1
```

2.1.40. ttl

Use **ttl** to set the maximum number of hops that the probe packets can traverse.

Use **undo ttl** to restore the default.

Syntax

ttl *value*

undo ttl

Default

The maximum number of hops is 20 for probe packets.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

value: Specifies the maximum number of hops that the probe packets can traverse, in the range of 1 to 255.

Usage guidelines

The **route-option bypass-route** command sets the TTL to 1 for probe packets. If you configure both the **route-option bypass-route** and **ttl** commands for an operation, the **ttl** command does not take effect.

Examples

Set the maximum number of hops to 16 for probe packets in the ICMP echo operation.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] ttl 16
```

2.1.41. type

Use **type** to specify an NQA operation type and enter its view.

Syntax

type { **dhcp** | **dlsw** | **dns** | **ftp** | **http** | **icmp-echo** | **snmp** | **tcp** | **udp-echo** | **udp-jitter** | **voice** }

Default

No operation type is specified.

Views

NQA operation view

Predefined user roles

network-admin

Parameters

dhcp: Specifies the DHCP operation type.

dlsw: Specifies the DLSw operation type.

dns: Specifies the DNS operation type.

ftp: Specifies the FTP operation type.

http: Specifies the HTTP operation type.

icmp-echo: Specifies the ICMP echo operation type.

snmp: Specifies the SNMP operation type.

tcp: Specifies the TCP operation type.

udp-echo: Specifies the UDP echo operation type.

udp-jitter: Specifies the UDP jitter operation type.

voice: Specifies the voice operation type.

Examples

Specify FTP as the NQA operation type and enter FTP operation view.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type ftp
[Switch-nqa-admin-test-ftp]
```

2.1.42. url

Use **url** to specify the URL of the destination.

Use **undo url** to restore the default.

Syntax

url *url*

undo url

Default

The destination URL is not specified.

Views

FTP/HTTP operation view

Predefined user roles

network-admin

Parameters

url: Specifies the URL of the destination server, a case-sensitive string of 1 to 255 characters. The following table describes the URL format and parameters for different operations.

Operation	URL format	Parameter description
HTTP operation	http://*host*/*resource* http://*host*:*port*/*resource*	The *host* parameter represents the host name of the destination server. The host name is a dot-separated case-sensitive string including letters, digits, hyphens (-), and underscores (_). Host names are composed of series of labels, aabbcc.com for example. Each label consists of 1 to 63 characters. Consecutive dots (.) and question marks are not allowed. For description about the filename parameter, see *Fundamentals Configuration Guide*.
FTP operation	ftp://*host/filename* ftp://*host*:*port*/*filename*	

Examples

Configure the URL that the HTTP operation visits as **http://www.company.com/index.htm**.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type http
[Switch-nqa-admin-test-http] url http://www.company.com/index.html
```

2.1.43. username

Use **username** to specify a username.

Use **undo username** to restore the default.

Syntax

username *username*

undo username

Default

No username is configured.

Views

FTP/HTTP operation view

Predefined user roles

network-admin

Parameters

username: Specifies the username. This argument is case sensitive. It is a string of 1 to 32 characters for an FTP, HTTP, or HTTPS username, and a string of 1 to 253 characters for a RADIUS authentication username.

Examples

Set the FTP login username to **administrator**.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type ftp
[Switch-nqa-admin-test-ftp] username administrator
```

Related commands

operation

password

2.1.44. version

Use **version** to specify the version used in the HTTP operation.

Use **undo version** to restore the default.

Syntax

version { **v1.0** | **v1.1** }

undo version

Default

Version 1.0 is used in the HTTP operation.

Views

HTTP operation view

Predefined user roles

network-admin

Parameters

v1.0: Uses version 1.0.

v1.1: Uses version 1.1.

Examples

Configure the HTTP operation to use the HTTP version 1.1.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type http
[Switch-nqa-admin-test-http] version v1.1
```

2.1.45. vpn-instance

Use **vpn-instance** to apply the operation to a VPN instance.

Use **undo vpn-instance** to restore the default.

Syntax

vpn-instance *vpn-instance-name*

undo vpn-instance

Default

The operation applies to the public network.

Views

ICMP echo/TCP/UDP echo operation view

DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP jitter/voice operation view

Predefined user roles

network-admin

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After you specify the VPN, the NQA operation tests the connectivity in the specified VPN instance.

Examples

Apply the ICMP echo operation to **vpn1**.

```
<Switch> system-view
[Switch] nqa entry admin test
[Switch-nqa-admin-test] type icmp-echo
[Switch-nqa-admin-test-icmp-echo] vpn-instance vpn1
```

2.2. NQA server commands

IMPORTANT:
Configure the NQA server only for UDP jitter, TCP, UDP echo, and voice operations.

2.2.1. display nqa server

Use **display nqa server status** to display NQA server status.

Syntax

display nqa server

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display NQA server status.

```
<Switch> display nqa server
NQA server status: Enabled
TCP connect:
   IP address          Port      Tos    VPN instance
   2.2.2.2             2000      200    -
UDP echo:
   IP address          Port      Tos    VPN instance
   3.3.3.3             3000      255    -
```

Table 2-7 Command output

Field	Description
NQA server status	Whether the NQA server is enabled.
TCP connect	Information about the TCP listening service on the NQA server.
UDP echo	Information about the UDP listening service on the NQA server.
IP address	IP address specified for the TCP/UDP listening service on the NQA server.
Port	Port number specified for the TCP/UDP listening service on the NQA server.
Tos	ToS value in reply packets sent by the NQA server.
VPN instance	Name of the VPN instance to which the IP address that the NQA server listens on belongs. This field displays a hyphen (-) if the NQA server listens on a public IP address.

Related commands

nqa server enable

nqa server tcp-connect

nqa server udp-echo

2.2.2. nqa server enable

Use **nqa server enable** to enable the NQA server.

Use **undo nqa server enable** to disable the NQA server.

Syntax

nqa server enable

undo nqa server enable

Default

The NQA server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the NQA server.

```
<Switch> system-view
[Switch] nqa server enable
```

Related commands

display nqa server

nqa server tcp-connect

nqa server udp-echo

2.2.3. nqa server tcp-connect

Use **nqa server tcp-connect** to configure a TCP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server tcp-connect** to remove a TCP listening service.

Syntax

nqa server tcp-connect *ip-address port-number* [**vpn-instance** *vpn-instance-name*] [**tos** *tos*]

undo nqa server tcp-connect *ip-address port-number*

Default

No TCP listening services exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address for the TCP listening service.

port-number: Specifies the port number for the TCP listening service, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the NQA server listens on a public IP address.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range is 0 to 255, and the default value is 0.

Usage guidelines

Use this command on the NQA server only for the TCP operation.

When you configure the IP address and port number for a TCP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address, port number, and VPN instance must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the TCP listening service on well-known ports from 1 to 1023.

Examples

Configure a TCP listening service to enable the NQA server to listen to port 9000 on the IP address 169.254.10.2.

```
<Switch> system-view
[Switch] nqa server tcp-connect 169.254.10.2 9000
```

Related commands

display nqa server

nqa server enable

2.2.4. nqa server udp-echo

Use **nqa server udp-echo** to configure a UDP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server udp-echo** to remove the UDP listening service created.

Syntax

nqa server udp-echo *ip-address port-number* [**vpn-instance** *vpn-instance-name*] [**tos** *tos*]

undo nqa server udp-echo *ip-address port-number*

Default

No UDP listening services exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address for the UDP listening service.

port-number: Specifies the port number for the UDP listening service, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the NQA server listens on a public IP address.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range for this argument is 0 to 255, and the default value is 0.

Usage guidelines

Use this command on the NQA server only for the UDP jitter, UDP echo, and voice operations.

When you configure the IP address and port number for a UDP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address, port number, and VPN instance must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the UDP listening service on well-known ports from 1 to 1023.

Examples

Configure a UDP listening service to enable the NQA server to listen to port 9000 on the IP address 169.254.10.2.

```
<Switch> system-view
[Switch] nqa server udp-echo 169.254.10.2 9000
```

3. NTP commands

3.1. NTP commands

NTP is supported on the following Layer 3 interfaces:

- Layer 3 Ethernet interfaces.
- VLAN interfaces.
- Tunnel interfaces.

3.1.1. display ntp-service sessions

Use **display ntp-service sessions** to display information about all IPv4 NTP associations.

Syntax

display ntp-service sessions [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed information about all IPv4 NTP associations. If you do not specify this keyword, the command displays only brief information about the NTP associations.

Usage guidelines

When a device is operating in NTP broadcast or multicast server mode, the **display ntp-service sessions** command does not display the IPv4 NTP association information corresponding to the broadcast or multicast server. However, the associations are counted in the total number of associations.

Examples

Display brief information about all IPv4 NTP associations.

```
<Switch> display ntp-service sessions
       source          reference       stra reach poll  now offset  delay disper
**********************************************************************************
[12345]LOCAL(0)        LOCL              0     1    64    - 0.0000 0.0000 7937.9
    [5]0.0.0.0         INIT             16     0    64    - 0.0000 0.0000 0.0000
Notes: 1 source(master), 2 source(peer), 3 selected, 4 candidate, 5 configured.
 Total sessions: 1
```

Table 3-1 Command output

Field	Description
source	• When the reference clock is the local clock, the field displays **LOCAL** (*number*). It indicates that the IP address of the local clock is 127.127.1.*number*, where *number* represents the NTP process

Field	Description
	number in the range of 0 to 3. • When the reference clock is the clock of another device, the field displays the IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
reference	Reference clock ID of the NTP server: • If the reference clock is the local clock, the value of this field is related to the value of the **stra** field: ○ When the value of the **stra** field is 0 or 1, this field displays **LOCL**. ○ When the **stra** field has another value, this field displays the IP address of the local clock. • If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.
stra	Stratum level of the clock source, which determines the clock accuracy. The value is in the range of 1 to 16. The clock accuracy decreases from stratum 1 to stratum 16. A stratum 1 clock has the highest precision, and a stratum 16 clock is not synchronized and cannot be used as a reference clock.
reach	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
poll	Polling interval in seconds. It is the maximum interval between successive NTP messages.
now	Length of time from when the last NTP message was received or when the local clock was last updated to the current time. Time is in seconds by default. • If the time length is greater than 2048 seconds, it is displayed in minutes (m). • If the time length is greater than 300 minutes, it is displayed in hours (h). • If the time length is greater than 96 hours, it is displayed in days (d). • If the time length is greater than 999 days, it is displayed in years (y). If the time when the most recent NTP message was received or when the local clock was updated most recently is behind the current time, this field displays a hyphen (-).
offset	Offset of the system clock relative to the reference clock, in milliseconds.
delay	Roundtrip delay from the local device to the NTP server, in milliseconds.
disper	Maximum error of the system clock relative to the reference source, in milliseconds.
[12345]	• **1**—Clock source selected by the system (the current reference source). • **2**—The stratum level of the clock source is less than or equal to 15. • **3**—The clock source has survived the clock selection algorithm. • **4**—The clock source is a candidate clock source. • **5**—The clock source was created by a configuration command.

Field	Description
Total sessions	Total number of associations.

Display detailed information about all IPv4 NTP associations.

```
<Switch> display ntp-service sessions verbose
 Clock source: 192.168.1.40
 Session ID: 35888
 Clock stratum: 2
 Clock status:  configured, master, sane, valid

 Total sessions: 1
```

Table 3-2 Command output

Field	Description
Clock source	IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
Clock stratum	Stratum level of the NTP server, which determines the clock accuracy. The value is in the range of 1 to 16. A lower stratum level represents greater clock accuracy. A stratum 16 clock is not synchronized and cannot be used as a reference clock.
Clock status	Status of the clock source corresponding to this association: • **configured**—The association was created by a configuration command. • **dynamic**—The association is established dynamically. • **master**—The clock source is the primary reference source of the current system. • **selected**—The clock source has survived the clock selection algorithm. • **candidate**—The clock source is the candidate reference source. • **sane**—The clock source has passed authentication and will be used as a reference clock. • **insane**—The clock source has not passed authentication, or it has passed authentication but will not be used as a reference

Field	Description
	clock. • **valid**—The clock source is valid, which means the clock source meets the following requirements: ○ It has been authenticated and synchronized. ○ Its stratum level is valid. ○ Its root delay and root dispersion values are within their ranges. • **invalid**—The clock source is invalid. • **unsynced**—The clock source has not been synchronized or the value of the stratum level is invalid.
Reference clock ID	Reference clock ID of the NTP server: • If the reference clock is the local clock, the value of this field is related to the value of the **Clock** stratum field: ○ When the value of the **Clock** stratum field is 0 or 1, this field displays **LOCL**. ○ When the **Clock** stratum field has another value, this field displays the IP address of the local clock. • If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.
VPN instance	VPN instance to which the NTP server belongs. If the NTP server is in a public network, the field displays **Not specified**.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
local poll interval	Polling interval of the local device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Peer mode	Operation mode of the peer device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
peer poll interval	Polling interval of the peer device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
roundtrip delay	Roundtrip delay from the local device to the NTP server, in

Field	Description
	milliseconds.
dispersion	Maximum error of the system clock relative to the reference clock.
Root roundtrip delay	Roundtrip delay from the local device to the primary reference source, in milliseconds.
root dispersion	Maximum error of the system clock relative to the primary reference clock, in milliseconds.
Reachabilities	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
sync distance	Synchronization distance relative to the upper-level clock, in seconds, and calculated from dispersion and roundtrip delay values.
Precision	Accuracy of the system clock.
version	NTP version in the range of 1 to 4.
source interface	Source interface. If the source interface is not specified, this field is **Not specified**.
Reftime	Reference timestamp in the NTP message.
Orgtime	Originate timestamp in the NTP message.
Rcvtime	Receive timestamp in the NTP message.
Xmttime	Transmit timestamp in the NTP message.
Filter order	Sample information order.
Reference clock status	Status of the local clock. The field is displayed only when you use the **ntp-service refclock-master** command to set the local clock as a reference clock. When the reach field of the local clock is 255, the field is displayed as **working normally**. Otherwise, the field is displayed as **working abnormally**.
Total sessions	Total number of associations.

3.1.2. display ntp-service status

Use **display ntp-service status** to display NTP service status.

Syntax

display ntp-service status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display NTP service status after time synchronization.

```
<Switch> display ntp-service status
 Clock status: synchronized
```

```
 Clock stratum: 2
 System peer: LOCAL(0)
 Local mode: client
 Reference clock ID: 127.127.1.0
 Leap indicator: 00
 Clock jitter: 0.000977 s
 Stability: 0.000 pps
 Clock precision: 2^-19
 Root delay: 0.00000 ms
 Root dispersion: 3.96367 ms
 Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
 System poll interval: 256 s
```

Display the NTP service status when time is not synchronized.

```
<Switch> display ntp-service status
 Clock status: unsynchronized
 Clock stratum: 16
 Reference clock ID: none
 Clock jitter: 0.000000 s
 Stability: 0.000 pps
 Clock precision: 2^-19
 Clock precision:
 Root delay: 0.00000 ms
 Root dispersion: 0.00002 ms
 Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
 System poll interval: 8 s
```

Table 3-3 Command output

Field	Description
Clock status	Status of the system clock: • **synchronized**—The system clock has been synchronized. • **unsynchronized**—The system clock has not been synchronized.
Clock stratum	Stratum level of the system clock.
System peer	IP address of the selected NTP server.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
Reference clock ID	For an IPv4 NTP server: The field represents the IP address of the remote server when the local device is synchronized to a remote NTP server. The field represents the local clock when the local device uses the local clock as a reference source. • When the local clock has a stratum level of 1, this field displays

Field	Description
	LOCL. • When the local clock has any other stratum, this field displays the IP address of the local clock. For an IPv6 NTP server: The field represents the MD5 digest of the first 32 bits of the IPv6 address of the remote server when the local device is synchronized to a remote IPv6 NTP server. The field represents the local clock when the local device uses the local clock as a reference source. • When the local clock has a stratum level of 1, this field displays **LOCL**. • When the local clock has any other stratum, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the local clock.
Leap indicator	Alarming status: • **00**—Normal. • **01**—Leap second, indicates that the last minute in a day has 61 seconds. • **10**—Leap second, indicates that the last minute in a day has 59 seconds. • **11**—Time is not synchronized.
Clock jitter	Difference between the system clock and reference clock, in seconds.
Stability	Clock frequency stability. A lower value represents better stability.
Clock precision	Accuracy of the system clock.
Root delay	Roundtrip delay from the local device to the primary reference source, in milliseconds.
Root dispersion	Maximum error of the system clock relative to the primary reference source, in milliseconds.
Reference time	Reference timestamp.
System poll interval	System polling interval in seconds.

3.1.3. display ntp-service trace

Use **display ntp-service trace** to display brief information about each NTP server from the local device back to the primary reference source.

Syntax

display ntp-service trace

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

To trace back to the primary reference source from the source interface, make sure the source interface and the NTP servers from the local device to the primacy reference source are reachable to each other.

Examples

Display brief information about each NTP server from the local device back to the primary reference source.

```
<Switch> display ntp-service trace
Server     127.0.0.1
Stratum    3, jitter  0.000, synch distance 0.0000.
Server     3000::32
Stratum    2 , jitter 790.00, synch distance 0.0000.
RefID      127.127.1.0
```

The output shows that server 127.0.0.1 is synchronized to server 3000::32, and server 3000::32 is synchronized to the local clock.

Table 3-4 Command output

Field	Description
Server	IP address of the NTP server.
Stratum	Stratum level of the NTP server.
jitter	Root mean square (RMS) value of the clock offset relative to the upper-level clock, in seconds.
synch distance	Synchronization distance relative to the upper-level NTP server, in seconds, calculated from dispersion and roundtrip delay values.
RefID	Identifier of the primary reference source. When the stratum level of the primary reference clock is 0, it is displayed as **LOCL**. Otherwise, it is displayed as the IP address of the primary reference clock.

Related commands

ntp-service source

ntp-service unicast-server

ntp-service unicast-peer

3.1.4. ntp-service acl

Use **ntp-service acl** to configure the right for peer devices to access the IPv4 NTP services on the local device.

Use **undo ntp-service** to remove the configured IPv4 NTP service access right.

Syntax

ntp-service { **peer** | **query** | **server** | **synchronization** } **acl** *ipv4-acl-number*

undo ntp-service { **peer** | **query** | **server** | **synchronization** } [**acl** *ipv4-acl-number*]

Default

The right for the peer devices to access the IPv4 NTP services on the local device is **peer**.

Views

System view

Predefined user roles

network-admin

Parameters

peer: Allows time requests and NTP control queries (such as alarms, authentication status, and time server information) from a peer device and allows the local device to synchronize itself to a peer device.

query: Allows only NTP control queries from a peer device to the local device.

server: Allows time requests and NTP control queries from a peer device, but does not allow the local device to synchronize itself to a peer device.

synchronization: Allows only time requests from a peer device.

acl *ipv4-acl-number*: Specifies an IPv4 ACL by its number. The peer devices that match the IPv4 ACL have the access right specified in the command. The *ipv4-acl-number* argument represents an IPv4 basic ACL number in the range of 2000 to 2999 or an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

When the device receives an IPv4 NTP request, it matches the request against the access rights in order from the least restrictive to the most restrictive: **peer**, **server**, **synchronization**, and **query**.

- If no IPv4 NTP access control is configured, the **peer** access right applies.
- If the IP address of the peer device matches a **permit** statement in an IPv4 ACL, the access right is granted to the peer device. If a **deny** statement or no IPv4 ACL is matched, no access right is granted.
- If no IPv4 ACL is specified for an access right or the IPv4 ACL specified for the access right is not created, the access right is not granted.
- If none of the IPv4 ACLs specified for the access rights is created, the **peer** access right applies.
- If none of the IPv4 ACLs specified for the access rights contains rules, no access right is granted.

The **ntp-service acl** command provides minimal security for a system running NTP. A more secure method is NTP authentication.

Examples

Configure the peer devices on subnet 10.10.0.0/16 to have full access to the local device.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Switch-acl-ipv4-basic-2001] quit
[Switch] ntp-service peer acl 2001
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

3.1.5. ntp-service authentication enable

Use **ntp-service authentication enable** to enable NTP authentication.

Use **undo ntp-service authentication enable** to disable NTP authentication.

Syntax

ntp-service authentication enable

undo ntp-service authentication enable

Default

NTP authentication is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Enable NTP authentication in networks that require time synchronization security to make sure NTP clients are synchronized only to authenticated NTP servers.

To authenticate an NTP server, set an authentication key and specify it as a trusted key.

Examples

Enable NTP authentication.

```
<Switch> system-view
[Switch] ntp-service authentication enable
```

Related commands

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

3.1.6. ntp-service authentication-keyid

Use **ntp-service authentication-keyid** to set an NTP authentication key.

Use **undo ntp-service authentication-keyid** to remove an NTP authentication key.

Syntax

ntp-service authentication-keyid *keyid* **authentication-mode md5** { **cipher** | **simple** } *string*

undo ntp-service authentication-keyid *keyid*

Default

No NTP authentication key exists.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key ID in the range of 1 to 4294967295.

authentication-mode: Specifies an authentication algorithm.

- **md5**: Specifies the MD5 algorithm.

cipher: Specifies an authentication key in encrypted form.

simple: Specifies an authentication key in plaintext form. For security purposes, the authentication key specified in plaintext form will be stored in encrypted form.

string: Specifies a case-sensitive authentication key. Its plaintext form is a string of 1 to 32 characters. Its encrypted form is a string of 1 to 73 characters.

Usage guidelines

In a network where there is a high security demand, the NTP authentication feature must be enabled for a system running NTP. This feature enhances the network security by using client-server key authentication, which prohibits a client from synchronizing to a device that has failed the authentication.

To ensure a successful NTP authentication, configure the same key ID, authentication algorithm, and key on the time server and client.

After you specify an NTP authentication key, use the **ntp-service reliable authentication-keyid** command to configure the key as a trusted key. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

You can set a maximum of 128 authentication keys by executing the command.

Examples

Set a plaintext MD5 authentication key, with the key ID of **10** and key value of **BetterKey**.

```
<Switch> system-view
[Switch] ntp-service authentication enable
[Switch] ntp-service authentication-keyid 10 authentication-mode md5 simple BetterKey
```

Related commands

ntp-service authentication enable

ntp-service reliable authentication-keyid

3.1.7. ntp-service broadcast-client

Use **ntp-service broadcast-client** to configure the device to operate in NTP broadcast client mode and use the current interface to receive NTP broadcast packets.

Use **undo ntp-service broadcast-client** to remove the configuration.

Syntax

ntp-service broadcast-client

undo ntp-service broadcast-client

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After you configure the command, the device listens to NTP messages sent by the NTP broadcast server and is synchronized based on the received NTP messages.

If you have configured the device to operate in broadcast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast client mode and receive NTP broadcast messages on VLAN-interface 1.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ntp-service broadcast-client
```

Related commands

ntp-service broadcast-server

3.1.8. ntp-service broadcast-server

Use **ntp-service broadcast-server** to configure the device to operate in NTP broadcast server mode and use the current interface to send NTP broadcast packets.

Use **undo ntp-service broadcast-server** to remove the configuration.

Syntax

ntp-service broadcast-server [**authentication-keyid** *keyid* | **version** *number*] *

undo ntp-service broadcast-server

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

authentication-keyid *keyid*: Specifies the key ID to be used for sending broadcast messages to broadcast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize broadcast clients enabled with NTP authentication.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4, and the default is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the broadcast address 255.255.255.255.

If you have configured the device to operate in broadcast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast server mode and send NTP broadcast messages on VLAN-interface 1, using key 4 for encryption. Set the NTP version to 4.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ntp-service broadcast-server authentication-keyid 4 version 4
```

Related commands

ntp-service broadcast-client

3.1.9. ntp-service dscp

Use **ntp-service dscp** to set a DSCP value for IPv4 NTP packets.

Use **undo ntp-service dscp** to restore the default.

Syntax

ntp-service dscp *dscp-value*

undo ntp-service dscp

Default

The DSCP value for IPv4 NTP packets is 48.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets a DSCP value in the range of 0 to 63 for IPv4 NTP packets.

Usage guidelines

The DSCP value is included in the ToS field of an IPv4 packet to identify the packet priority.

Examples

Set the DSCP value for IPv4 NTP packets to **30**.

```
<Switch> system-view
[Switch] ntp-service dscp 30
```

3.1.10. ntp-service enable

Use **ntp-service enable** to enable the NTP service.

Use **undo ntp-service enable** to disable the NTP service.

Syntax

ntp-service enable

undo ntp-service enable

Default

The NTP service is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the NTP service.

```
<Switch> system-view
[Switch] ntp-service enable
```

3.1.11. ntp-service inbound enable

Use **ntp-service inbound enable** to enable an interface to receive NTP messages.

Use **undo ntp-service inbound enable** to disable an interface from receiving NTP messages.

Syntax

ntp-service inbound enable

undo ntp-service inbound enable

Default

An interface receives NTP messages.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Execute the **undo ntp-service inbound enable** command on an interface in the following cases:

- You do not want the interface to synchronize the peer device in the corresponding subnet.
- You do not want the device to be synchronized by the peer device in the subnet corresponding to the interface.

Examples

Disable VLAN-interface 1 from receiving NTP messages.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] undo ntp-service inbound enable
```

3.1.12. ntp-service max-dynamic-sessions

Use **ntp-service max-dynamic-sessions** to set the maximum number of dynamic NTP sessions.

Use **undo ntp-service max-dynamic-sessions** to restore the default.

Syntax

ntp-service max-dynamic-sessions *number*

undo ntp-service max-dynamic-sessions

Default

The maximum number of dynamic NTP sessions is 100.

Views

System view

Predefined user roles

network-admin

Parameters

number: Sets the maximum number of dynamic NTP associations, in the range of 0 to 100.

Usage guidelines

A device can have a maximum of 128 concurrent associations, including static associations and dynamic associations. A static association refers to an association that a user has manually created by using an NTP command. A dynamic association is a temporary association created by the system during operation.

This command limits the number of dynamic NTP associations and prevents dynamic NTP associations from occupying too many system resources.

Examples

Set the maximum number of dynamic NTP associations to 50.

```
<Switch> system-view
[Switch] ntp-service max-dynamic-sessions 50
```

Related commands

display ntp-service sessions

3.1.13. ntp-service multicast-client

Use **ntp-service multicast-client** to configure the device to operate in NTP multicast client mode and use the current interface to receive NTP multicast packets.

Use **undo ntp-service multicast-client** to remove the configuration.

Syntax

ntp-service multicast-client [*ip-address*]

undo ntp-service multicast-client [*ip-address*]

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a multicast IP address. The default is 224.0.1.1. A multicast server and client must be configured with the same multicast IP address.

Usage guidelines

After you configure the command, the device listens to NTP messages using the specified multicast address as the destination address.

If you have configured the device to operate in multicast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

The value range for the *ip-address* argument is 224.0.1.1 to 224.0.1.255 for VLAN interfaces and for Layer 3 Ethernet interfaces on the master device in an IRF fabric.

Examples

Configure the device to operate in multicast client mode and receive NTP multicast messages on VLAN-interface 1, and set the multicast address to 224.0.1.1.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ntp-service multicast-client 224.0.1.1
```

Related commands

ntp-service multicast-server

3.1.14. ntp-service multicast-server

Use **ntp-service multicast-server** to configure the device to operate in NTP multicast server mode and use the current interface to send NTP multicast packets.

Use **undo ntp-service multicast-server** to remove the configuration.

Syntax

ntp-service multicast-server [*ip-address*] [**authentication-keyid** *keyid* | **ttl** *ttl-number* | **version** *number*] *

undo ntp-service multicast-server [*ip-address*]

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a multicast IP address. The default is 224.0.1.1. A multicast server and client must be configured with the same multicast IP address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending multicast messages to multicast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize multicast clients enabled with NTP authentication.

ttl *ttl-number*: Specifies the TTL of NTP multicast messages. The value range for the *ttl-number* argument is 1 to 255. The default value is 16.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the specified multicast address.

If you have configured the device to operate in multicast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

The value range for the *ip-address* argument is 224.0.1.1 to 224.0.1.255 for VLAN interfaces and for Layer 3 Ethernet interfaces on the master device in an IRF fabric.

Examples

Configure the device to operate in multicast server mode and send NTP multicast messages on VLAN-interface 1 to the multicast address 224.0.1.1, using key 4 for encryption. Set the NTP version to 4.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] ntp-service multicast-server 224.0.1.1 version 4
authentication-keyid 4
```

Related commands

ntp-service multicast-client

3.1.15. ntp-service refclock-master

Use **ntp-service refclock-master** to configure the local clock as the reference source.

Use **undo ntp-service refclock-master** to remove the configuration.

Syntax

ntp-service refclock-master [*ip-address*] [*stratum*]

undo ntp-service refclock-master [*ip-address*]

Default

The device does not use its local clock as the reference clock.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: IP address of the local clock, 127.127.1.*u*, where *u* is the NTP process ID in the range of 0 to 3. The default value is 127.127.1.0.

stratum: Stratum level of the local clock, in the range of 1 to 15. The default value is 8. A lower stratum level represents higher clock accuracy.

Usage guidelines

Typically an NTP server that gets its time from an authoritative time source, such as an atomic clock has stratum 1 and operates as the primary time server to provide time synchronization for other devices in the network. The accuracy of each server is the stratum, with the topmost level (primary servers) assigned as one and each level downwards (secondary servers) in the hierarchy assigned as one greater than the preceding level.

If the devices in a network cannot synchronize to an authoritative time source, you can perform the following tasks:

- Select a device that has a relatively accurate clock from the network.
- Use the local clock of the device as the reference clock to synchronize other devices in the network.

Use the command with caution to avoid time errors. As a best practice, set the local clock time to a correct value before you execute the command.

Examples

Specify the local clock as the reference source, with the stratum level 2.

```
<Switch> system-view
[Switch] ntp-service refclock-master 2
```

3.1.16. ntp-service reliable authentication-keyid

Use **ntp-service reliable authentication-keyid** to specify an authentication key as a trusted key.

Use **undo ntp-service reliable authentication-keyid** to remove the configuration.

Syntax

ntp-service reliable authentication-keyid *keyid*

undo ntp-service reliable authentication-keyid *keyid*

Default

No trusted key is specified.

Views

System view

Predefined user roles

network-admin

Parameters

keyid: Specifies an authentication key by its ID in the range of 1 to 4294967295.

Usage guidelines

When NTP authentication is enabled, a client can be synchronized only to a server that can provide a trusted authentication key.

Before you use the command, make sure NTP authentication is enabled and an authentication key is configured. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

You can set a maximum of 128 keys by executing the command.

Examples

Enable NTP authentication, specify the MD5 algorithm, with the key ID of 37 and key value of **BetterKey**.

```
<Switch> system-view
[Switch] ntp-service authentication enable
[Switch] ntp-service authentication-keyid 37 authentication-mode md5 simple BetterKey
```

Specify this key as a trusted key.

```
[Switch] ntp-service reliable authentication-keyid 37
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

3.1.17. ntp-service source

Use **ntp-service source** to specify a source interface for NTP messages.

Use **undo ntp-service source** to restore the default.

Syntax

ntp-service source *interface-type interface-number*

undo ntp-service source

Default

No source interface is specified for NTP messages. The device performs the following operations:

- Searches the routing table for the outbound interface of NTP messages.
- Uses the primary IP address of the outbound interface as the source IP address for NTP messages.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If you specify a source interface for NTP messages, the device uses the primary IP address of the specified interface as the source IP address to send NTP messages. Consequently, the destination address of the NTP response messages is the primary IP address of the source interface.

When the device responds to an NTP request, the source IP address of the NTP response is always the IP address of the interface that has received the NTP request.

If you do not want the IP address of an interface on the local device to become the destination address for response messages, use the command to specify another interface as the source interface for NTP messages.

The source interface for NTP messages can also be specified in the following ways:

- In NTP client/server mode, if you have specified the source interface for NTP messages in the **ntp-service unicast-server** command, the specified interface acts as the source interface for NTP messages.
- In NTP symmetric active/passive mode, if you have specified the source interface for NTP messages in the **ntp-service unicast-peer** command, the specified interface acts as the source interface for NTP messages.
- In NTP multicast mode, if you have configured the **ntp-service multicast-server** command on an interface, the interface acts as the source interface for NTP multicast messages.
- In NTP broadcast mode, if you have configured the **ntp-service broadcast-server** command on an interface, the interface acts as the source interface for NTP broadcast messages.

If the specified source interface is down, the device does not send NTP messages.

Examples

Specify the source interface for NTP messages as VLAN-interface 1.

```
<Switch> system-view
[Switch] ntp-service source vlan-interface 1
```

3.1.18. ntp-service unicast-peer

Use **ntp-service unicast-peer** to specify a symmetric-passive peer for the device.

Use **undo ntp-service unicast-peer** to remove the symmetric-passive peer specified for the device.

Syntax

ntp-service unicast-peer { *peer-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number* | **version** *number*] *

undo ntp-service unicast-peer { *peer-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*]

Default

No symmetric-passive peer is specified.

Views

System view

Predefined user roles

network-admin

Parameters

peer-name: Specifies a symmetric-passive peer by its host name, a case-insensitive string of 1 to 253 characters.

ip-address: Specifies a symmetric-passive peer by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the symmetric-passive peer belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the symmetric-passive peer is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the peer. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and the peer do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies the peer specified by *ip-address* or *peer-name* as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. In an NTP message the local device sends to its peer, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify a passive peer for the device, the device and its passive peer can be synchronized to each other. If their clocks are in synchronized state, the clock with a high stratum level is synchronized to the clock with a lower stratum level.

To synchronize the PE to a PE or CE in a VPN instance, provide **vpn-instance** *vpn-instance-name* in your command.

If you include **vpn-instance** *vpn-instance-name* in the **undo ntp-service unicast-peer** command, the command removes the symmetric-passive peer in the specified VPN instance. If you do not include **vpn-instance** *vpn-instance-name* in the command, the command removes the symmetric-passive peer on the public network.

After you specify a symmetric-passive peer for a device, the device polls and synchronizes its time with the peer device at the minimum polling interval. If the time discrepancy between the two maintains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect from the next polling.

Examples

Specify the device with the IP address of 10.1.1.1 as the symmetric-passive peer of the device, and configure the device to run NTP version 4. Specify the source interface of NTP messages as VLAN-interface 1.

```
<Switch> system-view
[Switch] ntp-service unicast-peer 10.1.1.1 version 4 source-interface vlan-interface 1
```

Related commands

ntp-service authentication enable

ntp-service reliable authentication-keyid

3.1.19. ntp-service unicast-server

Use **ntp-service unicast-server** to specify an NTP server for the device.

Use **undo ntp-service unicast-server** to remove an NTP server specified for the device.

Syntax

ntp-service unicast-server { *server-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number* | **version** *number*] *

undo ntp-service unicast-server { *server-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*]

Default

No NTP server is specified.

Views

System view

Predefined user roles

network-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters.

ip-address: Specifies an NTP server by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the NTP server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the NTP server is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies this NTP server as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. For an NTP message the local device sends to the NTP server, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the

routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify an NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

To synchronize the PE to a PE or CE in a VPN instance, provide **vpn-instance** *vpn-instance-name* in your command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service unicast-server** command, the command removes the NTP server in the specified VPN instance. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the NTP server on the public network.

After you specify an NTP server for a device, the device polls and synchronizes its time with the server at the minimum polling interval. If the time discrepancy between the two maintains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect from the next polling.

Examples

Specify NTP server 10.1.1.1 for the device, and configure the device to run NTP version 4.

```
<Switch> system-view
[Switch] ntp-service unicast-server 10.1.1.1 version 4
```

4. SNMP commands

4.1. SNMP commands

The SNMP agent sends notifications (traps and informs) to inform the NMS of significant events, such as link state changes and user logins or logouts. Unless otherwise stated, the **trap** keyword in the command line includes both traps and informs.

4.1.1. display snmp-agent community

Use **display snmp-agent community** to display information about SNMPv1 or SNMPv2c communities.

Syntax

display snmp-agent community [**read** | **write**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

read: Specifies SNMP read-only communities.

write: Specifies SNMP read and write communities.

Usage guidelines

If you do not specify the **read** or **write** keyword, this command displays information about all SNMPv1 and SNMPv2c communities.

This command displays SNMPv1 and SNMPv2c communities created in the following ways:

- Created by using the **snmp-agent community** command.
- Automatically created by the system for SNMPv1 and SNMPv2c users that have been assigned to an existing SNMP group.

Examples

Display information about all SNMPv1 and SNMPv2c communities.

```
<Switch> display snmp-agent community
   Community name: aa
       Group name: aa
       ACL:2001
       Storage-type: nonVolatile
       Context name: con1

   Community name: bb
       Role name: bb
       Storage-type: nonVolatile
```

```
   Community name: userv1
       Group name: testv1
       Storage-type: nonvolatile
Community name: cc
       Group name: cc
       ACL name: testacl
       Storage-type: nonVolatile
```

Table 4-1 Command output

Field	Description
Community name	Community name created by using the **snmp-agent community** command or username created by using the **snmp-agent usm-user** { **v1** | **v2c** } command.
Group name	SNMP group name. • If the community is created by using the **snmp-agent community** command in VACM mode, the group name is the same as the community name. • If the community is created by using the **snmp-agent usm-user** { **v1** | **v2c** } command, the name of the group that has the user is displayed.
Role name	User role name for the community.
ACL	Number of the ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community. It is exclusive with the **ACL name** field.
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMPv1 or SNMPv2c community. It is exclusive with the **ACL** field.
Storage-type	Storage type: • **volatile**—Settings are lost when the system reboots. • **nonVolatile**—Settings remain after the system reboots. • **permanent**—Settings remain after the system reboots and can be modified but not deleted. • **readOnly**—Settings remain after the system reboots and cannot be modified or deleted. • **other**—Any other storage type.
Context name	SNMP context: • If a mapping between the SNMP community and an SNMP context is configured, the SNMP context is displayed. • If no mapping between the SNMP community and an SNMP context exists, this field is empty.

Related commands

snmp-agent community

snmp-agent usm-user { **v1** | **v2c** }

4.1.2. display snmp-agent group

Use **display snmp-agent group** to display information about SNMP groups.

Syntax

display snmp-agent group [*group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-name: Specifies a SNMPv1, SNMPv2c, or SNMPv3 group name. It is a case-sensitive string of 1 to 32 characters. If you do not specify a group, this command displays information about all SNMP groups.

Examples

Display information about all SNMP groups.

```
<Switch> display snmp-agent group
   Group name: groupv3
       Security model: v3 noAuthnoPriv
       Readview: ViewDefault
       Writeview: <no specified>
       Notifyview: <no specified>
       Storage-type: nonvolatile
        ACL name: testacl
```

Table 4-2 Command output

Field	Description
Group name	SNMP group name.
Security model	Security model of the SNMP group: • **authPriv**—Authentication with privacy. • **authNoPriv**—Authentication without privacy. • **noAuthNoPriv**—No authentication, no privacy. Security model of a SNMPv1 or SNMPv2c group can only be noAuthNoPriv.
Readview	Read-only MIB view accessible to the SNMP group.
Writeview	Write MIB view accessible to the SNMP group.
Notifyview	Notify MIB view for the SNMP group. The SNMP users in the group can send notifications only for the nodes in the notify MIB view.
Storage-type	Storage type, including **volatile**, **nonvolatile**, **permanent**, **readOnly**, and **other**. For more information, see Table 4-1 .
ACL	Number of the ACL. This field appears only when an ACL is specified for the SNMP group. It is exclusive with the **ACL name** field.

Field	Description
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMP group. It is exclusive with the **ACL** field.

Related commands

snmp-agent group

4.1.3. display snmp-agent local-engineid

Use **display snmp-agent local-engineid** to display the local SNMP engine ID.

Syntax

display snmp-agent local-engineid

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Every SNMP entity has one SNMP engine to provide services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects.

An SNMP engine ID uniquely identifies an SNMP entity in an SNMP domain.

Examples

Display the local SNMP engine ID.

```
<Switch> display snmp-agent local-engineid
   SNMP local engine ID: 800063A2800084E52BED7900000001
```

Related commands

snmp-agent local-engineid

4.1.4. display snmp-agent mib-view

Use **display snmp-agent mib-view** to display MIB views.

