NEC

GVT-070107-001-00 1.26

QX-S5600G Series Ethernet Switches

Command References

Revision History

Revision	Date	Reason for Change
1.0	2018/10	First Revision
1.1	2019/10	・The parity error monitor commands was added to “10 Device management commands” in “1.Fundamentals”. ・The resource-monitor commands was added to “10 Devaice management commands” in “1.Fundamentals”. ・The setting range of the link-delay command was changed of “1.Ethernet interface commands” in “3.Layer 2 – LAN Switching “. ・The auto option was added to combo enable command of “1 Ethernet interface commands” in “3.Layer 2 – LAN Switching”, and the default was changed to auto. ・The force option was added to port link-aggregation group command of “6. Ethernet link aggregation commands” in “3.Layer 2 – LAN Switching” ・The reauthentication server-select command was add to “1.AAA commands” in “8.Security”. ・The NetMeister commands was added to “12.NetMeister commands” in “11.Network Management and Monitoring”. ・Writing error correction
1.2	2020/02/24	Writing error correction
1.3	2020/03	・The packet-filter filter commands was added to “1 ACL commands” in “8.ACL and QoS”. ・Writing error correction
1.4	2020/06	・IMPORTAN has been added to the car command of “2. QoS Policy Commands” in “8.ACL and QoS”.
1.5	2020/07	・The restful https enable command was added to “3 Login management commands” in “1.Fundamentals”. ・The lldp management-address command was added to “15 LLDP commands” in “3.Layer 2 – LAN Switching”. ・The ip address unnumbered command was added to “ 5 IP addressing commands” in “4.Layer 3 – IP Services”. ・The arp route-direct advertise command was added to “ 14 ARP direct route advertisement commands” in “4.Layer 3 – IP Services”. ・The max-ecmp-num command was added to “ 1 Basic IP routing commands” in “5.Layer 3 – IP Routing”. ・The 1etconf ssh server enable command was added to “ 6 NETCONF commands” in “11.Network Management and Monitoring”. ・The OpenFlow commands was added to “12 OpenFlow” in “ 1. OpenFlow commands”. ・The OVSDB commands was added to “ 1 VXLAN commands” in “ 13.VXLAN”. ・The vtep access port command was added to “ 1 VXLAN commands” in “ 13.VXLAN”.

Revision	Date	Reason for Change
		・The vtep enable command was added to “ 1 VXLAN commands” in “ 13.VXLAN”.
1.6	2020/12/21	・Chapter 7 of 09-Security Password-control blacklist all-line command has been added to password management. ・Chapter 7 of 09-Security Password-control change-password first-login enable command has been added to password management. ・Chapter 7 of 09-Security Password-control change-password weak-password enable command has been added to password management. ・Chapter 09-Security Chapter 7 Changed the display example of the display password-control command of password management. ・Chapter 7 of 09-Security Changed the contents of password management display password-control blacklist. ・Chapter 7 of 09-Security Password-control { aging | command | history | length } enable has been changed. ・Chapter 09-Security Chapter 7 Password-control complex of password management has been changed. ・Chapter 09-Security Chapter 7 Password-control command content has been changed. ・Chapter 7 of 09-Security Password-control enable contents of password management have been changed. ・Chapter 09-Security Chapter 7 Password-control history has been changed. ・Chapter 09-Security Chapter 7 Password-control login-attempt has been changed. ・Chapter 09-Security Chapter 7 Password-control super command type-number has been changed. ・Chapter 09-Security Chapter 7 Added notes to password-control super length of password management. ・” 13 VCF fabric commands” in “ 11. Network Management and Monitoring” added. ・Added “1.4. Rate Limit Logging” to Chapter 1 System Maintenance and Debugging in “11-System Management”. ・The display arp suppression vsi command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The display l2vpn mac-address command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The display l2vpn service-instance command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The display l2vpn vsi command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The display vxlan tunnel command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The vxlan command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The display 2etconf2e vsi-interface command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”. ・The ovsdb server ptcp command was changed of “ 1 VXLAN commands” in “ 13.VXLAN”.

Revision	Date	Reason for Change
		・The arp-advertising disable command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display bgp l2vpn evpn command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display evpn auto-discovery command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display evpn instance vxlan command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The display evpn route arp command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display evpn route arp suppression command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display evpn route arp-mobility command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The display evpn route mac command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The display evpn route mac-mobility command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The evpn encapsulation command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The evpn route arp-mobility suppression command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The evpn route mac-mobility suppression command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The export route-policy command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The import evpn mac-ip command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The import route-policy command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The ip-prefix-route generate disable command was added to “ 1 EVPN commands” in “ 14.EVPN” ・The ip public-instance command was deleted from “ 1 EVPN commands” in “ 14.EVPN” ・The l3-vni command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The mac-advertising diable command was changed of “ 1 EVPN commands” in “ 14.EVPN”. ・The vpn-target command was changed of “ 1 EVPN commands” in “ 14.EVPN”.
1.7	2020/12/25	・ The option of the LAG interface has been added to “Chapter 16 L2PT” of “03-Access”. ・ NetMiester proxy has been added to “Chapter 13 NetMiester” in “11-System Management”. ・Writing error correction

Revision	Date	Reason for Change
1.8	2021/04	・Added NSR to the following chapters of “05-Routing”. “Capter 03 RIP”,” Capter 04 OSPF”,” Capter 05 BGP”, ”Capter 08 RIPng”,” Capter 09 OSPFv3” ・Writing error correction
1.9	2021/06	・Added notes to the restful https enable command in “3 Login management commands” in “ 1. Fundamentals” ・Added notes to the 4etconf ssh server enable command in “6 NETCONF commands commands” in “ 11. Network Management and Monitoring” ・Added notes to the vcf-fabric topology enable command in “13 VCF fabric commands” in “ 11. Network Management and Monitoring” ・Added notes to the vcf-fabric underlay autoconfigure command in “13 VCF fabric commands” in “ 11. Network Management and Monitoring” ・Added notes to the ovsdb server enable command in “1 VXLAN commands” in “ 13. VXLAN” ・Added notes to the ovsdb server ptcp command in “1 VXLAN commands” in “ 13. VXLAN” ・Added notes to the vtep access port command in “1 VXLAN commands” in “ 13. VXLAN” ・Added notes to the vtep enable command in “1 VXLAN commands” in “ 13. VXLAN”
1.10	2021/09	・The ssh2 algorithm commands was added to “9 SSH commands” in “9.Security”.
1.11	2021/09	・”control-plane protocol” and “control-plane protocol-group” option added to if-match command “ 2 QoS policy commands “ in “8.QoS/ACL”. ・The control-plane commands was added to “ 2 QoS policy commands “ in “8.QoS/ACL”.
1.12	2022/02	・Add the following commands to “6. Data buffer commands” in “8.ACL and QoS”. Buffer apply buffer shared display buffer
1.13	2022/08	・”lt “, “gt” and “range” option added to rule(Ipv4 advanced ACL view) command “ 1 ACL commands “ in “8.QoS/ACL”. ・Writing error correction
1.14	2022/10	・Added “17 M-LAG” to “03-Access”. ・Added “12 PIM Snooping” and “13 IGMP Proxy” to “06-Multicast”. ・Added “vrrp state-transition-delay” and “vrrp ipv6 state-transition-delay” to “Chapter 7 VRRP” of “10-High Availability”. ・Added “netmeister management ip”to 13 NetMeister in “11-Network Management and Monitorring”.