Syntax

display snmp-agent mib-view [**exclude** | **include** | **viewname** *view-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

exclude: Displays the subtrees excluded from any MIB view.

include: Displays the subtrees included in any MIB view.

viewname *view-name*: Displays information about the specified MIB view. The *view-name* argument is a case-sensitive string of 1 to 32 characters.

Usage guidelines

If you do not specify any parameters, this command displays all MIB views.

Examples

Display all MIB views.

```
<Switch> display snmp-agent mib-view
   View name: ViewDefault
       MIB Subtree: iso
       Subtree mask:
       Storage-type: nonVolatile
       View Type: included
       View status: active

   View name: ViewDefault
       MIB Subtree: snmpUsmMIB
       Subtree mask:
       Storage-type: nonVolatile
       View Type: excluded
       View status: active

   View name: ViewDefault
       MIB Subtree: snmpVacmMIB
       Subtree mask:
       Storage-type: nonVolatile
       View Type: excluded
       View status: active

   View name: ViewDefault
       MIB Subtree: snmpModules.18
       Subtree mask:
       Storage-type: nonVolatile
       View Type: excluded
       View status: active
```

ViewDefault is the default MIB view. The output shows that except for the MIB objects in the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees, all the MIB objects in the **iso** subtree are accessible.

Table 4-3 Command output

Field	Description
View name	MIB view name.
MIB Subtree	MIB subtree covered by the MIB view.
Subtree mask	MIB subtree mask.
Storage-type	Type of the medium (see Table 4-1) where the subtree view is stored.

Field	Description
View Type	Access privilege for the MIB subtree in the MIB view: • **Included**—All objects in the MIB subtree are accessible in the MIB view. • **Excluded**—None of the objects in the MIB subtree is accessible in the MIB view.
View status	Status of the MIB view: • **active**—MIB view is effective. • **inactive**—MIB view is ineffective. The objects in the MIB view are not accessible, but they can send notifications.

Related commands

snmp-agent mib-view

4.1.5. display snmp-agent statistics

Use **display snmp-agent statistics** to display SNMP message statistics.

Syntax

display snmp-agent statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display SNMP message statistics.

```
<Switch> display snmp-agent statistics
  1684 messages delivered to the SNMP entity.
  5 messages were for an unsupported version.
  0 messages used an unknown SNMP community name.
  0 messages represented an illegal operation for the community supplied.
  0 ASN.1 or BER errors in the process of decoding.
  1679 messages passed from the SNMP entity.
  0 SNMP PDUs had badValue error-status.
  0 SNMP PDUs had genErr error-status.
  0 SNMP PDUs had noSuchName error-status.
  0 SNMP PDUs had tooBig error-status (Maximum packet size 1500).
  16544 MIB objects retrieved successfully.
  2 MIB objects altered successfully.
  7 GetRequest-PDU accepted and processed.
  7 GetNextRequest-PDU accepted and processed.
  1653 GetBulkRequest-PDU accepted and processed.
  1669 GetResponse-PDU accepted and processed.
  2 SetRequest-PDU accepted and processed.
  0 Trap PDUs accepted and processed.
```

```
0 alternate Response Class PDUs dropped silently.
0 forwarded Confirmed Class PDUs dropped silently.
```

Table 4-4 Command output

Field	Description
messages delivered to the SNMP entity	Number of messages that the SNMP agent has received.
messages were for an unsupported version	Number of messages that are not supported by the SNMP agent version.
messages used an unknown SNMP community name	Number of messages that used an unknown SNMP community name.
messages represented an illegal operation for the community supplied	Number of messages carrying an operation that the community has no right to perform.
ASN.1 or BER errors in the process of decoding	Number of messages that had ASN.1 or BER errors during decoding.
messages passed from the SNMP entity	Number of messages sent by the SNMP agent.
SNMP PDUs had badValue error-status	Number of PDUs with a BadValue error.
SNMP PDUs had genErr error-status	Number of PDUs with a genErr error.
SNMP PDUs had noSuchName error-status	Number of PDUs with a NoSuchName error.
SNMP PDUs had tooBig error-status	Number of PDUs with a TooBig error (the maximum packet size is 1500 bytes).
MIB objects retrieved successfully	Number of MIB objects that have been successfully retrieved.
MIB objects altered successfully	Number of MIB objects that have been successfully modified.
GetRequest-PDU accepted and processed	Number of GetRequest requests that have been received and processed.
GetNextRequest-PDU accepted and processed	Number of getNext requests that have been received and processed.
GetBulkRequest-PDU accepted and processed	Number of getBulk requests that have been received and processed.
GetResponse-PDU accepted and processed	Number of get responses that have been received and processed.
SetRequest-PDU accepted and processed	Number of set requests that have been received and processed.
Trap PDUs accepted and processed	Number of notifications that have been received and processed.
alternate Response Class PDUs dropped silently	Number of dropped response packets.
forwarded Confirmed Class PDUs dropped silently	Number of forwarded packets that have been dropped.

4.1.6. display snmp-agent sys-info

Use **display snmp-agent sys-info** to display SNMP agent system information.

Syntax

display snmp-agent sys-info [**contact** | **location** | **version**] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

contact: Displays the system contact.

location: Displays the physical location of the device.

version: Displays the SNMP agent version.

Usage guidelines

If you do not specify any keywords, this command displays all SNMP agent system information.

Examples

Display all SNMP agent system information.

```
<Switch> display snmp-agent sys-info
   The contact information of the agent:
       The contact is not configured.

   The location information of the agent:
       The contact is not configured.

   The SNMP version of the agent:
       SNMPv3
```

Related commands

snmp-agent sys-info

4.1.7. display snmp-agent trap queue

Use **display snmp-agent trap queue** to display basic information about the trap queue.

Syntax

display snmp-agent trap queue

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the trap queue configuration and usage status.

```
<Switch> display snmp-agent trap queue
   Queue size: 100
   Message number: 6
```

Related commands

snmp-agent trap life

snmp-agent trap queue-size

4.1.8. display snmp-agent trap-list

Use **display snmp-agent trap-list** to display SNMP notifications enabling status for modules.

Syntax

display snmp-agent trap-list

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

If a module has multiple sub-modules and SNMP notifications are enabled for one of its sub-modules, the command output shows that the module is SNMP notifications-enabled.

To determine whether a module supports SNMP notifications, execute the **snmp-agent trap enable ?** command.

The **display snmp-agent trap-list** command output varies by the **snmp-agent trap enable** command configuration and the module configuration.

Examples

Display SNMP notifications enabling status for modules.

```
<Switch> display snmp-agent trap-list
arp notification is disabled.
   bfd notification is enabled.
   bgp notification is enabled.
   configuration notification is enabled.
   isis notification is enabled.
   l3vpn notification is enabled.
   mac-address notification is enabled.
   ospf notification is enabled.
   radius notification is disabled.
   standard notification is enabled.
   stp notification is disabled.
   syslog notification is disabled.
   system notification is enabled.
```

```
Enabled notifications: 9; Disabled notifications: 4
```

Related commands

snmp-agent trap enable

4.1.9. display snmp-agent usm-user

Use **display snmp-agent usm-user** to display SNMPv3 user information.

Syntax

display snmp-agent usm-user [**engineid** *engineid* | **group** *group-name* | **username** *user-name*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

engineid *engineid*: Specifies an SNMP engine ID. The engine ID is case insensitive. When a SNMPv3 user is created, the system records the local SNMP entity engine ID. The user becomes invalid when the engine ID changes, and it becomes valid again when the recorded engine ID is restored.

group *group-name*: Specifies an SNMP group by its name. The group name is case sensitive.

username *user-name*: Specifies a SNMPv3 user by its name. The username is case sensitive.

Usage guidelines

This command displays only SNMPv3 users that you have created by using the **snmp-agent usm-user v3** command. To display SNMPv1 or SNMPv2c users created by using the **snmp-agent usm-user** { **v1** | **v2c** } command, use the **display snmp-agent community** command.

Examples

Display information about all SNMPv3 users.

```
<Switch> display snmp-agent usm-user
   Username: userv3
   Group name: mygroupv3
       Engine ID: 800063A203000FE240A1A6
       Storage-type: nonVolatile
       UserStatus: active
       ACL: 2000

   Username: userv3
   Group name: mygroupv3
       Engine ID: 8000259503000BB3100A508
       Storage-type: nonVolatile
       UserStatus: active
       ACL name: testacl
```

```
Username: userv3code
Role name: groupv3code
           network-operator
    Engine ID: 800063A203000FE240A1A6
    Storage-type: nonVolatile
    UserStatus: active

Username: userv3code
Role name: snmprole
           network-operator
    Engine ID: 800063A280000002BB0001
    Storage-type: nonVolatile
    UserStatus: active
```

Table 4-5 Command output

Field	Description
Username	SNMP username.
Group name	SNMP group name.
Role name	SNMP user role name.
Engine ID	Engine ID that the SNMP agent used when the SNMP user was created.
Storage-type	Storage type: • **volatile**. • **nonvolatile**. • **permanent**. • **readOnly**. • **other**. For more information about these storage types, see Table 4-1 .
UserStatus	SNMP user status: • **active**—The SNMP user is effective. • **notInService**—The SNMP user is correctly configured but not activated. • **notReady**—The SNMP user configuration is incomplete. • **other**—Any other status.
ACL	Number of the ACL. This field appears only when an ACL is specified for the SNMPv3 user. It is exclusive with the **ACL name** field.
ACL name	Name of the ACL. This field appears only when an ACL is specified for the SNMPv3 user. It is exclusive with the **ACL** field.

Related commands

snmp-agent usm-user v3

4.1.10. enable snmp trap updown

Use **enable snmp trap updown** to enable link state notifications on an interface.

Use **undo enable snmp trap updown** to disable link state notifications on an interface.

Syntax

enable snmp trap updown

undo enable snmp trap updown

Default

Link state notifications are enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

For an interface to generate linkUp/linkDown notifications when its state changes, you must also enable the linkUp/linkDown notification function globally by using the **snmp-agent trap enable standard** [**linkdown** | **linkup**] * command.

Examples

Enable GigabitEthernet 1/0/1 to send linkUp/linkDown SNMP traps to 10.1.1.1 in the community **public**.

```
<Switch> system-view
[Switch] snmp-agent trap enable
[Switch] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] enable snmp trap updown
```

Related commands

snmp-agent target-host

snmp-agent trap enable

4.1.11. snmp-agent

Use **snmp-agent** to enable the SNMP agent.

Use **undo snmp-agent** to disable the SNMP agent.

Syntax

snmp-agent

undo snmp-agent

Default

The SNMP agent is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The SNMP agent is automatically enabled when you execute any command that begins with **snmp-agent** except for the **snmp-agent calculate-password** command.

Examples

Enable the SNMP agent.

```
<Switch> system-view
[Switch] snmp-agent
```

4.1.12. snmp-agent { inform | trap } source

Use **snmp-agent** { **inform** | **trap** } **source** to specify a source IP address for the informs or traps sent by the SNMP agent.

Use **undo snmp-agent** { **inform** | **trap** } **source** to restore the default.

Syntax

snmp-agent { **inform** | **trap** } **source** *interface-type interface-number*

undo snmp-agent { **inform** | **trap** } **source**

Default

The SNMP agent uses the IP address of the outgoing interface as the source IP address of notifications.

Views

System view

Predefined user roles

network-admin

Parameters

inform: Specifies informs.

trap: Specifies traps.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The **snmp-agent source** command enables the SNMP agent to use the primary IP address of an interface as the source IP address in all its SNMP informs or traps, regardless of their outgoing interfaces. An NMS can use this IP address to filter all the informs or traps sent by the SNMP agent.

Make sure the specified interface has been created and assigned a valid IP address. The configuration will fail if the interface has not been created and will take effect only after a valid IP address is assigned to the specified interface.

Examples

Configure the primary IP address of GigabitEthernet 1/0/1 as the source address of SNMP traps.

```
<Switch> system-view
[Switch] snmp-agent trap source gigabitethernet 1/0/1
```

Configure the primary IP address of GigabitEthernet 1/0/2 as the source address of SNMP informs.

```
<Switch> system-view
```

```
[Switch] snmp-agent inform source gigabitethernet 1/0/2
```

Related commands

snmp-agent target-host

snmp-agent trap enable

4.1.13. snmp-agent calculate-password

Use **snmp-agent calculate-password** to calculate the encrypted form for a key in plaintext form.

Syntax

snmp-agent calculate-password *plain-password* **mode** { **3desmd5** | **3dessha** | **md5** | **sha** } { **local-engineid** | **specified-engineid** *engineid* }

Views

System view

Predefined user roles

network-admin

Parameters

plain-password: Specifies a key in plaintext form. The *plain-password* argument is a case-sensitive string of 1 to 64 characters.

mode: Specifies an authentication algorithm and encryption algorithm. The device supports the HMAC-MD5 and HMAC-SHA1 authentication algorithms. The HMAC-MD5 algorithm is faster than the HMAC-SHA1 algorithm. The HMAC-SHA1 algorithm provides more security than the HMAC-MD5 algorithm. The 3DES, and DES encryption algorithms (in descending order of security strength) are available for the device. A more secure algorithm calculates slower. DES is enough to meet general security requirements.

- **3desmd5**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-MD5 authentication algorithm.
- **3dessha**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-SHA1 authentication algorithm.
- **md5**: Calculates the encrypted form for the authentication key or encryption key by using the HMAC-MD5 authentication algorithm and AES or DES encryption algorithm. When the HMAC-MD5 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.
- **sha**: Calculates the encrypted form for the authentication key or encryption key by using HMAC-SHA1 authentication algorithm and AES or DES encryption algorithm. When the HMAC-SHA1 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.

local-engineid: Uses the local engine ID to calculate the encrypted form for the key. You can configure the local engine ID by using the **snmp-agent local-engineid** command.

specified-engineid *engineid*: Uses a user-defined engine ID to calculate the encrypted form for the key. The *engineid* argument is an even number of case-insensitive hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64.

Usage guidelines

Make sure the SNMP agent is enabled before you execute the **snmp-agent calculate-password** command.

For security purposes, use the encrypted-form key generated by using this command when you create SNMPv3 users by specifying the **cipher** keyword in the **snmp-agent usm-user v3** command.

The encrypted form of the key is valid only under the engine ID specified for key conversion.

Examples

Use the local engine ID and the HMAC-SHA1 algorithm to calculate the encrypted form for key **authkey**.

```
<Switch> system-view
[Switch] snmp-agent calculate-password authkey mode sha local-engineid
The encrypted key is: 09659EC5A9AE91BA189E5845E1DDE0CC
```

snmp-agent usm-user v3

4.1.14. snmp-agent community

Use **snmp-agent community** to configure a SNMPv1 or SNMPv2c community.

Use **undo snmp-agent community** to delete a SNMPv1 or SNMPv2c community.

Syntax

snmp-agent community { **read** | **write** } [**simple** | **cipher**] *community-name* [**mib-view** *view-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent community [**cipher**] *community-name*

Default

No SNMPv1 or SNMPv2c communities exist.

Views

System view

Predefined user roles

network-admin

Parameters

read: Assigns the specified community read-only access to MIB objects. A read-only community can only inquire MIB information.

write: Assigns the specified community read and write access to MIB objects. A read and write community can configure MIB information.

simple: Specifies a community name in plaintext form. For security purposes, the community name specified in plaintext form will be stored in encrypted form.

cipher: Specifies a community name in encrypted form.

community-name: Specifies the community name. The plaintext form is a case-sensitive string of 1 to 32 characters. The encrypted form is a case-sensitive string of 33 to 73 characters. Input a string as escape characters after a backslash (\).

mib-view *view-name*: Specifies the MIB view available for the community. The *view-name* argument represents a MIB view name, a case-sensitive string of 1 to 32 characters. A MIB view represents a set of accessible MIB objects. If you do not specify a view, the specified community can access the MIB objects in the default MIB view **ViewDefault**.

user-role *role-name*: Specifies a user role name for the community, a case-sensitive string of 1 to 63 characters.

acl: Specifies a basic or advanced IPv4 ACL for the community.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the community.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

An SNMP community is identified by a community name. It contains a set of NMSs and SNMP agents. Devices in an SNMP community authenticate each other by using the community name. An NMS and an SNMP agent can communicate only when they use the same community name.

Typically, **public** is used as the read-only community name and **private** is used as the read and write community name. To enhance security, you can assign your SNMP communities a name other than **public** and **private**.

The **snmp-agent community** command allows you to use either of the following modes to control SNMP community access to MIB objects:

- **View-based access control model**—The VACM mode controls access to MIB objects by assigning MIB views to SNMP communities.

You can create a maximum of 10 SNMP communities by using the **snmp-agent community** command.

If you execute the command multiple times to specify the same community name but different other settings each time, the most recent configuration takes effect.

To set and save a community name in plain text, do not specify the **simple** or **cipher** keyword.

The ACL is used to filter illegitimate NMSs.

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the community name can access the SNMP agent.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the SNMP agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

You can also create an SNMP community by using the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands. These two commands create a SNMPv1 or SNMPv2c user and the group to which the user is assigned. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

Examples

Create the read-only community with the plaintext form name **readaccess** so a SNMPv1 or SNMPv2c NMS can use the community name **readaccess** to read the MIB objects in the default view **ViewDefault**.

```
<Switch> system-view
[Switch] snmp-agent sys-info version v1 v2c
[Switch] snmp-agent community read simple readaccess
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.1 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Switch-acl-ipv4-basic-2001] rule deny source any
[Switch-acl-ipv4-basic-2001] quit
[Switch] snmp-agent sys-info version v2c
[Switch] snmp-agent community write simple writeaccess acl 2001
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.2 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Switch> system-view
[Switch] acl basic name testacl
[Switch-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
[Switch-acl-ipv4-basic-testacl] rule deny source any
[Switch-acl-ipv4-basic-testacl] quit
[Switch] snmp-agent sys-info version v2c
[Switch] snmp-agent community write simple writeaccess acl name testacl
```

Create the read and write community with the plaintext form name **wr-sys-acc** so a SNMPv1 or SNMPv2c NMS can use the community name **wr-sys-acc** to read or set the MIB objects in the system subtree (OID 1.3.6.1.2.1.1).

```
<Switch> system-view
[Switch] snmp-agent sys-info version v1 v2c
[Switch] undo snmp-agent mib-view ViewDefault
[Switch] snmp-agent mib-view included test system
[Switch] snmp-agent community write simple wr-sys-acc mib-view test
```

Related commands

display snmp-agent community

snmp-agent mib-view

4.1.15. snmp-agent group

Use **snmp-agent group** to create an SNMP group.

Use **undo snmp-agent group** to delete an SNMP group.

Syntax

SNMPv1 and SNMP v2c:

snmp-agent group { **v1** | **v2c** } *group-name* [**read-view** *view-name*] [**write-view** *view-name*] [**notify-view** *view-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent group { **v1** | **v2c** } *group-name*

SNMPv3:

snmp-agent group v3 *group-name* [**authentication** | **privacy**] [**read-view** *read-view*] [**write-view** *write-view*] [**notify-view** *notify-view*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent group v3 *group-name* [**authentication** | **privacy**]

Default

No SNMP groups exist.

Views

System view

Predefined use roles

network-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

group-name: Specifies an SNMP group name, a case-sensitive string of 1 to 32 characters.

authentication: Specifies the authentication without privacy security model for the SNMPv3 group.

privacy: Specifies the authentication with privacy security model for the SNMPv3 group.

read-view *view-name*: Specifies a read-only MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read-only MIB view, the SNMP group has read access to the default view **ViewDefault**.

write-view *view-name:* Specifies a read and write MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read and write view, the SNMP group cannot set any MIB object on the SNMP agent.

notify-view *view-name*: Specifies a notify MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. The SNMP agent sends notifications to the users in the specified group only for the MIB objects included in the notify view. If you do not specify a notify view, the SNMP agent does not send any notification to the users in the specified group.

acl: Specifies a basic or advanced IPv4 ACL for the group.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the group.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

All users in an SNMP group share the security model and access rights of the group.

You can create a maximum of 20 SNMP groups, including SNMPv1, SNMPv2c, and SNMPv3 groups.

All SNMPv3 users in a group share the same security model, but can use different authentication and encryption key settings. To implement a security model for a user and avoid SNMP communication failures, make sure the security model configuration for the group and the security key settings for the user are compliant with Table 4-6 and match the settings on the NMS.

Table 4-6 Basic security setting requirements for different security models

Security model	Security model keyword for the group	Security key settings for the user	Remarks
Authentication with privacy	**privacy**	Authentication key, encryption key	If the authentication key or the encryption key is not configured, SNMP communication will fail.
Authentication without privacy	**authentication**	Authentication key	If no authentication key is configured, SNMP communication will fail. The encryption key (if any) for the user does not take effect.
No authentication, no privacy	Neither **authentication** nor **privacy**	None	The authentication and encryption keys, if configured, do not take effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Create the SNMPv3 group **group1**.

```
<Switch> system-view
[Switch] snmp-agent group v3 group1
```

Related commands

display snmp-agent group

snmp-agent mib-view

snmp-agent usm-user

4.1.16. snmp-agent local-engineid

Use **snmp-agent local-engineid** to set an SNMP engine ID.

Use **undo snmp-agent local-engineid** to restore the default.

Syntax

snmp-agent local-engineid *engineid*

undo snmp-agent local-engineid

Default

The engine ID of a device is the combination of the company ID and the device ID. Each device has a unique device ID.

Views

System view

Predefined user roles

network-admin

Parameters

engineid: Specifies an SNMP engine ID, a case-insensitive hexadecimal string. Its length is an even number in the range of 10 to 64. All-zero and all-F strings are invalid.

Usage guidelines

An SNMP engine ID uniquely identifies a device in an SNMP managed network. Make sure the local SNMP engine ID is unique within your SNMP managed network to avoid communication problems.

If you have configured SNMPv3 users, change the local SNMP engine ID only when necessary. The change can void the SNMPv3 usernames and encrypted keys you have configured.

You can use the default engine ID or configure an easy-to-remember engine ID based on the network plan. For example, you can set the engine ID for device 1 on the first floor of building A to 000Af0010001 and device 2 to 000Af0010002.

Examples

Set the local SNMP engine ID to **123456789A**.

```
<Switch> system-view
[Switch] snmp-agent local-engineid 123456789A
```

Related commands

display snmp-agent local-engineid

snmp-agent usm-user

4.1.17. snmp-agent log

Use **snmp-agent log** to enable SNMP logging.

Use **undo snmp-agent log** to disable SNMP logging.

Syntax

snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

undo snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

Default

SNMP logging operations are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

all: Enables logging SNMP authentication failures, Get operations, and Set operations.

authfail: Enables logging SNMP authentication failures.

get-operation: Enables logging SNMP Get operations.

set-operation: Enables logging SNMP Set operations.

Usage guidelines

Use SNMP logging to record the SNMP operations performed on the SNMP agent or authentication failures from the NMS to the agent for auditing NMS behaviors. The SNMP agent sends log data to the information center. You can configure the information center to output the data to a destination as needed.

Examples

Enable logging SNMP Get operations.

```
<Switch> system-view
[Switch] snmp-agent log get-operation
```

Enable logging SNMP Set operations.

```
<Switch> system-view
[Switch] snmp-agent log set-operation
```

Enable logging SNMP authentication failures.

```
<Switch> system-view
[Switch] snmp-agent log authfail
```

4.1.18. snmp-agent mib-view

Use **snmp-agent mib-view** to create or update a MIB view.

Use **undo snmp-agent mib-view** to delete a MIB view.

Syntax

snmp-agent mib-view { **excluded** | **included** } *view-name oid-tree* [**mask** *mask-value*]

undo snmp-agent mib-view *view-name*

Default

The system creates the **ViewDefault** view when the SNMP agent is enabled. In this default MIB view, all MIB objects in the **iso** subtree but the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees are accessible.

Views

System view

Predefined user roles

network-admin

Parameters

excluded: Denies access to any node in the specified MIB subtree.

included: Permits access to all the nodes in the specified MIB subtree.

view-name: Specifies a view name, a case-sensitive string of 1 to 32 characters.

oid-tree: Specifies a MIB subtree by its root node's OID (for example, **1.3.6.1.2.1.1**) or object name (for example, **system**). The *oid-tree* argument is a case-sensitive string of 1 to 255 characters. An OID is a dotted numeric string that uniquely identifies an object in the MIB tree.

mask *mask-value*: Sets a MIB subtree mask, a case-insensitive hexadecimal string. Its length is an even number in the range of 1 to 32.

Usage guidelines

A MIB view represents a set of MIB objects (or MIB object hierarchies) with certain access privilege. The MIB objects included in the MIB view are accessible while those excluded from the MIB view are inaccessible.

Each *view-name oid-tree* pair represents a view record. If you specify the same record with different MIB subtree masks multiple times, the most recent configuration takes effect.

Be cautious with deleting the default MIB view. The operation blocks the access to any MIB object on the device from NMSs that use the default view.

Examples

Include the **mib-2** (OID 1.3.6.1.2.1) subtree in the **mibtest** view and exclude the **system** subtree from this view.

```
<Switch> system-view
[Switch] snmp-agent sys-info version v1
[Switch] snmp-agent mib-view included mibtest 1.3.6.1.2.1
[Switch] snmp-agent mib-view excluded mibtest system
[Switch] snmp-agent community read public mib-view mibtest
```

A SNMPv1 NMS in the **public** community can query the objects in the **mib-2** subtree but not any object (for example, the **sysDescr or sysObjectID** node) in the **system** subtree.

Related commands

display snmp-agent mib-view

snmp-agent group

4.1.19. snmp-agent packet max-size

Use **snmp-agent packet max-size** to set the maximum size (in bytes) of SNMP packets that the SNMP agent can receive or send.

Use **undo snmp-agent packet max-size** to restore the default.

Syntax

snmp-agent packet max-size *byte-count*

undo snmp-agent packet max-size

Default

An SNMP agent can process SNMP packets with a maximum size of 1500 bytes.

Views

System view

Predefined user roles

network-admin

Parameters

byte-count: Sets the maximum size (in bytes) of SNMP packets that the SNMP agent can receive or send. The value range is 484 to 17940.

Usage guidelines

If any device on the path to the NMS does not support packet fragmentation, limit the SNMP packet size to prevent large-sized packets from being discarded. For most networks, the default value is sufficient.

Examples

Set the maximum SNMP packet size to 1024 bytes.

```
<Switch> system-view
[Switch] snmp-agent packet max-size 1024
```

4.1.20. snmp-agent packet response dscp

Use **snmp-agent packet response dscp** to set the DSCP value for SNMP responses.

Use **undo snmp-agent packet response dscp** to restore the default.

Syntax

snmp-agent packet response dscp *dscp-value*

undo snmp-agent packet response dscp

Default

The DSCP value for SNMP responses is 0.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets the DSCP value for SNMP responses, in the range of 0 to 63. A greater DSCP value represents a higher priority.

Usage guidelines

The DSCP value is encapsulated in the ToS field of an IP packet. It specifies the priority level of the packet and affects the transmission priority of the packet.

Examples

Set the DSCP value to 40 for SNMP responses.

```
<Switch> system-view
[Switch] snmp-agent packet response dscp 40
```

4.1.21. snmp-agent sys-info contact

Use **snmp-agent sys-info contact** to configure the system contact.

Use **undo snmp-agent sys-info contact** to restore the default contact.

Syntax

snmp-agent sys-info contact *sys-contact*

undo snmp-agent sys-info contact

Default

The contact is not configured.

Views

System view

Predefined user roles

network-admin

Parameters

sys-contact: Specifies the system contact, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the system contact for system maintenance and management.

Examples

Configure the system contact as **Dial System Operator # 27345**.

```
<Switch> system-view
[Switch] snmp-agent sys-info contact Dial System Operator # 27345
```

Related commands

display snmp-agent sys-info

4.1.22. snmp-agent sys-info location

Use **snmp-agent sys-info location** to configure the system location.

Use **undo snmp-agent sys-info location** to restore the default location.

Syntax

snmp-agent sys-info location *sys-location*

undo snmp-agent sys-info location

Default

The system location is not configured.

Views

System view

Predefined user roles

network-admin

Parameters

sys-location: Specifies the system location, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the location of the device for system maintenance and management.

Examples

Configure the system location as **Room524-row1-3**.

```
<Switch> system-view
[Switch] snmp-agent sys-info location Room524-row1-3
```

Related commands

display snmp-agent sys-info

4.1.23. snmp-agent sys-info version

Use **snmp-agent sys-info version** to enable SNMP versions.

Use **undo snmp-agent sys-info version** to disable SNMP versions.

Syntax

snmp-agent sys-info contact version { **all** | { **v1** | **v2c** | **v3** } * }

undo snmp-agent sys-info version { **all** | { **v1** | **v2c** | **v3** } * }

Default

SNMPv3 is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

all: Specifies SNMPv1, SNMPv2c, and SNMPv3.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

Usage guidelines

Configure the SNMP agent with the same SNMP version as the NMS for successful communications between them.

Examples

Enable SNMPv3.

```
<Switch> system-view
[Switch] snmp-agent sys-info version v3
```

Related commands

display snmp-agent sys-info

4.1.24. snmp-agent target-host

Use **snmp-agent target-host** to configure an SNMP notification target host.

Use **undo snmp-agent target-host** to remove an SNMP notification target host.

Syntax

snmp-agent target-host inform address udp-domain { *ipv4-address* | **ipv6** *ipv6-address* } [**udp-port** *port-number*] [**vpn-instance** *vpn-instance-name*] **params securityname** *security-string* { **v2c** | **v3** [**authentication** | **privacy**] }

snmp-agent target-host trap address udp-domain { *ipv4-address* | **ipv6** *ipv6-address* } [**udp-port** *port-number*] [**dscp** *dscp-value*] [**vpn-instance** *vpn-instance-name*] **params securityname** *security-string* [**v1** | **v2c** | **v3** [**authentication** | **privacy**]]

undo snmp-agent target-host { **trap** | **inform** } **address udp-domain** { *ipv4-address* | **ipv6** *ipv6-address* } **params securityname** *security-string* [**vpn-instance** *vpn-instance-name*]

Default

No SNMP notification target hosts exist.

Views

System view

Predefined user roles

network-admin

Parameters

inform: Specifies a host that receives informs.

trap: Specifies a host that receives traps.

address: Specifies the destination address of SNMP notifications.

udp-domain: Specifies UDP as the transport protocol.

ipv4-address: Specifies a target host by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. The string can only contain letters, numbers, hyphens (-), underscores (_), and dots (.). If you specify a host name, the IPv4 address of the target host can be obtained.

ipv6 *ipv6-address*: Specifies a target host by its IPv6 address or host name. The host name is a case-insensitive string of 1 to 253 characters, which only contains letters, numbers, hyphens (-),

underscores (_), and dots (.). If you specify a host name, the IPv6 address of the target host can be obtained. If you specify an IPv6 address, the address cannot be a link local address.

udp-port *port-number*: Specifies the UDP port for SNMP notifications. The default port number is 162.

dscp-value: Sets the DSCP value for traps sent to the target host, in the range of 0 to 63. The DSCP value is encapsulated in the ToS field of an IP packet. It specifies the priority level of the packet and affects the transmission priority of the packet. A greater DSCP value represents a higher priority. The default DSCP value for traps is 0.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the target host belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the target host belongs to the public network, do not specify this option.

params securityname *security-string*: Specifies the authentication parameter. The *security-string* argument specifies a SNMPv1 or SNMPv2c community name or a SNMPv3 username, a case-sensitive string of 1 to 32 characters.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

- **authentication**: Specifies the security model to be authentication without privacy. You must specify the authentication key when you create the SNMPv3 user.
- **privacy**: Specifies the security model to be authentication with privacy. You must specify the authentication key and encryption key when you create the SNMPv3 user.

Usage guidelines

You can specify multiple SNMP notification target hosts.

Make sure the SNMP agent uses the same UDP port for SNMP notifications as the target host. Typically, NMSs, for example, MIB Browser, use port 162 for SNMP notifications as defined in the SNMP protocols.

If none of the keywords **v1**, **v2c**, or **v3** is specified, SNMPv1 is used. Make sure the SNMP agent uses the same SNMP version as the target host so the host can receive the notification.

If neither **authentication** nor **privacy** is specified, the security model is no authentication, no privacy.

Examples

Configure the SNMP agent to send SNMPv3 traps to 10.1.1.1 by using the username **public**.

```
<Switch> system-view
[Switch] snmp-agent trap enable standard
[Switch] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public v3
```

Related commands

snmp-agent { **inform** | **trap** } **source**

snmp-agent trap enable

snmp-agent trap life

4.1.25. snmp-agent trap enable

Use **snmp-agent trap enable** to enable SNMP notifications.

Use **undo snmp-agent trap enable** to disable SNMP notifications.

Syntax

snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

undo snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

Default

SNMP configuration notifications, standard notifications, and system notifications are enabled. Whether other SNMP notifications are enabled varies by module.

Views

System view

Predefined user roles

network-admin

Parameters

configuration: Specifies configuration notifications. If configuration notifications are enabled, the system checks the running configuration and the startup configuration every 10 minutes for any change and generates a notification for the most recent change.

protocol: Specifies protocol module notifications. You can use the **snmp-agent trap enable ?** command to obtain the value of this argument. For more information about this argument, see the command reference for each module.

standard: Specifies SNMP standard notifications.

Table 4-7 Standard SNMP notifications

Keyword	Definition
authentication	Authentication failure notification sent when an NMS fails to be authenticated by the SNMP agent.
coldstart	Notification sent when the device restarts.
linkdown	Notification sent when the link of a port goes down.
linkup	Notification sent when the link of a port comes up.
warmstart	Notification sent when the SNMP agent restarts.

system: Specifies system notifications sent when the system time is modified, the system reboots, or the main system software image is not available.

Usage guidelines

To report critical protocol events to an NMS, enable SNMP notifications for the protocol. For SNMP notifications to be sent correctly, you must also configure the notification sending parameters as required.

If no optional parameters are specified, this command or its **undo** form enables or disables all SNMP notifications supported by the device.

Examples

Enable the SNMP agent to send SNMP authentication failure notifications.

```
<Switch> system-view
[Switch] snmp-agent trap enable standard authentication
```

Related commands

snmp-agent target-host

4.1.26. snmp-agent trap if-mib link extended

Use **snmp-agent trap if-mib link extended** to configure the SNMP agent to send extended linkUp/linkDown notifications.

Use **undo snmp-agent trap if-mib link extended** to restore the default.

Syntax

snmp-agent trap if-mib link extended

undo snmp-agent trap if-mib link extended

Default

The SNMP agent sends standard linkUp/linkDown notifications.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Extended linkUp and linkDown notifications add interface description and interface type to the standard linkUp/linkDown notifications for fast failure point identification.

When you use this command, make sure the NMS supports the extended linkup and linkDown notifications.

Examples

Enable extended linkUp/linkDown notifications.

```
<Switch> system-view
[Switch] snmp-agent trap if-mib link extended
```

4.1.27. snmp-agent trap life

Use **snmp-agent trap life** to set the lifetime of notifications in the SNMP notification queue.

Use **undo snmp-agent trap life** to restore the default notification lifetime.

Syntax

snmp-agent trap life *seconds*

undo snmp-agent trap life

Default

The SNMP notification lifetime is 120 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

seconds: Sets a lifetime in the range of 1 to 2592000, in seconds.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. The notification lifetime sets how long a notification can stay in the queue. A notification is deleted when its lifetime expires.

Examples

Set the SNMP notification lifetime to 60 seconds.

```
<Switch> system-view
[Switch] snmp-agent trap life 60
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent trap queue-size

4.1.28. snmp-agent trap log

Use **snmp-agent trap log** to enable SNMP notification logging.

Use **undo snmp-agent trap log** to disable SNMP notification logging.

Syntax

snmp-agent trap log

undo snmp-agent trap log

Default

SNMP notification logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use SNMP notification logging to record SNMP notifications sent by the SNMP agent for notification tracking. The SNMP agent sends the logs to the information center. You can configure the information center to output the logs to a destination as needed.

Examples

Enable SNMP notification logging.

```
<Switch> system-view
[Switch] snmp-agent trap log
```

4.1.29. snmp-agent trap periodical-interval

Use **snmp-agent trap periodical-interval** to enable SNMP alive traps and set the sending interval.

Use **undo snmp-agent trap periodical-interval** to set 60 seconds.

Syntax

snmp-agent trap periodical-interval *interval*

undo snmp-agent trap periodical-interval

Default

SNMP notification logging is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies an interval for sending SNMP alive traps. The value is 0 or is in the range of 10 to 3600, in seconds. Setting this argument to 0 disables SNMP alive traps.

Usage guidelines

This command enables the device to send SNMP alive traps to the NMS at the specified intervals to inform the NMS that SNMP is operating correctly on the device.

Using **undo snmp-agent trap periodical-interval** cannot restore the default. You must use the **snmp-agent trap periodical-interval 0** command to reconfigure the sending interval.

Examples

Enable SNMP alive traps and set the sending interval to 10 seconds.

```
<Switch> system-view
[Switch] snmp-agent trap periodical-interval 10
```

Disable SNMP alive traps.

```
<Switch> system-view
[Switch] snmp-agent trap periodical-interval 0
```

Related commands

snmp-agent target-host

snmp-agent trap enable

4.1.30. snmp-agent trap queue-size

Use **snmp-agent trap queue-size** to set the SNMP notification queue size.

Use **undo snmp-agent trap queue-size** to restore the default queue size.

Syntax

snmp-agent trap queue-size *size*

undo snmp-agent trap queue-size

Default

The SNMP notification queue can store a maximum of 100 notifications.

Views

System view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum number of notifications that the SNMP notification queue can hold. The value range is 1 to 1000.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. SNMP notification queue size sets the maximum number of notifications that this queue can hold. When the queue size is reached, the oldest notifications are dropped for new notifications.

Examples

Set the SNMP notification queue size to 200.

```
<Switch> system-view
[Switch] snmp-agent trap queue-size 200
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent trap life

4.1.31. snmp-agent usm-user { v1 | v2c }

Use **snmp-agent usm-user** { **v1** | **v2c** } to create a SNMPv1 or SNMPv2c user.

Use **undo snmp-agent usm-user** { **v1** | **v2c** } to delete a SNMPv1 or SNMPv2c user.

Syntax

snmp-agent usm-user { **v1** | **v2c** } *user-name group-name* [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent usm-user { **v1** | **v2c** } *user-name*

Default

No SNMPv1 or SNMPv2c users exist.

Views

System view

Predefined user roles

network-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

user-name: Specifies a SNMP username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies a SNMPv1 or SNMPv2c group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

On a SNMPv1 or SNMPv2c network, NMSs and agents authenticate each other by using the community name. On a SNMPv3 network, NMSs and agents authenticate each other by using the username.

You can create a SNMPv1 or SNMPv2c community by using either of the following ways:

- Execute the **snmp-agent community** command.
- Execute the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands to create a SNMPv1 or SNMPv2c user and the group that the user is assigned to. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Add the user **userv2c** to the SNMPv2c group **readCom** so an NMS can use the protocol SNMPv2c and the read-only community name **userv2c** to access the device.

```
<Switch> system-view
[Switch] snmp-agent sys-info version v2c
[Switch] snmp-agent group v2c readCom
[Switch] snmp-agent usm-user v2c userv2c readCom
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.1 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
<Switch> system-view
```

```
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Switch-acl-ipv4-basic-2001] rule deny source any
[Switch-acl-ipv4-basic-2001] quit
[Switch] snmp-agent sys-info version v2c
[Switch] snmp-agent group v2c readCom
[Switch] snmp-agent usm-user v2c userv2c readCom acl 2001
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.2 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
[Switch] acl basic name testacl
[Switch-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
[Switch-acl-ipv4-basic-testacl] rule deny source any
[Switch-acl-ipv4-basic-testacl] quit
[Switch] snmp-agent sys-info version v2c
[Switch] snmp-agent group v2c readCom
[Switch] snmp-agent usm-user v2c userv2c readCom acl name testacl
```

4.1.32. snmp-agent usm-user v3

Use **snmp-agent usm-user v3** to create a SNMPv3 user.

Use **undo snmp-agent usm-user v3** to delete a SNMPv3 user.

Syntax

snmp-agent usm-user v3 *user-name group-name* [{ **cipher** | **simple** } **authentication-mode** { **md5** | **sha** } *auth-password* [**privacy-mode** { **3des** | **aes128** | **des56** } *priv-password*]] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent usm-user v3 *user-name* { **local** | **engineid** *engineid-string* }

Default

No SNMPv3 users exist.