Revision	Date	Reason for Change
		・Correction of errors
1.15	2023/01	・Deleted “10.1.25 display transceiver diagnosis” from “10. Device management commands” in “1.Fundamentals”(correction of error). ・Modified “10.1.53. temperature-limit” of “10. Device management commands” in “1.Fundamentals”(correction of error). ・Added the following parameters to “03-DHCP commands” in “04-Layer 3 - IP Services” (correction of error). class public vpn-instance ・Added “security-enhanced level” command to “10-SSL” in “9-Security”. ・Deleted the delay parameter from “09-Track commands” in “10-High Availability”(correction of error). ・Added “fast-detection enable” and “fast-timer” to “Chapter 4 RRPP” of “10-High Availability”. ・Added “display evpn m-lag synchronized-mac”, “evpn m-lag group”, “evpn m-lag local”, “evpn global-mac”, “ip forwarding-conversational-learning”, “l2vpn m-lag peer-link ac-match-rule vxlan-mapping” and “l2vpn statistics vsi l3-vni” to “Chapter 1 EVPN” of “14-EVPN”. ・Added the System-view to “mac-address static source-check enable” in “Chapter 4 MAC address table” of ”03- Layer 2 - LAN Switching”. ・Added option to “xconnect vsi” in “Chapter 1 VXLAN” of ”13- VXLAN”.
1.16	2023/05	・An explanation has been added to the display of "display stp" in "Chapter 8 STP" of "03-Access." ・A gratuitous-arp mac-change retransmit command was added to “Chapter 2 Gratuitous ARP commands” of “04-Layer 3 - IP Services”. ・Added a processable broadcast condition to "rip version" in " Chapter 3 RIP commands" of "05- Layer 3 - IP Routing."
1.17	2023/07	・Fixed the default value of the "10.1.53 temperature-limit" command from "Chapter 10 Equipment Management" in "01 - Introduction." ・Added dropped packets to "bpdu-drop any" description in "Chapter 8 STP" of "03-Access." ・Added description of "dhcp relay server-address" in “Chapter 6 DHCP commands” of “04-Layer3-IP Services”.
1.18	2023/09	・Added support for the parent mode for "Chapter 12 NetMiester" in "10-System Management".
1.19	2024/05	・Added " Chapter 12 Automatic configuration commands " to "01- Fundamentals". ・Added "mac-address" to " Chapter 10 VLAN commands" of "03-Layer 2 - LAN Switching". ・Added "ospf peer sub-address enable" to " Chapter 4 OSPF commands" of "05-Layer 3 - IP Routing". ・Added " peer source-address" to " Chapter 5 BGP commands" of "05-Layer 3 - IP Routing".

Revision	Date	Reason for Change
		・Added “m-lag auto-recovery reload-delay”,” m-lag keepalive interval”,”m-lag mad exclude logical-interfaces”,”m-lag mad persistent”,”m-lag role priority”,”m-lag system-mac” , “m-lag system-priority” and "port m-lag virtual-ip" to Chapter 17 M-LAG commands" of “03-Layer2 -LAN Switching”.
1.20	2024/10	・Added notes to “Chapter 12 PIM snooping commnads” of ”06- IP Multicast”. ・Added notes to “Chapter 13 IGMP proxy commnads” of ”06- IP Multicast”.
1.21	2024/11	・The following commands have been added to “10. Device management commands” in “01-Fundamentals”: “10.1.27. dying-gasp host” and “10.1.28. dying-gasp source”.
1.22	2025/01	・Modified the parameters of the "1.2.11. mtu" command from "1. VXLAN commands" in "13 - VXLAN."
1.23	2025/02	Deleted the note of “port m-lag virtual-ip” command
1.24	2025/07	・Modified the Logo image on the Cover. ・The default for “set authentication password” has been changed. ・Added an explanation to "display mad" in " Chapter 1 IRF commands" of "02- IRF." ・Added a memo to "display igmp-snooping" in " Chapter 1 IGMP snooping commands" of "06- IP Multicast." ・Added an explanation to " igmp-snooping" and “igmp-snooping enable” in " Chapter 1 IGMP snooping commands" of "06- IP Multicast." ・The arp scan commands was added to “13 ARP attack protection commands “ in “9.Security”
1.25	2026/01	・Added an example of storm-constrain settings when specifying pps in "1.2.4 storm-constrain" in "03-Access." ・Corrected the lower limit of storm-constrain from 0 to 1 when specifying pps in "1.2.4 storm-constrain" in "03-Access." ・Added a note about interface view settings in "3.1.4 mac-authentication access-user log enable" in "09-Security." ・Added a note about interface view settings in "5.1.14 port-security timer autolearn aging" in "09-Security."
1.26	2026/09	・ Added "display transceiver alarm" to "10. Device management commands" in "01-Fundamentals". ・ Added "display transceiver diagnosis" to "10. Device management commands" in "01-Fundamentals". ・ Added a example and note of "display transceiver interface" in "10. Device management commands" of "01-Fundamentals". ・ Added "display transceiver manuinfo" to "10. Device management commands" in "01-Fundamentals". ・ Corrected an error in the description in "Table 10-6 Command output" of "10. Device management commands" in "01-Fundamentals". ・ Corrected an error in the description in "1.1.16. mad bfd enable" of "1. IRF commands" in "02-IRF".Corrected an error in the description in "1.1.17. mad enable" of "1. IRF commands" in "02-IRF". ・ Corrected an error in the description in "10.1.10. vlan" of "10. VLAN commands" in "03-Layer2".