Views

System view

Predefined user roles

network-admin

Parameters

user-name: Specifies a SNMPv3 username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies a SNMPv3 group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

cipher: Specifies an authentication key and an encryption key in encrypted form. The keys will be converted to a digest in encrypted form and stored in the device.

simple: Specifies an authentication key and an encryption key in plaintext from. The keys will be converted to a digest in encrypted form and stored in the device.

authentication-mode: Specifies an authentication algorithm. If you do not specify the keyword, the system does not perform authentication.

- **md5**: Specifies the HMAC-MD5 authentication algorithm.
- **sha**: Specifies the HMAC-SHA1 authentication algorithm.

auth-password: Specifies an authentication key. This argument is case sensitive.

- The plaintext form of the key is a string of 1 to 64 characters, which must contain numbers, uppercase letters, lowercase letters, and special characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

privacy-mode: Specifies an encryption algorithm. If you do not specify this keyword, the system does not perform encryption.

- **3des**: Specifies the 3DES encryption algorithm that uses a 168-bit key.
- **aes128**: Specifies the AES encryption algorithm that uses a 128-bit key.
- **des56**: Specifies the DES encryption algorithm that uses a 56-bit key.

priv-password: Specifies an encryption key. This argument is case sensitive.

- The plaintext form of the key is a string of 1 to 64 characters, which must contain numbers, uppercase letters, lowercase letters, and special characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

local: Specifies the local SNMP engine. By default, a SNMPv3 user is associated with the local SNMP engine.

engineid *engineid-string*: Specifies an SNMP engine ID. The *engineid-string* argument is an even number of hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64. If you change the local engine ID, the existing SNMPv3 users and keys become invalid. To delete an invalid username, specify the engine ID associated with the username in the **undo snmp-agent usm-user v3** command.

Usage guidelines

Only users with the network-admin or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

You can use either of the following modes to control SNMPv3 user access to MIB objects.

- **VACM**—Controls user access to MIB objects by assigning the user to an SNMP group. To make sure the user takes effect, make sure the group has been created. An SNMP group contains one or multiple users and specifies the MIB views and security model for the users. The authentication and encryption algorithms for each user are specified when they are created.

You can execute the **snmp-agent usm-user v3** command multiple times to create different SNMPv3 users in VACM mode. If you do not change the username each time, the most recent configuration takes effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs from accessing the agent. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If you do not specify an ACL, the specified ACL does not exist, or the specified ACL does not have any rules, all NMSs that use the username can access the SNMP agent.
- If you have specified an ACL and the ACL has rules, only the NMSs permitted by the ACL can access the agent.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication for the group. Specify authentication algorithm **HMAC-SHA1** and plaintext-form authentication key **123456TESTplat&!** for the user.

```
<Switch> system-view
[Switch] snmp-agent group v3 testGroup authentication
[Switch] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTplat&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm and key.

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication and encryption for the group. Specify authentication algorithm **HMAC-SHA1**, encryption algorithm **AES**, plaintext-form authentication key **123456TESTauth&!**, and plaintext-form encryption key **123456TESTencr&!** for the user.

```
<Switch> system-view
[Switch] snmp-agent group v3 testGroup privacy
[Switch] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTauth&! privacy-mode aes128 123456TESTencr&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm.
- Privacy algorithm.
- Plaintext authentication and encryption keys.

5. RMON commands

5.1. RMON commands

5.1.1. display rmon alarm

Use **display rmon alarm** to display information about RMON alarm entries.

Syntax

display rmon alarm [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an alarm entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all RMON alarm entries.

Examples

Display information about all RMON alarm entries.

```
<Switch> display rmon alarm
AlarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Sampled variable               : 1.3.6.1.2.1.16.1.1.1.4.1<etherStatsOctets.1>
  Sampling interval (in seconds) : 10
  Rising threshold               : 50(associated with event 1)
  Falling threshold              : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Latest value                   : 0
```

Table 5-1 Command output

Field	Description
AlarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status: • *entry-number*—Alarm entry index. • *owner*—Entry owner. • *status*—Entry status: ○ **VALID**—The entry is valid. ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default. The **display rmon alarm** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Field	Description
Sample type	Sample type: • absolute. • delta.
Sampled variable	Monitored variable.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
associated with event	Event index associated with the alarm..
Falling threshold	Alarm falling threshold.
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Latest value	Most recent sampled value.

Related commands

rmon alarm

5.1.2. display rmon event

Use **display rmon event** to display information about RMON event entries.

Syntax

display rmon event [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all event entries.

Usage guidelines

An event entry includes the following information:

- Event index.
- Event owner.
- Event description.
- Action triggered by the event (such as logging the event or sending an SNMP notification).
- Last time when the event occurred (seconds that elapsed since the system startup).

Examples

Display information about all RMON event entries.

```
<Switch> display rmon event
EventEntry 1 owned by user1 is VALID.
  Description: N/A
  Community: Security
  Take the action log-trap when triggered, last triggered at 0days 00h:02m:27s uptime.
```

Table 5-2 Command output

Field	Description
EventEntry *entry-number* owned by *owner* is *status*.	Event entry owner and status: • *entry-number*—Event entry index. • *owner*—Entry owner. • *status*—Entry status: ○ **VALID**—The entry is valid. ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default. The **display rmon event** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.
Description	Event description.
Community	SNMP community name for the RMON event.
Take the action *action* when triggered	Actions that the system takes when the event is triggered: • **none**—Takes no action. • **log**—Logs the event. • **trap**—Sends an SNMP notification. • **log-trap**—Logs the event and sends an SNMP notification.
last triggered at *time* uptime	Last time when the event occurred, which is represented as the amount of time that elapsed since the system startup.

Related commands

rmon event

5.1.3. display rmon eventlog

Use **display rmon eventlog** to display information about event log entries.

Syntax

display rmon eventlog [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays log entries for all event entries.

Usage guidelines

If the log action is specified for an event, the system adds a record in the event log table each time the event occurs. Each record contains the log entry index, time when the event was logged (the amount of time that elapsed since system startup), and event description.

The system can maintain a maximum of 10 records for an event. The most recent record replaces the oldest record if the number of records reaches 10.

Examples

Display the RMON log for event entry **99**.

```
<Switch> display rmon eventlog 99
EventEntry 99 owned by ww is VALID.
  LogEntry 99.1 created at 50days 08h:54m:44s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     uprise 16760000 with alarm value 16776314. Alarm sample type is absolute.
  LogEntry 99.2 created at 50days 09h:11m:13s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     less than(or =) 20000000 with alarm value 16951648. Alarm sample type is absolute.
  LogEntry 99.3 created at 50days 09h:18m:43s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     less than(or =) 15000000 with alarm value 14026493. Alarm sample type is absolute.
  LogEntry 99.4 created at 50days 09h:23m:28s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     uprise 17000000 with alarm value 17077846. Alarm sample type is absolute.
```

This example shows that the event log table has four records for event 99:

- Two records were created when event 99 was triggered by alarm entry 77.
- Two records were created when event 99 was triggered by private alarm entry 777.

Table 5-3 Command output

Field	Description
EventEntry *entry-number* owned by *owner* is *status*.	Event log entry owner and status: • *entry-number*—Event log entry index, which is the same as the event entry index for which this log entry is generated. • *owner*—Entry owner. • *status*—Entry status: ○ **VALID**—The entry is valid (default value). ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All event log entries are valid by default. The **`display rmon eventlog`** command can display invalid entries, but the **`display current-configuration`** and **`display this`** commands do not display their settings.
LogEntry *entry-number* created at *created-time* uptime.	Time when an event record was created: • *entry-number*—Event record index, represented as logEventIndex.logIndex, where logEventIndex and logIndex are MIB objects. A record index uniquely identifies a record among all records for the event. • *created-time*—Time when the event entry was created.
Description	Record description.

Related commands

rmon event

5.1.4. display rmon history

Use **display rmon history** to display RMON history control entries and history samples of Ethernet statistics for Ethernet interfaces.

Syntax

display rmon history [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type i*nterface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays history samples for all interfaces that have an RMON history control entry.

Usage guidelines

RMON uses the etherHistoryTable object to store the history samples of Ethernet statistics for Ethernet interfaces.

To collect history samples for an Ethernet interface, you must first create a history control entry on the interface.

To configure the number of history samples that can be displayed and the history sampling interval, use the **rmon history** command.

Examples

Display the RMON history control entry and history samples for GigabitEthernet 1/0/1.

```
<Switch> display rmon history gigabitethernet 1/0/1
HistoryControlEntry 6 owned by user1 is VALID.
  Sampled interface     : GigabitEthernet1/0/1<ifIndex.117>
  Sampling interval     : 8(sec) with 3 buckets max
  Sampling record 1 :
    dropevents        : 0         , octets               : 5869
    packets           : 54        , broadcast packets    : 9
    multicast packets : 23        , CRC alignment errors : 0
    undersize packets : 0         , oversize packets     : 0
    fragments         : 0         , jabbers              : 0
    collisions        : 0         , utilization          : 0
```

Table 5-4 Command output

Field	Description
HistoryControlEntry *entry-number* owned by *owner* is *status*.	Status and owner of the history control entry: • *entry-number*—History control entry index. • *owner*—Entry owner.

Field	Description
	• *status*—Entry status: ○ **VALID**—The entry is valid. ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All history control entries created from the CLI are valid by default. The **`display rmon history`** command can display invalid entries, but the **`display current-configuration`** and **`display this`** commands do not display their settings.
Sampled Interface	Sampled interface.
Sampling interval	Sampling interval in seconds.
buckets max	Maximum number of samples that can be saved for the history control entry. If the expected bucket size specified with the **`rmon history`** command exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as possible. If the bucket has been full, RMON overwrites the oldest sample with the new sample.
Sampling record	History sample index.
dropevents	Total number of events in which packets were dropped during the sampling interval. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.
octets	Total number of octets received during the sampling interval.
packets	Total number of packets (including bad packets) received during the sampling interval.
broadcast packets	Number of broadcast packets received during the sampling interval.
multicast packets	Number of multicast packets received during the sampling interval.
CRC alignment errors	Number of packets received with CRC alignment errors during the sampling interval.
undersize packets	Number of undersize packets received during the sampling interval. Undersize packets are shorter than 64 octets (excluding framing bits but including FCS octets).
oversize packets	Number of oversize packets received during the sampling interval. Oversize packets are longer than 1518 octets (excluding framing bits but including FCS octets).
fragments	Number of undersize packets with CRC errors received during the sampling interval.
jabbers	Number of oversize packets with CRC errors received during the sampling interval.
collisions	Number of colliding packets received during the sampling interval.
utilization	Bandwidth utilization (in hundreds of a percent) during the sampling period.

rmon history

5.1.5. display rmon prialarm

Use **display rmon prialarm** to display information about RMON private alarm entries.

Syntax

display rmon prialarm [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535. If you do not specify an entry, the command displays all private alarm entries.

Examples

Display information about all RMON private alarm entries.

```
<Switch> display rmon prialarm
PrialarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Variable formula          : (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
  Description                      : ifUtilization.GigabitEthernet1/0/1
  Sampling interval (in seconds) : 10
  Rising threshold                 : 80(associated with event 1)
  Falling threshold                : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Entry lifetime                   : forever
  Latest value                     : 85
```

Table 5-5 Command output

Field	Description
PrialarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status: • *entry-number*—Alarm entry index. • *owner*—Entry owner. • *status*—Entry status: ○ **VALID**—The entry is valid. ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default. The **display rmon prialarm** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.
Sample type	Sample type:

Field	Description
	• absolute. • delta.
Variable formula	Variable formula.
Description	Description of the alarm.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
Falling threshold	Alarm falling threshold.
associated with event	Event index associated with the alarm..
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Entry lifetime	Lifetime of the entry. • If the lifetime is set to **forever**, the entry never expires. • If the lifetime is set to an amount of time, the entry is removed when the timer expires.
Latest value	Most recent sampled value.

Related commands

rmon prialarm

5.1.6. display rmon statistics

Use **display rmon statistics** to display RMON statistics.

Syntax

display rmon statistics [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, the command displays RMON statistics for all interfaces.

Usage guidelines

This command displays the cumulative interface statistics for the period from the time the statistics entry was created to the time the command was executed. The statistics are cleared when the device reboots.

Examples

Display RMON statistics for GigabitEthernet 1/0/1.

```
<Switch> display rmon statistics gigabitethernet 1/0/1
EtherStatsEntry 1 owned by user1 is VALID.
  Interface : GigabitEthernet1/0/1<ifIndex.3>
  etherStatsOctets         : 43393306  , etherStatsPkts          : 619825
  etherStatsBroadcastPkts  : 503581    , etherStatsMulticastPkts : 44013
  etherStatsUndersizePkts  : 0         , etherStatsOversizePkts  : 0
  etherStatsFragments      : 0         , etherStatsJabbers       : 0
  etherStatsCRCAlignErrors : 0         , etherStatsCollisions    : 0
  etherStatsDropEvents (insufficient resources): 0
  Incoming packets by size:
  64     : 0         ,  65-127  : 0         ,  128-255  : 0
  256-511: 0         ,  512-1023: 0         ,  1024-1518: 0
```

Table 5-6 Command output

Field	Description
EtherStatsEntry *entry-number* owned by *owner* is *status*.	Statistics entry owner and status: • *entry-number*—Statistics entry index. • *owner*—Entry owner. • *status*—Entry status: ○ **VALID**—The entry is valid. ○ **UNDERCREATION**—The entry is invalid. The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default. The **display rmon statistics** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.
Interface	Interface on which statistics are gathered.
etherStatsOctets	Total number of octets received on the interface.
etherStatsPkts	Total number of packets received on the interface.
etherStatsBroadcastPkts	Total number of broadcast packets received on the interface.
etherStatsMulticastPkts	Total number of multicast packets received on the interface.
etherStatsUndersizePkts	Total number of undersize packets received on the interface.
etherStatsOversizePkts	Total number of oversize packets received on the interface.
etherStatsFragments	Total number of undersize packets received with CRC errors on the interface.
etherStatsJabbers	Total number of oversize packets received with CRC errors on the interface.
etherStatsCRCAlignErrors	Total number of packets received with CRC errors on the interface.
etherStatsCollisions	Total number of colliding packets received on the interface.
etherStatsDropEvents	Total number of events in which packets were dropped. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.

Field	Description
Incoming packets by size:	Incoming-packet statistics by packet length: • **64**—Number of packets with a lengthequal to 64 bytes. • **65-127**—Number of 65- to 127-byte packets. • **128-255**—Number of 128- to 255-byte packets. • **256-511**—Number of 256- to 511-byte packets. • **512-1023**—Number of 512- to 1023-byte packets. • **1024-1518**—Number of 1024- to 1518-byte packets.

Related commands

rmon statistics

5.1.7. rmon alarm

Use **rmon alarm** to create an RMON alarm entry.

Use **undo rmon alarm** to remove an RMON alarm entry.

Syntax

rmon alarm *entry-number alarm-variable sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* [**owner** *text*]

undo rmon alarm *entry-number*

Default

No RMON alarm entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535.

alarm-variable: Specifies an alarm variable, a string of 1 to 255 characters. You can only specify variables that can be parsed as an ASN.1 INTEGER value (INTEGER, INTEGER32, Unsigned32, Counter32, Counter64, Gauge, or TimeTicks) for the *alarm-variable* argument. The alarm variables must use one of the formats in Table 5-7 .

Table 5-7 Alarm variable formats

Format	Examples
Dotted OID format: *entry.integer.instance*	1.3.6.1.2.1.2.1.10.1
Object name.instance	etherStatsOctets.1 etherStatsPkts.1 etherStatsBroadcastPkts.1 ifInOctets.1

Format	Examples
	ifInUcastPkts.1 ifInNUcastPkts.1

sampling-interval: Sets the sampling interval in the range of 5 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 60 RMON alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

RMON samples the monitored alarm variable at the specified sampling interval, compares the sampled value with the predefined thresholds, and performs one of the following operations:

- Triggers the event associated with the rising alarm if the sampled value is equal to or greater than the rising threshold.
- Triggers the event associated with the falling alarm if the sampled value is equal to or less than the falling threshold.

Examples

Create an alarm entry to perform absolute sampling on the number of octets received on GigabitEthernet 1/0/1 (object instance 1.3.6.1.2.1.16.1.1.1.4.1) at 10-seconds intervals. If the sampled value reaches or exceeds 5000, log the rising alarm event. If the sampled value is equal to or less than 5, take no actions.

```
<Switch> system-view
```

```
[Switch] rmon event 1 log
[Switch] rmon event 2 none
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] rmon statistics 1
[Switch-GigabitEthernet1/0/1] quit
[Switch] rmon alarm 1 1.3.6.1.2.1.16.1.1.1.4.1 10 absolute rising-threshold 5000 1
falling-threshold 5 2 owner user1
```

In this example, you can replace 1.3.6.1.2.1.16.1.1.1.4.1 with etherStatsOctets.1, where 1 is the statistics entry index for the interface. If you execute the **rmon statistics 5** command, you can use etherStatsOctets.5 to replace 1.3.6.1.2.1.16.1.1.1.4.5.

Related commands

display rmon alarm

rmon event

5.1.8. rmon event

Use **rmon event** to create an RMON event entry.

Use **undo rmon event** to remove an RMON event entry.

Syntax

rmon event *entry-number* [**description** *string*] { **log** | **log-trap** *security-string* | **none** | **trap** *security-string* } [**owner** *text*]

undo rmon event *entry-number*

Default

No RMON event entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies an event entry index in the range of 1 to 65535.

description *string*: Configures an event description, a case-sensitive string of 1 to 127 characters.

log: Logs the event .

log-trap: Logs the event and sends an SNMP notification.

security-string: Specifies the SNMP community name carried in the SNMP notifications. The *security-string* argument is a case-sensitive string of 1 to 127 characters and is determined by the SNMP configuration. This argument is supported but does not take effect in the current software version.

none: Performs no action.

trap: Sends an SNMP notification.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

NOTE:

The SNMP community name setting for the *security-string* argument does not take effect even though you can configure it with the command. Instead, the system uses the settings you configure with SNMP when it sends RMON SNMP notifications. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

Usage guidelines

You can create a maximum of 60 event entries.

You can associate an event entry with a standard or private alarm entry to specify the action to take when an alarm condition occurs. Depending on your configuration, the system logs the event, sends an SNMP notification, does both, or does neither.

You can associate an event with multiple alarm entries.

Examples

Create an RMON log event entry. Specify its index as **10** and the entry owner as **user1**.

```
<Switch> system-view
[Switch] rmon event 10 log owner user1
```

Related commands

display rmon event

rmon alarm

rmon prialarm

5.1.9. rmon history

Use **rmon history** to create an RMON history control entry.

Use **undo rmon history** to remove an RMON history control entry.

Syntax

rmon history *entry-number* **buckets** *number* **interval** *interval* [**owner** *text*]

undo rmon history *entry-number*

Default

No RMON history control entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a history control entry index in the range of 1 to 65535.

buckets *number*: Specifies the expected maximum number of samples to be retained for the entry, in the range of 1 to 65535. RMON can retain a maximum of 50 samples for each history control entry. If the expected bucket size exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as is possible. However, the granted bucket size will not exceed 50. For example, the bucket size for a history control entry will be 30 if the expected bucket size is set to 55, but the available bucket size is only 30.

interval *interval*: Specifies the sampling interval in the range of 5 to 3600 seconds.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

The system supports a maximum of 100 history control entries.

If an Ethernet interface has a history control entry, RMON periodically samples packet statistics on the interface and stores the samples to the history table. When the bucket size for the history control entry is reached, RMON overwrites the oldest sample with the most recent sample.

You can create multiple RMON history control entries for an Ethernet interface.

Examples

Create RMON history control entry 1 for GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] rmon history 1 buckets 10 interval 5 owner user1
```

Related commands

display rmon history

5.1.10. rmon prialarm

Use **rmon** *prialarm* to create an RMON private alarm entry.

Use **undo rmon** *prialarm* to remove an RMON private alarm entry.

Syntax

rmon prialarm *entry-number prialarm-formula prialarm-des sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* **entrytype** { **forever** | **cycle** *cycle-period* } [**owner** *text*]

undo rmon prialarm *entry-number*

Default

No RMON private alarm entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a private alarm entry index in the range of 1 to 65535.

prialarm-formula: Configures a private alarm variable formula, a string of 1 to 255 characters. The variables in the formula must be represented in OID format that starts with a dot (.), for example, (.1.3.6.1.2.1.2.1.10.1)*8. You can configure a formula to perform the basic math operations of addition, subtraction, multiplication, and division on these variables. To get a correct calculation result, make sure the following conditions are met:

- The values of the variables in the formula are positive integers.
- The result of each calculating step is in the value range for long integers.

prialarm-des: Configures an entry description, a case-sensitive string of 1 to 127 characters.

sampling-interval: Sets the sampling interval in the range of 10 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

forever: Configures the entry as a permanent entry. RMON retains a permanent private alarm entry until it is manually deleted.

cycle *cycle-period*: Sets the lifetime of the entry, in the range of 0 to 4294967 seconds. RMON deletes the entry when its lifetime expires.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 50 private alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

The RMON agent samples variables and takes an alarm action based on a private alarm entry as follows:

1. Periodically samples the variables specified in the private alarm formula.
2. Processes the sampled values with the formula.
3. Compares the calculation result with the predefined thresholds, and then takes one of the following actions:
   - Triggers the event associated with the rising alarm event if the result is equal to or greater than the rising threshold.
   - Triggers the event associated with the falling alarm event if the result is equal to or less than the falling threshold.

Examples

Add a permanent private alarm entry to monitor the ratio of incoming broadcasts to the total number of incoming packets on GigabitEthernet 1/0/1. Log the rising alarm event when the ratio exceeds 80%, and take no actions when the ratio drops to 5%. The formula is (1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1), where 1.3.6.1.2.1.16.1.1.1.6.1 is the OID of the object instance etherStatsBroadcastPkts.1, and 1.3.6.1.2.1.16.1.1.1.5.1 is the OID of the object instance etherStatsPkts.1.

```
<Switch> system-view
[Switch] rmon event 1 log
[Switch] rmon event 2 none
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] rmon statistics 1
[Switch-GigabitEthernet1/0/1] quit
[Switch] rmon prialarm 1 (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
BroadcastPktsRatioOfGE1/0/1 10 absolute rising-threshold 80 1 falling-threshold 5 2
entrytype forever owner user1
```

The last number in the OID forms of variables must be the same as the statistics entry index for the interface. For example, if you execute the **rmon statistics 5** command, you must replace 1.3.6.1.2.1.16.1.1.1.6.1 and 1.3.6.1.2.1.16.1.1.1.5.1 with 1.3.6.1.2.1.16.1.1.1.6.5 and 1.3.6.1.2.1.16.1.1.1.5.5, respectively.

Related commands

display rmon prialarm

rmon event

5.1.11. rmon statistics

Use **rmon statistics** to create an RMON statistics entry.

Use **undo rmon statistics** to remove an RMON statistics entry.

Syntax

rmon statistics *entry-number* [**owner** *text*]

undo rmon statistics *entry-number*

Default

No RMON statistics entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

entry-number: Specifies a statistics entry index in the range of 1 to 65535.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

Each RMON statistics entry provides a set of cumulative traffic statistics collected up to the present time for an interface. Statistics include number of collisions, CRC alignment errors, number of

undersize or oversize packets, number of broadcasts, number of multicasts, number of bytes received, and number of packets received. The statistics are cleared at a reboot.

To display the RMON statistics table, use the **display rmon statistics** command.

You can create only one RMON statistics entry for an Ethernet interface.

Examples

Create an RMON statistics entry for GigabitEthernet 1/0/1. The index is 20 and the owner is **user1**.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] rmon statistics 20 owner user1
```

6. NETCONF commands

6.1. NETCONF commands

6.1.1. netconf log

Use **netconf log** to enable NETCONF logging.

Use **undo netconf log** to remove the configuration for the specified NETCONF operation sources and NETCONF operations.

Syntax

netconf log source { { **agent** | **soap** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **verbose** }

undo netconf log source { { **agent** | **soap** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **verbose** }

Default

NETCONF logging is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

source: Specifies a NETCONF operation source that represents clients that use a protocol.

- **agent**: Specifies clients that use Telnet, SSH, console, or NETCONF over SSH.
- **soap**: Specifies clients that use SOAP over HTTP, or SOAP over HTTPS.

protocol-operation: Logs requests and replies for specific types of NETCONF operations.

- **all**: Specifies all types of NETCONF operations.
- **action**: Specifies the <action> operation.
- **config**: Specifies the configuration-related NETCONF operations, including the <CLI>, <save>, <load>, <rollback>, <lock>, <unlock>, and <save-point> operations.
- **get**: Specifies the data retrieval-related NETCONF operations, including the <get>, <get-config>, <get-bulk>, <get-bulk-config>, and <get-sessions> operations.
- **session**: Specifies session-related NETCONF operations, including the <kill-session> and <close-session> operations, and capability exchanges by hello messages.
- **set**: Specifies all <edit-config> operations.
- **syntax**: Specifies the requests that include XML and schema errors.
- **others**: Specifies NETCONF operations except for those specified by keywords **action**, **config**, **get**, **set**, **session**, and **syntax**.

verbose: Logs detailed information about requests and replies for types of NETCONF operations, including packet contents of format-correct requests and error information about failed <edit-config> operations.

Usage guidelines

If you specify the **protocol-operation** keyword, the device logs each of the matching operation and the operation result. For example, if you perform a NETCONF operation to create VLANs 3 through 5, the device outputs the following log messages:

```
%Mar 21 17:11:34:479 2017 NEC XMLSOAP/6/XML_REQUEST: test from 192.168.100.198, session id 2,message-id 100, receive edit-config request.
%Mar 21 17:11:34:483 2017 NEC XMLSOAP/6/EDIT-CONFIG: test from 192.168.100.198, session id 2,message-id 100, execute success.
```

For NETCONF to correctly send the generated logs to the information center, you must also configure the information center. For information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to log NETCONF edit-config information sourced from agent clients.

```
<Switch> system-view
[Switch] netconf log source agent protocol-operation set
```

6.1.2. netconf soap enable

Use **netconf soap enable** to enable NETCONF over SOAP.

Use **undo netconf soap enable** to disable NETCONF over SOAP.

Syntax

netconf soap { **http** | **https** } **enable**

undo netconf soap { **http** | **https** } **enable**

Default

NETCONF over SOAP is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

http: Specifies NETCONF over SOAP over HTTP.

https: Specifies NETCONF over SOAP over HTTPS.

Usage guidelines

This command enables the device to resolve NETCONF messages that are encapsulated with SOAP in HTTP or HTTPS packets.

Examples

Enable NETCONF over SOAP over HTTP.

```
<Switch> system-view
[Switch] netconf soap http enable
```

6.1.3. netconf ssh server enable

Use **netconf ssh server enable** to enable NETCONF over SSH.

Use **undo netconf ssh server enable** to disable NETCONF over SSH.

Syntax

netconf ssh server enable

undo netconf ssh server enable

Default

NETCONF over SSH is disabled.

Predefined user roles

network-admin

Usage guidelines

This feature allows you to use an SSH client to invoke NETCONF as an SSH subsystem. Then, you can directly use XML messages to perform NETCONF operations without using the **xml** command.

Before you execute this command, configure the authentication mode for users as **scheme** on the device. Then, the NETCONF-over-SSH-enabled user terminals can access the device through NETCONF over SSH.

Only capability set **urn:ietf:params:netconf:base:1.0** is available. It is supported by both the device and user terminals.

Examples

Enable NETCONF over SSH.

```
<Switch> system-view
[Switch] netconf ssh server enable
```

NOTE:

The **netconf ssh server enable** command are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

6.1.4. xml

Use **xml** to enter XML view.

Syntax

xml

Views

User view

Predefined user roles

network-admin

network-operator

Usage guidelines

In XML view, use NETCONF messages to configure the device or obtain data from the device. The NETCONF operations you can perform depend on the user roles you have, as shown in Table 6-1 .

Table 6-1 NETCONF operations available for the predefined user roles

User role	NETCONF operations
network-admin	All NETCONF operations
network-operator	• Get • Get-bulk • Get-bulk-config • Get-config • Get-sessions • Close-session

To ensure the format correctness of NETCONF messages in XML view, do not enter NETCONF messages manually. Copy and paste the messages.

While the device is performing a NETCONF operation, do not perform any other operations, such as pasting a NETCONF message or pressing **Enter**.

For the device to identify NETCONF messages, you must add end mark **]]>]]>** at the end of each NETCONF message.

After you enter XML view, the device automatically advertises its NETCONF capabilities to the client. In response, you must configure the client to notify the device of its supported NETCONF capabilities. After the capability exchange, you can use the client to configure the device.

NETCONF messages must comply with the XML format requirements and semantic and syntactic requirements in the NETCONF XML API reference for the device. As a best practice, use third-party software to generate NETCONF messages to ensure successful configuration.

To quit XML view, use a NETCONF message instead of the **quit** command.

If you have configured a shortcut key (**Ctrl + C**, by default) by using the **escape-key** command in user line/user line class view, the NETCONF message should not contain the shortcut key string. If the NETCONF message contains the shortcut key string, relevant configurations in XML view might be affected. For example, in user line view, you configured "a" as the shortcut key by using the **escape-key a** command. When a NETCONF message includes the character "a," only the contents after the last "a" in the message can be processed.

Examples

Enter XML view.

```
<Switch> xml
<?xml version="1.0" encoding="UTF-8"?><hello
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0"><capabilities><capability>urn:ietf:pa
rams:netconf:base:1.1</capability><capability>urn:ietf:params:netconf:writable-runnin
g</capability><capability>urn:ietf:params:netconf:capability:notification:1.0</capabi
lity><capability>urn:ietf:params:netconf:capability:validate:1.1</capability><capabil
ity>urn:ietf:params:netconf:capability:interleave:1.0</capability><capability>urn:nec
:params:netconf:capability:nec-netconf-ext:1.0</capability></capabilities><session-id
>1</session-id></hello>]]>]]>
```

Notify the device of the NETCONF capabilities supported on the client.

```
<hello xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <capabilities>
    <capability>
            urn:ietf:params:netconf:base:1.0
    </capability>
  </capabilities>
</hello>]]>]]>
```

Quit XML view.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <close-session>
  </close-session>
</rpc>]]>]]>
<Switch>
```

7. Process monitoring and maintenance commands

7.1. Process monitoring and maintenance commands

7.1.1. display exception context

Use **display exception context** to display context information for process exceptions.

Syntax

display exception context [**count** *value*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

Parameters

count *value*: Specifies the number of context information entries, in the range of 1 to 20. The default value is 1.

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays context information for process exceptions on the IRF master device.

Usage guidelines

The system generates a context information entry for each process exception. A context information entry includes the process ID, the crash time, the core file directory, stack information, and register information.

Examples

Display the exception context information on the x86-based 32-bit terminal.

```
<Switch> display exception context
Index 1 of 1

Table 7-1 Command output

Filed	Description
Crashed PID	ID of the crashed process.
Crash signal	Signals that led to the crash: • **SIGABRT**—Abort. • **SIGBUS**—Bus error. • **SIGFPE**—Erroneous arithmetic operation. • **SIGILL**—Illegal hardware instructions. • **SIGQUIT**—Quit signal sent by the controlling terminal. • **SIGSEGV**—Invalid memory access. • **SIGSYS**—Invalid system call. • **SIGTRAP**—Trap message. • **SIGXCPU**—CPU usage limit exceeded. • **SIGXFSZ**—File size limit exceeded. • **SIGUNKNOW**—Unknown reason.
Crash time	Time when the crash occurred.
Core file path	Directory where the core file is saved.
Backtrace stopped	All stack information has been displayed.

Related commands

reset exception context

7.1.2. display exception filepath

Use **display exception filepath** to display the core file directory.

Syntax

display exception filepath [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command displays the core file directory on the IRF master device.

Examples

Display the core file directory on the specified slot.

```
<Switch> display exception filepath slot 1
The exception filepath on slot 1 is flash:.
```

7.1.3. exception filepath

Use **exception filepath** to specify the directory for saving core files.

Use **undo exception filepath** to remove the specified directory.

Syntax

exception filepath *directory*

undo exception filepath *directory*

Default

The directory for saving core files is **flash:/**.

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies the directory for saving core files.

Usage guidelines

The specified directory must be the root directory of a file system on the master.

You can use the command to change the directory if there are different types of storage media on the device.

The system saves core files to the **core** directory in the specified directory. If the **core** directory does not exist in the specified directory, the system creates the **core** directory before saving core files.

If no directory is specified or the specified directory is not accessible, the system cannot save core files.

Examples

Set the directory for saving core files to flash:/.

```
<Switch> exception filepath flash:/
```

Related commands

display exception filepath

process core

7.1.4. process core

Use **process core** to enable or disable a process to generate core files for exceptions and set the maximum number of core files.

Syntax

process core { **maxcore** *value* | **off** } { **job** *job-id* | **name** *process-name* } [**slot** *slot-number*]

Views

User view

Default

A process generates a core file for the first exception and does not generate any core files for subsequent exceptions.

Predefined user roles

network-admin

Parameters

off: Disables core file generation.

maxcore *value*: Enables core file generation and sets the maximum number of core files, in the range of 1 to 10.

name *process-name*: Specifies a process by its name, a case-insensitive string of 1 to 15 characters.

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647. The job ID does not change after the process restarts.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

Usage guidelines

The command applies to all instances of a process.

The command enables the system to generate a core file each time the specified process crashes until the maximum number of core files is reached. A core file records the exception information.

Because the core files consume system storage resources, you can disable core file generation for processes for which you do not need to review exception information.

Examples

Disable core file generation for process **routed**.

```
<Switch> process core off name routed
```

Enable core file generation for process **routed** and set the maximum number of core files to 5.

```
<Switch> process core maxcore 5 name routed
```

Related commands

display exception context

exception filepath

7.1.5. reset exception context

Use **reset exception context** to clear context information for process exceptions.

Syntax

reset exception context [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its ID. If you do not specify this option, the command clears context information for process exceptions on the IRF master device.

Examples

Clear context information for exceptions.

```
<Switch> reset exception context
```

Related commands

display exception context

8. Port mirroring commands

8.1. Port mirroring commands

8.1.1. display mirroring-group

Use **display mirroring-group** to display mirroring group information.

Syntax

display mirroring-group { *group-id* | **all** | **local** | **remote-destination** | **remote-source** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

all: Specifies all mirroring groups.

local: Specifies local mirroring groups.

remote-destination: Specifies remote destination groups.

remote-source: Specifies remote source groups.

Usage guidelines

Mirroring group information includes the type, status, and content of a mirroring group. It is sorted by mirroring group number.

Examples

Display information about all mirroring groups.

```
<Switch> display mirroring-group all
Mirroring group 1:
    Type: Local
    Status: Active
    Mirroring port:
        GigabitEthernet1/0/1  Inbound
    Monitor port: GigabitEthernet1/0/2
```

Table 8-1 Command output

Field	Description
Mirroring group	Number of the mirroring group.
Type	Type of the mirroring group: • Local. • Remote source.

Field	Description
	• Remote destination.
Status	Status of the mirroring group: • **Active**—The mirroring group has taken effect. • **Incomplete**—The mirroring group configuration is not complete and does not take effect.
Mirroring port	Source port.
Monitor port	Destination port.

8.1.2. mirroring-group

Use **mirroring-group** to create a mirroring group.

Use **undo mirroring-group** to delete mirroring groups.

Syntax

mirroring-group *group-id* { **local** | **remote-destination** | **remote-source** }

undo mirroring-group { *group-id* | **all** | **local** | **remote-destination** | **remote-source** }

Default

No mirroring groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group ID. The value range for this argument is 1 to 7.

local: Specifies local mirroring groups.

remote-destination: Specifies remote destination groups.

remote-source: Specifies remote source groups.

all: Specifies all mirroring groups.

Examples

Create local mirroring group 1.

```
<Switch> system-view
[Switch] mirroring-group 1 local
```

8.1.3. mirroring-group mirroring-port (interface view)

Use **mirroring-group mirroring-port** to configure a port as a source port for a mirroring group.

Use **undo mirroring-group mirroring-port** to restore the default.

Syntax

mirroring-group *group-id* **mirroring-port** { **both** | **inbound** | **outbound** }

undo mirroring-group *group-id* **mirroring-port**

Default

A port does not act as a source port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

both: Mirrors both received and sent packets.

inbound: Mirrors only received packets.

outbound: Mirrors only sent packets.

Usage guidelines

You can configure source ports only for local mirroring groups and remote source groups.

On a Layer 2 aggregate interface configured as a source port, only the overlay traffic of the VXLAN network can be mirrored.

On a member port of a Layer 2 aggregate interface configured as a source port, VXLAN traffic cannot be mirrored.

Do not assign a source port of a mirroring group to the remote probe VLAN of the mirroring group.

A port can act as a source port for only one mirroring group. If you assign a port as a source port to multiple mirroring groups, the most recent configuration takes effect.

A source port cannot be used as a reflector port, monitor port, or egress port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of the port GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] mirroring-group 1 local
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mirroring-group 1 mirroring-port both
```

Create remote source group 2 to monitor the bidirectional traffic of the port GigabitEthernet 1/0/2.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-source
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] mirroring-group 2 mirroring-port both
```

Related commands

mirroring-group

8.1.4. mirroring-group mirroring-port (system view)

Use **mirroring-group mirroring-port** to configure source ports for a mirroring group.

Use **undo mirroring-group mirroring-port** to remove source ports from a mirroring group.

Syntax

mirroring-group *group-id* **mirroring-port** *interface-list* { **both** | **inbound** | **outbound** }

undo mirroring-group *group-id* **mirroring-port** *interface-list*

Default

No source port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

interface-list: Specifies a space-separated list of up to eight interface items. Each item specifies an interface by its type and number or specifies a range of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. When you specify a range of interfaces, the interfaces must be of the same type and on the same slot. The start interface number must be identical to or lower than the end interface number.

both: Mirrors both received and sent packets.

inbound: Mirrors only received packets.

outbound: Mirrors only sent packets.

Usage guidelines

You can configure source ports only for local mirroring groups and remote source groups.

On a Layer 2 aggregate interface configured as a source port, only the overlay traffic of the VXLAN network can be mirrored.

On a member port of a Layer 2 aggregate interface configured as a source port, VXLAN traffic cannot be mirrored.

Do not assign a source port of a mirroring group to the remote probe VLAN of the mirroring group.

A port can act as a source port for only one mirroring group. If you assign a port as a source port to multiple mirroring groups, the most recent configuration takes effect.

A source port cannot be used as a reflector port, monitor port, or egress port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] mirroring-group 1 local
[Switch] mirroring-group 1 mirroring-port gigabitethernet 1/0/1 both
```

Create remote source group 2 to monitor the bidirectional traffic of GigabitEthernet 1/0/2.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-source
[Switch] mirroring-group 2 mirroring-port gigabitethernet 1/0/2 both
```

Related commands

mirroring-group

8.1.5. mirroring-group monitor-egress

Use **mirroring-group monitor-egress** to configure the egress port for a remote source group.

Use **undo mirroring-group monitor-egress** to restore the default.

Syntax

In system view:

mirroring-group *group-id* **monitor-egress** *interface-type interface-number*

undo mirroring-group *group-id* **monitor-egress** *interface-type interface-number*

In interface view:

mirroring-group *group-id* **monitor-egress**

undo mirroring-group *group-id* **monitor-egress**

Default

No egress port is configured for a remote source group.

Views

System view

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

interface-type interface-number: Specifies a port by its type and number.

Usage guidelines

You can configure egress ports only for remote source groups.

For port mirroring to work correctly, disable the following features on the egress port of a mirroring group:

- Spanning tree.
- 802.1X.
- IGMP snooping.
- Static ARP.
- MAC address learning.

The member port of an existing mirroring group cannot be configured as an egress port.

The member port of an aggregate interface cannot be configured as an egress port.