Revision	Date	Reason for Change
		· Added a description in "14.1.2. vlan mapping" of "14. VLAN mapping commands" in "03-Layer2". · Added "17.1.19. m-lag mad restore" to "17. M-LAG commands" in "03-Layer2". · Added "17.1.22. m-lag standalone enable" to "17. M-LAG commands" in "03-Layer2". · Deleted the note from "m-lag auto-recovery reload-delay" in "17. M-LAG commands" of "03-Layer2 - LAN Switching". · Deleted the note from "m-lag keepalive interval" in "17. M-LAG commands" of "03-Layer2 - LAN Switching". · Deleted the note from "m-lag mad exclude logical-interfaces" in "17. M-LAG commands" of "03-Layer2 - LAN Switching". · Deleted the note from "m-lag mad persistent" in "17. M-LAG commands" of "03-Layer2 - LAN Switching". · Deleted the note from "m-lag role priority" in "17. M-LAG commands" of "03-Layer2 - LAN Switching". · Corrected an error in the description in "13.1.1. http-redirect https-port" of "13. HTTPS redirect commands" in "04-Layer3-IP services". · Added "tunnel vpn-instance" to "12. Tunneling commands" in "04-Layer3 IP services". · Corrected an error in the description in "6.1.1. apply next-hop" of "6. Policy-based routing commands" in "05-Layer3 IP Routing". · Corrected an error in the description in "3.1.1. display qos map-table" of "3. Priority mapping commands" in "08-ACL and QoS". · Corrected an error in the description in "3.1.3. qos map-table" of "3. Priority mapping commands" in "08-ACL and QoS". · Corrected an error in the description in "1.2.4. display local-user" of "1. AAA commands" in "09-Security". · Corrected an error in the description in "1.2.7. local-user" of "1. AAA commands" in "09-Security".Corrected an error in the description in "1.2.10. service-type" of "1. AAA commands" in "09-Security". · Corrected an error in the description in "3.1.10. mac-authentication timer" of "3. MAC authentication commands" in "09-Security". · Added a description in "4.1.1. protected-vlan" of "4. RRPP commands" in "10-High Availability". · Corrected an error in the description in "8.1.3. bfd detect-multiplier" of "8. BFD commands" in "10-High Availability". · Corrected an error in the description in "8.1.11. bfd multi-hop detect-multiplier" of "8. BFD commands" in "10-High Availability".

Notice

- Only the command indicated on *QX-S5600G Series Ethernet Switches Command References* can use this device. When using the command which isn't indicated on the *QX-S5600G Series Switch Command References*, operation of device isn't guaranteed.
- The information in this document is subject to change without notice. Every effort has been made in the preparation of this document to ensure accuracy of the contents, but all statements, information, and recommendations in this document do not constitute the warranty of any kind, express or implied.

Preface

Version

This command reference corresponds after software version 7.1.X.

Documentation Set

The Documentation Set of QX-S5600G Series Ethernet Switches includes the following documentations.

Documentation Set	Description
QX-S5600G Series Ethernet Switches Installation Guide	This documentation describes installation.
QX-S5600G Series Ethernet Switches Configuration Guides	This documentation describes configuration.
QX-S5600G Series Ethernet Switches Command References	This documentation describes commands.

Sections

This command reference includes the following sections.

- **Fundamentals**

  The Fundamentals Command Reference describes commands for configuring command line interface (CLI), login management, FTP and TFTP, file system management, configuration file management, device management, etc.

- **IRF**

  The IRF Command Reference describes IRF configuration commands for creating an IRF fabric. It covers the commands for binding physical ports to an IRF port, configuring the member switch ID and priority, and detecting and maintaining the IRF link.

- **Layer 2 - LAN Switching**

  The Layer 2 - LAN Switching Command Reference describes the commands for configuring Layer 2 technologies and features in a LAN switched network, etc.

- **Layer 3 - IP Services**

  The Layer 3—IP Services Command Reference describes the commands for configuring IP addressing, IP performance optimization, ARP, IP forwarding basics and IPv6 basics, etc.

- **Layer 3 - IP Routing**

The Layer 3 – IP Routing Command Reference describes the routing configuration commands, etc.

- **IP Multicast**

  The IP Multicast Command Reference describes the commands for IGMP snooping, IGMP, Multicast routing and forwarding (IPv4, IPv6), PIM (IPv4, IPv6), MLD snooping, MLD, etc.

- **MCE**

  The MCE Command Reference describes the MCE configuration commands.

- **ACL and QoS**

  The ACL and QoS Command Reference describe ACL and QoS configuration commands. It covers the commands for creating ACLs, using ACLs for packet filtering, configuring QoS policies, and configuring common QoS techniques, such as traffic policing, congestion management, and congestion avoidance, etc.

- **Security**

  The Security Command Reference describes security configuration commands. It covers the commands for configuring identity authentication feature (AAA), secure management features (Public key management and SSH), and attack protection features (IP source guard and ARP attack protection), etc.

- **High Availability**

  The High Availability Command Reference describes high availability commands. It covers the commands for Ethernet OAM, Connectivity Fault Detection (CFD), Device Link Detection Protocol (DLDP), IPv4 and IPv6 VRRP, BFD, etc.

- **Network Management and Monitoring**

  The Network Management and Monitoring Command Reference describe network management and monitoring configuration commands. It covers the commands for viewing system information, synchronizing time for all devices with clocks in your network, and checking and debugging the current network connectivity with the ping, tracert, and debug commands.

- **OpenFlow**

  The OpenFlow Command Reference describes the OpenFlow configuration commands.

- **VXLAN**

  The VXLAN Command Reference describes the VXLAN configuration commands.

- **EVPN**

  The EVPN Command Reference describes the EVPN configuration commands.

Conventions

This section describes the conventions used in this documentation set.

I. Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select at least one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

II. GUI conventions

Convention	Description
< >	Button names are inside angle brackets. For example, click <OK>.
[ ]	Window names, menu items, data table and field names are inside square brackets. For example, pop up the [New User] window.
/	Multi-level menus are separated by forward slashes. For example, [File/Create/Folder].

III. Keyboard Operations

Convention	Description
<KEY>	Push the KEY of keyboard. For example, <Enter> is push the Enter key.
<KEY1 + KEY2>	Push some KEYs of keyboard. For example, <Ctrl+Alt+A> is push the Ctrl key, the Alt key and the A key at the same time.
<KEY1, KEY2>	Push in turn some KEYs of keyboard. For example, <Alt,A> is push the Alt key then push the A key.

IV. Mouse Operations

Convention	Description
Click	Push the button of the mouse one time quickly. Usually, push the left button.
Double Click	Push the left button of the mouse two times quickly.
Drag	Move the mouse while holding down the left button of the mouse.

V. Symbols

Convention	Description
⚠ **WARNING**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
⚠ **CAUTION**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
⚠ **IMPORTANT**	An alert that calls attention to essential information.
🕮 **NOTE**	An alert that contains additional or supplementary information.
🕮 **TIP**	An alert that provides helpful information.

VI. Configuration Example

The configuration example of the command reference is an example. Interface Number or the information of the display command, etc. may differ from your device.

VII. Security consideration

To enhance security, configured plain password is converted to hash or cipher password.

This command reference includes the following sections.

01 - Fundamentals

02 - IRF

03 - Layer 2 - LAN Switching

04 - Layer 3 - IP Services

05 - Layer 3 - IP Routing

06 - IP Multicast

07 - MCE

08 - ACL and QoS

09 - Security

10 - High Availability

11 - Network Management and Monitoring

12 - OpenFlow

13 - VXLAN

14 - EVPN

QX-S5600G Series Ethernet Switches

Command References

1.Fundamentals

This manual is including the following chapters.