Examples

Create remote source group 1. Configure GigabitEthernet 1/0/1 as its egress port in system view.

```
<Switch> system-view
```

```
[Switch] mirroring-group 1 remote-source
[Switch] mirroring-group 1 monitor-egress gigabitethernet 1/0/1
```

Create remote source group 2. Configure GigabitEthernet 1/0/2 as its egress port in interface view.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-source
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] mirroring-group 2 monitor-egress
```

Related commands

mirroring-group

8.1.6. mirroring-group monitor-port (interface view)

Use **mirroring-group monitor-port** to configure a port as the monitor port for a mirroring group.

Use **undo mirroring-group monitor-port** to restore the default.

Syntax

mirroring-group *group-id* **monitor-port**

undo mirroring-group *group-id* **monitor-port**

Default

A port does not act as the monitor port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

Usage guidelines

You can configure monitor ports only for local mirroring groups and remote destination groups.

Do not enable the spanning tree feature on the monitor port of a mirroring group.

A Layer 2 interface cannot be configured as the monitor port for a mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives and analyzes only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Switch> system-view
[Switch] mirroring-group 1 local
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mirroring-group 1 monitor-port
```

Create remote destination group 2 and configure GigabitEthernet 1/0/2 as its monitor port.

```
<Switch> system-view
```

```
[Switch] mirroring-group 2 remote-destination
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] mirroring-group 2 monitor-port
```

Related commands

mirroring-group

8.1.7. mirroring-group monitor-port (system view)

Use **mirroring-group monitor-port** to configure the monitor ports for a mirroring group.

Use **undo mirroring-group monitor-port** to remove the monitor ports from a mirroring group.

Syntax

mirroring-group *group-id* **monitor-port** *interface-type interface-number*

undo mirroring-group *group-id* **monitor-port** *interface-type interface-number*

Default

No monitor port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure monitor ports only for local mirroring groups and remote destination groups.

Do not enable the spanning tree feature on the monitor port of a mirroring group.

A Layer 2 aggregate interface cannot be configured as the monitor port for a mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Switch> system-view
[Switch] mirroring-group 1 local
[Switch] mirroring-group 1 monitor-port gigabitethernet 1/0/1
```

Create remote destination group 2 and configure GigabitEthernet 1/0/2 as its monitor port.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-destination
[Switch] mirroring-group 2 monitor-port gigabitethernet 1/0/2
```

Related commands

mirroring-group

8.1.8. mirroring-group reflector-port

Use **mirroring-group reflector-port** to configure the reflector port for a remote source group.

Use **undo mirroring-group reflector-port** to restore the default.

Syntax

In system view:

mirroring-group *group-id* **reflector-port** *interface-type interface-number*

undo mirroring-group *group-id* **reflector-port** *interface-type interface-number*

In interface view:

mirroring-group *group-id* **reflector-port**

undo mirroring-group *group-id* **reflector-port**

Default

No reflector port is configured for a mirroring group.

Views

System view

Interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

interface-type interface-number: Specifies a port by its type and number.

Usage guidelines

You can configure reflector ports only for remote source groups.

The port to be configured as a reflector port must be a port not in use. Do not connect a network cable to a reflector port.

When a port is configured as a reflector port, the port restores to the factory default settings. You cannot configure other features on a reflector port.

If an IRF port is bound to only one physical interface, do not configure the physical interface as a reflector port. Otherwise, the IRF might split.

You cannot change the duplex mode, MDI settings, or speed for a reflector port.

The member port of an aggregate interface cannot be configured as a reflector port.

Examples

Create remote source group 1. Configure GigabitEthernet 1/0/1 as its reflector port in system view.

```
<Switch> system-view
[Switch] mirroring-group 1 remote-source
[Switch] mirroring-group 1 reflector-port gigabitethernet 1/0/1
```

```
This operation may delete all settings made on the interface. Continue? [Y/N]: y
```

Create remote source group 2. Configure GigabitEthernet 1/0/2 as its reflector port in interface view.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-source
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] mirroring-group 2 reflector-port
This operation may delete all settings made on the interface. Continue? [Y/N]: y
```

Related commands

mirroring-group

8.1.9. mirroring-group remote-probe vlan

Use **mirroring-group remote-probe vlan** to specify a VLAN as the remote probe VLAN for a mirroring group.

Use **undo mirroring-group remote-probe vlan** to restore the default.

Syntax

mirroring-group *group-id* **remote-probe vlan** *vlan-id*

undo mirroring-group *group-id* **remote-probe vlan** *vlan-id*

Default

No remote probe VLAN is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies a mirroring group by its ID. The value range for this argument is 1 to 7.

vlan-id: Specifies a VLAN by its ID.

Usage guidelines

You can configure remote probe VLANs only for remote source groups and remote destination groups.

When a VLAN is configured as a remote probe VLAN, use the VLAN for port mirroring exclusively.

The remote mirroring groups on the source device and destination device must use the same remote probe VLAN.

Only a static VLAN that already exists can be configured as a remote probe VLAN. A VLAN can be configured as the remote probe VLAN for only one mirroring group.

To delete a VLAN that is configured as a remote probe VLAN, remove the remote probe VLAN configuration first.

Examples

Create remote source group 1 and configure VLAN 10 as its remote probe VLAN.

```
<Switch> system-view
[Switch] mirroring-group 1 remote-source
```

```
[Switch] mirroring-group 1 remote-probe vlan 10
```

Create remote destination group 2 and configure VLAN 20 as its remote probe VLAN.

```
<Switch> system-view
[Switch] mirroring-group 2 remote-destination
[Switch] mirroring-group 2 remote-probe vlan 20
```

9. Flow mirroring commands

9.1. Flow mirroring commands

9.1.1. mirror-to interface

Use **mirror-to interface** to configure a mirroring action that mirrors traffic to an interface.

Use **undo mirror-to interface** to delete a mirroring action that mirrors traffic to an interface.

Syntax

mirror-to interface *interface-type interface-number*

undo mirror-to interface *interface-type interface-number*

Default

No mirroring actions exist to mirror traffic to interfaces.

Views

Traffic behavior view

Predefined user roles

network-admin

Parameters

*interface-type interface-numbe*r: Specifies an interface by its type and number.

Usage guidelines

You can execute this command multiple times for a traffic behavior to mirror traffic to different interfaces.

You can mirror traffic to only one interface. If you execute this command for a traffic behavior multiple times, the most recent configuration takes effect.

Examples

Create traffic behavior 1 and configure the action of mirroring traffic to GigabitEthernet 1/0/1 for the traffic behavior.

```
<Switch> system-view
[Switch] traffic behavior 1
[Switch-behavior-1] mirror-to interface gigabitethernet 1/0/1
```

GE1/0/1        1     100         1     128     1000       Random    Active
GE1/0/2        2     100         2     128     1000       Random    Active
```

Table 10-1 Command output

Field	Description
sFlow datagram version	sFlow version, which can only take the value of 5. The device can send only sFlow packets whose sFlow version is 5.
Global information	Global sFlow information.
Agent IP	IP address of the sFlow agent: • **CLI**—Manually configured IP address. • **Auto**—Automatically configured IP address.
Source address	Source IP address of sFlow packets.
Collector information	sFlow collector information.
ID	sFlow collector ID.

Field	Description
IP	sFlow collector IP address.
Port	sFlow collector port.
Aging	Remaining lifetime of the sFlow collector. If this field displays **N/A**, the sFlow collector never ages out.
Size	Maximum length of the sFlow data portion in a sFlow packet.
VPN-instance	Name of the VPN instance to which the sFlow collector belongs.
Description	Description of the sFlow collector.
Port information	Information about interfaces configured with sFlow.
Interface	Interface configured with sFlow.
CID	ID of the sFlow collector for receiving counter sampled packets. If no sFlow collector ID is specified, this field displays **0**.
Interval(s)	Counter sampling interval, in seconds.
FID	ID of the sFlow collector for receiving flow sampled packets. If no sFlow collector ID is specified, this field displays **0**.
MaxHLen	Maximum number of bytes that can be copied in a sampled packet (starting from the packet header).
Rate	Number of packets out of which the interface samples a packet by using flow sampling.
Mode	Flow sampling mode.
Status	sFlow status of the port: • **Suspended**—The sFlow feature is suspended because the port is down. • **Active**—The sFlow feature is active because the port is up.

10.1.2. sflow agent

Use **sflow agent** to configure an IP address for the sFlow agent.

Use **undo sflow agent** to restore the default.

Syntax

sflow agent { **ip** *ipv4-address* | **ipv6** *ipv6-address* }

undo sflow agent { **ip** | **ipv6** }

Default

No IP address is configured for the sFlow agent. The device periodically identifies whether the sFlow agent has an IP address. If the sFlow agent does not have an IP address, the device automatically selects an IPv4 address for the sFlow agent. It does not save the IPv4 address in the configuration file.

Views

System view

Predefined user roles

network-admin

Parameters

ip *ipv4-address*: Specifies an IPv4 address for the sFlow agent.

ipv6 *ipv6-address*: Specifies an IPv6 address for the sFlow agent.

Usage guidelines

As a best practice, manually configure an IP address for the sFlow agent.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify IP address 10.10.10.1 for the sFlow agent.

```
<Switch> system-view
[Switch] sflow agent ip 10.10.10.1
```

10.1.3. sflow collector

Use **sflow collector** to configure parameters for a sFlow collector.

Use **undo sflow collector** to remove a sFlow collector.

Syntax

sflow collector *collector-id* [**vpn-instance** *vpn-instance-name*] { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**datagram-size** *size*] [**time-out** *seconds*] [**description** *string*]

undo sflow collector *collector-id*

Default

No sFlow collector information is configured.

Views

System view

Predefined user roles

network-admin

Parameters

collector-id: Specifies a sFlow collector by its ID. The value range for this argument is 1 to 10.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the sFlow collector belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. The VPN instance name cannot contain spaces. By default, the sFlow collector belongs to the public network.

ip *ipv4-address*: Specifies an IPv4 address for the sFlow collector.

ipv6 *ipv6-address*: Specifies an IPv6 address for the sFlow collector.

port *port-number*: Specifies the UDP port number of the sFlow collector, in the range of 1 to 65535. The default is 6343.

datagram-size *size*: Specifies the maximum length of the sFlow data portion in a sFlow packet. The value range for the *size* argument is 200 to 3000 bytes, and the default value is 1400 bytes.

time-out *seconds*: Specifies the aging timer of the sFlow collector, in the range of 1 to 2147483647 seconds. When the aging timer expires, the sFlow collector settings are deleted. The sFlow collector settings do not age out by default.

description *string*: Specifies a description, a case-sensitive string of 1 to 127 characters. The default description is "CLI Collector."

Examples

Configure the following parameters for sFlow collector 2:

- **IP address**—3.3.3.1.
- **Port number**—Default.
- **Description**—netserver.
- **Aging timer**—1200 seconds.
- **Maximum length of the sFlow data portion in the sFlow packet**—1000 bytes.

```
<Switch> system-view
[Switch] sflow collector 2 ip 3.3.3.1 description netserver time-out 1200 datagram-size
1000
```

10.1.4. sflow counter collector

Use **sflow counter collector** to specify a sFlow collector for counter sampling.

Use **undo sflow counter collector** to restore the default.

Syntax

sflow counter collector *collector-id*

undo sflow counter collector

Default

No sFlow collector is specified for counter sampling.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

collector-id: Specifies a sFlow collector by its ID. The value range for this argument is 1 to 10.

Examples

Specify sFlow collector 2 on GigabitEthernet 1/0/1 for counter sampling.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow counter collector 2
```

10.1.5. sflow counter interval

Use **sflow counter interval** to enable counter sampling and set a counter sampling interval.

Use **undo sflow counter interval** to disable counter sampling.

Syntax

sflow counter interval *interval*

undo sflow counter interval

Default

Counter sampling is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the counter sampling interval in the range of 2 to 86400 seconds.

Examples

Enable counter sampling and set the counter sampling interval to 120 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow counter interval 120
```

10.1.6. sflow flow collector

Use **sflow flow collector** to specify a sFlow collector for flow sampling.

Use **undo sflow flow collector** to restore the default.

Syntax

sflow flow collector *collector-id*

undo sflow flow collector

Default

No sFlow collector is specified for flow sampling.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

collector-id: Specifies a sFlow collector by its ID. The value range for this argument is 1 to 10.

Examples

Specify sFlow collector 2 on GigabitEthernet 1/0/1 for flow sampling.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow flow collector 2
```

10.1.7. sflow flow max-header

Use **sflow flow max-header** to set the maximum number of bytes (starting from the packet header) that flow sampling can copy per packet.

Use **undo sflow flow max-header** to restore the default.

Syntax

sflow flow max-header *length*

undo sflow flow max-header

Default

Flow sampling can copy up to 128 bytes of a packet.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

length: Specifies the maximum number of bytes that can be copied, in the range of 18 to 512. As a best practice, use the default value.

Examples

Set the maximum number of bytes to 60 for flow sampling to copy per packet on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow flow max-header 60
```

10.1.8. sflow sampling-mode

Use **sflow sampling-mode** to specify a flow sampling mode.

Use **undo sflow sampling-mode** to restore the default.

Syntax

sflow sampling-mode random

undo sflow sampling-mode

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

random: Specifies the random sampling mode. For example, if the packet sampling interval is set to 4000 (by using the **sflow sampling-rate** command), the device samples packets randomly as follows:

- The device might sample one packet from the first 4000 packets.
- The device might sample multiple packets from the next 4000 packets.
- The device might sample no packets from the third 4000 packets.

However, the device samples one packet from 4000 packets on average.

Examples

Specify random flow sampling mode on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow sampling-mode random
```

Related commands

sflow sampling-rate

10.1.9. sflow sampling-rate

Use **sflow sampling-rate** to enable flow sampling and specify the number of packets out of which flow sampling will sample a packet.

Use **undo sflow sampling-rate** to disable flow sampling.

Syntax

sflow sampling-rate *rate*

undo sflow sampling-rate

Default

Flow sampling is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

rate: Specifies the number of packets out of which flow sampling will sample a packet on the interface. The value range for this argument is 1000 to 500000. As a best practice, set the sampling interval to 2^n that is greater than or equal to 8192, for example, 32768.

Examples

Enable flow sampling to sample a packet out of 32768 packets on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] sflow sampling-rate 32768
```

Related commands

sflow sampling-mode

10.1.10. sflow source

Use **sflow source** to specify the source IP address of sent sFlow packets.

Use **undo sflow source** to restore the default.

Syntax

sflow source { **ip** *ipv4-address* | **ipv6** *ipv6-address* } *

undo sflow source { **ip** | **ipv6** } *

Default

The source IP address of sent sFlow packets is determined by routing.

Views

System view

Predefined user roles

network-admin

Parameters

ip *ipv4-address*: Specifies the source IPv4 address of sent sFlow packets.

ipv6 *ipv6-address*: Specifies the source IPv6 address of sent sFlow packets.

Examples

Specify the source IPv4 address of sent sFlow packets as 10.0.0.1.

```
<Switch> system-view
[Switch] sflow source ip 10.0.0.1
```

11. Information center commands

11.1. Information center commands

11.1.1. display info-center

Use **display info-center** to display information center configuration.

Syntax

display info-center

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information center configuration.

```
<Switch> display info-center
Information Center: Enabled
Console: Enabled
Monitor: Enabled
Log host: Enabled
    192.168.0.1,
    port number: 5000, host facility: local7
Log buffer: Enabled
    Max buffer size 1024, current buffer size 512,
    Current messages 0, dropped messages 0, overwritten messages 0
Log file: Enabled
Security log file: Enabled
Information timestamp format:
    Log host: Date
    Other output destination: Date
```

11.1.2. display logbuffer

Use **display logbuffer** to display the state of the log buffer and the log information in the log buffer.

Syntax

display logbuffer [**reverse**] [**level** *severity* | **size** *buffersize* | **slot** *slot-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

reverse: Displays log entries chronologically, with the most recent entry at the top. If you do not specify this keyword, the command displays log entries chronologically, with the oldest entry at the top.

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information for all levels.

Table 11-1 Log levels

Severity value	Level	Description	Keyword in commands
0	Emergency	The system is unusable. For example, the system authorization has expired.	**emergency**
1	Alert	Action must be taken immediately. For example, traffic on an interface exceeds the upper limit.	**alert**
2	Critical	Critical condition. For example, the device temperature exceeds the upper limit, the power module fails, or the fan tray fails.	**critical**
3	Error	Error condition. For example, the link state changes.	**error**
4	Warning	Warning condition. For example, an interface is disconnected, or the memory resources are used up.	**warning**
5	Notification	Normal but significant condition. For example, a terminal logs in to the device, or the device reboots.	**notification**
6	Informational	Informational message. For example, a command or a **ping** operation is executed.	**informational**
7	Debugging	Debugging message.	**debugging**

size *buffersize*: Specifies the number of latest logs to be displayed. The value range is 1 to 1024. If you do not specify this option, the command displays all logs in the log buffer.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Examples

Display the state and log information of the log buffer.

```
<Switch> display logbuffer
Log buffer: Enabled
Max buffer size: 1024
Actual buffer size: 512
Dropped messages: 0
Overwritten messages: 718
```

```
Current messages: 512
%Jun 17 15:57:09:578 2016 Switch SYSLOG/7/SYS_RESTART:System restarted --
…
```

Table 11-2 Command output

Field	Description
Log buffer	Status of the log buffer: • **Enabled**—Logs can be output to the log buffer. • **Disabled**—Logs cannot be output to the buffer.
Max buffer size	Maximum buffer size supported by the device.
Actual buffer size	Maximum buffer size configured by using the **info-center logbuffer size** command.
Dropped messages	Number of dropped messages.
Overwritten messages	Number of overwritten messages.
Current messages	Number of current messages.

Related commands

info-center logbuffer

reset logbuffer

11.1.3. display logbuffer summary

Use **display logbuffer summary** to display the summary of the log buffer.

Syntax

display logbuffer summary [**level** *severity* | **slot** *slot-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information of all levels in the log buffer. For more information about log levels, see Table 11-1 .

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Examples

Display the summary of the log buffer.

```
<Switch> display logbuffer summary
  Slot EMERG ALERT  CRIT ERROR  WARN NOTIF  INFO DEBUG
```

```
1      0      0      0      7      0      34     38     0
```

Table 11-3 Command output

Field	Description
EMERG	Represents emergency. For more information, see Table 11-1 .
ALERT	Represents alert. For more information, see Table 11-1 .
CRIT	Represents critical. For more information, see Table 11-1 .
ERROR	Represents error. For more information, see Table 11-1 .
WARN	Represents warning. For more information, see Table 11-1 .
NOTIF	Represents notification. For more information, see Table 11-1 .
INFO	Represents informational. For more information, see Table 11-1 .
DEBUG	Represents debug. For more information, see Table 11-1 .

11.1.4. display logfile summary

Use **display logfile summary** to display the log file configuration.

Syntax

display logfile summary

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the log file configuration.

```
<Switch> display logfile summary
  Log file: Enabled.
  Log file size quota: 10 MB
  Log file directory: flash:/logfile
  Writing frequency: 24 hour 0 min 10 sec
```

Table 11-4 Command output

Field	Description
Log file	Log file status: • **Enabled**—Logs can be output to a log file. • **Disabled**—Logs cannot be output to a log file.
Log file size quota	Maximum storage space reserved for a log file, in MB.
Log file directory	Log file directory.
Writing frequency	Log file writing frequency.

11.1.5. enable log updown

Use **enable log updown** to enable an interface to generate link up or link down logs when the interface state changes.

Use **undo enable log updown** to disable an interface from generating link up or link down logs when the interface state changes.

Syntax

enable log updown

undo enable log updown

Default

All interfaces are allowed to generate link up and link down logs.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable GigabitEthernet 1/0/1 from generating link up or link down logs.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo enable log updown
```

11.1.6. info-center enable

Use **info-center enable** to enable the information center.

Use **undo info-center enable** to disable the information center.

Syntax

info-center enable

undo info-center enable

Default

The information center is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the information center.

```
<Switch> system-view
[Switch] info-center enable
Information center is enabled.
```

11.1.7. info-center logbuffer

Use **info-center logbuffer** to enable log output to the log buffer.

Use **undo info-center logbuffer** to disable log output to the log buffer.

Syntax

info-center logbuffer

undo info-center logbuffer

Default

Log output to the log buffer is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable log output to the log buffer.

```
<Switch> system-view
[Switch] info-center logbuffer
```

Related commands

display logbuffer

info-center enable

11.1.8. info-center logbuffer size

Use **info-center logbuffer size** to set the maximum number of logs that can be stored in the log buffer.

Use **undo info-center logbuffer size** to restore the default.

Syntax

info-center logbuffer size *buffersize*

undo info-center logbuffer size

Default

The log buffer can store a maximum of 512 logs.

Views

System view

Predefined user roles

network-admin

Parameters

buffersize: Specifies the maximum number of logs that can be stored in the log buffer. The value range is 0 to 1024, and the default is 512.

Examples

Set the maximum log buffer size to 50.

```
<Switch> system-view
[Switch] info-center logbuffer size 50
```

Restore the default maximum log buffer size.

```
<Switch> system-view
[Switch] undo info-center logbuffer size
```

Related commands

display logbuffer

info-center enable

11.1.9. info-center logfile directory

Use **info-center logfile directory** to specify the directory to save the log file.

Syntax

info-center logfile directory *dir-name*

Default

The log file directory is **flash:/logfile**.

Views

System view

Predefined user roles

network-admin

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified log file directory must have been created.

The log file uses the .log extension.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the log file directory to **flash:/test**.

```
<Switch> mkdir test
Creating directory flash:/test... Done.
<Switch> system-view
[Switch] info-center logfile directory flash:/test
```

Related commands

info-center logfile enable

11.1.10. info-center logfile enable

Use **info-center logfile enable** to enable the log file feature.

Use **undo info-center logfile enable** to disable the log file feature.

Syntax

info-center logfile enable

undo info-center logfile enable

Default

The log file feature is enabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable log output to the log file.

```
<Switch> system-view
[Switch] info-center logfile enable
```

11.1.11. info-center logfile frequency

Use **info-center logfile frequency** to configure the interval at which the system saves logs from the log file buffer to the log file.

Use **undo info-center logfile frequency** to restore the default.

Syntax

info-center logfile frequency *freq-sec*

undo info-center logfile frequency

Default

The log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

freq-sec: Specifies the log file saving interval in seconds. The value range is 1 to 86400.

Usage guidelines

This command enables the system to automatically save logs in the log file buffer to the log file at the specified interval. NEC recommends that you use this command by the default.

Examples

Set the log file saving interval to 60000 seconds.

```
<Switch> system-view
[Switch] info-center logfile frequency 60000
```

Related commands

info-center logfile enable

11.1.12. info-center logfile size-quota

Use **info-center logfile size-quota** to set the maximum size for the log file.

Use **undo info-center logfile size-quota** to restore the default.

Syntax

info-center logfile size-quota *size*

undo info-center logfile size-quota

Default

The maximum size for the log file is 10 MB.

Views

System view

Predefined user roles

network-admin

Parameters

size: Specifies the maximum size for the log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the log file.

```
<Switch> system-view
[Switch] info-center logfile size-quota 6
```

Related commands

info-center logfile enable

CAUTION:
Please check whether the storage has enough space for the log file size before you use this command.

11.1.13. info-center loghost

Use **info-center loghost** to specify a log host and to configure output parameters.

Use **undo info-center loghost** to remove a log host.

Syntax

info-center loghost [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**facility** *local-number*]

undo info-center loghost [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

No log hosts are specified.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the log host is on the public network, do not specify this option.

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, and special characters including hyphen (-), underscore (_), and dot (.).

ipv4-address: Specifies a log host by its IPv4 address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address.

port *port-number*: Specifies the port number of the log host, in the range of 1 to 65535. The default is 514. It must be the same as the value configured on the log host. Otherwise, logs cannot be sent to the log host.

facility *local-number*: Specifies a logging facility from local0 to local7 for the log host. The default value is local7. Logging facilities are used to mark different logging sources, and query and filer logs.

Usage guidelines

The **info-center loghost** command takes effect only after the information center is enabled by using **info-center enable** command.

Examples

Output logs to the log host at 1.1.1.1.

```
<Switch> system-view
[Switch] info-center loghost 1.1.1.1
```

11.1.14. info-center loghost source

Use **info-center loghost source** to specify a source IP address for logs sent to log hosts.

Use **undo info-center loghost source** to restore the default.

Syntax

info-center loghost source *interface-type interface-number*

undo info-center loghost source

Default

The source IP address of logs sent to log hosts is the primary IP address of the outgoing interface.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The system uses the primary IP address of the specified interface as the source IP address of the logs sent to log hosts.

The **info-center loghost source** command takes effect only after the information center is enabled by using **info-center enable** command.

Examples

Use the IP address of interface Loopback 0 as the source IP address of the logs sent to log hosts.

```
<Switch> system-view
[Switch] interface loopback 0
[Switch-LoopBack0] ip address 2.2.2.2 32
[Switch-LoopBack0] quit
[Switch] info-center loghost source loopback 0
```

11.1.15. info-center source

Use **info-center source** to configure a log output rule for a module.

Use **undo info-center source** to restore the default.

Syntax

info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** } { **deny** | **level** *severity* }

undo info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** }

Default

Table 11-5 lists the default log output rules.

Table 11-5 Default output rules

Destination	Source modules	Common log	Security log	Diagnostic log	Hidden log
Console	All supported modules	debugging	Disabled	Disabled	Disabled
Monitor terminal	All supported modules	debugging	Disabled	Disabled	Disabled
Log host	All supported modules	informational	Disabled	Disabled	informational
Log buffer	All supported modules	informational	Disabled	Disabled	informational
Log file	All supported	informational	Disabled	Disabled	informational

Destination	Source modules	Common log	Security log	Diagnostic log	Hidden log
	modules				
Security log file	All supported modules, cannot be filtered	Disabled	Debugging, which cannot be filtered	Disabled	Disabled
Diagnostic log file	All supported modules, cannot be filtered	Disabled	Disabled	Debugging, which cannot be filtered	Disabled

Views

System view

Predefined user roles

network-admin

Parameters

module-name: Specifies a module by its name. You can use the **info-center source ?** command to view the modules supported by the device.

default: Specifies all supported modules.

console: Outputs logs to the console.

logbuffer: Outputs logs to the log buffer.

logfile: Outputs logs to the log file.

loghost: Outputs logs to the log host.

monitor: Outputs logs to the monitor terminal.

deny: Disables log output.

level *severity*: Specifies a severity level in the range of 0 to 7. The smaller the severity value, the higher the severity level. See Table 11-1 for more information. Logs at the specified severity level and higher levels are allowed or denied to be output.

Usage guidelines

If you do not set an output rule for a module, the module uses the output rule set by using the **default** keyword. If no rule is set by using the **default** keyword, the module uses the default output rule.

To modify or remove an output rule set for a module, you must use the *module-name* argument. A new output rule configured by using the **default** keyword does not take effect on the module.

If you execute this command for a module multiple times, the most recent configuration takes effect.

If you execute this command for the **default** modules multiple times, the most recent configuration takes effect.

Examples

Output only VLAN module's information with the emergency level to the console.

```
<Switch> system-view
[Switch] info-center source default console deny
[Switch] info-center source vlan console level emergency
```

Based on the previous configuration, disable output of VLAN module's information to the console so no system information is output to the console.

```
<Switch> system-view
[Switch] undo info-center source vlan console
```

11.1.16. info-center synchronous

Use **info-center synchronous** to enable synchronous information output.

Use **undo info-center synchronous** to disable synchronous information output.

Syntax

info-center synchronous

undo info-center synchronous

Default

Synchronous information output is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

System log output interrupts ongoing configuration operations, including obscuring previously entered commands. Synchronous information output shows the obscured commands. It also provides a command prompt in command editing mode, or a [Y/N] string in interaction mode so you can continue your operation from where you were stopped.

Examples

Enable synchronous information output, and then execute the **display current-configuration** command to view the current configuration of the device.

```
<Switch> system-view
[Switch] info-center synchronous
Info-center synchronous output is on
[Switch] display current-
```

At this time, the system receives log information. It displays the log information first, and then displays your previous input, which is **display current-** in this example.

```
%May 21 14:33:19:425 2007 Switch SHELL/4/LOGIN: VTY login from 192.168.1.44
[Switch] display current-
```

Enter **configuration** to complete the **display current-configuration** command, and press the **Enter** key to execute the command.

Enable synchronous information output, and then save the current configuration (enter interactive information).

```
<Switch> system-view
```

```
[Switch] info-center synchronous
Info-center synchronous output is on
[Switch] save
The current configuration will be written to the device. Are you sure? [Y/N]:
```

At this time, the system receives the log information. It displays the log information first and then displays [Y/N].

```
%May 21 14:33:19:425 2007 Switch SHELL/4/LOGIN: VTY login from 192.168.1.44
[Y/N]:
```

Enter **Y** or **N** to complete your input.

11.1.17. info-center syslog min-age

Use **info-center syslog min-age** to set the minimum storage period for logs in the log buffer and log file.

Use **undo info-center syslog min-age** to restore the default.

Syntax

info-center syslog min-age *min-age*

undo info-center syslog min-age

Default

The log minimum storage period is not set.

Views

System view

Predefined user roles

network-admin

Parameters

min-age: Sets the minimum storage period in hours. The value range is 1 to 8760.

Examples

Set the log minimum storage period to 168 hours.

```
<Switch> system-view
[Switch] info-center syslog min-age 168
```

11.1.18. info-center timestamp

Use **info-center timestamp** to set the timestamp format for logs sent to the console, monitor terminal, log buffer, and log file.

Use **undo info-center timestamp** to restore the default.

Syntax

info-center timestamp { **boot** | **date** | **none** }

undo info-center timestamp

Default

The timestamp format for logs sent to the console, monitor terminal, log buffer, and log file is **date**.

Views

System view

Predefined user roles

network-admin

Parameters

boot: Sets the timestamp format to xxx.yyy, where xxx is the most significant 32 bits (in milliseconds) and yyy is the least significant 32 bits. For example, 0.21990989 equals Jun 25 14:09:26:881 2007. The **boot** time shows the time since system startup.

date: Sets the timestamp format to MMM DD hh:mm:ss:xxx YYYY, such as Dec 8 10:12:21:708 2007. The **date** time shows the current system time.

- MMM: Abbreviations of the months in English, which could be Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec.
- DD: Date, starting with a space if it is less than 10, for example " 7".
- hh:mm:ss:xxx: Local time, with hh in the range of 00 to 23, mm and ss in the range of 00 to 59, and xxx in the range of 0 to 999.
- YYYY: Year.

none: Indicates no time information is provided.

Examples

Set the timestamp format to **boot** for logs sent to the console, monitor terminal, log buffer, and log file.

```
<Switch> system-view
[Switch] info-center timestamp boot
```

Related commands

info-center timestamp loghost

11.1.19. info-center timestamp loghost

Use **info-center timestamp loghost** to set the timestamp format for logs sent to log hosts.

Use **undo info-center timestamp loghost** to restore the default.

Syntax

info-center timestamp loghost { **date** | **iso** | **no-year-date** | **none** }

undo info-center timestamp loghost

Default

The timestamp format for logs sent to log hosts is **date**.

Views

System view

Predefined user roles

network-admin

Parameters

date: Sets the timestamp format to mmm dd hh:mm:ss yyyy, such as Dec 8 10:12:21 2007. The **date** time shows the current system time.

iso: Sets the ISO 8601 timestamp format, for example, 2009-09-21T15:32:55.

no-year-date: Sets the timestamp format to the current system date and time without year.

none: Indicates that no timestamp information is provided.

Examples

Set the timestamp format to **no-year-date** for logs sent to log hosts.

```
<Switch> system-view
[Switch] info-center timestamp loghost no-year-date
```

Related commands

info-center timestamp

11.1.20. logfile save

Use **logfile save** to manually save logs in the log file buffer to the log file.

Syntax

logfile save

Views

Any view

Predefined user roles

network-admin

Usage guidelines

You can specify the directory to save the log file by using the **info-center logfile directory** command.

The system clears the log file buffer after saving the buffered logs to the log file automatically or manually.

If the log file buffer is empty, this command displays a success message event though no logs are saved to the log file.

Examples

Manually save logs from the log file buffer to a log file.

```
<Switch> logfile save
The contents in the log file buffer have been saved to the file flash:/logfile/logfile.log.
```

Related commands

info-center logfile enable

info-center logfile directory

11.1.21. reset logbuffer

Use **reset logbuffer** to clear the log buffer.

Syntax

reset logbuffer

Views

User view

Predefined user roles

network-admin

Examples

Clear the log buffer.

```
<Switch> reset logbuffer
```

Related commands

display logbuffer

11.1.22. snmp-agent trap enable syslog

Use **snmp-agent trap enable syslog** to enable SNMP notifications for log messages.

Use **undo snmp-agent trap enable syslog** to disable SNMP notifications for log messages.

Syntax

snmp-agent trap enable syslog

undo snmp-agent trap enable syslog

Default

The device does not send SNMP notifications for log messages.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to send an SNMP notification for each log message it outputs. The device encapsulates logs in SNMP notifications and then sends them to the SNMP module and the log trap buffer.

For the SNMP module to send the received SNMP notifications correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

To view the traps in the log trap buffer, access the MIB corresponding to the log trap buffer. The log trap buffer size can be set by using the **info-center syslog trap buffersize** command.

Examples

Enable the device to send SNMP notifications for log messages.

```
<Switch> system-view
[Switch] snmp-agent trap enable syslog
```

Related commands

info-center syslog trap buffersize

11.1.23. terminal debugging

Use **terminal debugging** to enable display of debug information on the current terminal.

Use **undo terminal debugging** to disable display of debug information on the current terminal.

Syntax

terminal debugging

undo terminal debugging

Default

Display of debug information is disabled on the current terminal.

Views

User view

Predefined user roles

network-admin

Usage guidelines

To enable display of debug information on the console, perform the following tasks:

1. Execute the **terminal debugging** command.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

To enable display of debug information on the current terminal, perform the following tasks:

1. Execute the **terminal monitor** and **terminal debugging** commands.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

You can also enable display of debug information on the current terminal by executing the **terminal logging level 7** command. This command has the following differences from the **terminal debugging** command:

- The **terminal logging level 7** command enables log display for all levels (levels **0** through **7**) on the current terminal.
- The **terminal debugging** command only enables display of logs with the following severity levels:
  - Debug level (level **7**).
  - Severity level higher than or equal to the level specified in the **terminal logging level** command.

Examples

Enable display of debug information on the current terminal.

```
<Switch> terminal debugging
The current terminal is enabled to display debugging information.
```

Related commands

terminal logging level

terminal monitor

11.1.24. terminal logging level

Use **terminal logging level** to set the lowest level of logs that can be output to the current terminal.

Use **undo terminal logging level** to restore the default.

Syntax

terminal logging level *severity*

undo terminal logging level

Default

The lowest level of logs that can be output to the current terminal is 6 (Informational).

Views

User view

Predefined user roles

network-admin

Parameters

severity: Specifies a log severity level. Valid values are alert, critical, debugging, emergency, error, informational, notification, warning, and digits from 0 to 7.

Usage guidelines

This command enables the device to output logs with a severity level higher than or equal to the specified level to the current terminal. For example, if you set the *severity* argument to 6, logs with a severity value from 0 to 6 are output to the current terminal.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

Examples

Configure the device to output logs with the debugging level and higher levels to the current terminal.

```
<Switch> terminal logging level 7
```

11.1.25. terminal monitor

Use **terminal monitor** to enable monitoring of logs on the current terminal.

Use **undo terminal monitor** to disable monitoring of logs on the current terminal.

Syntax

terminal monitor

undo terminal monitor

Default

Monitoring of logs is enabled on the console and disabled on the monitor terminal.

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

Examples

Enable monitoring of logs on the current terminal.

```
<Switch> terminal monitor
The current terminal is enabled to display logs.
```

Parent 2:
  IP address                                        : 192.168.0.255
  Port number                                       : 8443
  Connection state                                 : Connected
```

Figure 12-1 Command Output

Field	Description
NetMeister state	• Enabled. • Disabled.
Connection state with NetMeister	• Connected. • Disconnected.
Account name	GroupID of the child device.

Field	Description
Proxy information	Information about connecting to the NetMeister proxy server.
IP address	IP address of the parent device.
Port number	Port number of the parent.
Connection state	State of the connection between the child device and parent device. Options include: • Connected. • Disconnected.
Parent information	Parent device information.
Site name	Name of the site to which the parent device belongs. If no site name is configured, this field displays **--**.
Interval	Interval (in seconds) at which the parent device sends registration packets and update packets to the cloud platform. If the device fails to obtain the interval, this field displays **--**.
MQTT interval	MQTT heartbeat interval in seconds. If the device fails to obtain the interval, this field displays **--**.
MQTT status	MQTT connection state. If no MQTT connection has ever been established, this field displays **--**.

Related commands

netmeister account

netmeister enable

netmeister parent

12.1.2. netmeister account

Use **netmeister account** to specify the GroupID and password used by the child device in authentication and registration.

Use **undo netmeister account** to delete the specified GroupID and password.

Syntax

netmeister account *account* **password { cipher** *cipherPassword* **| simple** *plainPassword* **}**

undo netmeister account

Default

No GroupID and password is specified for the authentication and registration of a child device.

Views

System view

Predefined user roles

network-admin

Parameters

account: Specifies the GroupID, a string of 2 to 31 characters. The string can only contain lower-case letters, digits, and hyphens (-), and cannot start or end with hyphens (-).

password: Specifies the password.

cipher: Sets a password in encrypted form.

cipherPassword: Specifies an encrypted-form password, a string of 41 to 73 characters.

simple: Sets a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

plainPassword: Specifies a plaintext-form password, a string of 8 to 31 characters. The string can contain only letters, digits, and the following special characters: !#$%&'()*+,-./:;<=>@[]^_`{|}~. The string must contain a minimum of one letter and one digit.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect. Every execution will trigger the child device to disconnect from and then reconnect to the NetMeister platform with the newly specified GroupID and password.

To avoid configuration failure, make sure NetMeister is disabled on the device before you specify the GroupID and password.

Make sure the specified GroupID and password already exist on the NetMeister platform.

Make sure that the specified GroupID and password are also used on the parent device.

The username and password specified on the device must be the same as those configured on the parent device and NetMeister.

Examples

Configure the child device to use GroupID **nec** and plaintext-form password **nec1234** in authentication and registration.

```
<Sysname> system-view
[Sysname] netmeister account nec password simple nec1234
```

Related commands

netmeister enable

display netmeister

12.1.3. netmeister enable

Use **netmeister enable** to enable NetMeister.

Use **undo netmeister enable** to disable NetMeister.

Syntax

netmeister enable

undo netmeister enable

Default

NetMeister is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables a device to act as a child device in a NetMeister network.

- Before you enable this feature, configure the required settings on the child device, parent device, and NetMeister.
- After you enable this feature, only parent device related settings take effect in parent mode, and only child device related settings take effect in child mode.

Examples

Enable NetMeister.

```
<Sysname> system-view
[Sysname] netmeister enable
```

12.1.4. netmeister management ip

Syntax

netmeister management ip *ip-address*

undo netmeister management ip

Default

disabled.

View

System-view

Predefined user roles

network-admin

Usage guidelines

Use the **netmeister management ip** command to set the management IP address to be displayed in the NetMeister function [Log in remotely with a closed network].

Restore the defaults by **undo netmeister management ip** command.

For more information on NetMeister features, see the NetMeister operating guide.

Examples

Set the management IP address displayed in the NetMeister function [Log in remotely with a closed network] to 10.1.1.10.

```
<Sysname> system-view
[Sysname] netmeister management ip 10.1.1.10
```

Memo:
netmeister management ip command is supported from later software, including Version 7.4.30.

12.1.5. netmeister parent ip

Use **netmeister parent** to specify the IP address and port number of a parent for the child device.

Use **undo netmeister parent** to delete the IP address and port number of a parent.

Syntax

netmeister parent ip *ip-address* **[port** *port-number* **]**

undo netmeister parent ip *ip-address*

Default

No parent is specified for a child device.

Views

System view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Specifies the IP address of a parent.

port *port-number*: Specifies the port number of the parent, in the range of 1 to 65535. The default port number is 443.

Usage guidelines

To avoid configuration failure, make sure NetMeister is disabled on the device before you specify the IP address and port number of a parent.

After a parent and account are specified and Netmeister is enabled, the child device sends authentication requests to the parent at specific intervals until receiving an authentication response. If you execute this command multiple times, the child device sends requests to all the specified addresses and establishes connections with all the possible parents. This improves network availability by preventing parent failure from causing service interruption. Two parent IP addresses can be configured.