01-Basic CLI commands

02-RBAC commands

03-Login management commands

04-FTP commands

05-TFTP commands

06-File system management commands

07-Configuration file management commands

08-Software upgrade commands

09-ISSU commands

10-Device management commands

11-Python commands

Contents

A page of this section is **1-x-x**

1. Basic CLI commands 1-1
1.1. Basic CLI commands 1-1
1.1.1. alias 1-1
1.1.2. display | { begin | exclude | include } 1-3
1.1.3. display | by-linenum 1-3
1.1.4. display > 1-4
1.1.5. display >> 1-5
1.1.6. display alias 1-6
1.1.7. display history-command 1-7
1.1.8. display history-command all 1-8
1.1.9. display hotkey 1-9
1.1.10. hotkey 1-10
1.1.11. quit 1-12
1.1.12. return 1-13
1.1.13. screen-length disable 1-13
1.1.14. system-view 1-14

1. Basic CLI commands

1.1. Basic CLI commands

1.1.1. alias

Use **alias** to configure a command alias.

Use **undo alias** to delete a command alias.

Syntax

alias *alias command*

undo alias *alias*

Default

The device has a set of system-defined command aliases, as listed in Table 1-1 .

Table 1-1 System-defined command aliases

Command alias	Command or command keyword
access-list	**acl**
end	**return**
erase	**delete**
exit	**quit**
hostname	**sysname**
logging	**info-center**
no	**undo**
show	**display**
write	**save**

Views

System view

Predefined user roles

network-admin

Parameters

alias: Specifies an alias, a case-sensitive string of 1 to 20 characters. An alias cannot be **alias** or contain spaces.

command: Specifies a command string. Make sure the command string meets the syntax requirements.

Usage guidelines

System-defined command aliases cannot be deleted.

You can configure one or more aliases for a command or the starting keywords of commands. Then, you can use the aliases to execute the command or commands. If the command or commands have **undo** forms, you can also use the aliases to execute the **undo** command or commands.

For example, if you configure the alias **shiprt** for **display ip routing-table**, you can enter **shiprt** to execute the **display ip routing-table** command. If you configure the alias **ship** for **display ip**, you can use **ship** to execute all commands that start with **display ip**:

- Enter **ship routing-table** to execute the **display ip routing-table** command.
- Enter **ship interface** to execute the **display ip interface** command.

The command string can include up to nine parameters. Each parameter starts with the dollar sign ($) and a sequence number in the range of 1 to 9. For example, you can configure the alias **shinc** for the **display ip $1 | include $2** command. Then, to execute the **display ip routing-table | include Static** command, you only need to enter **shinc routing-table Static**. To execute the **display ip interface | include GigabitEthernet1/0/1** command, you only need to enter **shinc interface GigabitEthernet1/0/1**.

Examples

Configure **shiprt** as the alias for the **display ip routing-table** command and verify the configuration.

```
<Switch> system-view
[Switch] alias shiprt display ip routing-table
[Switch] shiprt
Destinations : 13        Routes : 13
Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0

```

Configure **shinc** as the alias for **display ip $1 | include $2**.

```
[Switch] alias shinc display ip $1 | include $2
```

Use alias **shinc** to display all static routes.

```
[Switch] shinc routing-table Static
3.3.3.3/32          Static  60  0           192.168.1.62    Vlan1
```

Related commands

display alias

1.1.2. display | { begin | exclude | include }

Use **display |** { **begin** | **exclude** | **include** } to filter the output from a **display** command with a regular expression.

Syntax

display *command* **|** { **begin** | **exclude** | **include** } *regular-expression*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

begin: Displays the first line matching the specified regular expression and all subsequent lines.

exclude: Displays all lines not matching the specified regular expression.

include: Displays all lines matching the specified regular expression.

regular-expression: Specifies a regular expression, a case-sensitive string of 1 to 256 characters.

Usage guidelines

Use the **|** { **begin** | **exclude** | **include** } *regular-expression* option with a **display** command to filter the command output. For more information about regular expressions, see *Fundamentals Configuration Guide*.

Examples

Display the lines that contain **vlan** in the running configuration.

```
<Switch> display current-configuration | include vlan
vlan 1
vlan 999
 port access vlan 999
```

1.1.3. display | by-linenum

Use **display | by-linenum** to number each output line for a **display** command.

Syntax

display *command* **| by-linenum**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

Usage guidelines

By numbering each output line from a **display** command, you can easily identify the lines of interest.

Each line number is displayed as a 5-character string and might be followed by a colon (:) or hyphen (-). If you specify both **| by-linenum** and **| begin** *regular-expression* for a **display** command, a hyphen is displayed for all lines that do not match the regular expression.