Examples

Specify a parent with IP address 192.168.0.254 and port number 443 for the child device.

```
<Sysname> system-view
[Sysname] netmeister parent ip 192.168.0.254 port 443
```

Specify a parent with IP address 192.168.1.254 for the child device.

```
<Sysname> system-view
[Sysname] netmeister parent ip 192.168.1.254
```

Related commands

netmeister enable

display netmeister

12.1.6. netmeister proxy

🕮 memo:
The **netmeister proxy** command is supported from version 7.2.23 and later software.

Use **netmeister proxy** to specify the proxy over which https communication to NetMiester is routed.

Use **undo netmeister proxy** to delete the proxy.

Syntax

netmeister proxy url *url* [**username** *username* **password** { **cipher | simple** } *string*]

undo netmeister proxy

Default

No netmeister proxy is specified..

Views

System view

Predefined user roles

network-admin

Parameters

url *url*: Specifies the URL of the proxy server. The http://<domain>:<port> format specifies a case-sensitive string of 8 to 128 characters. The <domain> argument represents the domain name or IP address of the proxy server, and the <port> argument represents a port number between 1 and 65535. The default port number is 80.

username *username*: Specifies the user name used to access the proxy server. 1 to 31 case-sensitive characters. Strings may contain backslashes (\), quotation marks ("), and question marks (?), cannot contain spaces.

password: Specifies the password used to access the proxy server.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 31 characters. Its encrypted form is a case-sensitive string of 33 to 73 characters. Strings cannot include backslashes (\), quotation marks ("), question marks (?), and spaces.

Usage guidelines

The netmeister proxy command causes the device to use the specified proxy server for https communication to NetMeister. No proxy server is used for https communication to the parent. Use undo netmeister proxy to remove the proxy server designation.

Before configuring the netmeister proxy command, make sure that netmeister enable is disabled.

If you run the netmeister proxy multiple times, the latest configuration takes effect.

Examples

Specify a parent with IP address 192.168.0.254 and proxy server with IP address 10.1.1.254 for the child device.

```
<Switch> system-view
[Switch] netmeister parent ip 192.168.1.254
[Switch] netmeister proxy url http://10.1.1.254:8080
```

Related commands

netmeister enable

display netmeister

12.1.7. display netmeister parent-mode statistics

memo:
The **display netmeister parent-mode statistics** command is supported from version 7.4.35 and later software.

Use **display netmeister parent-mode statistics** to display statistics for messages transmitted between the parent device and NetMeister.

Syntax

display netmeister parent-mode statistics [**failed**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

failed: Displays statistics for messages that failed to be sent between the parent device and NetMeister in chorological order. The system can display a maximum of 5 most recent messages. If you do not specify this keyword, this command displays statistics for all messages between the parent device and NetMeister.

Examples

Display statistics for messages between the parent device and NetMeister.

```
<Sysname> display netmeister parent-mode statistics
Tasks and registration:
 145 total, 138 succeeded, 7 failed
 7 connection errors, 0 internal errors
MQTT:
 35 total, 34 succeeded, 1 failed
 1 connection errors, 0 internal errors
Alarm:
 10 occurred, 8 succeeded, 2 failed
 7 recovered, 7 succeeded
Report:
 10 total, 9 succeeded, 1 failed
```

Table 1 Command output

Field	Description
Tasks and registration	Statistics for task and registration messages.
total	Total number of messages.
succeeded	Number of messages that were successfully processed.
failed	Number of messages that failed to be processed.
connection errors	Number of connection error messages among all messages that failed to be processed.
internal errors	Number of internal error messages among all messages that failed to be processed.
MQTT	Statistics for MQTT messages.
Alarm	Statistics for alarm messages.
occurred	Number of messages when an alarm was triggered.
recovered	Number of messages when an alarm was cleared.
Report	Statistics of periodically reported messages.

Display statistics for messages that failed to be sent between the parent device and NetMeister.

```
<Sysname> display netmeister parent-mode statistics failed
Tasks and registration:
 Count: 1
  Type: register
  HTTP error code:503
  Inner error code:--
  Time: 2021/12/06 14:00

```

```
HTTP error code:400
Inner error code:--
Time: 2021/12/07 15:30
```

Table 2 Command output

Field	Description
Tasks and registration	Statistics for task and registration messages that failed to be processed.
Count	Serial number of messages that failed to be processed.
Type	Type of task and registration messages. Options include: • **register**—Registration message. • **update**—Update message. • **get task**—Task obtaining message. • **update firmware**—Task of firmware update. • **acquire collective information of equipment**—Task of viewing device collective information. • **get running config**—Task of viewing device effective configuration. • **get config**—Task of viewing device running configuration and the startup file for next start. • **get device list**—Task of viewing the device list. • **get tab information**—Task of viewing the effective configuration for port and VLAN modules. • **execution display command**—Task of displaying device information. • **set device list**—Task of configuring device list. • **execution setting command**—Task of configuring device information. • **apply config**—Task of configuring the startup file for next start. • **save**—Task of saving the configuration to the startup file for next start. • **reboot**—Task of restarting the device. • **new certificate**—Task of obtaining a new certificate. • **task result**—Task result each time.
HTTP error code	HTTP message error code. Options include: • **1000**—Failed to send the message. • **1001**—Message sent successfully but no response. • **1002**—Invalid contents for MQTT packets. • **200**—Connected successfully but internal processing errors occurred for the device. • **400**—Request error. • **401**—Authentication failed. • **403**—Messages are banned. • **404**—Messages not detected. • **405**—Invalid method. • **406**—Messages denied. • **409**—Message conflict. • **429**—Too many requests. • **500**—Server error. • **502**—Incorrect gateway.

Field	Description
	• **503**—Service unavailable.
Inner error code	Error code for device internal message. Options include: • **1000**—Failed to send the message. • **1001**—Message sent successfully but no response. • **1002**—Invalid contents for MQTT packets. • **1003**—Client internal error. • **1004**—Unknown client error such as unrecognized error code returned by the service endpoint.
Time	Time when the message is generated.
MQTT	Statistics of MQTT messages that failed to be processed.
Type	MQTT event type. Options include: • **subscribe**—Subscription event. • **unsubscribe**—Unsubscription event. • **publish**—Publishing event. • **keepalive**—Heartbeat event. • **Connect**—Connection event. • **Disconnect**—Disconnection event.
Alarm	Statistics of alarm messages that failed to be processed.
Type	Alarm type. Options include: • **cpu**—Processor usage ratio alarm. • **Fan**—Fan alarm. • **Temperature**—Temperature alarm. • **memory**—Memory usage ratio alarm. • **reboot**—Restart exception alarm.
Report	Statistics of periodically reported messages that fail to be processed.
Type	Reported message type. This field displays **report**, which indicates the information of processor usage ratio, temperature, memory usage ratio, and port that the device reports to the cloud platform at intervals of 5 minutes.

Related commands

reset netmeister parent-mode statistics

12.1.8. netmeister mode parent

🕮 memo:
The **netmeister mode parent** command is supported from version 7.4.35 and later software.

Use **netmeister mode parent** to specify the device mode as parent mode.

Use **undo netmeister mode parent** to restore the default.

Syntax

netmeister mode parent

undo netmeister mode parent

Default

The device is in child mode.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables the device to function as the parent device that connects child devices to NetMeister.

A NetMeister network must include the following roles:

- **Child**—Device to be managed.
- **Parent**—Device that connects all child devices to NetMeister. The parent device authenticates child devices and issues NetMeister messages to authenticated child devices.
- **NetMeister**—Cloud platform for network administrators to manage and maintain child devices from the parent device.

Examples

Specify the device mode as parent mode.

```
<Sysname> system-view
[Sysname] netmeister mode parent
```

12.1.9. netmeister parent-mode sitename

🕮 memo:
The **netmeister parent-mode sitename** command is supported from version 7.4.35 and later software.

Use **netmeister parent-mode sitename** to specify the parent site name.

Use **undo netmeister parent-mode sitename** to restore the default.

Syntax

netmeister parent-mode sitename *name*

undo netmeister parent-mode sitename

Default

No parent site name is specified.

Views

System view

Predefined user roles

network-admin

Parameters

name: Specifies the parent site name, a string of 2 to 31 characters. Only lowercase letters, digits, and hyphens (-) are allowed, and the string cannot start or end with a hyphen.

Usage guidelines

For the parent device, you must specify the parent site name before you enable NetMeister.

Examples

Specify the parent site name as **qx-devel**.

```
<Sysname> system-view
[Sysname] netmeister parent-mode sitename qx-devel
```

Related commands

display netmeister

12.1.10. netmeister parent-mode mqtt port

> 🕮 memo:
> The **netmeister parent-mode mqtt port** command is supported from version 7.4.35 and later software.

Use **netmeister parent-mode mqtt port** to specify the MQTT port number.

Use **undo netmeister parent-mode mqtt port** to restore the default.

Syntax

netmeister parent-mode mqtt port *port-number*

undo netmeister parent-mode mqtt port

Default

The MQTT port number is 8883.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the MQTT port number. Options include 443 and 8883.

Usage guidelines

The parent device and NetMeister use Message Queuing Telemetry Transport (MQTT) as the transport protocol to communicate with each other. NetMeister uses the MQTT protocol to deploy events to the parent device, and the parent device uses the MQTT protocol to subscribe to events from NetMeister.

This configuration terminates the session between the parent device and NetMeister. The device then uses the newly specified port to re-establish a connection to the NetMeister platform.

This command takes effect only when NetMeister is enabled.

Examples

Specify the MQTT port number 443 for the parent device.

```
<Sysname> system-view
[Sysname] netmeister parent-mode mqtt port 443
```

Related commands

display netmeister

12.1.11. reset netmeister parent-mode statistics

memo:
The **reset netmeister parent-mode statistics** command is supported from version 7.4.35 and later software.

Use **reset netmeister parent-mode statistic** to clear statistics for messages between the parent device and NetMeister.

Syntax

reset netmeister parent-mode statistic

Views

User view

Predefined user roles

network-admin

Examples

Clear statistics for messages between the parent device and NetMeister.

```
<Sysname> reset netmeister parent-mode statistics
```

13.1. VCF fabric commands

13.1.1. vcf-fabric topology enable

Use **vcf-fabric topology enable** to enable VCF fabric topology discovery.

Use **undo vcf-fabric topology enable** to disable VCF fabric topology discovery.

Syntax

vcf-fabric topology enable

undo vcf-fabric topology enable

Default

VCF fabric topology discovery is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable VCF fabric topology discovery.

```
<Switch> system-view
[Switch] vcf-fabric topology enable
```

NOTE:

The **vcf-fabric topology enable** command are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

13.1.2. vcf-fabric underlay autoconfigure

Use **vcf-fabric underlay autoconfigure** to specify the template file for automated underlay network deployment.

Use **undo vcf-fabric underlay autoconfigure** to restore the default.

Syntax

vcf-fabric underlay autoconfigure *template*

undo vcf-fabric underlay autoconfigure

Default

No template file is specified for automated underlay network deployment.

Views

System view

Predefined user roles

network-admin

Parameters

template: Specifies a template file by its name, a case-insensitive string of 1 to 127 characters. A template file is a file ending with the **.template** file extension.

Usage guidelines

After this command is executed, the device uses the specified template file to deploy the underlay network.

Examples

Specify template file **vxlan_leaf.template** for automated underlay network deployment.

```
<Switch> system-view
[Switch] vcf-fabric underlay autoconfigure vxlan_leaf.template
```

NOTE:

The **vcf-fabric underlay autoconfigure** command are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

1. VXLAN commands

1.1. Basic VXLAN commands

1.1.1. ac statistics enable

Use **ac statistics enable** to enable packet statistics for Ethernet service instances of a VLAN.

Use **undo ac statistics enable** to disable packet statistics for Ethernet service instances of a VLAN.

Syntax

ac statistics enable

undo ac statistics enable

Default

The packet statistics feature is disabled for Ethernet service instances of a VLAN.

Views

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command enables packet statistics for the Ethernet service instances automatically created for VLAN-based VXLAN assignment.

Before you enable this feature, you must use the **vxlan vlan-based** command to enable VLAN-based VXLAN assignment.

Examples

Map VLAN 10 to VXLAN 100, and enable packet statistics for Ethernet service instances of VLAN 10.

```
<Switch> system-view
[Switch] vxlan vlan-based
[Switch] vlan 10
[Switch-vlan10] vxlan vni 100
[Switch-vlan10] ac statistics enable
```

Related commands

display l2vpn service-instance

reset l2vpn statistics ac

vxlan vlan-based

1.1.2. arp suppression enable

Use **arp suppression enable** to enable ARP flood suppression.

Use **undo arp suppression enable** to disable ARP flood suppression.

Syntax

arp suppression enable

undo arp suppression enable

Default

ARP flood suppression is disabled.

Views

VSI view

Predefined user roles

network-admin

Usage guidelines

ARP flood suppression reduces ARP request broadcasts by enabling the VTEP to reply to ARP requests on behalf of VMs.

This feature snoops ARP packets to populate the ARP flood suppression table with local and remote MAC addresses. If an ARP request has a matching entry, the VTEP replies to the request on behalf of the VM. If no match is found, the VTEP floods the request to both local and remote sites.

Examples

Enable ARP flood suppression for VSI **vsi1**.

```
<Switch> system-view
[Switch] vsi vsi1
[Switch-vsi-vsi1] arp suppression enable
```

Related commands

display arp suppression vsi

reset arp suppression vsi

1.1.3. arp suppression ip-source-binding record

Use **arp suppression ip-source-binding record** to enable the device to generate dynamic IPv4SG bindings based on ARP flood suppression entries.

Use **undo arp suppression ip-source-binding record** to disable the device from generating dynamic IPv4SG bindings based on ARP flood suppression entries.

Syntax

arp suppression ip-source-binding record

undo arp suppression ip-source-binding record

Default

The device does not generate dynamic IPv4SG bindings based on ARP flood suppression entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you execute this command, the device notifies the IP source guard module of ARP flood suppression entries for it to generate dynamic IPv4SG bindings based on these entries.

For more information about IP source guard, see *Security Configuration Guide*.

Examples

Enable the device to generate dynamic IPv4SG bindings based on ARP flood suppression entries.

```
<Switch> system-view
[Switch] arp suppression ip-source-binding record
```

Related commands

arp suppression enable

reset arp suppression vsi

1.1.4. description

Use **description** to configure a description for a VSI.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

A VSI does not have a description.

Views

VSI view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Examples

Configure a description for VSI **vpn1**.

```
<Switch> system-view
[Switch] vsi vpn1
[Switch-vsi-vpn1] description vsi for vpn1
```

Related commands

display l2vpn vsi

1.1.5. display arp suppression vsi

Use **display arp suppression vsi** to display ARP flood suppression entries.

Syntax

display arp suppression vsi [**name** *vsi-name*] [**slot** *slot-number*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays entries on the master device.

count: Displays the number of ARP flood suppression entries that match the command.

Examples

Display ARP flood suppression entries.

```
<Switch> display arp suppression vsi
IP address      MAC address    VSI Name                        Link ID    Aging(min)
1.1.1.2         000f-e201-0101 vsi1                            0x70000    14
1.1.1.3         000f-e201-0202 vsi1                            0x80000    18
1.1.1.4         000f-e201-0203 vsi2                            0x90000    10
```

Display the number of ARP flood suppression entries.

```
<Switch> display arp suppression vsi count
Total entries: 3
```

Table 1-1 Command output

Field	Description
Link ID	Link ID that uniquely identifies an AC or a VXLAN tunnel on a VSI.
Aging(min)	Remaining lifetime (in minutes) of the ARP flood suppression entry. When the timer expires, the entry is deleted.

Related commands

arp suppression enable

reset arp suppression vsi

1.1.6. display ipv6 nd suppression vsi

Use **display ipv6 nd suppression vsi** to display ND flood suppression entries.

Syntax

display ipv6 nd suppression vsi [**name** *vsi-name*] [**slot** *slot-number*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays entries on the master device.

count: Displays the number of ND flood suppression entries that match the command.

Examples

Display ND flood suppression entries.

```
<Switch> display ipv6 nd suppression vsi
IPv6 address     MAC address      VSI Name         Link ID      Aging (min)
1000::2          000f-e201-0101   vsi1             0x70000      5
1000::3          000f-e201-0202   vsi1             0x80000      5
1000::4          000f-e201-0203   vsi2             0x90000      5
```

Display the number of ND flood suppression entries.

```
<Switch> display ipv6 nd suppression vsi count
Total entries: 3
```

Table 1-2 Command output

Field	Description
Link ID	Link ID that uniquely identifies an AC or a VXLAN tunnel on a VSI.
Aging (min)	Remaining lifetime (in minutes) of the ND flood suppression entry. When the timer expires, the entry is deleted.

Related commands

ipv6 nd suppression enable

reset ipv6 nd suppression vsi

1.1.7. display l2vpn mac-address

Use **display l2vpn mac-address** to display MAC address entries for VSIs.

Syntax

display l2vpn mac-address [**vsi** *vsi-name*] [**dynamic**] [**count** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays MAC address entries for all VSIs.

dynamic: Specifies dynamic MAC address entries learned in the data plane. If you do not specify this keyword, the command displays all MAC address entries, including:

- Dynamic remote- and local-MAC entries.
- Remote-MAC entries advertised through BGP EVPN.
- Manually added static remote-MAC entries.
- Remote-MAC entries issued through OpenFlow.
- Remote-MAC entries issued through OVSDB.

count: Displays the number of MAC address entries.

verbose: Displays detailed information about MAC address entries.

Usage guidelines

If you do not specify the **count** or **verbose** keyword, this command displays brief information about MAC address entries.

Examples

Display brief information about MAC address entries for all VSIs.

```
<Switch> display l2vpn mac-address
MAC Address : 5237-a625-0e06
VSI Name    : vpna
State       : Dynamic
Link ID/Name      Aging
Tunnel1           Aging

MAC Address : 52f6-bc1e-0d06
VSI Name    : vpna
State       : Dynamic
Link ID/Name      Aging
GE1/0/1           Aging
--- 2 mac address(es) found  ---
```

Display the total number of MAC address entries in all VSIs.

```
<Switch> display l2vpn mac-address count
2 mac address(es) found
```

Table 1-3 Command output

Field	Description
VSI Name	VSI name in one of the following formats: • *vsi-name*—VSI name for the MAC address entry. • *vsi1* (*vsi2*)—The MAC address belongs to *vsi1* and has been issued to *vsi2* by the controller.
State	Entry state: • **Dynamic**—Local- or remote-MAC entry dynamically learned in the data plane. • **Static**—Static remote-MAC entry. • **EVPN**—Remote-MAC entry advertised through BGP EVPN. • **OpenFlow**—Remote-MAC entry issued by a remote controller through OpenFlow. • **OVSDB**—Remote-MAC entry issued by a remote controller

Field	Description
	through OVSDB.
Link ID/Name	For a local MAC address, this field displays the name of the interface that hosts the Ethernet service instance for the MAC address. For a remote MAC address, this field displays the tunnel interface name.
Aging	Entry aging state: • **Aging**. • **NotAging**.

Display detailed information about MAC address entries for all VSIs.

```
<Switch> display l2vpn mac-address verbose
MAC Address : 0000-0000-000b
VSI Name    : vpn1
VXLAN ID    : 123
Interface   : GE1/0/1
Link ID     : 1
State       : Dynamic
Aging       : Aging
```

Table 1-4 Command output

Field	Description
Interface	For a local MAC address, this field displays the name of the interface that hosts the Ethernet service instance for the MAC address. For a remote MAC address, this field displays the tunnel interface name.
VSI Name	VSI name in one of the following formats: • *vsi-name*—VSI name for the MAC address entry. • *vsi1* (*vsi2*)—The MAC address belongs to *vsi1* and has been issued to *vsi2* by the controller.
Link ID	Link ID that uniquely identifies an AC or a VXLAN tunnel on a VSI.
State	Entry state: • **Dynamic**—Local- or remote-MAC entry dynamically learned in the data plane. • **Static**—Static remote-MAC entry. • **EVPN**—Remote-MAC entry advertised through BGP EVPN. • **OpenFlow**—Remote-MAC entry issued by a remote controller through OpenFlow. • **OVSDB**—Remote-MAC entry issued by a remote controller through OVSDB.
Aging	Entry aging state: • **Aging**. • **NotAging**.

Related commands

reset l2vpn mac-address

1.1.8. display l2vpn service-instance

Use **display l2vpn service-instance** to display information about Ethernet service instances.

Syntax

display l2vpn service-instance [**interface** *interface-type interface-number* [**service-instance** *instance-id*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet interface or Layer 2 aggregate interface by its interface type and number. If you do not specify an interface, this command displays Ethernet service instance information for all Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 4096. If you do not specify an Ethernet service instance, this command displays information about all Ethernet service instances on the specified Layer 2 Ethernet interface or Layer 2 aggregate interface.

verbose: Displays detailed information about Ethernet service instances. If you do not specify this keyword, the command displays brief information about Ethernet service instances.

Examples

Display brief information about all Ethernet service instances.

```
<Switch> display l2vpn service-instance
Total number of service-instances: 2, 2up, 0 down
Total number of ACs: 2, 2 up, 0 down

Interface                ID   Owner                          LinkID State Type
GE1/0/1                  3     vsi12                          1       Up    VSI
GE1/0/1                  4     vsi13                          1       Up    VSI
```

Table 1-5 Command output

Field	Description
Total number of ACs	Total number of attachment circuits (ACs) and the number of ACs in each state (up or down).
Interface	Name of a Layer 2 Ethernet interface or Layer 2 aggregate interface.
ID	Ethernet service instance ID.
Owner	VSI name. This field is empty if an Ethernet service instance is not mapped to any VSI.
LinkID	Ethernet service instance's link ID on the VSI.
State	Ethernet service instance state:

Field	Description
	• **Up**. • **Down**.
Type	L2VPN type of the Ethernet service instance: • **VSI**. • **VPWS**.

Display detailed information about all Ethernet service instances on GigabitEthernet 1/0/1.

```
<Switch> display l2vpn service-instance interface gigabitethernet 1/0/1 verbose
Interface: GE1/0/1
  Service Instance: 1
    Type          : Manual
    Encapsulation : s-vid 16
    Bandwidth     : -
    VSI Name      : vsi10

      Packets  :0
    Output Statistics:
      Octets   :0
      Packets  :0
```

Table 1-6 Command output

Field	Description
Interface	Name of a Layer 2 Ethernet interface or Layer 2 aggregate interface.
Service Instance	Ethernet service instance ID.
Type	Type and traffic match mode of the Ethernet service instance: • **Dynamic (MAC-based)**—Dynamic Ethernet service instance in MAC-based traffic match mode. • **Manual**—Static Ethernet service instance in VLAN-based traffic match mode.
Encapsulation	Frame match criterion of the Ethernet service instance. If the Ethernet service instance does not contain a match criterion, the command does not display this field.
Bandwidth	This field is not supported in the current software version. Bandwidth limit in kbps. If no bandwidth limit is set for the Ethernet service instance, **Unlimited** is displayed.
Link ID	Ethernet service instance's link ID on the VSI.
State	Ethernet service instance state: • **Up**. • **Down**.
Statistics	Packet statistics state: • **Enabled**—The packet statistics feature is enabled for the Ethernet service instance.

Field	Description
	• **Disabled**—The packet statistics feature is disabled for the Ethernet service instance.
Input Statistics	Incoming traffic statistics: • **Octets**—Number of incoming bytes. • **Packets**—Number of incoming packets.
Output Statistics	Outgoing traffic statistics: • **Octets**—Number of outgoing bytes. • **Packets**—Number of outgoing packets.

Related commands

service-instance

1.1.9. display l2vpn vsi

Use **display l2vpn vsi** to display information about VSIs.

Syntax

display l2vpn vsi [**name** *vsi-name*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays information about all VSIs.

verbose: Displays detailed information about VSIs. If you do not specify this keyword, the command displays brief information about VSIs.

Examples

Display brief information about all VSIs.

```
<Switch> display l2vpn vsi
Total number of VSIs: 1, 1 up, 0 down, 0 admin down

VSI Name                        VSI Index       MTU     State

Table 1-8 Command output

Field	Description
VSI Description	Description of the VSI. If the VSI does not have a description, the command does not display this field.
VSI State	VSI state: • **Up**—The VSI is up. • **Down**—The VSI is down. • **Administratively down**—The VSI has been manually shut down by using the **shutdown** command.

Field	Description
MTU	MTU on the VSI.
Bandwidth	This field is not supported in the current software version. Bandwidth limit in kbps. If no bandwidth limit is set for the VSI, **Unlimited** is displayed.
Broadcast Restrain	This field is not supported in the current software version. Broadcast restraint bandwidth (in kbps). If the broadcast restraint bandwidth is not set, **Unlimited** is displayed.
Multicast Restrain	This field is not supported in the current software version. Multicast restraint bandwidth (in kbps). If the multicast restraint bandwidth is not set, **Unlimited** is displayed.
Unknown Unicast Restrain	This field is not supported in the current software version. Unknown unicast restraint bandwidth (in kbps). If the unknown unicast restraint bandwidth is not set, **Unlimited** is displayed.
MAC Learning	State of the MAC learning feature.
MAC Table Limit	This field is not supported in the current software version. Maximum number of MAC address entries on the VSI.
MAC Learning rate	This field is not supported in the current software version. MAC address entry learning rate of the VSI.
Drop Unknown	This field is not supported in the current software version. Action on source MAC-unknown frames received after the maximum number of MAC entries is reached.
Flooding	State of the VSI's flooding feature: • **Enabled**—Flooding is enabled on the VSI. • **Disabled**—Flooding is disabled on the VSI.
Statistics	Packet statistics state: • **Enabled**—The packet statistics feature is enabled for the VSI. • **Disabled**—The packet statistics feature is disabled for the VSI.
Input statistics	Incoming traffic statistics: • **Octets**—Number of incoming bytes. • **Packets**—Number of incoming packets. • **Errors**—Number of error packets. • **Discards**—Number of discarded packets.
Output statistics	Outgoing traffic statistics: • **Octets**—Number of outgoing bytes. • **Packets**—Number of outgoing packets. • **Errors**—Number of error packets. • **Discards**—Number of discarded packets.
Gateway Interface	VSI interface name.
State	Tunnel state: • **Up**—The tunnel is operating correctly. • **Down**—The tunnel interface is down.

Field	Description
Type	Tunnel assignment method: • **Auto**—The tunnel was automatically assigned to the VXLAN. For an EVPN network, VXLAN tunnels are automatically assigned to VXLANs. • **Manual**—The tunnel was manually assigned to the VXLAN.
Flood proxy	Flood proxy state. This field is not supported in the current software version.
ACs	ACs that are bound to the VSI.
Link ID	AC's link ID on the VSI.
State	AC state: • **Up**. • **Down**.
Type	Type and traffic match mode of the Ethernet service instance: • **Dynamic (DRNI)**—Dynamic Ethernet service instance created on the IPL in VLAN-based traffic match mode. • **Dynamic (MAC-based)**—Dynamic Ethernet service instance in MAC-based traffic match mode. • **Manual**—Static Ethernet service instance in VLAN-based traffic match mode.

1.1.10. display vxlan tunnel

Use **display vxlan tunnel** to display VXLAN tunnel information for VXLANs.

Syntax

display vxlan tunnel [**vxlan-id** *vxlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vxlan-id: Specifies a VXLAN ID. The value range for this argument is0 to 16777215. If you do not specify a VXLAN, this command displays VXLAN tunnel information for all VXLANs.

Examples

Display VXLAN tunnel information for all VXLANs.

```
<Switch> display vxlan tunnel
Total number of VXLANs: 1

VXLAN ID: 10, VSI name: vpna, Total tunnels: 3 (3 up, 0 down, 0 defect, 0 blocked)
Tunnel name          Link ID    State  Type         Flood proxy
Tunnel1              0x5000001  Up     Manual       Disabled
Tunnel2              0x5000002  Up     Manual       Disabled
MTunnel0             0x6002710  Up     Auto         Disabled
```

Display VXLAN tunnel information for VXLAN **10**.

```
<Switch> display vxlan tunnel vxlan-id 10
VXLAN ID: 10, VSI name: vpna, Total tunnels: 3 (3 up, 0 down, 0 defect, 0 blocked)
Tunnel name          Link ID    State  Type         Flood proxy
Tunnel1              0x5000001  Up     Manual       Disabled
Tunnel2              0x5000002  Up     Manual       Disabled
MTunnel0             0x6002710  Up     Auto         Disabled
```

Table 1-9 Command output

Field	Description
Link ID	Tunnel's link ID in the VXLAN.
State	Tunnel state: • **Up**—The tunnel is operating correctly. • **Down**—The tunnel interface is down.
Type	Tunnel assignment method: • **Auto**—The tunnel was automatically assigned to the VXLAN. For an EVPN network, VXLAN tunnels are automatically assigned to VXLANs. • **Manual**—The tunnel was manually assigned to the VXLAN.
Flood proxy	Flood proxy state. This field is not supported in the current software version.

1.1.11. encapsulation

Use **encapsulation** to configure a frame match criterion for an Ethernet service instance.

Use **undo encapsulation** to restore the default.

Syntax

encapsulation s-vid *vlan-id* [**only-tagged**]

encapsulation untagged

undo encapsulation

Default

An Ethernet service instance does not contain a frame match criterion.

Views

Ethernet service instance view

Predefined user roles

network-admin

Parameters

s-vid: Matches frames that are tagged with the specified outer 802.1Q VLAN IDs.

vlan-id: Specifies an 802.1Q VLAN ID in the range of 1 to 4094.

only-tagged: Matches tagged frames. If the outer 802.1Q VLAN is not the PVID, the matching result does not differ, whether or not you specify the **only-tagged** keyword. If the outer 802.1Q VLAN is the PVID, the matching result depends on whether or not the **only-tagged** keyword is specified.

- To match only PVID-tagged frames, specify the **only-tagged** keyword.
- To match both untagged frames and PVID-tagged frames, do not specify the **only-tagged** keyword.

untagged: Matches any frames that do not have an 802.1Q VLAN tag.

Usage guidelines

An Ethernet service instance can contain only one match criterion. To change the match criterion, first execute the **undo encapsulation** command to remove the original criterion. When you remove the match criterion in an Ethernet service instance, the mapping between the service instance and the VSI is removed automatically.

Examples

Configure Ethernet service instance 1 on GigabitEthernet 1/0/1 to match frames that have an outer 802.1Q VLAN ID of 111.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] service-instance 1
[Switch-GigabitEthernet1/0/1-srv1] encapsulation s-vid 111
```

Related commands

display l2vpn service-instance

1.1.12. flooding disable

Use **flooding disable** to disable flooding for a VSI.

Use **undo flooding disable** to enable flooding for a VSI.

Syntax

flooding disable { **all** | { **broadcast** | **unknown-multicast** | **unknown-unicast** } * }

undo flooding disable

Default

Flooding is enabled for a VSI.

Views

VSI view

Predefined user roles

network-admin

Parameters

all: Specifies broadcast, unknown unicast, and unknown multicast traffic.

broadcast: Specifies broadcast traffic.

unknown-multicast: Specifies unknown multicast traffic.

unknown-unicast: Specifies unknown unicast traffic.

Usage guidelines

By default, the device floods broadcast, unknown unicast, and unknown multicast frames received from the local site to the following interfaces in the frame's VXLAN:

- All site-facing interfaces except for the incoming interface.
- All VXLAN tunnel interfaces.

To confine a kind of flood traffic to the site-facing interfaces, use this command to disable flooding for that kind of flood traffic on the VSI bound to the VXLAN. The VSI will not flood the corresponding frames to VXLAN tunnel interfaces.

Examples

Disable flooding of broadcast traffic for VSI **vsi1**.

```
<Switch> system-view
[Switch] vsi vsi1
[Switch-vsi-vsi1] flooding disable broadcast
```

1.1.13. ipv6 nd suppression enable

Use **ipv6 nd suppression enable** to enable ND flood suppression.

Use **undo ipv6 nd suppression enable** to disable ND flood suppression.

Syntax

ipv6 nd suppression enable

undo ipv6 nd suppression enable

Default

ND flood suppression is disabled.

Views

VSI view

Predefined user roles

network-admin

Usage guidelines

ND flood suppression reduces ND request multicasts by enabling the VTEP to reply to ND requests on behalf of user terminals.

This feature snoops ND packets to populate the ND flood suppression table with local and remote MAC addresses. If an ND request has a matching entry, the VTEP replies to the request on behalf of the user terminal. If no match is found, the VTEP floods the request to both local and remote sites.

Examples

Enable ND flood suppression for VSI **vsi1**.

```
<Switch> system-view
[Switch] vsi vsi1
[Switch-vsi-vsi1] ipv6 nd suppression enable
```

Related commands

display ipv6 nd suppression vsi

reset ipv6 nd suppression vsi

1.1.14. ipv6 nd suppression notify-ipsg

Use **ipv6 nd suppression notify-ipsg** to enable the device to generate dynamic IPv6SG bindings based on ND flood suppression entries.

Use **undo ipv6 nd suppression notify-ipsg** to disable the device from generating dynamic IPv6SG bindings based on ND flood suppression entries.

Syntax

ipv6 nd suppression notify-ipsg

undo ipv6 nd suppression notify-ipsg

Default

The device does not generate dynamic IPv6SG bindings based on ND flood suppression entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you execute this command, the device notifies the IP source guard module of ND flood suppression entries for it to generate dynamic IPv6SG bindings based on these entries.

For more information about IP source guard, see *Security Configuration Guide*.

Examples

Enable the device to generate dynamic IPv6SG bindings based on ND flood suppression entries.

```
<Switch> system-view
[Switch] ipv6 nd suppression notify-ipsg
```

Related commands

display ipv6 source binding (*Security Command Reference*)

ipv6 nd suppression enable

1.1.15. l2vpn enable

Use **l2vpn enable** to enable L2VPN.

Use **undo l2vpn enable** to disable L2VPN.

Syntax

l2vpn enable

undo l2vpn enable

Default

L2VPN is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You must enable L2VPN before you can configure L2VPN settings.

Examples

Enable L2VPN.

```
<Switch> system-view
[Switch] l2vpn enable
```

1.1.16. l2vpn statistics interval

Use **l2vpn statistics interval** to set the L2VPN statistics collection interval.

Use **undo l2vpn statistics interval** to restore the default.

Syntax

l2vpn statistics interval *interval*

undo l2vpn statistics interval

Default

The L2VPN statistics collection interval is 900 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

Interval: Sets the L2VPN statistics collection interval in seconds, in the range of 30 to 65535.

Examples

Set the L2VPN statistics collection interval to 30 seconds.

```
<Sysname> system-view
[Sysname] l2vpn statistics interval 30
```

1.1.17. mac-address static vsi

Use **mac-address static vsi** to add a static remote-MAC address entry for a VXLAN VSI.

Use **undo mac-address static vsi** to remove a static remote-MAC address entry for a VXLAN VSI.

Syntax

mac-address static *mac-address* **interface tunnel** *tunnel-number* **vsi** *vsi-name*

undo mac-address static [*mac-address*] **interface tunnel** *tunnel-number* **vsi** *vsi-name*

Default

VXLAN VSIs do not have static remote-MAC address entries.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in H-H-H format. Do not specify a multicast MAC address or an all-zeros MAC address. You can omit the consecutive zeros at the beginning of each segment. For example, you can enter **f-e2-1** for **000f-00e2-0001**.

interface tunnel *tunnel-number*: Specifies a VXLAN tunnel interface by its tunnel interface number. The specified tunnel interface must already exist.

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A remote MAC address is the MAC address of a VM in a remote site. Remote MAC entries include manually added MAC entries, dynamically learned MAC entries, and MAC entries advertised through BGP EVPN.

When you add a remote MAC address entry, make sure the VSI's VXLAN has been specified on the VXLAN tunnel.

Do not configure static remote-MAC entries for tunnels that are automatically established by using EVPN.

- EVPN re-establishes tunnels if the transport-facing interface goes down and then comes up. If you have configured static remote-MAC entries, the entries are deleted when the tunnels are re-established.
- EVPN re-establishes tunnels if you perform configuration rollback. If the tunnel IDs change during tunnel re-establishment, configuration rollback fails, and static remote-MAC entries on the tunnels cannot be restored.

The **undo mac-address static vsi** *vsi-name* command removes all static remote-MAC address entries for a VSI.

Examples

Add MAC address **000f-e201-0101** to VSI **vsi1**. Specify Tunnel-interface 1 as the outgoing interface.

```
<Switch> system-view
[Switch] mac-address static 000f-e201-0101 interface tunnel 1 vsi vsi1
```

Related commands

vxlan tunnel mac-learning disable

1.1.18. reserved vxlan

Use **reserved vxlan** to specify a reserved VXLAN.

Use **undo reserved vxlan** to restore the default.

Syntax

reserved vxlan *vxlan-id*

undo reserved vxlan

Default

No VXLAN has been reserved.

Views

System view

Predefined user roles

network-admin

Parameters

vxlan-id: Specifies a VXLAN ID in the range of 0 to 16777215.

Usage guidelines

You can specify only one reserved VXLAN on the VTEP. The reserved VXLAN cannot be the VXLAN created on any VSI.

Examples

Specify VXLAN 10000 as the reserved VXLAN.

```
<Switch> system-view
[Switch] reserved vxlan 10000
```

1.1.19. reset arp suppression vsi

Use **reset arp suppression vsi** to clear ARP flood suppression entries on VSIs.

Syntax

reset arp suppression vsi [**name** *vsi-name*]

Views

User view

Predefined user roles

network-admin

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears ARP flood suppression entries on all VSIs.

Examples

Clear ARP flood suppression entries on all VSIs.

```
<Switch> reset arp suppression vsi
This command will delete all entries. Continue? [Y/N]:y
```

Related commands

arp suppression enable

display arp suppression vsi

1.1.20. reset ipv6 nd suppression vsi

Use **reset ipv6 nd suppression vsi** to clear ND flood suppression entries on VSIs.

Syntax

reset ipv6 nd suppression vsi [**name** *vsi-name*]

Views

User view

Predefined user roles

network-admin

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears ND flood suppression entries on all VSIs.

Examples

Clear ND flood suppression entries on all VSIs.

```
<Switch> reset ipv6 nd suppression vsi
This command will delete all entries. Continue? [Y/N]:y
```

Related commands

display ipv6 nd suppression vsi

ipv6 nd suppression enable

1.1.21. reset l2vpn mac-address

Use **reset l2vpn mac-address** to clear dynamic MAC address entries on VSIs.

Syntax

reset l2vpn mac-address [**vsi** *vsi-name*]

Views

User view

Predefined user roles

network-admin

Parameters

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears all dynamic MAC address entries on all VSIs.

Usage guidelines

Use this command when the number of dynamic MAC address entries reaches the limit or the device learns incorrect MAC addresses.

Examples

Clear the dynamic MAC address entries on VSI **vpn1**.

```
<Switch> reset l2vpn mac-address vsi vpn1
```

Related commands

display l2vpn mac-address vsi

1.1.22. reset l2vpn statistics ac

Use **reset l2vpn statistics ac** to clear packet statistics on ACs.

Syntax

reset l2vpn statistics ac [**interface** *interface-type interface-number* [**service-instance** *instance-id*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

service-instance *instance-id*: Specifies an Ethernet service instance ID in the range of 1 to 4096.

Usage guidelines

If you do not specify any parameters, this command clears packet statistics on all ACs.

Examples

Clear packet statistics for Ethernet service instance 1 on GigabitEthernet 1/0/1.

```
<Switch> reset l2vpn statistics ac interface gigabitethernet 1/0/1 service-instance 1
```

Related commands

ac statistics enable

display l2vpn interface

statistics enable (Ethernet service instance view)

1.1.23. service-instance

Use **service-instance** to create an Ethernet service instance and enter its view, or enter the view of an existing Ethernet service instance.

Use **undo service-instance** to delete an Ethernet service instance.

Syntax

service-instance *instance-id*

undo service-instance *instance-id*

Default

No Ethernet service instances exist.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

instance-id: Specifies an Ethernet service instance ID in the range of 1 to 4096.

Examples

On Layer 2 Ethernet interface GigabitEthernet 1/0/1, create Ethernet service instance 1 and enter Ethernet service instance view.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] service-instance 1
[Switch-GigabitEthernet1/0/1-srv1]
```

Related commands

display l2vpn service-instance

1.1.24. shutdown

Use **shutdown** to shut down a VSI.

Use **undo shutdown** to bring up a VSI.

Syntax

shutdown

undo shutdown

Default

VSIs are up.

Views

VSI view

Predefined user roles

network-admin

Usage guidelines

Use this command to temporarily disable a VSI to provide Layer 2 switching services. The shutdown action does not change settings on the VSI. You can continue to configure the VSI. After you bring up the VSI again, the VSI provides services based on the latest settings.

Examples

Shut down VSI **vpn1**.

```
<Switch> system-view
[Switch] vsi vpn1
[Switch-vsi-vpn1] shutdown
```

Related commands

display l2vpn vsi

1.1.25. statistics enable (Ethernet service instance view)

Use **statistics enable** to enable packet statistics for an Ethernet service instance.

Use **undo statistics enable** to disable packet statistics for an Ethernet service instance.

Syntax

statistics enable

undo statistics enable

Default

The packet statistics feature is disabled for an Ethernet service instance.

Views

Ethernet service instance view

Predefined user roles

network-admin

Usage guidelines

For this command to take effect, you must configure a frame match criterion for the Ethernet service instance and map it to a VSI. If you modify the frame match criterion or VSI mapping, packet statistics of the instance is cleared.

Examples

Enable packet statistics for Ethernet service instance 200 on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] service-instance 200
[Switch-GigabitEthernet1/0/1-srv200] statistics enable
```

Related command

display l2vpn service-instance verbose

reset l2vpn statistics ac

1.1.26. statistics enable (VSI view)

Use **statistics enable** to enable packet statistics for a VSI.

Use **undo statistics enable** to disable packet statistics for a VSI.

Syntax

statistics enable

undo statistics enable

Default

The packet statistics feature is disabled for a VSI.

Views

VSI view

Predefined user roles

network-admin

Examples

Enable packet statistics for VSI **vsi1**.

```
<Switch> system-view
[Switch] vsi vsi1
[Switch-vsi-vsi1] statistics enable
```

Related commands

display l2vpn vsi verbose

reset l2vpn statistics vsi

1.1.27. tunnel

Use **tunnel** to assign VXLAN tunnels to a VXLAN.

Use **undo tunnel** to remove VXLAN tunnels from a VXLAN.

Syntax

tunnel { *tunnel-number* [**backup-tunnel** *tunnel-number*] | **all** }

undo tunnel { *tunnel-number* | **all** }

Default

A VXLAN does not contain VXLAN tunnels.

Views

VXLAN view

Predefined user roles

network-admin

Parameters

*tunnel-numb*er: Specifies a tunnel interface number. The value range for this argument is 0 to 511. The tunnel must be a VXLAN tunnel.

backup-tunnel *tunnel-number*: Specifies a backup tunnel by its tunnel interface number. The value range for the *tunnel-number* argument is 0 to 511. The tunnel must be a VXLAN tunnel.

all: Specifies all VXLAN tunnels.

Usage guidelines

This command assigns a VXLAN tunnel to a VXLAN to provide Layer 2 connectivity for the VXLAN between two sites. In unicast mode, the system floods unknown unicast, multicast, and broadcast traffic to each tunnel in the VXLAN.

You can assign multiple VXLAN tunnels to a VXLAN, and configure a VXLAN tunnel to trunk multiple VXLANs.

To assign a pair of primary and backup VXLAN tunnels to the VXLAN, specify the **backup-tunnel** *tunnel-number* option. When the primary VXLAN tunnel is operating correctly, the backup VXLAN tunnel does not forward traffic. When the primary VXLAN tunnel goes down, traffic is switched to the backup VXLAN tunnel.

If the **tunnel all** command is used for a VXLAN, you cannot remove the VXLAN tunnels one by one. You can only use the **undo tunnel all** command to remove all the VXLAN tunnels.

Examples

Assign VXLAN tunnels 1 and 2 to VXLAN 10000.

```
<Switch> system-view
[Switch] vsi vpna
[Switch-vsi-vpna] vxlan 10000
[Switch-vsi-vpna-vxlan-10000] tunnel 1
[Switch-vsi-vpna-vxlan-10000] tunnel 2
```

Related commands

display vxlan tunnel

1.1.28. tunnel global source-address

Use **tunnel global source-address** to specify a global source address for VXLAN tunnels.

Use **undo tunnel global source-address** to restore the default.

Syntax

tunnel global source-address *ip-address*

undo tunnel global source-address

Default

No global source address is specified for VXLAN tunnels.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address.

Usage guidelines

IMPORTANT:
For correct VXLAN deployment and VTEP management, do not manually specify tunnel-specific source addresses for VXLAN tunnels if OVSDB is used.

A VXLAN tunnel uses the global source address if you do not specify a source interface or source address for the tunnel.

The global source address takes effect only on VXLAN tunnels.

Examples

Specify 1.1.1.1 as the global source address for VXLAN tunnels.

```
<Switch> system-view
[Switch] tunnel global source-address 1.1.1.1
```

1.1.29. vsi

Use **vsi** to create a VSI and enter its view, or enter the view of an existing VSI.

Use **undo vsi** to delete a VSI.

Syntax

vsi *vsi-name*

undo vsi *vsi-name*

Default

No VSIs exist.

Views

System view

Predefined user roles

network-admin

Parameters

vsi-name: Specifies a VSI name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A VSI acts as a virtual switch to provide Layer 2 switching services for a VXLAN on a VTEP. A VSI has all functions of a physical Ethernet switch, including source MAC address learning, MAC address aging, and flooding.

A VSI can provide services only for one VXLAN.

Examples

Create VSI **vxlan10** and enter VSI view.

```
<Switch> system-view
[Switch] vsi vxlan10
[Switch-vsi-vxlan10]
```

Related commands

display l2vpn vsi

1.1.30. vxlan

Use **vxlan** to create a VXLAN and enter its view, or enter the view of an existing VXLAN.

Use **undo vxlan** to restore the default.

Syntax

vxlan *vxlan-id*

undo vxlan

Default

No VXLANs exist.

Views

VSI view

Predefined user roles

network-admin

Parameters

vxlan-id: Specifies a VXLAN ID. The value range for this argument is 0 to 16777215.

Usage guidelines

You can create only one VXLAN for a VSI. The VXLAN ID for each VSI must be unique.

Examples

Create VXLAN 10000 for VSI **vpna** and enter VXLAN view.

```
<Switch> system-view
[Switch] vsi vpna
[Switch-vsi-vpna] vxlan 10000
[Switch-vsi-vpna-vxlan-10000]
```

Related commands

vsi

1.1.31. vxlan default-decapsulation

Use **vxlan default-decapsulation** to enable default IPv4 VXLAN decapsulation.

Use **undo vxlan default-decapsulation** to disable default IPv4 VXLAN decapsulation.

Syntax

vxlan default-decapsulation source interface *interface-type interface-number*

undo vxlan default-decapsulation source interface

Default

Default IPv4 VXLAN decapsulation is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

source interface *interface-type interface-number*: Specifies an interface by its type and number.

Usage guidelines

If an IPv4 VXLAN tunnel is configured on only one VTEP of a pair of VTEPs, the IPv4 VXLAN tunnel is a unidirectional tunnel to the VTEP not configured with the tunnel. In this situation, that VTEP drops the VXLAN packets received from the unidirectional VXLAN tunnel. For a VTEP to receive VXLAN packets from a unidirectional IPv4 VXLAN tunnel, enable default IPv4 VXLAN decapsulation on the interface whose IPv4 address is the tunnel destination address. The VTEP will decapsulate all the VXLAN packets destined for the IPv4 address of that interface.

This command takes effect only when the specified interface has an IPv4 address.

The IP address of the specified interface must meet the following requirements:

- It is the destination address of a unidirectional VXLAN tunnel.
- It is the source address of a minimum of one up VXLAN tunnel.

Default IPv4 VXLAN decapsulation does not take effect on bidirectional VXLAN tunnels. If you remove the one-way communication issue for an IPv4 VXLAN tunnel by configuring the tunnel on both the local and remote VTEPs, this feature no longer takes effect on that tunnel.

Examples

Enable default IPv4 VXLAN decapsulation.

```
<Switch> system-view
[Switch] vxlan default-decapsulation source interface gigabitethernet1/0/1
```

1.1.32. vxlan ip-forwarding

Use **vxlan ip-forwarding** to enable Layer 3 forwarding for all VXLANs.

Use **undo vxlan ip-forwarding** to enable Layer 2 forwarding for all VXLANs.

Syntax

vxlan ip-forwarding

undo vxlan ip-forwarding

Default

Layer 3 forwarding is enabled for all VXLANs.

Views.

System view

Predefined user roles

network-admin

Usage guidelines

If the device is a VTEP, enable Layer 2 forwarding for VXLANs. If the device is a VXLAN IP gateway, enable Layer 3 forwarding for VXLANs.

In Layer 3 forwarding mode, the VTEP uses the ARP table (IPv4 network) or ND table (IPv6 network) to forward traffic for VXLANs. In Layer 2 forwarding mode, the VTEP uses the MAC address table to forward traffic for VXLANs.

You must delete all VSIs, VSI interfaces, and VXLAN tunnel interfaces before you can change the forwarding mode.

Examples

Enable Layer 3 forwarding for all VXLANs.

```
<Switch>system-view
[Switch] vxlan ip-forwarding
```

1.1.33. vxlan local-mac report

Use **vxlan local-mac report** to enable local-MAC logging.

Use **undo vxlan local-mac report** to disable local-MAC logging.

Syntax

vxlan local-mac report

undo vxlan local-mac report

Default

Local-MAC logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When the local-MAC logging feature is enabled, the VXLAN module immediately sends a log message with its local MAC addresses to the information center. When a local MAC address is added or removed, a log message is also sent to the information center to notify the local-MAC change.

With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable local-MAC logging.

```
<Switch> system-view
[Switch] vxlan local-mac report
```

1.1.34. vxlan tunnel mac-learning disable

Use **vxlan tunnel mac-learning disable** to disable remote-MAC address learning.

Use **undo vxlan tunnel mac-learning disable** to enable remote-MAC address learning.

Syntax

vxlan tunnel mac-learning disable

undo vxlan tunnel mac-learning disable

Default

Remote-MAC address learning is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When network attacks occur, use this command to prevent the device from learning incorrect remote MAC addresses in the data plane.

Examples

Disable remote-MAC address learning.

```
<Switch> system-view
[Switch] vxlan tunnel mac-learning disable
```

1.1.35. vxlan udp-port

Use **vxlan udp-port** to set the destination UDP port number for VXLAN packets.

Use **undo vxlan udp-port** to restore the default.

Syntax

vxlan udp-port *port-number*

undo vxlan udp-port

Default

The destination UDP port number is 4789 for VXLAN packets.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a UDP port number in the range of 1 to 65535. As a best practice, specify a port number in the range of 1024 to 65535 to avoid conflict with well-known ports.

Usage guidelines

You must configure the same destination UDP port number on all VTEPs in a VXLAN.

If you modify the destination UDP port number, only VXLAN tunnels established after the modification use the new port number for sending VXLAN packets. For the new port number to take effect on VXLAN tunnels created before the modification, you must disconnect and re-establish the tunnels.

Examples

Set the destination UDP port number to 6666 for VXLAN packets.

```
<Switch> system-view
[Switch] vxlan udp-port 6666
```

1.1.36. vxlan vlan-based

Use **vxlan vlan-based** to enable VLAN-based VXLAN assignment.

Use **undo vxlan vlan-based** to disable VLAN-based VXLAN assignment.

Syntax

vxlan vlan-based

undo vxlan vlan-based

Default

VLAN-based VXLAN assignment is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You can assign customer traffic to a VXLAN by using one of the following methods:

- **Ethernet service instance-to-VSI mapping**—This method uses the frame match criterion of an Ethernet service instance to match a list of VLANs on a site-facing Layer 2 interface. The VTEP assigns customer traffic to a VXLAN by mapping the Ethernet service instance to a VSI.
- **VLAN-based VXLAN assignment**—This method maps a VLAN to a VXLAN. When a VLAN is mapped to a VXLAN and VLAN-based VXLAN assignment is enabled, the device automatically performs the following operations:
  a. Creates an Ethernet service instance that uses the VLAN ID as its instance ID on each interface in the VLAN. The matching outer VLAN ID of the Ethernet service instances is the VLAN ID.
  b. Maps the Ethernet service instances to the VSI of the VXLAN.

Do not configure both Ethernet service instance-to-VSI mapping and VLAN-based VXLAN assignment.

Examples

Enable VLAN-based VXLAN assignment.

```
<Switch> system-view
[Switch] vxlan vlan-based
```

1.1.37. vxlan vni

Use **vxlan vni** to map a VLAN to a VXLAN.

Use **undo vxlan vni** to remove the VXLAN mapping for a VLAN.

Syntax

vxlan vni *vxlan-id*

undo vxlan vni

Default

A VLAN is not mapped to a VXLAN.

Views

VLAN view

Predefined user roles

network-admin

Parameters

vxlan-id: Specifies a VXLAN ID in the range of 0 to 16777215.

Usage guidelines

Before you map VLANs to VXLANs, enable VLAN-based VXLAN assignment by using the **vxlan vlan-based** command.

You cannot map VLAN 1 to any VXLAN. Do not map a VLAN to the L3 VXLAN ID of EVPN.

If you map a VLAN to a nonexistent VXLAN, the configuration takes effect after the VXLAN is created.

Examples

Map VLAN 10 to VXLAN 100.

```
<Switch> system-view
[Switch] vlan 10
[Switch-vlan10] vxlan vni 100
```

Related commands

vxlan vlan-based

1.1.38. xconnect vsi

Use **xconnect vsi** to map an AC to a VSI.

Use **undo xconnect vsi** to restore the default.

Syntax

xconnect vsi *vsi-name* [**access-mode** { **ethernet** | **vlan** } | **on-demand**] * [**track** *track-entry-number*&<1-3>]

undo xconnect vsi

Default

An AC is not mapped to any VSI.

Views

Ethernet service instance view

Predefined user roles

network-admin

Parameters

vsi-name: Specifies the VSI name, a case-sensitive string of 1 to 31 characters.

access-mode: Specifies an access mode. The default access mode is VLAN.

vlan: Specifies the VLAN access mode.

ethernet: Specifying Ethernet access mode.

track *track-entry-number*&<1-3>: Specifies a space-separated list of up to three track entry numbers in the range of 1 to 1024. The AC is up only if a minimum of one associated track entry is in positive state.

Usage guidelines

To monitor the status of an AC, associate it with track entries.

To use this command for an Ethernet service instance, you must first use the **encapsulation** command to add a traffic match criterion to the service instance.

For traffic that matches the Ethernet service instance, the system uses the VSI's MAC address table to make a forwarding decision.

The device supports the VLAN access mode. In this mode, Ethernet frames received from or sent to the local site must contain 802.1Q VLAN tags.

- For an Ethernet frame received from the local site, the VTEP removes all its 802.1Q VLAN tags before forwarding the frame.
- For an Ethernet frame destined for the local site, the VTEP adds 802.1Q VLAN tags to the frame before forwarding the frame.

In VLAN access mode, VXLAN packets sent between VXLAN sites do not contain 802.1Q VLAN tags. VXLAN can provide Layer 2 connectivity for different 802.1Q VLANs between sites. You can use different 802.1Q VLANs to provide the same service in different sites.

Examples

On GigabitEthernet 1/0/1, configure Ethernet service instance 200 to match frames with an outer 802.1Q VLAN tag of 200, and map the instance to VSI **vpn1**.

```
<Switch> system-view
[Switch] vsi vpn1
[Switch-vsi-vpn1] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] service-instance 200
[Switch-GigabitEthernet1/0/1-srv200] encapsulation s-vid 200
[Switch-GigabitEthernet1/0/1-srv200] xconnect vsi vpn1
```

Related commands

display l2vpn service-instance

1.2. VXLAN IP gateway commands

1.2.1. arp distributed-gateway dynamic-entry synchronize

Use **arp distributed-gateway dynamic-entry synchronize** to enable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

Use **undo arp distributed-gateway dynamic-entry synchronize** to disable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

Syntax

arp distributed-gateway dynamic-entry synchronize

undo arp distributed-gateway dynamic-entry synchronize

Default

Dynamic ARP entry synchronization is disabled for distributed VXLAN IP gateways.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When local proxy ARP is enabled on distributed VXLAN IP gateways, each gateway learns ARP information independently. A gateway does not forward ARP packets destined for its local VSI interfaces to other gateways. For distributed VXLAN IP gateways to have the same ARP entries, you must enable dynamic ARP entry synchronization.

A controller or the EVPN feature can also synchronize ARP entries among distributed VXLAN IP gateways. When you use a controller or the EVPN feature, do not enable dynamic ARP entry synchronization.

Examples

Enable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

```
<Switch> system-view
[Switch] arp distributed-gateway dynamic-entry synchronize
```

Related commands

distributed-gateway local

local-proxy-arp enable (*Layer 3—IP Services Command Reference*)

1.2.2. arp send-rate

Use **arp send-rate** to set an ARP packet sending rate limit for a VSI interface.

Use **undo arp send-rate** to remove the ARP packet sending rate limit for a VSI interface.

Syntax

arp send-rate *pps*

undo arp send-rate

Default

The ARP packet sending rate is not limited for a VSI interface.

Views

VSI interface view

Predefined user roles

network-admin

Parameters

pps: Specifies a rate limit in the range of 1 to 500 pps.

Usage guidelines

VMs have limited capacity to process packets. To prevent packet processing from degrading VM performance, limit the ARP packet sending rate of the VSI interface for VMs. The VTEP will drop excess ARP packets if the rate limit is exceeded.

Examples

Set the ARP packet sending rate limit to 50 pps for VSI-interface 1.

```
<Switch> system
[Switch] interface vsi-interface 1
[Switch-Vsi-interface1] arp send-rate 50
```

1.2.3. default

Use **default** to restore the default settings for a VSI interface.

Syntax

default

Views

VSI interface view

Predefined user roles

network-admin

Usage guidelines

CAUTION:
The default command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions.

To resolve this problem:

1. Use the **display this** command in interface view to identify these commands.
2. Use their **undo** forms or follow the command reference to restore their default settings.
3. If the restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for VSI-interface 100.

```
<Switch> system-view
```

```
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] default
This command will restore the default settings. Continue? [Y/N]:y
```

1.2.4. description

Use **description** to configure the description of a VSI interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of a VSI interface is *interface-name* plus **Interface** (for example, **Vsi-interface100 Interface**).

Views

VSI interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure the description as gateway for **VXLAN 10** for VSI-interface 100.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] description gateway for VXLAN 10
```

1.2.5. display interface vsi-interface

Use **display interface vsi-interface** to display information about VSI interfaces.

Syntax

display interface [**vsi-interface** [*vsi-interface-id*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vsi-interface [*vsi-interface-id*]: Specifies VSI interfaces. If you specify a VSI interface, this command displays information about the specified interface. If you specify only the **vsi-interface** keyword, this command displays information about all VSI interfaces. If you do not specify the **vsi-interface** [*vsi-interface-id*] option, this command displays

information about all interfaces. Make sure the specified VSI interfaces have been created on the device.

brief: Display brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays interfaces that are physically down as well as the down reason. If you do not specify this keyword, the command does not filter output by physical interface state.

Examples

Display information about VSI-interface 100.

```
<Switch> display interface vsi-interface 100
Vsi-interface100
Current state: UP
Line protocol state: UP
Description: Vsi-interface100 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Internet address: 10.1.1.1/24 (primary)
IP packet frame type: Ethernet II, hardware address: 0011-2200-0102
IPv6 packet frame type: Ethernet II, hardware address: 0011-2200-0102
Physical: Unknown, baudrate: 1000000 kbps
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 1-10 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the interface: • **UP**—The data link layer protocol is up. • **UP(spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. • **DOWN**—The data link layer protocol is down.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: *ip-*	IP address of the interface and type of the address in

Field	Description
address/*mask-length* (*Type*)	parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-Allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-Allocated**−BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-Negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address.
IPv6 packet frame type	IPv6 packet framing format.
Physical	Physical type of the interface, which is fixed at **Unknown**.
baudrate	Interface baudrate in kbps.
Last clearing of counters	Last time when the interface statistics are cleared. The current software version does not support clearing interface statistics. This field always displays **Never.**
Last 300 seconds input rate	Average input rate for the last 300 seconds.
Last 300 seconds output rate	Average output rate for the last 300 seconds.
Input: 0 packets, 0 bytes, 0 drops	Incoming traffic statistics on the interface: • Number of incoming packets. • Number of incoming bytes. • Number of dropped incoming packets.
Output: 0 packets, 0 bytes, 0 drops	Outgoing traffic statistics on the interface: • Number of outgoing packets. • Number of outgoing bytes. • Number of dropped outgoing packets.

Display brief information about all VSI interfaces.

```
<Switch> display interface vsi-interface brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
```

```
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
Vsi100               DOWN DOWN     --
```

Display brief information and complete description for VSI-interface 100.

```
<Switch> display interface vsi-interface 100 brief description
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
Vsi100               UP   UP       1.1.1.1         VSI-interface100
```

Displays interfaces that are physically down and the down reason.

```
<Switch> display interface brief down
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Interface            Link   Cause
Vsi100               DOWN   Administratively
Vsi200               DOWN   Administratively
```

Table 1-11 Command output

Field	Description
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **UP (s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. • **DOWN**—The data link layer protocol of the interface is down.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Not connected**—The interface is not mapped to any VSI, or the mapped VSI does not have any AC or VXLAN tunnel.

Related commands

reset counters interface vsi-interface

1.2.6. distributed-gateway local

Use **distributed-gateway local** to specify a VSI interface as a distributed gateway to provide services for the local site.

Use **undo distributed-gateway local** to restore the default.

Syntax

distributed-gateway local

undo distributed-gateway local

Default

A VSI interface is not a distributed gateway.

Views

VSI interface view

Predefined user roles

network-admin

Usage guidelines

If a VXLAN uses distributed gateway services, you must assign the same IP address to the VXLAN's VSI interfaces on different VTEPs. To avoid IP address conflicts, you must specify the VSI interface on each VTEP as a distributed gateway.

Examples

Specify VSI-interface 100 as a distributed gateway.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] distributed-gateway local
```

1.2.7. gateway vsi-interface

Use **gateway vsi-interface** to specify a gateway interface for a VSI.

Use **undo gateway vsi-interface** to restore the default.

Syntax

gateway vsi-interface *vsi-interface-id*

undo gateway vsi-interface

Default

No gateway interface is specified for a VSI.

Views

VSI view

Predefined user roles

network-admin

Parameters

vsi-interface-id: Specifies a VSI interface by its number. The VSI interface must already exist.

Usage guidelines

When you delete a VSI interface by using the **undo interface vsi-interface** command, the gateway interface setting of the VSI interface is also deleted.

A VSI can have only one gateway interface.

Examples

Specify VSI-interface 100 as the gateway interface for VSI **vpna**.

```
<Switch> system-view
[Switch] vsi vpna
[Switch-vsi-vpna] gateway vsi-interface 100
```

Related commands

interface vsi-interface

1.2.8. interface vsi-interface

Use **interface vsi-interface** to create a VSI interface and enter its view, or enter the view of an existing VSI interface.

Use **undo interface vsi-interface** to delete a VSI interface.

Syntax

interface vsi-interface *vsi-interface-id*

undo interface vsi-interface *vsi-interface-id*

Default

No VSI interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

vsi-interface-id: Specifies a VSI interface number. The value range for this argument is 0 to 16777215.

Usage guidelines

When you delete a VSI interface by using the **undo interface vsi-interface** command, the gateway interface setting of the VSI interface is also deleted.

Examples

Create VSI-interface 100 and enter VSI interface view.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100]
```

Related commands

1.2.9. ipv6 nd distributed-gateway dynamic-entry synchronize

Use **ipv6 nd distributed-gateway dynamic-entry synchronize** to enable dynamic ND entry synchronization for distributed VXLAN IP gateways.

Use **undo ipv6 nd distributed-gateway dynamic-entry synchronize** to disable dynamic ND entry synchronization for distributed VXLAN IP gateways.

Syntax

ipv6 nd distributed-gateway dynamic-entry synchronize

undo ipv6 nd distributed-gateway dynamic-entry synchronize

Default

Dynamic ND entry synchronization is disabled for distributed VXLAN IP gateways.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When local ND proxy is enabled on distributed VXLAN IP gateways, each gateway learns ND information independently. A gateway does not forward ND packets destined for its local VSI interfaces to other gateways. For distributed VXLAN IP gateways to have the same ND entries, you must enable dynamic ND entry synchronization.

A controller or the EVPN feature can also synchronize ND entries among distributed VXLAN IP gateways. When you use a controller or the EVPN feature, do not enable dynamic ND entry synchronization.

Examples

Enable dynamic ND entry synchronization for distributed VXLAN IP gateways.

```
<Switch> system-view
[Switch] ipv6 nd distributed-gateway dynamic-entry synchronize
```

Related commands

distributed-gateway local

1.2.10. mac-address

Use **mac-address** to assign a MAC address to a VSI interface.

Use **undo mac-address** to restore the default.

Syntax

mac-address *mac-address*

undo mac-address

Default

The MAC address of VSI interfaces is the bridge MAC address + 26.

Views

VSI interface view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in H-H-H format.

Examples

Assign MAC address 0001-0001-0001 to VSI-interface 100.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] mac-address 1-1-1
```

1.2.11. mtu

Use **mtu** to set the MTU for a VSI interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The default MTU of a VSI interface is 1444 bytes.

Views

VSI interface view

Predefined user roles

network-admin

Parameters

size: Specifies an MTU value in the range of 46 to 4096 bytes.

Examples

Set the MTU to 1430 bytes for VSI-interface 100.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] mtu 1430
```

1.2.12. shutdown

Use **shutdown** to shut down a VSI interface.

Use **undo shutdown** to bring up a VSI interface.

Syntax

shutdown

undo shutdown

Default

A VSI interface is up.

Views

VSI interface view

Predefined user roles

network-admin

Examples

Shut down VSI-interface 100.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] shutdown
```

1.2.13. vxlan tunnel arp-learning disable

Use **vxlan tunnel arp-learning disable** to disable remote ARP learning for VXLANs.

Use **undo vxlan tunnel arp-learning disable** to enable remote ARP learning for VXLANs.

Syntax

vxlan tunnel arp-learning disable

undo vxlan tunnel arp-learning disable

Default

Remote ARP learning is enabled for VXLANs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the device learns ARP information of remote VMs from packets received on VXLAN tunnel interfaces. To save resources on VTEPs in an SDN transport network, you can temporarily disable remote ARP learning when the controller and VTEPs are synchronizing entries. After the entry synchronization is completed, use the **undo vxlan tunnel arp-learning disable** command to enable remote ARP learning.

As a best practice, disable remote ARP learning for VXLANs only when the controller and VTEPs are synchronizing entries.

Examples

Disable remote ARP learning for VXLANs.

```
<Switch> system
[Switch] vxlan tunnel arp-learning disable
```

1.2.14. vxlan tunnel nd-learning disable

Use **vxlan tunnel nd-learning disable** to disable remote ND learning for VXLANs.

Use **undo vxlan tunnel nd-learning disable** to enable remote ND learning for VXLANs.

Syntax

vxlan tunnel nd-learning disable

undo vxlan tunnel nd-learning disable

Default

Remote ND learning is enabled for VXLANs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the device learns ND information of remote VMs from packets received on VXLAN tunnel interfaces. To save resources on VTEPs in an SDN transport network, you can temporarily disable remote ND learning when the controller and VTEPs are synchronizing entries. After the entry synchronization is completed, use the **undo vxlan tunnel nd-learning disable** command to enable remote ND learning.

As a best practice, disable remote ND learning for VXLANs only when the controller and VTEPs are synchronizing entries.

Examples

Disable remote ND learning for VXLANs.

```
<Switch> system
[Switch] vxlan tunnel nd-learning disable
```

1.3. OVSDB commands

1.3.1. ovsdb server enable

Use **ovsdb server enable** to enable the OVSDB server.

Use **undo ovsdb server enable** to disable the OVSDB server.

Syntax

ovsdb server enable

undo ovsdb server enable

Default

The OVSDB server is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

To obtain configuration data from controllers, you must enable the OVSDB server.

Before you enable the OVSDB server, you must establish an OVSDB SSL or TCP connection with a minimum of one controller.

Examples

Enable the OVSDB server.

```
<Switch> system-view
[Switch] ovsdb server enable
```

1.3.2. ovsdb server ptcp

Use **ovsdb server ptcp** to enable the device to listen for OVSDB TCP connection requests.

Use **undo ovsdb server ptcp** to restore the default.

Syntax

ovsdb server ptcp [**port** *port-number*] [**acl** *acl-number*]

undo ovsdb server ptcp

Default

The device does not listen for OVSDB TCP connection requests.

Views

System view

Predefined user roles

network-admin

Parameters

port *port-number*: Specifies a port to listen for OVSDB TCP connection requests. The value range for the *port-number* argument is 1 to 65535. If you do not specify a port, the device uses the port number 6640.

acl *acl-number*: Specifies a basic IPv4 ACL by its ACL number to filter OVSDB TCP connection requests. The value range for the *acl-number* argument is 2000 to 2999.

Usage guidelines

You can specify only one port to listen for OVSDB TCP connection requests. If you execute this command multiple times, the most recent configuration takes effect.

For the specified port setting to take effect, you must execute the **ovsdb server enable** command to enable the OVSDB server. You must disable and then re-enable the OVSDB server if it has been enabled.

If you specify a basic IPv4 ACL for this command, the OVSDB server accepts only the OVSDB TCP connection requests that are permitted by the ACL. The OVSDB server rejects any OVSDB TCP connection requests that do not match the ACL or that are denied by the ACL.

The OVSDB server does not filter OVSDB TCP connection requests in any of the following situations:

- No IPv4 ACL is specified for this command.
- The specified IPv4 ACL does not exist.
- The specified IPv4 ACL does not have rules.

You can specify only one IPv4 ACL to filter OVSDB TCP connection requests. If you execute this command multiple times, the most recent configuration takes effect.

Modification to rules in the specified IPv4 ACL takes effect only on OVSDB TCP connection requests that are received after the modification. If you specify another IPv4 ACL, the IPv4 ACL also takes effect only on OVSDB TCP connection requests that are received after the modification.

Examples

Enable the device to listen for OVSDB TCP connection requests on port 6640.

```
<Switch> system-view
[Switch] ovsdb server ptcp
```

Related commands

ovsdb server enable

1.3.3. vtep access port

Use **vtep access port** to specify a site-facing interface as a VTEP access port.

Use **undo vtep access port** to restore the default.

Syntax

vtep access port

undo vtep access port

Default

An interface is not a VTEP access port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

For controllers to manage a site-facing interface, you must specify the interface as a VTEP access port.

Examples

Specify GigabitEthernet 1/0/1 as a VTEP access port.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] vtep access port
```

1.3.4. vtep acl disable

Use **vtep acl disable** to disable the ACLs issued by the OVSDB controller.

Use **undo vtep acl disable** to enable the ACLs issued by the OVSDB controller.

Syntax

vtep acl disable

undo vtep acl disable

Default

The ACLs issued by the OVSDB controller are enabled on the device.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Before you use this command, you must use the **vtep enable** command to enable the OVSDB VTEP service.

Use the **vtep acl disable** command on a VTEP to disable all the ACLs issued by the OVSDB controller in order to save ACL resources on the VTEP.

Examples

Disable the ACLs issued by the OVSDB controller.

```
<Switch> system-view
[Switch] vtep enable
[Switch] vtep acl disable
```

Related commands

vtep enable

1.3.5. vtep enable

Use **vtep enable** to enable the OVSDB VTEP service.

Use **undo vtep enable** to disable the OVSDB VTEP service.

Syntax

vtep enable

undo vtep enable

Default

The OVSDB VTEP service is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the OVSDB VTEP service.

```
<Switch> system-view
[Switch] vtep enable
```

1.4. Loop detection command

NOTE:

VXLAN loop detection commands are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

1.4.1. display loopback-detection

Use **display loopback-detection** to display the loop detection configuration and status.

Syntax

display loopback-detection

Views

Any view

Predefined user roles

network-admin

network-operator

Example

Display the loop detection configuration and status.

```
<Switch> display loopback-detection
Loop detection is enable.
Global loop detection interval is 30 second(s).
Loop is detected on following interfaces:
* indicates the loop protection action was not triggered.
# indicates the loop protection action failed.
  Interface                      Action mode     VLANs/VSI
  GigabitEthernet1/0/1 srv100    None            vsi1
  GigabitEthernet1/0/2 srv100    Block*          vsi2
  GigabitEthernet1/0/3 srv100    Block#          vsi3
```

Table 1-12 Command output

Field	Description
Action mode	Loop protection action: • **Block**—When a loop is detected on an interface, the device generates a log, disables the interface from learning MAC addresses, and blocks the interface. An asterisk (*) indicates that the block action is not triggered because the loop detection priority of the AC on the interface is higher than that in received loop detection frames. A pound sign (#) indicates that the system failed to execute the block action. • **None**—When a loop is detected on an interface, the device generates a log but performs no action on the interface.
VLANs/VSI	VLANs or VSI to which the interface belongs and where loops are detected.

1.4.2. loopback-detection action

Use **loopback-detection action** to set the loop protection action on a per-VSI basis.

Use **undo loopback-detection action** to restore the default.

Syntax

loopback-detection action block

undo loopback-detection action

Default

When the device detects a loop on an AC, it generates a log but performs no action on the AC.

Views

VSI view

Predefined user roles

network-admin

Parameters

block: Enables the block mode. If a loop is detected on an AC whose loop detection priority is lower than that in received loop detection frames, the device performs the following operations:

- Generates a log.
- Disables MAC address learning on the AC.
- Blocks the AC.

Usage guidelines

The global loop detection action does not take effect on VSIs.

Example

Set the loop protection action to **block** on VSI **vsi1**.

```
<Switch> system-view
[Switch] l2vpn enable
[Switch] vsi vsi1
[Switch-vsi-vsi1] loopback-detection action block
```

Related commands

display loopback-detection

1.4.3. loopback-detection enable

Use **loopback-detection enable** to enable single-tagged loop detection on a VSI.

Use **undo loopback-detection enable** to disable single-tagged loop detection on a VSI.

Syntax

loopback-detection enable [**vlan** *vlan-id-list*]

undo loopback-detection enable [**vlan** *vlan-id-list*]

Default

Loop detection is disabled on VSIs.

Views

VSI view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for *vlan-id2* cannot be smaller than the value for *vlan-id1*. If you do not specify any VLAN IDs, each AC of the VSI sends loop detection frames tagged with the VLAN IDs that the AC matches.

Usage guidelines

This command enables the ACs of a VSI to send loop detection frames with one layer of VLAN tags or without VLAN tags.

If you execute this command multiple times for a VSI, all specified VLAN IDs take effect.

This command is mutually exclusive with the **loopback-detection enable s-vid c-vid** command. Do not use them together on a VSI.

Do not execute both the **loopback-detection enable** and **loopback-detection enable vlan** *vlan-id-list* commands on a VSI.

Example

Enable single-tagged loop detection on VSI **vsi1**.

```
<Switch> system-view
[Switch] l2vpn enable
[Switch] vsi vsi1
[Switch-vsi-vsi1] loopback-detection enable
```

Related commands

display loopback-detection

loopback-detection enable s-vid c-vid

loopback-detection priority

1.4.4. loopback-detection interval-time

Use **loopback-detection interval-time** to set the loop detection interval.

Use **undo loopback-detection interval-time** to restore the default.

Syntax

loopback-detection interval-time *interval*

undo loopback-detection interval-time

Default

The loop detection interval is 30 seconds.

Views

VSI view

Predefined user roles

network-admin

Parameters

interval: Sets the loop detection interval in the range of 1 to 32768 seconds.

Usage guidelines

The global loop detection interval does not take effect on VSIs.

With loop detection enabled, the device sends loop detection frames at the specified interval. A shorter interval offers more sensitive detection but consumes more resources. Consider the system performance and loop detection speed when you set the loop detection interval.

Example

Set the loop detection interval to 10 seconds on VSI **vsi1**.

```
<Switch> system-view
[Switch] l2vpn enable
[Switch] vsi vsi1
[Switch-vsi-vsi1] loopback-detetion interval-time 10
```

Related commands

display loopback-detection

1.4.5. loopback-detection priority

Use **loopback-detection priority** to set the priority value in the loop detection priority of a VSI.

Use **undo loopback-detection priority** to restore the default.

Syntax

loopback-detection priority *priority*

undo loopback-detection priority

Default

The priority value is 7 in the loop detection priority of a VSI.

Views

VSI view

Predefined user roles

network-admin

Parameters

priority: Sets the priority value in the range of 1 to 7. The smaller the value, the higher the priority.

Usage guidelines

The loop detection frames sent by an AC carry the loop detection priority of the VSI mapped to the AC. The loop detection priority of a frame contains the priority value, the bridge MAC address, and the AC's link ID. When an AC receives a loop detection frame, it compares its own loop detection priority with that in the frame to identify whether a loop exists. If the loop detection priority in the frame is higher, a loop exists and the loop protection action is triggered. If the loop detection priority of the AC is higher, the system only records the loop information.

An AC uses the following procedure to compare its loop detection priority with that in an incoming loop detection frame:

1. Compares the priority values. The smaller the value, the higher the priority.
2. Compares the bridge MAC addresses if the priority values are the same. A lower bridge MAC address has a higher priority.
3. Compares the link IDs if the bridge MAC addresses are the same, which indicates the loop detection frame is sent by another AC of the device. A smaller link ID has a higher priority.

Example

Set the priority value in the loop detection priority to 3 on VSI **vsi1**.

```
<Switch> system-view
[Switch] l2vpn enable
[Switch] vsi vsi1
[Switch-vsi-vsi1] loopback-detetion priority 3
```

1. EVPN commands

1.1. EVPN commands

1.1.1. address-family evpn (public instance view)

Use **address-family evpn** to enter EVPN view of the public instance.

Use **undo address-family evpn** to delete all settings in EVPN view of the public instance.

Syntax

address-family evpn

undo address-family evpn

Views

Public instance view

Predefined user roles

network-admin

Usage guidelines

You can configure EVPN settings such as route targets in EVPN view of the public instance.

Examples

Enter EVPN view of the public instance.

```
<Switch> system-view
[Switch] ip public-instance
[Switch-public-instance] address-family evpn
[Switch-public-instance-evpn]
```

1.1.2. address-family evpn (VPN instance view)

Use **address-family evpn** to enter EVPN view of a VPN instance.

Use **undo address-family evpn** to delete all settings in EVPN view of a VPN instance.

Syntax

address-family evpn

undo address-family evpn

Views

VPN instance view

Predefined user roles

network-admin

Usage guidelines

You can configure EVPN settings such as route targets and routing policies in EVPN view of a VPN instance.

Examples

Enter EVPN view of VPN instance **tenant**.

```
<Switch> system-view
[Switch] ip vpn-instance tenant
[Switch-vpn-instance-tenant] address-family evpn
[Switch-vpn-evpn-tenant]
```

1.1.3. address-family ipv4 (public instance view)

Use **address-family ipv4** to enter IPv4 VPN view of the public instance.

Use **undo address-family ipv4** to delete all settings in IPv4 VPN view of the public instance.

Syntax

address-family ipv4

undo address-family ipv4

Views

Public instance view

Predefined user roles

network-admin

Examples

Enter IPv4 VPN view of the public instance.

```
<Switch> system-view
[Switch] ip public-instance
[Switch-public-instance] address-family ipv4
[Switch-public-instance-ipv4]
```

1.1.4. address-family ipv6 (public instance view)

Use **address-family ipv6** to enter IPv6 VPN view of the public instance.

Use **undo address-family ipv6** to delete all settings in IPv6 VPN view of the public instance.

Syntax

address-family ipv6

undo address-family ipv6

Views

Public instance view

Predefined user roles

network-admin

Examples

Enter IPv6 VPN view of the public instance.

```
<Switch> system-view
[Switch] ip public-instance
[Switch-public-instance] address-family ipv6
[Switch-public-instance-ipv6]
```

1.1.5. address-family l2vpn evpn

Use **address-family l2vpn evpn** to create the BGP EVPN address family and enter its view, or enter the view of the existing BGP EVPN address family.