Examples

Display VLAN 999 settings, with each output line identified by a number.

```
<Switch> display vlan 999 | by-linenum
    1:  VLAN ID: 999
    2:  VLAN type: Static
    3:  Route interface: Configured
    4:  IPv4 address: 192.168.2.1
    5:  IPv4 subnet mask: 255.255.255.0
    6:  Description: For LAN Access
    7:  Name: VLAN 0999
    8:  Tagged ports:   None
    9:  Untagged ports:
   10:     GigabitEthernet1/0/1
```

Display the first line that begins with **user-group** in the running configuration and all of the following lines.

```
<Switch> display current-configuration | by-linenum begin user-group
  114:  user-group system
  115-  #
  116-  return
```

1.1.4. display >

Use **display >** to save the output from a **display** command to a separate file.

Syntax

display *command* **>** *filename*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

filename: Specifies the name of the file that is used to save the output, a string of 1 to 63 characters.

Usage guidelines

The **display** commands show the configuration, statistics, and states of the device. You can use the **display >** command to save the output to a file.

If the specified file does not exist, the system creates the file and saves the output to the file. If the file already exists, the system overwrites the file.

Examples

Save VLAN 1 settings to a separate file named **vlan.txt**.

```
<Switch> display vlan 1 > vlan.txt
```

Check the content of the **vlan.txt** file.

```
<Switch> more vlan.txt
VLAN ID: 1
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
```

1.1.5. display >>

Use **display >>** to append the output from a **display** command to the end of a file.

Syntax

display *command* **>>** *filename*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

command: Specifies the keywords and arguments of a **display** command. To display available keywords and arguments, enter **display ?**.

filename: Specifies the name of the file that is used to save the output, a string of 1 to 63 characters.

Usage guidelines

The **display** commands show the configuration, statistics, and states of the device. You can use **display >>** to save the output to a file.

If the specified file does not exist, the system creates the file and saves the output to the file. If the file already exists, the system appends the output to the end of the file.

Examples

Append the VLAN 999 settings to the end of the **vlan.txt** file.

```
<Switch> display vlan 999 >> vlan.txt
<Switch>
```

Check the content of the **vlan.txt** file.

```
<Switch> more vlan.txt
VLAN ID: 1
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0001
 Name: VLAN 0001
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2

 VLAN ID: 999
 VLAN type: Static
 Route interface: Configured
 IPv4 address: 192.168.2.1
 IPv4 subnet mask: 255.255.255.0
 Description: For LAN Access
 Name: VLAN 0999
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
```

1.1.6. display alias

Use **display alias** to display command aliases.

Syntax

display alias [*alias*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

alias: Specifies a command alias. If you do not specify this argument, the command displays all command aliases.

Examples

Display all command aliases.

```
<Switch> display alias
Index     Alias               Command key
1         access-list         acl
2         end                 return
3         erase               delete
4         exit                quit
5         hostname            sysname
6         logging             info-center
```

```
7          no                    undo
8          shinc                 display $1 | include $2
9          show                  display
10         sirt                  display ip routing-table
11         write                 save
```

Display the command alias **shinc**.

```
<Switch> display alias shinc
Alias                Command key
shinc                display ip $1 | include $2
```

Related commands

alias

1.1.7. display history-command

Use **display history-command** to display all commands that are saved in the command history buffer for the current CLI session.

Syntax

display history-command

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

The system automatically saves commands you have successfully executed to the command history buffer for the current CLI session. You can view them and execute them again.

By default, the system can save up to 10 commands in the buffer. You can use the **history-command max-size** command to change the buffer size. To buffer a new command when the buffer is full, the system deletes the oldest command entry in the buffer.

All commands in the command history buffer for the current CLI session will be cleared when you log out.

After v7.3.21：

The system displays passwords as asterisks (*) to ensure device security if the command history buffer has password configuration commands.

Examples

Display all commands saved in the command history buffer for the current CLI session.

```
<Switch> display history-command
  system-view
  vlan 2
  quit
```

Related commands

history-command max-size

1.1.8. display history-command all

Use **display history-command all** to display all commands that are saved in the command history buffer for all CLI sessions.