Use **undo address-family l2vpn evpn** to delete the BGP EVPN address family and all settings in BGP EVPN address family view.

Syntax

address-family l2vpn evpn

undo address-family l2vpn evpn

Default

The BGP EVPN address family does not exist.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

Configuration made in BGP EVPN address family view takes effect only on routes and peers of the BGP EVPN address family that are on the public network.

Examples

Create the BGP EVPN address family and enter its view.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family l2vpn evpn
[Switch-bgp-default-evpn]
```

1.1.6. advertise l2vpn evpn

Use **advertise l2vpn evpn** to enable BGP EVPN route advertisement to the local site.

Use **undo advertise l2vpn evpn** to disable BGP EVPN route advertisement to the local site.

Syntax

advertise l2vpn evpn

undo advertise l2vpn evpn

Default

BGP EVPN route advertisement to the local site is enabled.

Views

BGP-VPN IPv4 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to advertise private BGP EVPN routes to the local site after the device adds the routes to the routing table of a VPN instance.

Examples

Enable BGP EVPN route advertisement to the local site for VPN instance **vpn1**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] ip vpn-instance vpn1
[Switch-bgp-default-vpn1] address-family ipv4
[Switch-bgp-default-ipv4-vpn1] advertise l2vpn evpn
```

1.1.7. arp mac-learning disable

Use **arp mac-learning disable** to disable an EVPN instance from learning MAC addresses from ARP information.

Use **undo arp mac-learning disable** to restore the default.

Syntax

arp mac-learning disable

undo arp mac-learning disable

Default

An EVPN instance learns MAC addresses from ARP information.

Views

EVPN instance view

Predefined user roles

network-admin

Usage guidelines

The MAC information and ARP information advertised by a remote VTEP overlap. To avoid duplication, use this command to disable the learning of MAC addresses from ARP information. EVPN will learn remote MAC addresses only from the MAC information advertised from remote sites.

Examples

Disable an EVPN instance from learning MAC addresses from ARP information.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] arp mac-learning disable
```

1.1.8. arp-advertising disable

Use **arp-advertising disable** to disable ARP information advertisement for a VSI EVPN instance.

Use **undo arp-advertising disable** to restore the default.

Syntax

arp-advertising disable

undo arp-advertising disable

Default

ARP information advertisement is enabled for a VSI EVPN instance.

Views

VSI EVPN instance view

Predefined user roles

network-admin

Usage guidelines

In an EVPN network with distributed gateways, you can disable ARP information advertisement for a VXLAN to save resources if all its user terminals use the same EVPN gateway device. The EVPN instance of the VXLAN will stop advertising ARP information through MAC/IP advertisement routes and withdraw advertised ARP information. When ARP information advertisement is disabled, user terminals in other VXLANs still can communicate with that VXLAN through IP prefix advertisement routes.

Examples

Disable ARP information advertisement for a VSI EVPN instance.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] arp-advertising disable
```

1.1.9. display bgp l2vpn evpn

Use **display bgp l2vpn evpn** to display BGP EVPN routes.

Syntax

display bgp [**instance** *instance-name*] **l2vpn evpn** [**peer** { *ipv4-address* | *ipv6-address* } { **advertised-routes** | **received-routes** } [**statistics**] | [**route-distinguisher** *route-distinguisher* | **route-type** { **auto-discovery** | **es** | **igmp-ls** | **igmp-js** | **imet** | **ip-prefix** | **mac-ip** | **s-pmsi** | **smet** }] * [{ *evpn-route route-length* | *evpn-prefix* } [**advertise-info** | **ext-community**] | { *ipv4-address* | *ipv6-address* | *mac-address* } [**verbose**]] | **statistics**]

Views

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays BGP EVPN routes for the default BGP instance.

peer { *ipv4-address* | *ipv6-address* }: Specifies a peer by its IPv4 address or IPv6 address.

advertised-routes: Specifies the routes advertised to the specified peer.

received-routes: Specifies the routes received from the specified peer.

statistics: Displays BGP EVPN route statistics.

route-distinguisher *route-distinguisher*: Specifies a route distinguisher (RD), a string of 3 to 21 characters. The RD can use one of the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 101:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*. For example, 65536:1. The AS number must be equal to or greater than 65536.

route-type: Specifies a route type.

auto-discovery: Specifies Ethernet auto-discovery routes.

es: Specifies Ethernet segment (ES) routes.

imet: Specifies inclusive multicast Ethernet tag (IMET) routes.

ip-prefix: Specifies IP prefix advertisement routes.

mac-ip: Specifies MAC/IP advertisement routes.

s-pmsi: Specifies Selective Provider Multicast Service Interface (S-PMSI) routes.*evpn-route*: Specifies a BGP EVPN route, a case-insensitive string of 1 to 512 characters.

smet: Specifies selective multicast Ethernet tag (SMET) routes.

route-length: Specifies the route length in bits, in the range of 0 to 65535.

advertise-info: Displays advertisement information for BGP EVPN routes.

ext-community: Specifies the extended community attribute.

verbose: Displays detailed BGP EVPN route information. If you do not specify this keyword, the command displays brief BGP EVPN route information.

Usage guidelines

If you do not specify any parameter, this command displays brief information about all BGP EVPN routes.

Examples

Display brief information about all BGP EVPN routes.

```
<Switch> display bgp l2vpn evpn

BGP local router ID is 8.8.8.8
 Status codes: * - valid, > - best, d - dampened, h - history,

Table 1-1 Command output

Field	Description
Status codes	Route status codes: • *** - valid**—Valid route. • **> - best**—Optimal route. • **d - dampened**—Dampened route. • **h - history**—History route. • **i - internal**—Internal route. • **e - external**—External route. • **s - suppressed**—Suppressed route. • **S - Stale**—Stale route.

Field	Description
Origin	Origin of the route: • **i – IGP**—Originated in the AS. The origin of routes advertised by using the **network** command is **IGP**. • **e – EGP**—Learned through EGP. • **? – incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is **incomplete**.
Network	BGP EVPN route/route length. BGP EVPN routes are as follows: • [1][ESI][EthernetTagID] ○ **1**—Ethernet auto-discovery route. ○ **ESI**—Ethernet segment identifier (ESI). ○ **EthernetTagID**—Ethernet tag ID. • [2][EthernetTagID][MACLength][MAC][IPAddressLength][IPAddress] ○ **2**—MAC/IP advertisement route. ○ **EthernetTagID**—Ethernet tag ID. ○ **MACLength**—MAC address length. ○ **MAC**—MAC address. ○ **IPAddressLength**—IP address length. ○ **IPAddress**—IP address. • [3][EthernetTagID][IPAddressLength][IPAddress] ○ **3**—IMET route. ○ **IPAddressLength**—IP address length. ○ **IPAddress**—IP address of the originating router. • [4][ESI][IPAddressLength][IPAddress] ○ **4**—ES route. ○ **ESI**—ESI. ○ **IPAddressLength**—IP address length. ○ **IPAddress**—IP address of the originating router. • [5][EthernetTagID][IPAddressLength][IPAddress] ○ **5**—IP prefix advertisement route. ○ **EthernetTagID**—Ethernet tag ID. ○ **IPAddressLength**—IP address length. ○ **IPAddress**—IP address of the originating router. • [6][EthernetTagID][Source Len][Source IP][Group Len][Group IP][Originator Len][Originator IP] ○ **6**—Selective multicast Ethernet tag route. ○ **EthernetTagID**—Ethernet tag ID. ○ **Source Len**—Length of the multicast source address. This field displays 0 if the multicast source is any (*, G). ○ **Source IP**—Source IP address of IGMP membership reports. This field is not displayed if the multicast source is any (*, G). ○ **Group Len**—Length of the multicast group address. ○ **Group IP**—Multicast group address of IGMP membership reports. ○ **Originator Len**—Length of the originating router's IP address. ○ **Originator IP**—IP address of the originating router.
NextHop	Next hop IP address.

Field	Description
MED	Multi-Exit Discriminator (MED) attribute.
LocPrf	Local precedence.
OutLabel	Outgoing label.
PrefVal	Preferred value.
Path/Ogn	AS_PATH and ORIGIN attributes of the route.
Ext-Community	Extended community attribute.

Display detailed information about BGP EVPN route [1][00:00:00:00:00:00:00:00:00:00][5]/120 with RD 1.1.1.1:100.

```
<Switch> display bgp l2vpn evpn route-distinguisher 1.1.1.1:100
[1][00:00:00:00:00:00:00:00:00:00][5] 120

```

Table 1-2 Command output

Field	Description
Paths	Number of routes: • **available**—Number of valid routes.

Field	Description
	• **best**—Number of optimal routes.
From	IP address of the BGP peer that advertised the route.
Rely Nexthop	Next hop after route recursion. If no next hop is found, this field displays **not resolved**.
Original nexthop	Original next hop of the route. If the route was obtained from a BGP update message, the original next hop is the next hop IP address in the message.
OutLabel	Outgoing label of the route.
Ext-Community	Extended community attributes: • **RT**. • **Encapsulation Type**. • **ESI Label**.
RxPathID	Add-Path ID value of the received route. This field is not supported by the BGP EVPN address family.
TxPathID	Add-Path ID value of the sent route. This field is not supported by the BGP EVPN address family.
AS-path	AS_PATH attribute of the route. This attribute records the ASs the route has passed and avoids routing loops.
Origin	Origin of the route: • **igp**—Originated in the AS. The origin of routes advertised by using the **network** command is **IGP**. • **egp**—Learned through EGP. • **incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is **incomplete**.
Attribute value	Attributes of the route: • **MED**—MED value for the destination network. • **localpref**—Local preference value. • **pref-val**—Preferred value. • **pre**—Route preference value.
State	Current state of the route: • **valid**. • **internal**. • **external**. • **local**. • **synchronize**. • **best**. • **bgp-rib-only**—The route will not be flushed to the routing table. This field is displayed only in the detailed command output.
IP precedence	IP precedence in the range of 0 to 7. **N/A** indicates that the IP precedence is invalid.
QoS local ID	The current software version does not support this field. QoS local ID in the range of 1 to 4095. **N/A** indicates that the QoS local ID is invalid.
Traffic index	Traffic index in the range of 1 to 64. **N/A** indicates that the traffic index is invalid.

Field	Description
MPLS label	MPLS label. The current software version does not support this field.

Display detailed information about BGP EVPN route [2][5][48][0001-0203-0405][32][4.5.5.5]/136 with RD 1.1.1.1:100.

```
<Switch> display bgp l2vpn evpn route-distinguisher 1.1.1.1:100 [2][5][48][0001-0203-

Table 1-3 Command output

Field	Description
Ext-Community	Extended community attributes: • **RT**. • **Encapsulation Type**. • **Router's Mac**. • **MAC Mobility**—MAC mobility. ○ **Flag**—Indicates whether the MAC address can move. A value of 1 indicates that the MAC address cannot move, and a value of 0 indicates that the MAC address can move. ○ **SeqNum**—Identifies the most recent move of the MAC address. • **Default GateWay**—Route for the default gateway.
State	Current state of the route: • **valid**. • **internal**. • **external**. • **local**. • **synchronize**. • **best**. • **reoriginated**—Reoriginated route. • **remoteredist**—MAC/IP advertisement route generated

Field	Description
	based on a remote route.
MPLS label1	VXLAN ID used for Layer 2 forwarding.
MPLS label2	L3 VXLAN ID used for Layer 3 forwarding.
Re-origination	State of route reorigination: • **Enable**. • **Disable**.

1.1.10. display evpn auto-discovery

Use **display evpn auto-discovery** to display information about IPv4 peers that are automatically discovered through BGP.

Syntax

display evpn auto-discovery { { **imet** | mac-ip } [**peer** *ip-address*] [**vsi** *vsi-name*] | **macip-prefix** [**nexthop** *next-hop*] [**count**] }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

imet: Specifies IPv4 peers discovered through IMET routes.

mac-ip: Specifies IPv4 peers discovered through MAC/IP advertisement routes that do not carry L3 VXLAN IDs.

peer *ip-address*: Specifies a peer by its IPv4 address. If you do not specify this option, the command displays information about all automatically discovered IPv4 peers.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays IPv4 peer information for all VSIs.

macip-prefix: Specifies IPv4 peers discovered through MAC/IP advertisement routes and IP prefix advertisement routes.

nexthop *next-hop*: Specifies a next hop. If you do not specify this option, the command displays IPv4 peer information for all next hops.

count: Displays the number of IPv4 peers. If you do not specify this keyword, the command displays detailed IPv4 peer information.

Examples

Display information about IPv4 peers discovered through IMET routes.

```
<Switch> display evpn auto-discovery imet
Total number of automatically discovered peers: 2

VSI name: vpna
EVPN instance: -
RD                    PE_address      Tunnel_address  Tunnel mode VXLAN ID
1:10                  2.2.2.2         2.2.2.2         VXLAN       10
2:100                 3.3.3.3         3.3.3.3         VXLAN       10
VSI name: vpnb
RD                    PE_address      In/Out label    Tunnel Mode
1:10                  4.4.4.4         1420/1419       PW
```

Table 1-8 Command output

Field	Description
EVPN instance	EVPN instance name. If the EVPN instance is created on a VSI, this field displays a hyphen (-).
PE_address	Identifier of the remote VTEP on the VSI.
Tunnel_address	Tunnel destination IP address.
Tunnel mode	Tunnel mode, which can only be **VXLAN**.
In/Out label	Incoming and outgoing labels for the PW. If the labels are invalid, this field displays a hyphen (-). PWs are not supported in the current software version.

Display information about IPv4 peers discovered through MAC/IP advertisement routes and IP prefix advertisement routes.

```
<Switch> display evpn auto-discovery macip-prefix
Destination IP  Source IP       L3VNI           Tunnel mode OutInterface
1.1.1.1         3.3.3.3         200             VXLAN       Vsi-interface3
2.2.2.2         3.3.3.3         200             VXLAN       Vsi-interface3
```

Display the total number of IPv4 peers discovered through MAC/IP advertisement routes and IP prefix advertisement routes.

```
<Switch> display evpn auto-discovery macip-prefix count
Total number of entries: 2
```

Table 1-9 Command output

Field	Description
Destination IP	Tunnel destination IP address.
Source IP	Tunnel source IP address.
L3VNI	L3 VXLAN ID used for Layer 3 forwarding.
Tunnel mode	VXLAN tunnel mode, which can only be **VXLAN**.
Outinterface	VSI interface associated with the L3 VXLAN ID.

1.1.11. display evpn m-lag synchronized-mac

Use **display evpn m-lag synchronized-mac** to display M-LAG-synchronized MAC address entries.

Syntax

display evpn m-lag synchronized-mac [**vsi** *vsi-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays MAC address entries for all VSIs.

count: Displays the number of MAC address entries that match the command. If you do not specify this keyword, the command displays detailed information about MAC address entries.

Usage guidelines

To ensure VM reachability information consistency in a M-LAG system, M-LAG member devices synchronize MAC address entries and ARP packets with each other through a peer-link. This command displays the synchronized MAC address entries from a M-LAG peer.

Examples

Display all M-LAG -synchronized MAC address entries.

```
<Sysname> display evpn m-lag synchronized-mac
VSI name: bbb
```

```
MAC address           Link ID      Interface
0000-0000-000a        1            BAGG10
0000-0000-0009        0            Tunnel1
```

Display the total number of M-LAG -synchronized MAC address entries.

```
<Sysname> display evpn m-lag synchronized-mac count
Total number of entries: 2
```

Table 1-10 Command output

Field	Description
Link ID	AC's or VXLAN tunnel's link ID on a VSI.
Interface	Outgoing interface name.

1.1.12. display evpn instance vxlan

Use **display evpn instance vxlan** to display EVPN instance information.

Syntax

display evpn instance [**name** *instance-name* | **vsi** *vsi-name*] **vxlan**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *instance-name*: Specifies an EVPN instance by its name, a case-sensitive string of 1 to 31 characters.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify any parameters, this command displays information about all EVPN instances.

Examples

Display information about all EVPN instances.

```
<Switch> display evpn instance vxlan
EVPN instance            : evpn1
  Route distinguisher    : 1:1
  Export VPN targets     : 1:1
  Import VPN targets     : 1:1
  ARP-based MAC learning : Disabled
  ND-based MAC learning  : Disabled
  ARP advertising        : Disabled
  MAC advertising        : Disabled
  VSI binding list:
    VSI name                                VSI tag ID
    vpna                                    3
```

```
    vpnb                                  5

EVPN instance            : - (created on VSI vpnc)
  Route distinguisher    : 1:1
  Export VPN targets     : 1:1
  Import VPN targets     : 1:1
  ARP-based MAC learning : Disabled
  ND-based MAC learning  : Disabled
  ARP advertising        : Disabled
  MAC advertising        : Disabled
```

Table 1-11 Command output

Field	Description
EVPN instance	EVPN instance name in one of the following formats: • *instance-name*—Name of an EVPN instance created in system view. • - (**created on VSI** *vsi-name*)—Name of an EVPN instance created on a VSI.
ARP-based MAC learning	Whether EVPN is enabled to learn MAC addresses from ARP information: • - —**Enabled**. • **Disabled**.
ND-based MAC learning	Whether EVPN is enabled to learn MAC addresses from ND information: • - —**Enabled**. • **Disabled**.
ARP advertising	Whether ARP information advertisement is enabled: • - —**Enabled**. • **Disabled**.
MAC advertising	Whether MAC address advertisement is enabled: • - —**Enabled**. • **Disabled**.
VSI binding list	VSIs bound to the EVPN instance.

1.1.13. display evpn route arp

Use **display evpn route arp** to display EVPN ARP entries.

Syntax

display evpn route arp [**local** | **remote**] [**public-instance** | **vpn-instance** *vpn-instance-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies local ARP entries.

remote: Specifies remote ARP entries.

public-instance: Specifies the public instance.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

count: Displays the number of ARP entries. If you do not specify this keyword, the command displays detailed information about ARP entries.

Usage guidelines

If you do not specify the **local** or **remote** keyword, this command displays both local and remote EVPN ARP entries.

If you do not specify the **public-instance** keyword or the **vpn-instance** *vpn-instance-name* option, this command displays EVPN ARP entries for the public instance and all VPN instances.

Examples

Display all EVPN ARP entries.

```
<Switch> display evpn route arp
Flags: D - Dynamic    B - BGP       L - Local active
       G - Gateway    S - Static    M - Mapping        I - Invalid

# Display the total number of EVPN ARP entries.
<Switch> display evpn route arp count
Total number of entries: 8
```

Table 1-12 Command output

Field	Description
Interface	VSI interface.
Flags	ARP entry type: • **D**—The entry is dynamically learned. • **B**—The entry is learned from BGP EVPN routes. • **L**—The local entry is active. If this flag is not set and the B flag is set, the entry learned from BGP EVPN routes is active.

Field	Description
	• **G**—The entry for the gateway is active. • **S**—The static entry is active. This entry type is not supported in the current software version. • **M**—The entry from a remote VXLAN mapped to a local VXLAN is active. This entry type is not supported in the current software version. • **I**—The entry is invalid.Possible reasons: ○ The VSI has been administratively shut down by using the **shutdown** command. ○ The outgoing tunnel interface does not exist.

1.1.14. display evpn route arp suppression

Use **display evpn route arp suppression** to display EVPN ARP flood suppression entries.

Syntax

display evpn route arp suppression [**local** | **remote**] [**vsi** *vsi-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies local ARP flood suppression entries.

remote: Specifies remote ARP flood suppression entries.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays ARP flood suppression entries for all VSIs.

count: Displays the number of ARP flood suppression entries. If you do not specify this keyword, the command displays detailed information about ARP flood suppression entries.

Usage guidelines

If you do not specify the **local** or **remote** keyword, this command displays both local and remote EVPN ARP flood suppression entries.

Examples

Display all EVPN ARP flood suppression entries.

```
<Switch> display evpn route arp suppression
Flags: D - Dynamic   B - BGP      L - Local active
       G - Gateway   S - Static   M - Mapping

VSI name: vpna
EVPN instance: -
IP address      MAC address       Flags           Encap
10.1.1.12       0002-0002-0002    B               VXLAN
10.1.1.13       0002-0002-0002    BI              VXLAN
```

```
10.1.1.101      0001-0011-0101    BS              VXLAN
10.1.1.102      0001-0011-0102    DL              VXLAN
```

Display the total number of ARP flood suppression entries.

```
<Switch> display evpn route arp suppression count
Total number of entries: 4
```

Table 1-13 Command output

Field	Description
EVPN instance	EVPN instance name. If the EVPN instance is created on a VSI, this field displays a hyphen (**-**).
Flags	ARP flood suppression entry type: • **D**—The entry is dynamically learned. • **B**—The entry is learned from BGP EVPN routes. • **L**—The local entry is active. If this flag is not set and the B flag is set, the entry learned from BGP EVPN routes is active. • **G**—The entry for the gateway is active. • **S**—The static entry is active. This entry type is not supported in the current software version. • **M**—The entry from a remote VXLAN mapped to a local VXLAN is active. This entry type is not supported in the current software version.
Encap	Packet encapsulation type, which can only be **VXLAN**.

1.1.15. display evpn route arp-mobility

Use **display evpn route arp-mobility** to display EVPN ARP mobility information.

Syntax

display evpn route arp-mobility [**public-instance** | **vpn-instance** *vpn-instance-name*] [**ip** *ip-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

public-instance: Specifies the public instance.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

ip *ip-address*: Specifies an IPv4 address in dotted decimal notation. If you do not specify an IP address, this command displays ARP mobility information about all IP addresses of the public instance or MPLS L3VPN instance.

Usage guidelines

If you do not specify any parameters, this command displays ARP mobility information about the public instance and all VPN instances.

Examples

Display EVPN ARP mobility information about the public instance and all VPN instances.

```
<Switch> display evpn route arp-mobility
Flags: S - Suppressed, N - Not suppressed
  Suppression threshold: 5
  Detection cycle      : 180s

VPN instance : vpn1
Interface    : Vsi-interface1
  IP address      Seq number Moved from               Flags Suppressed at
  192.168.156.120 5          GE1/0/1                  S     17:24:33 2018/04/01
  192.168.56.20   -          -                        N     -

Public instance
Interface    : Vsi-interface2
  IP address      Seq number Moved from               Flags Suppressed at
  192.168.156.120 5          GE1/0/2                  S     17:24:33 2018/04/01
  192.168.56.20   5          2.2.2.2                  S     17:24:33 2018/04/01
```

Table 1-14 Command output

Field	Description
Suppression threshold	ARP mobility suppression threshold, which is the number of ARP moves from the local site to a remote site.
Detection cycle	ARP mobility detection cycle in seconds.
Seq number	ARP move sequence number.
Moved from	Source interface or source VTEP IP address for the ARP move.
Flags	Whether the ARP move was suppressed: • **S**—Suppressed. • **N**—Not suppressed.
Suppressed at	Time when the ARP move was suppressed.

Related commands

evpn route arp-mobility suppression

1.1.16. display evpn route smet

Use **display evpn route smet** to display EVPN multicast routes.

Syntax

display evpn route smet [**local** | **remote**] [**vsi** *vsi-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

smet: Specifies SMET routes.

local: Specifies local multicast routes.

remote: Specifies remote multicast routes.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays multicast routes for all VSIs.

count: Displays the number of multicast routes. If you do not specify this keyword, the command displays detailed information about multicast routes.

Usage guidelines

If you do not specify the **local** or **remote** keyword, this command displays both local and remote multicast routes.

Examples

Display all SMET routes.

```
<Sysname> display evpn route smet
VSI name: bbb
  Source address  : 192.164.1.1
  Group address   : 226.1.1.1
  Local version   : v3(I)
  Peers :
    Nexthop          Tunnel name     Link ID    Remote version
    1.1.1.1          Tunnel0         0x5000000  v3(E)
  ACs   :
    AC                               Link ID    Flags
    GE1/0/1 srv1                     0          Sync
```

Table 1 Command output

Field	Description
Source address	Multicast source IP address.
Group address	Multicast group IP address.
Local version	Local IGMP version. IGMPv3 includes the v3(I) and v3(E) subversions.
Peers	Remote peers in SMET routes.
Nexthop	Remote VTEP IP address.
Tunnel name	Remote tunnel interface name.
Link ID	Link ID of the VXLAN tunnel.
Remote version	Remote IGMP version. IGMPv3 includes the v3(I) and v3(E) subversions.
ACs	Local ACs.
AC	AC name. This field displays a Layer 3 interface name or a Layer 2 interface name and an Ethernet service instance name.

Field	Description
Link ID	The AC's link ID.
Flags	Flags: • **Local**—Local AC. • **Sync**—AC synchronized from another VTEP.

1.1.17. display evpn route mac

Use **display evpn route mac** to display IPv4 EVPN MAC address entries.

Syntax

display evpn route mac [**local** | **remote**] [**vsi** *vsi-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies local MAC address entries.

remote: Specifies remote MAC address entries.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays MAC address entries for all VSIs.

count: Displays the number of MAC address entries. If you do not specify this keyword, the command displays detailed information about MAC address entries.

Usage guidelines

If you do not specify the **local** or **remote** keyword, this command displays both local and remote IPv4 EVPN MAC address entries.

Examples

Display all IPv4 EVPN MAC address entries.

```
<Switch> display evpn route mac
Flags: D - Dynamic   B - BGP      L - Local active
       G - Gateway   S - Static   M - Mapping        I - Invalid

VSI name: bbb
EVPN instance: -
MAC address     Link ID/Name   Flags   Encap           Next hop
0000-0000-000a  1              DL      VXLAN           -
0000-0000-0009  Tunnel1        B       VXLAN           2.2.2.2
0001-2000-4000  -              BI      VXLAN           3.3.3.3
```

Display the total number of IPv4 EVPN MAC address entries.

```
<Switch> display evpn route mac count
Total number of entries: 3
```

Table 1-15 Command output

Field	Description
EVPN instance	EVPN instance name. If the EVPN instance is created on a VSI, this field displays a hyphen (**-**).
Link ID/Name	For a local MAC address, this field displays the AC's link ID on the VSI. For a remote MAC address, this field displays the tunnel interface name.
Flags	MAC address entry type: • **D**—The entry is dynamically learned. • **B**—The entry is learned from BGP EVPN routes. • **L**—The local entry is active. If this flag is not set and the B flag is set, the entry learned from BGP EVPN routes is active. • **G**—The entry for the gateway is active. • **S**—The static entry is active. This entry type is not supported in the current software version. • **M**—The entry from a remote VXLAN mapped to a local VXLAN is active. This entry type is not supported in the current software version. • **I**—The entry is invalid.Possible reasons: ○ The VSI has been administratively shut down by using the **shutdown** command. ○ The outgoing tunnel interface does not exist.
Encap	Packet encapsulation type, which can only be **VXLAN**.
Next hop	IP address of the remote VTEP. If the MAC address entry is a local entry, a hyphen (**-**) is displayed.

1.1.18. display evpn route mac-mobility

Use **display evpn route mac-mobility** to display EVPN MAC mobility information.

Syntax

display evpn [**ipv6**] **route mac-mobility** [**vsi** *vsi-name*] [**mac-address** *mac-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6: Specifies IPv6 EVPN MAC mobility information. If you do not specify this keyword, the command displays IPv4 EVPN MAC mobility information.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays MAC mobility information about all VSIs.

mac-address *mac-address*: Specifies a MAC address in the format of H-H-H. You can omit the consecutive zeros at the beginning of each segment. For example, you can enter f-e2-1 for 000f-

00e2-0001. If you do not specify a MAC address, this command displays MAC mobility information about all MAC addresses in the specified VSI or all VSIs.

Usage guidelines

If you do not specify any parameters, this command displays IPv4 EVPN MAC mobility information about all VSIs.

Examples

Display IPv4 EVPN MAC mobility information about all VSIs.

```
<Switch> display evpn route mac-mobility
Flags: S - Suppressed, N - Not suppressed
  Suppression threshold: 5
  Detection cycle      : 180s

VSI name      : vpnb
EVPN instance : -
  MAC address          : 1000-1000-1001
  Sequence number      : 5
  Moved from           : 1::1
  Flags                : S
  Suppressed at        : 15:30:30 2018/03/30
```

Table 1-16 Command output

Field	Description
Suppression threshold	MAC mobility suppression threshold, which is the number of MAC moves from the local site to a remote site.
Detection cycle	MAC mobility detection cycle in seconds.
EVPN instance	EVPN instance name. If the EVPN instance is created on a VSI, this field displays a hyphen (-).
Seq number/Sequence number	MAC move sequence number.
Moved from	Source interface or source VTEP IP address for the MAC move.
Flags	Whether the MAC move was suppressed: • **S**—Suppressed. • **N**—Not suppressed.
Suppressed at	Time when the MAC move was suppressed.

Related commands

evpn route mac-mobility suppression

1.1.19. display evpn route nd

Use **display evpn route nd** to display EVPN ND entries.

Syntax

display evpn route nd [**local** | **remote**] [**public-instance** | **vpn-instance** *vpn-instance-name*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

local: Specifies local ND entries.

remote: Specifies remote ND entries.

public-instance: Specifies the public instance.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

count: Displays the number of ND entries. If you do not specify this keyword, the command displays detailed information about ND entries.

Usage guidelines

If you do not specify the **local** or **remote** keyword, this command displays both local and remote EVPN ND entries.

If you do not specify the **public-instance** keyword or the **vpn-instance** *vpn-instance-name* option, this command displays EVPN ND entries for the public instance and all VPN instances.

Examples

Display all EVPN ND entries.

```
<Switch> display evpn route nd
Flags: D - Dynamic   B - BGP      L - Local active
       G - Gateway   S - Static   M - Mapping

VPN instance: vpn1                          Interface: Vsi-interface1
IPv6 address :   AD80:0300:1000:0050:0200:0300:0100:0012
MAC address  :   0001-0001-0001       Router MAC    :   a0ce-7e40-0400
VSI index    :   0                    Flags         :   GL

IPv6 address :   AD10:0300:1000:0020:0200:0300:0100:0022
MAC address  :   0001-0001-0002       Router MAC    :   a0ce-7e40-0411
VSI index    :   0                    Flags         :   GL

Public instance                             Interface: Vsi-interface1
IPv6 address :   BC80:0300:1000:0050:0200:0300:0100:0033
MAC address  :   0002-0002-0001       Router MAC    :   a0ce-7e40-0422
VSI index    :   0                    Flags         :   GL

IPv6 address :   BC10:0300:1000:0020:0200:0300:0100:0034
MAC address  :   0002-0002-0002       Router MAC    :   a0ce-7e40-0433
VSI index    :   0                    Flags         :   GL
```

Display the total number of EVPN ND entries.

```
<Switch>display evpn route nd count
Total number of entries: 2
```

Table 1-17 Command output

Field	Description
Interface	VSI interface.
Flags	ND entry type: • **D**—The entry is dynamically learned. • **B**—The entry is learned from BGP EVPN routes. • **L**—The local entry is active. If this flag is not set and the B flag is set, the entry learned from BGP EVPN routes is active. • **G**—The entry for the gateway is active. • **S**—The static entry is active. This type is not supported in the current software version. • **M**—The entry from a remote VXLAN mapped to a local VXLAN is active. This type is not supported in the current software version.

1.1.20. display evpn routing-table

Use **display evpn routing-table** to display the EVPN routing table for a VPN instance.

Syntax

display evpn routing-table [**ipv6**] { **public-instance** | **vpn-instance** *vpn-instance-name* } [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6: Specifies IPv6 information. If you do not specify this keyword, the command displays IPv4 information.

public-instance: Specifies the public instance.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

count: Displays the number of entries in the routing table. If you do not specify this keyword, the command displays detailed information about the routing table.

Examples

Display the EVPN IPv4 routing table for VPN instance **vpn1**.

```
<Switch> display evpn routing-table vpn-instance vpn1

VPN instance name: vpn1                              Local L3VNI: 7
IP address          Nexthop            Outgoing interface       NibID
10.1.1.11           1.1.1.1            Vsi-interface3           0x18000000
10.1.1.12           2.2.2.2            Vsi-interface3           0x18000001
```

Display the EVPN IPv4 routing table for the public instance.

```
<Switch> display evpn routing-table public-instance

Public instance                                      Local L3VNI: 3900
IP address          Nexthop            Outgoing interface       NibID
10.1.1.11           1.1.1.1            Vsi-interface3           0x18000000
10.1.1.12           2.2.2.2            Vsi-interface3           0x18000001
```

Display the number of EVPN route entries in the IPv4 routing table for VPN instance **vpn1**.

```
<Switch> display evpn routing-table vpn-instance vpn1 count
Total number of entries: 2
```

Display the EVPN IPv6 routing table for VPN instance **vpna**.

```
<Switch> display evpn routing-table ipv6 vpn-instance vpna

VPN instance: vpna                                   Local L3VNI: 7
IPv6 address        :      BC10:0300:1000:0020:0200:0300:0100:0034
Next hop            :      1.1.1.1
Outgoing interface  :      Vsi-interface3
NibID               :      0x18000000

IPv6 address        :      BC10:0300:1000:0020:0200:0300:0100:0035
```

```
Next hop            :       2.2.2.2
Outgoing interface  :       Vsi-interface3
NibID               :       0x18000001
```

Table 1-18 Command output

Field	Description
Local L3VNI	L3 VXLAN ID associated with the VPN instance or the public instance.
NibID	Next hop ID.

1.1.21. evpn m-lag group

Use **evpn m-lag group** to enable EVPN M-LAG and specify the virtual VTEP address.

Use **undo evpn m-lag group** to restore the default.

Syntax

evpn m-lag group *virtual-vtep-ip*

undo evpn m-lag group

Default

EVPN M-LAG is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

virtual-vtep-ip: Specifies the virtual VTEP address.

Usage guidelines

EVPN M-LAG virtualizes two VTEPs or EVPN gateways into one M-LAG system to avoid single points of failure. The VTEPs or EVPN gateways use a virtual VTEP address to establish VXLAN tunnels to remote devices.

For the device to re-establish VXLAN tunnels, you must execute the **address-family l2vpn evpn** command in BGP instance view after you enable or disable EVPN M-LAG.

To modify the virtual VTEP address, you must first delete the original virtual VTEP address.

Examples

Enable EVPN M-LAG and specify the virtual VTEP address as 1.1.1.1.

```
<Sysname> system-view
[Sysname] evpn m-lag group 1.1.1.1
```

1.1.22. evpn m-lag local

Use **evpn m-lag local** to specify the IP addresses of the VTEPs in a M-LAG system.

Use **undo evpn m-lag local** to restore the default.

Syntax

evpn m-lag local *local-ip* **remote** *remote-ip*

undo evpn m-lag local

Default

The IP addresses of the VTEPs in a M-LAG system are not specified.

Views

System view

Predefined user roles

network-admin

Parameters

local *local-ip*: Specifies the IP address of the local VTEP.

remote *remote-ip*: Specifies the IP address of the peer VTEP.

Usage guidelines

An AC that is attached to only one of the VTEPs in a M-LAG system is called a single-armed AC. After you configure this command, each VTEP in a M-LAG system changes the next hop of the routes for single-armed ACs to its local VTEP IP address when advertising the routes. This ensures that the traffic of a single-armed AC is forwarded to its attached VTEP. When a VTEP receives BGP EVPN routes from the peer VTEP IP address specified by using this command, it does not set up a VXLAN tunnel to the peer VTEP.

You must execute this command if single-armed ACs are attached to a M-LAG system that uses an Ethernet aggregate link as the peer-link. You do not need to execute this command on a M-LAG system that uses a VXLAN tunnel as the peer-link. In such a M-LAG system, a VTEP uses the source IP address of the peer-link as the next hop of routes for single-armed ACs to ensure correct traffic forwarding.

When you execute this command, make sure the IP address of the local VTEP belongs to a local interface. Make sure the local VTEP IP address and peer VTEP IP address are reversed on the VTEPs in a M-LAG system.

Examples

Specify the IP addresses of the local and peer VTEPs in the M-LAG system as 2.2.2.2 and 3.3.3.3, respectively.

```
<Sysname> system-view
[Sysname] evpn m-lag local 2.2.2.2 remote 3.3.3.3
```

1.1.23. evpn encapsulation

Use **evpn encapsulation** to create an EVPN instance on a VSI and enter its view, or enter the view of the existing EVPN instance on a VSI.

Use **undo evpn encapsulation** to restore the default.

Syntax

evpn encapsulation vxlan

undo evpn encapsulation

Default

No EVPN instance exists.

Views

VSI view

Predefined user roles

network-admin

Parameters

vxlan: Specifies VXLAN encapsulation.

Usage guidelines

Before you can configure EVPN settings, you must create an EVPN instance.

Examples

Create an EVPN instance on VSI **aaa** and enter its view.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan]
```

1.1.24. evpn global-mac

Use **evpn global-mac** to configure the EVPN global MAC address.

Use **undo evpn global-mac** to restore the default.

Syntax

evpn global-mac *mac-address*

undo evpn global-mac

Default

No EVPN global MAC address is configured.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in H-H-H format. Do not specify a multicast MAC address, broadcast MAC address, or all-zeros MAC address.

Usage guidelines

The EVPN global MAC address is used only by VSI interfaces associated with an L3 VXLAN ID.

For a VSI interface associated with an L3 VXLAN ID, the MAC address assigned to it by using the **mac-address** command takes precedence over the EVPN global MAC address.

Examples

Configure the EVPN global MAC address as **0001-0001-0001**.

```
<Sysname> system-view
[Sysname] evpn global-mac 1-1-1
```

1.1.25. evpn route arp-mobility suppression

Use **evpn route arp-mobility suppression** to enable ARP mobility event suppression.

Use **undo evpn route arp-mobility suppression** to disable ARP mobility event suppression.

Syntax

evpn route arp-mobility suppression

undo evpn route arp-mobility suppression

Default

ARP mobility event suppression is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

On an EVPN VXLAN network, misconfiguration of IP addresses might cause two sites to contain the same IP address. In this condition, VTEPs at the two sites constantly synchronize and update EVPN ARP entries and determine that ARP mobility events occur. As a result, an inter-site loop might occur, and the bandwidth is occupied by ARP entry synchronization traffic. To eliminate loops and suppress those ARP mobility events, enable ARP mobility event suppression on the VTEPs. This feature allows an IP address to move at most four times from a site within 180 seconds. If an IP address moves more than four times within 180 seconds, the VTEP at the site will suppress the excess ARP mobility events and will not advertise ARP information for the IP address.

After you execute the **undo evpn route arp-mobility suppression** command, a VTEP acts as follows:

- Advertises ARP information immediately for the suppressed ARP entries that have not aged out.
- Relearns ARP information for the suppressed ARP entries that have aged out and advertises the ARP information.

ARP mobility event suppression takes effect only on the following networks:

- EVPN VXLAN network enabled with ARP flood suppression.
- EVPN VXLAN network configured with distributed VXLAN IP gateways.

Examples

Enable ARP mobility event suppression.

```
<Switch> system-view
[Switch] evpn route arp-mobility suppression
```

Related commands

display evpn route arp-mobility

1.1.26. evpn route mac-mobility suppression

Use **evpn route mac-mobility suppression** to enable MAC mobility event suppression.

Use **undo evpn route mac-mobility suppression** to disable MAC mobility event suppression.

Syntax

evpn route mac-mobility suppression

undo evpn route mac-mobility suppression

Default

MAC mobility event suppression is disabled.

Views

System view

Usage guidelines

On an EVPN VXLAN network, misconfiguration of MAC addresses might cause two sites to contain the same MAC address. In this condition, VTEPs at the two sites constantly synchronize and update EVPN MAC entries and determine that MAC mobility events occur. As a result, an inter-site loop might occur, and the bandwidth is occupied by MAC entry synchronization traffic. To eliminate loops and suppress those MAC mobility events, enable MAC mobility event suppression on the VTEPs. This feature allows an IP address to move at most four times from a site within 180 seconds. If an IP address moves more than four times within 180 seconds, the VTEP at the site will suppress the excess MAC mobility events and will not advertise information about the MAC address.

After you execute the **undo evpn route mac-mobility suppression** command, a VTEP acts as follows:

- Advertises MAC address entries immediately for the suppressed MAC address entries that have not aged out.
- Relearns the MAC addresses for the suppressed MAC address entries that have aged out and advertises the MAC address entries.

Examples

Enable MAC mobility event suppression.

```
<Switch> system-view
[Switch] evpn route mac-mobility suppression
```

Related commands

display evpn route mac-mobility

1.1.27. export route-policy

Use **export route-policy** to apply an export routing policy to EVPN on a VPN instance.

Use **undo export route-policy** to restore the default.

Syntax

export route-policy *route-policy*

undo export route-policy

Default

No export routing policy is applied to EVPN on a VPN instance.

Views

VPN instance EVPN view

Predefined user roles

network-admin

Parameters

route-policy: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify an export routing policy to filter advertised routes or modify their route attributes for EVPN.

If you execute this command multiple times, the most recent configuration takes effect.

EVPN can use an export routing policy specified in VPN instance view or in VPN instance EVPN view. Export routing policy configuration in VPN instance EVPN view takes precedence over that in VPN instance view.

Examples

Apply export routing policy **poly-1** to EVPN on VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] address-family evpn
[Switch-vpn-evpn-vpn1] export route-policy poly-1
```

Related commands

route-policy (*Layer 3—IP Routing Command Reference*)

1.1.28. import evpn mac-ip

Use **import evpn mac-ip** to enable the device to redistribute received MAC/IP advertisement routes that contain ARP or ND information into a BGP unicast routing table.

Use **undo import evpn mac-ip** to disable the device from redistributing received MAC/IP advertisement routes that contain ARP or ND information into a BGP unicast routing table.

Syntax

import evpn mac-ip

undo import evpn mac-ip

Default

MAC/IP advertisement routes that contain ARP or ND information are not redistributed into any BGP unicast routing table.

Views

BGP IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Usage guidelines

This command enables the device to redistribute received MAC/IP advertisement routes that contain ARP or ND information into a BGP unicast routing table.

- If you use this command in BGP IPv4 or IPv6 unicast address family view, the device will redistribute the routes into the BGP IPv4 or IPv6 unicast routing table. In addition, the device will advertise the routes to the local site.
- If you use this command in BGP-VPN IPv4 or IPv6 unicast address family view, the device will redistribute the routes into the BGP-VPN IPv4 or IPv6 unicast routing table of the corresponding VPN instance. To advertise the routes to the local site, you must configure the **advertise l2vpn evpn** command.

Examples

Redistribute received MAC/IP advertisement routes into the BGP-VPN IPv4 unicast routing table of VPN instance **vpna**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] ip vpn-instance vpna
[Switch-bgp-default-vpna] address-family ipv4
[Switch-bgp-default-ipv4-vpna] import evpn mac-ip
```

Related commands

advertise l2vpn evpn

1.1.29. import route-policy

Use **import route-policy** to apply an import routing policy to EVPN on a VPN instance.

Use **undo import route-policy** to restore the default.

Syntax

import route-policy *route-policy*

undo import route-policy

Default

No import routing policy is applied to EVPN on a VPN instance. The VPN instance accepts a route when the export route targets of the route match local import route targets.

Views

VPN instance EVPN view

Predefined user roles

network-admin

Parameters

route-policy: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify an import routing policy to filter received routes or modify their route attributes for EVPN.

If you execute this command multiple times, the most recent configuration takes effect.

EVPN can use an import routing policy specified in VPN instance view or in VPN instance EVPN view. Import routing policy configuration in VPN instance EVPN view takes precedence over that in VPN instance view.

Examples

Apply import routing policy **poly-1** to EVPN on VPN instance **vpn1**.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] address-family evpn
[Switch-vpn-evpn-vpn1] import route-policy poly-1
```

Related commands

route-policy (*Layer 3—IP Routing Command Reference*)

1.1.30. ip forwarding-conversational-learning

Use **ip forwarding-conversational-learning** to enable conversational learning for host route FIB entries.

Use **undo ip forwarding-conversational-learning** to disable conversational learning for host route FIB entries.

Syntax

ip forwarding-conversational-learning [**aging** *aging-time*]

undo ip forwarding-conversational-learning

Default

Conversational learning is disabled for host route FIB entries.

Views

System view

Predefined user roles

network-admin

Parameters

aging *aging-time*: Specifies an aging timer in minutes for host route FIB entries, in the range of 60 to 1440. The default value is 60.

Usage guidelines

Use this command only on an EVPN network.

By default, the device issues a host route FIB entry to the hardware after the entry is generated. This feature enables the device to issue a host route FIB entry to the hardware only when the entry is required for packet forwarding. This feature saves hardware resources on the device.

Set an appropriate aging timer for host route FIB entries according to your network. A much longer or shorter aging timer will degrade the device performance.

- If the aging timer is too long, the device will save many outdated host route FIB entries and fail to accommodate the most recent network changes. These entries cannot be used for correct packet forwarding and exhaust FIB resources.
- If the aging timer is too short, the device will delete the valid host route FIB entries that can still be effective for packet forwarding. As a result, FIB entry flapping will occur, and the device performance will be affected.

1.1.31. ip-prefix-route generate disable

Use **ip-prefix-route generate disable** to disable generation of IP prefix advertisement routes for the subnets of a VSI interface.

Use **undo ip-prefix-route generate disable** to enable generation of IP prefix advertisement routes for the subnets of a VSI interface.

Syntax

ip-prefix-route generate disable

undo ip-prefix-route generate disable

Default

The device only generates MAC/IP advertisement routes for a VSI interface that provides centralized VXLAN IP gateway service. The device generates IP prefix advertisement routes for the subnets of a VSI interface that provides distributed VXLAN IP gateway service.

Views

VSI interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on a VSI interface that provides distributed VXLAN IP gateway service (configured by using the **distributed-gateway local** command). It does not take effect on VSI interfaces that provide centralized VXLAN IP gateway service.

Examples

Disable generation of IP prefix advertisement routes for the subnets of VSI-interface 1.

```
<Switch> system-view
[Switch] interface vsi-interface 1
[Switch-Vsi-interface1] ip-prefix-route generate disable
```

1.1.32. l2vpn m-lag peer-link ac-match-rule vxlan-mapping

Use **l2vpn m-lag peer-link ac-match-rule vxlan-mapping** to enable the device to create frame match criteria based on VXLAN IDs for the dynamic ACs on the Ethernet aggregate link peer-link.

Use **undo l2vpn m-lag peer-link ac-match-rule vxlan-mapping** to restore the default.

Syntax

l2vpn m-lag peer-link ac-match-rule vxlan-mapping

undo l2vpn m-lag peer-link ac-match-rule vxlan-mapping

Default

On a M-LAG system that uses an Ethernet aggregate link as the peer-link, dynamic ACs on the peer-link use frame match criteria that are identical to those of site-facing ACs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, if a M-LAG system uses an Ethernet aggregate link as the peer-link, each M-LAG member device creates a dynamic AC on the peer-link when an AC is configured on a site-facing interface. The dynamic AC and the site-facing AC have the same frame match criteria and VSI mapping. If two site-facing ACs on different interfaces have the same frame match criteria but different VSI mappings, the dynamic ACs created for the site-facing ACs will conflict with each other. To prevent this issue, enable the M-LAG member devices to create frame match criteria based on VXLAN IDs for the dynamic ACs on the peer-link.

With this command configured, a M-LAG member device creates dynamic ACs on the peer-link and maps them to the VSIs of VXLANs after the VXLANs are created. The matching VLAN IDs in frame match criteria are calculated for the dynamic ACs according to the following rules:

- Outer VLAN ID = VXLAN ID / 4094 + 1.
- Inner VLAN ID = VXLAN ID % 4094 + 1.
- If the calculated outer VLAN ID of a dynamic AC is the PVID of the peer-link interface, the device uses the calculated inner VLAN ID as the outer VLAN ID. The device does not add a matching inner VLAN ID to the frame match criterion of the dynamic AC.

After you execute this command, do not create VXLANs with IDs larger than 16000000.

This command deletes existing dynamic ACs from peer-link interface and takes effect on all VXLANs.

Examples

Enable the device to create frame match criteria based on VXLAN IDs for the dynamic ACs on the Ethernet aggregate link peer-link.

```
<Sysname> system-view
[Sysname] l2vpn m-lag peer-link ac-match-rule vxlan-mapping
```

1.1.33. l2vpn statistics vsi l3-vni

Use **l2vpn statistics vsi l3-vni** to enable traffic statistics for the VSIs that are automatically created for L3 VXLAN IDs.

Use **undo l2vpn l3-vni vsi statistics** to disable traffic statistics for the VSIs that are automatically created for L3 VXLAN IDs.

Syntax

l2vpn statistics vsi l3-vni

undo l2vpn statistics vsi l3-vni

Default

The traffic statistics feature is disabled for the VSIs that are automatically created for L3 VXLAN IDs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If you configure an L3 VXLAN ID on a distributed EVPN gateway, the gateway automatically creates a VSI for the L3 VXLAN ID. You cannot enter the view of such a VSI to configure settings on it.

This command enables the device to collect incoming and outgoing traffic statistics for the automatically created VSIs. You can use the **display l2vpn vsi verbose** command to view the traffic statistics and use the **reset l2vpn statistics vsi** command to clear the traffic statistics.

Examples

Enable traffic statistics for the VSIs that are automatically created for L3 VXLAN IDs.

```
<Sysname> system-view
[Sysname] l2vpn statistics vsi l3-vni
```

Related commands

display l2vpn vsi verbose (*VXLAN Command Reference*)

reset l2vpn statistics vsi (*VXLAN Command Reference*)

1.1.34. l3-vni

Use **l3-vni** to configure an L3 VXLAN ID for a VSI interface or for the public instance.

Use **undo l3-vni** to remove the L3 VXLAN ID for a VSI interface or for the public instance.

Syntax

l3-vni *vxlan-id*

undo l3-vni

Default

No L3 VXLAN ID is configured for a VSI interface or for the public instance.

Views

VSI interface view

Public instance view

Predefined user roles

network-admin

Parameters

vxlan-id: Specifies a VXLAN ID. The value range for this argument is 0 to 16777215.

Usage guidelines

On distributed EVPN gateways, you must configure L3 VXLAN IDs for the gateways to differentiate traffic of different VPN instances.

To forward Layer 3 traffic of a VPN instance, you must assign an L3 VXLAN ID to the VSI interface of the VPN instance. To forward Layer 3 traffic of the public network, you must assign the same L3 VXLAN ID to the public instance and the VSI interface of the public instance.

To modify the L3 VXLAN ID for the public instance, you must first delete the original L3 VXLAN ID.

The L3 VXLAN ID specified by using this command cannot be the same as any VXLAN ID specified by using the **mapping vni** command.

Examples

Configure the L3 VXLAN ID as 1000 for VSI-interface 100.

```
<Switch> system-view
[Switch] interface vsi-interface 100
[Switch-Vsi-interface100] l3-vni 1000
```

1.1.35. mac-advertising disable

Use **mac-advertising disable** to disable MAC address advertisement and withdraw advertised MAC addresses.

Use **undo mac-advertising disable** to restore the default.

Syntax

mac-advertising disable

undo mac-advertising disable

Default

MAC address advertisement is enabled.

Views

VSI EVPN instance view

Predefined user roles

network-admin

Usage guidelines

The MAC information and ARP information advertised by the VTEP overlap. To avoid duplication, use this command to disable MAC address advertisement and withdraw the MAC addresses advertised to remote VTEPs.

Examples

Disable MAC address advertisement and withdraw advertised MAC addresses for a VSI EVPN instance.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] mac-advertising disable
```

1.1.36. nd mac-learning disable

Use **nd mac-learning disable** to disable an EVPN instance from learning MAC addresses from ND information.

Use **undo nd mac-learning disable** to restore the default.

Syntax

nd mac-learning disable

undo nd mac-learning disable

Default

An EVPN instance learns MAC addresses from ND information.

Views

EVPN instance view

Predefined user roles

network-admin

Usage guidelines

The MAC information and ND information advertised by a remote VTEP overlap. To avoid duplication, use this command to disable the learning of MAC addresses from ND information. EVPN will learn remote MAC addresses only from the MAC information advertised from remote sites.

Examples

Disable an EVPN instance from learning MAC addresses from ND information.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] nd mac-learning disable
```

1.1.37. policy vpn-target

Use **policy vpn-target** to enable route target filtering for BGP EVPN routes.

Use **undo policy vpn-target** to disable route target filtering for BGP EVPN routes.

Syntax

policy vpn-target

undo policy vpn-target

Default

Route target filtering is enabled for BGP EVPN routes.

Views

BGP EVPN address family view

Predefined user roles

network-admin

Usage guidelines

When route target filtering is enabled for BGP EVPN routes, the EVPN routing table accepts only BGP EVPN routes of which the export route targets match the local import route targets. If the device must save all BGP EVPN routes, use the **undo policy vpn-target** command to disable route target filtering for BGP EVPN routes.

Examples

Disable route target filtering for BGP EVPN routes.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family l2vpn evpn
[Switch-bgp-default-evpn] undo policy vpn-target
```

1.1.38. route-distinguisher (EVPN instance view)

Use **route-distinguisher** to configure an RD for an EVPN instance.

Use **undo route-distinguisher** to restore the default.

Syntax

route-distinguisher { *route-distinguisher* | **auto** }

undo route-distinguisher

Default

No RD is configured for an EVPN instance.

Views

EVPN instance view

Predefined user roles

network-admin

Parameters

route-distinguisher: Specifies an RD, a string of 3 to 21 characters. The RD cannot be all zeros and can use one of the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 101:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*. For example, 65536:1. The AS number must be equal to or greater than 65536.

auto: Automatically generates an RD in the *N:VXLAN ID* format. The initial value of *N* is 1. If *N:VXLAN ID* is already in use, the system increases the value of *N* by 1 until the RD is available.

Usage guidelines

EVPN uses MP-BGP to advertise BGP EVPN routes for automatic VTEP discovery, MAC reachability information advertisement, and host route advertisement. MP-BGP uses the RD to differentiate BGP EVPN routes of different EVPN instances.

Examples

Configure 22:1 as the RD of an EVPN instance.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] route-distinguisher 22:1
```

1.1.39. route-distinguisher (public instance view)

Use **route-distinguisher** to configure an RD for the public instance.

Use **undo route-distinguisher** to restore the default.

Syntax

route-distinguisher *route-distinguisher*

undo route-distinguisher

Default

No RD is configured for the public instance.

Views

Public instance view

Predefined user roles

network-admin

Parameters

route-distinguisher: Specifies an RD, a string of 3 to 21 characters. The RD can use one of the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 101:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*. For example, 65536:1. The AS number must be equal to or greater than 65536.

Usage guidelines

To modify the RD of the public instance, first execute the **undo route-distinguisher** command to remove the original RD.

Examples

Configure 22:1 as the RD of the public instance.

```
<Switch> system-view
[Switch] ip public-instance
[Switch-public-instance] route-distinguisher 22:1
```

1.1.40. route-distinguisher

Use **route-distinguisher** to configure an RD for an EVPN instance or the public instance.

Use **undo route-distinguisher** to restore the default.

Syntax

In public instance view:

route-distinguisher *route-distinguisher*

undo route-distinguisher

In VSI EVPN instance view:

route-distinguisher { *route-distinguisher* | **auto** [**router-id**] }

undo route-distinguisher

Default

No RD is configured for an EVPN instance or the public instance.

Views

Public instance view

VSI EVPN instance view

Predefined user roles

network-admin

Parameters

route-distinguisher: Specifies an RD, a string of 3 to 21 characters. The RD cannot be all zeros and can use one of the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 101:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.

- *32-bit AS number:16-bit user-defined number*. For example, 65536:1. The AS number must be equal to or greater than 65536.

auto: Automatically generates an RD in the *N:VXLAN ID* format. The initial value of *N* is 1. If *N:VXLAN ID* is already in use, the system increases the value of *N* by 1 until the RD is available.

router-id: Automatically generates an RD based on the router ID in the *Router ID*:*N* format. The initial value of *N* is 1. If *Router ID*:*N* is already in use, the system increases the value of *N* by 1 until the RD is available. If you do not specify this keyword with the **auto** keyword, the system automatically generates an RD based on the VXLAN ID in the *N*:*VXLAN ID* format.

Usage guidelines

EVPN uses MP-BGP to advertise BGP EVPN routes for automatic VTEP discovery, MAC reachability information advertisement, and host route advertisement. MP-BGP uses the RD to differentiate BGP EVPN routes of different EVPN instances.

To modify the RD of an EVPN instance or the public instance, first execute the **undo route-distinguisher** command to remove the original RD.

Examples

Configure 22:1 as the RD of the EVPN instance on VSI **aaa**.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] route-distinguisher 22:1
```

1.1.41. vpn-target

Use **vpn-target** to configure route targets for EVPN.

Use **undo vpn-target** to delete route targets for EVPN.

Syntax

In VSI EVPN instance view:

vpn-target { *vpn-target&<1-8>* | **auto** } * [**both** | **export-extcommunity** | **import-extcommunity**]

undo vpn-target { *vpn-target&<1-8>* | **auto** | **all** } [**both** | **export-extcommunity** | **import-extcommunity**]

In EVPN view of a VPN instance, public instance view, IPv4 VPN view of the public instance, IPv6 VPN view of the public instance, or EVPN view of the public instance:

vpn-target *vpn-target&<1-8>* [**both** | **export-extcommunity** | **import-extcommunity**]

undo vpn-target { **all** | *vpn-target&<1-8>* [**both** | **export-extcommunity** | **import-extcommunity**] }

Default

EVPN does not have route targets.

Views

VSI EVPN instance view

EVPN view of a VPN instance

Public instance view

EVPN view of the public instance

IPv4 VPN view of the public instance

IPv6 VPN view of the public instance

Predefined user roles

network-admin

Parameters

vpn-target&<1-8>: Specifies a space-separated list of up to eight route targets. Each route target is a string of 3 to 21 characters in one of the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 101:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*. For example, 65536:1. The AS number must be equal to or greater than 65536.

auto: Automatically generates a route target in the format of *BGP AS number:VXLAN ID*.

both: Uses the specified route targets as both import and export targets. If you do not specify the **both**, **export-extcommunity**, or **import-extcommunity** keyword, the **both** keyword applies.

export-extcommunity: Uses the specified route targets as export targets.

import-extcommunity: Uses the specified route targets as import targets.

all: Specifies all route targets.

Usage guidelines

EVPN uses MP-BGP to advertise BGP EVPN routes for automatic VTEP discovery, MAC reachability information advertisement, and host route advertisement. MP-BGP uses route targets to control the advertisement and acceptance of BGP EVPN routes.

A VTEP sets the export targets for BGP EVPN routes before advertising the routes to remote VTEPs. The VTEP checks the export targets of BGP EVPN routes from remote VTEPs and imports only BGP EVPN routes of which the export targets match the local import targets.

Examples

Configure import route targets 10:1, 100:1, and 1000:1 for the EVPN instance on VSI **aaa**.

```
<Switch> system-view
[Switch] vsi aaa
[Switch-vsi-aaa] evpn encapsulation vxlan
[Switch-vsi-aaa-evpn-vxlan] vpn-target 10:1 100:1 1000:1 import-extcommunity
```

2. MVXLAN commands

NOTE:

MVXLAN commands are being supported with after Ver7.4.27.

The MVXLAN commands are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

2.1. MVXLAN commands

2.1.1. address-family ipv4

Use **address-family ipv4** to create an MVXLAN IPv4 address family and enter its view, or enter the view of the existing MVXLAN IPv4 address family.

Use **undo address-family ipv4** to delete the MVXLAN IPv4 address family and all settings in MVXLAN IPv4 address family view.

Syntax

address-family ipv4

undo address-family ipv4

Default

No MVXLAN IPv4 address family exists.

Views

MVXLAN view

Predefined user roles

network-admin

Examples

In MVXLAN view of VPN instance vpna, create an MVXLAN IPv4 address family and enter its view.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpna] address-family ipv4
[Switch-mvxlan-vpna-ipv4]
```

2.1.2. data-delay

Use **data-delay** to set the data-delay period (delay period before the device switches over from the default MDT to the data MDT).

Use **undo data-delay** to restore the default.

Syntax

data-delay *delay*

undo data-delay

Default

The data-delay period is 3 seconds.

Views

MVXLAN IPv4 address family view

Predefined user roles

network-admin

Parameters

delay: Specifies a data-delay period in the range of 1 to 60 seconds.

Examples

In MVXLAN IPv4 address family view of VPN instance vpna, set the data-delay period to 10 seconds.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpna] address-family ipv4
[Switch-mvxlan-vpna-ipv4] data-delay 10
```

2.1.3. data-group

Use **data-group** to specify a data group range and optionally configure the criteria for the device to initiate a switchover of the default MDT to a data MDT.

Use **undo data-group** to restore the default.

Syntax

data-group *group-address* { *mask-length* | *mask* } [**acl** *acl-number* | **name** *acl-name*]

undo data-group

Default

No data group range exists, and the device never initiates a switchover of the default MDT to a data MDT.

Views

MVXLAN IPv4 address family view

Predefined user roles

network-admin

Parameters

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

mask-length: Specifies a mask length for the multicast group address. The value range for this argument is 27 to 32.

mask: Specifies a subnet mask for the multicast group address. The value range for this argument is 255.255.255.224 to 255.255.255.255.

acl *acl-number*: Specifies an advanced ACL by its number in the range of 3000 to 3999.

name *acl-name*: Specifies a basic or advanced ACL by its name, a case-insensitive string of 1 to 63 characters. The name must start with a letter and cannot be **all**.

Usage guidelines

This command enables the device to initiate a switchover of the default MDT to a data MDT if the multicast data permitted by the specified ACL keeps arriving for a data-delay period.

The specified ACL matches traffic according to the following rules:

- A basic ACL uses the **source** keyword in an ACL rule to match multicast traffic by the multicast source address. All optional parameters are ignored, except **source**, **fragment**, and **time-range**.
- An advanced ACL uses the **source** and **destination** keywords in an ACL rule to match multicast traffic by the multicast source address and the multicast group address. All optional parameters are ignored, except **source**, **destination**, **fragment**, and **time-range**.

On a VTEP, the data group range for an MVXLAN cannot include the default group or data groups of any other MVXLAN.

If you specify an ACL, the multicast data permitted by the ACL can trigger the switchover. If you do not specify an ACL, any multicast data can trigger the switchover.

If you execute this command multiple times in the same MVXLAN IPv4 address family view, the most recent configuration takes effect.

Examples

In MVXLAN IPv4 address family view of VPN instance vpna, specify 239.1.0.0 through 239.1.0.255 as the data group range.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpna] address-family ipv4
[Switch-mvxlan-vpna-ipv4] data-group 239.1.0.0 32
```

2.1.4. default-group

Use **default-group** to specify a default group.

Use **undo default-group** to restore the default.

Syntax

default-group *group-address*

undo default-group

Default

No default group exists.

Views

MVXLAN IPv4 address family view

Predefined user roles

network-admin

Parameters

group-address: Specifies a default group in the range of 224.0.1.0 to 239.255.255.255.

Usage guidelines

The default group for an MVXLAN must be different from the default group and the data group used by any other MVXLAN.

Examples

In MVXLAN IPv4 address family view of VPN instance vpna, specify 236.0.0.1 as the default group.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpna] address-family ipv4
[Switch-mvxlan-vpna-ipv4] default-group 236.0.0.1
```

2.1.5. display multicast-vpn vxlan data-group receive

Use **display multicast-vpn vxlan data-group receive** to display received data group information in an MVXLAN.

Syntax

display multicast-vpn vxlan { **vpn-instance** *instance-name* | **public-instance** } **data-group receive** [**brief** | [**active** | **group** *group-address* | **sender** *source-address* | *vpn-source-address* [**mask** { *mask-length* | *mask* }] | *vpn-group-address* [**mask** { *mask-length* | *mask* }]] *]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

public-instance: Specifies the public instance.

brief: Displays brief information. If you do not specify this keyword, the command displays detailed information.

active: Specifies data groups that have joined the data MDT.

group *group-address*: Specifies a data group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

sender *source-address*: Specifies an MVXLAN source interface by its IP address.

vpn-source-address: Specifies a multicast source address of the specified VPN instance.

vpn-group-address: Specifies a multicast group address of the specified VPN instance. The value range for this argument is 224.0.1.0 to 239.255.255.255.

mask-length: Specifies a mask length of the specified multicast source address or multicast group address. The value range for this argument is 0 to 32, and the default is 32.

mask: Specifies a subnet mask of the specified multicast source address or multicast group address. The default is 255.255.255.255.

Usage guidelines

If you do not specify any parameters, this command displays detailed information about all received data groups in the MVXLAN of the specified VPN instance or the public instance.

Examples

Display detailed information about received data groups in the MVXLAN of VPN instance vpna.

```
<Switch> display multicast-vpn vxlan vpn-instance vpna data-group receive
VPN instance: vpna
Total 2 data-groups for 8 entries
Total 2 data-groups and 8 entries matched

Data-group: 226.1.1.0  Reference count: 4   Active count: 2
  Sender: 1.1.1.1   Active count: 1
    (192.6.1.5, 239.1.1.1)       Remaining lifetime: 00:03:10 active
    (192.6.1.5, 239.1.1.158)     Remaining lifetime: 00:03:10
  Sender: 181.100.1.1   Active count: 1
    (195.6.1.2, 239.1.2.12)      Remaining lifetime: 00:03:10 active
    (195.6.1.2, 239.1.2.197)     Remaining lifetime: 00:03:10

Data-group: 229.1.1.0   Reference count: 4   Active count: 2
  Sender: 185.100.1.1   Active count: 1
    (198.6.1.5, 239.1.3.62)      Remaining lifetime: 00:03:10 active
    (198.6.1.5, 225.1.1.109)     Remaining lifetime: 00:03:10
  Sender: 190.100.1.1   Active count: 1
    (200.6.1.2, 225.1.4.80)      Remaining lifetime: 00:03:10 active
    (200.6.1.2, 225.1.4.173)     Remaining lifetime: 00:03:10
```

Display brief information about received data groups in the MVXLAN of VPN instance vpna.

```
<Switch> display multicast-vpn vxlan vpn-instance vpna data-group receive brief
VPN instance: vpna
Total 2 data-groups for 8 entries
Total 2 data-groups and 8 entries matched

Data-group: 226.1.1.0   Reference count: 4   Active count: 2
Data-group: 229.1.1.0   Reference count: 4   Active count: 2
```

Table 1 Command output

Field	Description
Total 2 data-groups for 8 entries	A total of 2 data groups, associated with 8 (S, G) entries.
Total 2 data-groups and 8 entries matched	A total of 2 matching data groups, associated with 8 (S, G) entries.
Data-group	IP address of the received data group.
Reference count	Number of (S, G) entries that use the data group in the VPN instance.
Active count	Number of active (S, G) entries (entries with active receivers) that use the data group in the VPN instance.
Sender	Address of the VTEP that sent the data group.
Remaining lifetime	Remaining lifetime for the (S, G) entry that uses the data group in the VPN instance.
active	Indicates that the (S, G) entry is active.

2.1.6. display multicast-vpn vxlan data-group send

Use **display multicast-vpn vxlan data-group send** to display sent data group information in an MVXLAN.

Syntax

display multicast-vpn vxlan { **vpn-instance** *instance-name* | **public-instance** } **data-group send** [**group** *group-address* | *vpn-source-address* [**mask** { *mask-length* | *mask* }] | *vpn-group-address* [**mask** { *mask-length* | *mask* }]] *

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

public-instance: Specifies the public instance.

group *group-address*: Specifies a data group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

vpn-source-address: Specifies a multicast source address of the specified VPN instance. The value range for this argument is 224.0.1.0 to 239.255.255.255.

vpn-group-address: Specifies a multicast group address of the specified VPN instance. The value range for this argument is 224.0.1.0 to 239.255.255.255.

mask-length: Specifies a mask length of the specified multicast source address or multicast group address. The value range for this argument is 0 to 32, and the default is 32.

mask: Specifies a subnet mask of the specified multicast source address or multicast group address. The default is 255.255.255.255.

Usage guidelines

If you do not specify any parameters, this command displays information about all sent data groups in the MVXLAN of the specified VPN instance or the public instance.

Examples

Display information about all sent data groups in the MVXLAN of VPN instance vpna.

```
<Switch> display multicast-vpn vxlan vpn-instance vpna data-group send
VPN instance: vpna
Total 2 data-groups for 6 entries
Total 2 data-groups and 6 entries matched

Data-group: 226.1.1.0   Reference count: 3
  (192.6.1.5, 239.1.1.1)                Switchover time: 00:00:21
  (192.6.1.5, 239.1.1.158)              Switchover time: 00:00:21
  (192.6.1.5, 239.1.2.50)               Switchover time: 00:00:05
Data-group: 226.1.1.1   Reference count: 3
```

```
(192.6.1.2, 225.1.1.1)                Switchover time: 00:00:21
(192.6.1.2, 225.1.2.50)               Switchover time: 00:00:05
(192.6.1.5, 239.1.1.159)              Switchover time: 00:00:21
```

Table 2 Command output

Field	Description
Total 2 data-groups for 6 entries	A total of 2 data groups, associated with 6 (S, G) entries.
Total 2 data-groups and 6 entries matched	A total of 2 matching data groups, associated with 6 (S, G) entries.
Data-group	Data group address.
Reference count	Number of (S, G) entries that use the data group in the VPN instance.
Switchover time	Switchover time of the (S, G) entry that uses the data group in the VPN instance.

2.1.7. display multicast-vpn vxlan default-group

Use **display multicast-vpn vxlan default-group** to display information about default groups.

Syntax

display multicast-vpn vxlan [**vpn-instance** *instance-name* | **public-instance**] **default-group** { **local** | **remote** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

public-instance: Specifies the public instance.

local: Specifies local default groups.

remote: Specifies remote default groups.

Usage guidelines

If you do not specify the **vpn-instance** *instance-name* option or the **public-instance** keyword, this command displays default group information for all VPN instances and the public instance.

Examples

Display information about local default groups in all VPN instances and the public instance.

```
<Switch> display multicast-vpn vxlan default-group local
MVXLAN local default-group information of VPN instance 50:
 Group address    Source address   Interface
 237.1.0.0        1.1.1.1          MTunnel0
```

Display information about remote default groups in all VPN instances and the public instance.

```
<Switch> display multicast-vpn vxlan default-group remote
MVXLAN remote default-group information:
 Group address   Source address  Next hop         VPN instance
 239.1.1.1       1.2.0.1         1.2.0.1          a
 239.1.1.1       1.2.0.2         1.2.0.2          a
 239.1.1.1       1.2.0.3         1.2.0.3          a
 239.1.1.2       1.2.0.1         1.2.0.1          b
 239.1.1.2       1.2.0.2         1.2.0.2          b
 239.1.1.3       1.2.0.1         1.2.0.1          c
```

Table 3 Command output

Field	Description
Group address	IP address of the default group.
Source address	IP address of the MVXLAN source interface. This field displays two hyphens (--) if no source interface IP address is configured for the MVXLAN.
Interface	MVXLAN tunnel outgoing interface.
Next hop	Next hop address.
VPN instance	VPN instance to which the default group belongs.

2.1.8. multicast extranet select-rpf

Use **multicast extranet select-rpf** to configure an IPv4 MVXLAN extranet RPF selection policy.

Use **undo multicast extranet select-rpf** to delete an IPv4 MVXLAN extranet RPF selection policy.

Syntax

multicast extranet select-rpf [**l3-vni** *vxlan-id* | **vpn-instance** *vpn-instance-name*] { **group** *group-address* { *mask* | *mask-length* } | **source** *source-address* { *mask* | *mask-length* } } *

undo multicast extranet select-rpf [**l3-vni** *vxlan-id* | **vpn-instance** *vpn-instance-name*] { **group** *group-address* { *mask* | *mask-length* } | **source** *source-address* { *mask* | *mask-length* } } *

Default

No IPv4 MVXLAN extranet RPF selection policies are configured.

Views

MRIB view

Predefined user roles

network-admin

Parameters

l3-vni *vxlan-id*: Specifies the L3 VXLAN ID of the VPN instance to which the multicast source belongs. The value range for the *vxlan-id* argument is 0 to 16777215. If the multicast source belongs to the public network, do not specify this option.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the multicast source belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. The PIM routing entry will select this VPN instance for the upstream RPF neighbor. If the multicast source belongs to the public network, do not specify this option.

group *group-address*: Specifies a multicast group address in the policy. The address range is 224.0.1.0 to 239.255.255.255. If you do not this option, all multicast traffic that matches the source address in the policy in the source VPN instance will be directed to the receiver VPN instance.

source *source-address*: Specifies a source address in the policy, which can a multicast source address or the address of the RP designated to multicast groups. If you do not specify this option, all multicast traffic that matches the multicast group in the policy in the source VPN instance will be directed to the receiver VPN instance.

mask-length: Specifies a mask length for the multicast source address or the multicast group address. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies a subnet mask for the multicast source address or the multicast group address.

Usage guidelines

MVXLAN extranet RPF routing policies are used for multicast transmission when multicast sources and receivers are located in different VPNs.

MVXLAN extranet RPF selection policies identify the multicast traffic to forward between VPN instances based on the L3 VXLAN ID or VPN instance of traffic.

You cannot specify both an L3 VXLAN ID and an MPLS L3VPN instance for a multicast source address and multicast group address pair.

If the multicast source resides on the public network, do not specify an L3 VXLAN ID or MPLS L3VPN instance.

The PIM mode in the source VPN instance and the receiver VPN instance must be the same. Only PIM-SM and PIM-SSM are supported.

If an MVXLAN extranet RPF selection policy with only the multicast group address specified is configured in the receiver VPN instance, the intra-VPN multicast traffic transmission will be interrupted.

Multicast source addresses in different MVXLAN extranet RPF routing policies cannot be the same, but they can overlap. The same restriction applies to the multicast group addresses in different MVXLAN extranet RPF routing policies. If multiple routing policies exist for an (S, G) entry, the device selects the policy in which the multicast group address has the longest mask. If multiple policies have the same mask length, the device selects the policy in which the multicast source address has the longest mask.

Examples

Configure an IPv4 MVXLAN extranet RPF selection policy to direct multicast traffic from VPN instance vpn-source to VPN instance vpn-receiver.

```
<Switch> system-view
[Switch] multicast routing vpn-instance vpn-receiver
[Switch-mrib-vpn-receiver] multicast extranet select-rpf vpn-instance vpn-source
source 192.168.10.0 24
[Switch-mrib-vpn-receiver] multicast extranet select-rpf vpn-instance  vpn-source
source 1.1.1.1 24
```

2.1.9. multicast-vpn vxlan edge remote

Use **multicast-vpn vxlan edge remote** to specify a peer ED for ED redundancy in the same data center for Layer 3 multicast in DCI multihoming scenarios.

Use **undo multicast-vpn vxlan edge remote** to remove the peer ED configuration for ED redundancy.

Syntax

multicast-vpn vxlan edge remote *remote-ipv4-address*

undo multicast-vpn vxlan edge remote [*remote-ipv4-address*]

Default

No peer ED is specified for ED redundancy in the same data center for Layer 3 multicast in DCI multihoming scenarios.

Views

System view

Predefined user roles

network-admin

Parameters

remote-ipv4-address: Specifies the IPv4 address of a peer ED.

Usage guidelines

To avoid single point of failure for Layer 3 multicast in DCI scenarios, you can deploy multiple EDs at the edge of a data center. On each ED, specify the IP addresses of the other EDs in the same data center in order to recognize the S-PMSI A-D routes from these EDs. This configuration avoids the local ED from joining the multicast tunnels of the other EDs in the same data center.

Repeat this command to specify the IP addresses of multiple EDs in the same data center.

If you do not specify the *remote-ipv4-address* argument when executing the **undo multicast-vpn vxlan edge remote** command, the command removes the IP addresses of all peer EDs from the local ED.

Examples

Specify the peer EDs at 3.3.3.3 and 4.4.4.4 for ED redundancy in the same data center for Layer 3 multicast in DCI multihoming scenarios.

```
<Sysname> system-view
[Sysname] multicast-vpn vxlan edge remote 3.3.3.3
[Sysname] multicast-vpn vxlan edge remote 4.4.4.4
```

2.1.10. multicast-vpn vxlan public-instance

Use **multicast-vpn vxlan public-instance** to create an MVXLAN for the public instance and enter its view, or enter the view of the existing public instance MVXLAN.

Use **undo multicast-vpn vxlan public-instance** to delete the public instance MVXLAN and all settings in public instance MVXLAN view.

Syntax

multicast-vpn vxlan public-instance mode mdt { **ingress-replication** | **mdt** }

undo multicast-vpn vxlan public-instance

Default

No MVXLAN exists in the public instance.

Views

System view

Predefined user roles

network-admin

Parameters

mode: Specifies the MVXLAN mode.

ingress-replication: Sets the mode to ingress replication.

mdt: Sets the mode to MDT.

Examples

Create an MDT-based MVXLAN for the public instance and enter public instance MVXLAN view.

```
<Switch> system-view
[Switch] multicast-vpn vxlan public-instance mode mdt
[Switch—mvxlan-public-instance]
```

2.1.11. multicast-vpn vxlan vpn-instance

Use **multicast-vpn vxlan vpn-instance** to create an MVXLAN for a VPN instance and enter its view, or enter the view of an existing VPN instance MVXLAN.

Use **undo multicast-vpn vxlan vpn-instance** to delete a VPN instance MVXLAN and all settings in its view.

Syntax

multicast-vpn vxlan vpn-instance *instance-name* **mode** { **ingress-replication** | **mdt** }

undo multicast-vpn vxlan vpn-instance *instance-name*

Default

No MVXLAN exists in a VPN instance.

Views

System view

Predefined user roles

network-admin

Parameters

instance-name: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

mode: Specifies the MVXLAN mode.

ingress-replication: Sets the mode to ingress replication.

mdt: Sets the mode to MDT.

Examples

Create an MDT-based MVXLAN for VPN instance vpna and enter VPN instance MVXLAN view.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch—mvxlan-vpna]
```

2.1.12. pim distributed-dr

Use **pim distributed-dr** to configure a VSI interface as a distributed DR interface.

Use **undo pim distributed-dr** to restore the default.

Syntax

pim distributed-dr

undo pim distributed-dr

Default

A VSI instance is not a distributed DR interface.

Views

VSI interface view

Predefined user roles

network-admin

Usage guidelines

On the VTEPs configured with MVXLAN, you must specify the VSI interfaces that act as distributed EVPN gateways as distributed DR interfaces. This operation ensures that a distributed EVPN gateway can forward multicast traffic to the local site.

Examples

Configure VSI-interface 1 as a distributed DR interface.

```
<Switch> system-view
[Switch] interface vsi-interface 1
[Switch-Vsi-interface1] pim distributed-dr
```

2.1.13. s-pmsi advertise source-active

Use **s-pmsi advertise source-active** to enable advertising active multicast sources through S-PMSI routes.

Use **undo s-pmsi advertise source-active** to restore the default.

Syntax

s-pmsi advertise source-active

undo s-pmsi advertise source-active

Default

The device does not advertise active multicast sources through S-PMSI routes.

Views

MVXLAN IPv4 address family view

Predefined user roles

network-admin

Usage guidelines

This command enables the VTEP to advertise an S-PMSI route for a (S, G) entry after it receives multicast traffic for the entry. The S-PMSI routes carry information about active multicast sources and allow other VTEPs and EDs in the MVXLAN network to be aware of multicast source location changes.

Examples

Enable the device to advertise active multicast sources through S-PMSI routes in MVXLAN IPv4 address family view of VPN instance vpna.

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpn-instance-vpna] address-family ipv4
[Switch-mvxlan-vpn-instance-vpna-ipv4] s-pmsi advertise source-active
```

2.1.14. source

Use **source** to specify an MVXLAN source interface.

Use **undo source** to restore the default.

Syntax

source *interface-type interface-number*

undo source

Default

No MVXLAN source interface is specified.

Views

MVXLAN IPv4 address family view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specify an interface by its type and number.

Usage guidelines

For the VTEP to obtain correct routing information, you must specify the interface used for establishing BGP peer relationship as the MVXLAN source interface.

Examples

In MVXLAN IPv4 address family view of VPN instance vpna, specify Loopback 0 as the MVXLAN source interface. (Loopback 0 is the source interface used for establishing BGP peer relationship.)

```
<Switch> system-view
[Switch] multicast-vpn vxlan vpn-instance vpna mode mdt
[Switch-mvxlan-vpna] address-family ipv4
[Switch-mvxlan-vpna-ipv4] source loopback 0
```