Syntax

display history-command all

Views

Any view

Predefined user roles

network-admin

Usage guidelines

The system automatically saves commands successfully executed by users to the command history buffer for all CLI sessions. Users can view them but cannot recall them from the buffer.

Up to 1024 commands can be saved in the command history buffer. To buffer a new command when the buffer is full, the system deletes the oldest command entry in the buffer.

A user logout does not cause the system to delete commands from the history buffer for all CLI sessions.

Examples

Display all commands saved in the command history buffer for all CLI sessions.

```
<Switch> display history-command all
  Date       Time     Terminal   Ip              User
  03/16/2017 20:03:33 vty0       192.168.1.26    **
  Cmd:dis his all

  03/16/2017 20:03:29 vty0       192.168.1.26    **
  Cmd:sys
```

Table 1-2 Command output

Field	Description
Date	Date when the command was executed.
Time	Time when the command was executed.
Terminal	User line used by the user.
Ip	IP address of the terminal used by the user.
User	Username used by the user if the user login authentication mode is **scheme**. If the login authentication mode is **none** or **password**, this field displays ******.
Cmd	Command string entered by the user.

1.1.9. display hotkey

Use **display hotkey** to display hotkey information.

Syntax

display hotkey

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display hotkey information.

```
<Switch> display hotkey
----------------- Hotkeys -----------------
           -Defined function hotkeys-
CTRL_A  Move the cursor to the beginning of the line.
CTRL_B  Move the cursor one character to the left.
CTRL_C  Stop the current command.
CTRL_D  Erase the character at the cursor.
CTRL_E  Move the cursor to the end of the line.
CTRL_F  Move the cursor one character to the right.
CTRL_H  Erase the character to the left of the cursor.
CTRL_K  Abort the connection request.
CTRL_N  Display the next command in the history buffer.
CTRL_P  Display the previous command in the history buffer.
CTRL_R  Redisplay the current line.
CTRL_V  Paste text from the clipboard.
CTRL_W  Delete the word to the left of the cursor.
CTRL_X  Delete all characters from the beginning of the line to the cursor.
CTRL_Y  Delete all characters from the cursor to the end of the line.
CTRL_Z  Return to the User View.
CTRL_]  Kill incoming connection or redirect connection.
ESC_B   Move the cursor back one word.
ESC_D   Delete all characters from the cursor to the end of the word.
ESC_F   Move the cursor forward one word.
ESC_N   Move the cursor down a line.
ESC_P   Move the cursor up a line.
ESC_<   Move the cursor to the beginning of the clipboard.
ESC_>   Move the cursor to the end of the clipboard.

           -Defined command hotkeys-
CTRL_G display current-configuration
CTRL_L display ip routing-table
CTRL_O undo debugging all
```

```
                -Undefined hotkeys-
CTRL_T NULL
CTRL_U NULL
```

Related commands

hotkey

1.1.10. hotkey

Use **hotkey** to configure a hotkey.

Use **undo hotkey** to restore the default.

Syntax

hotkey *hotkey* { *command* | **function** *function* | **none** }

undo hotkey *hotkey*

Default

Table 1-3 shows the default definitions for hotkeys.

Table 1-3 Default definitions for hotkeys

Hotkey	Function or command
Ctrl+A	**move_the_cursor_to_the_beginning_of_the_line**: Moves the cursor to the beginning of a line.
Ctrl+B	**move_the_cursor_one_character_to_the_left**: Moves the cursor one character to the left.
Ctrl+C	**stop_the_current_command**: Stops the current command.
Ctrl+D	**erase_the_character_at_the_cursor**: Deletes the character at the cursor.
Ctrl+E	**move_the_cursor_to_the_end_of_the_line**: Moves the cursor to the end of a line.
Ctrl+F	**move_the_cursor_one_character_to_the_right**: Moves the cursor one character to the right.
Ctrl+G	**display current-configuration**: Displays the running configuration.
Ctrl+H	**erase_the_character_to_the_left_of_the_cursor**: Deletes the character to the left of the cursor.
Ctrl+K	**abort_the_connection_request**: Aborts the connection request.
Ctrl+L	**display ip routing-table**: Displays the IPv4 routing table information.
Ctrl+N	**display_the_next_command_in_the_history_buffer**: Displays the next command in the history buffer.
Ctrl+O	**undo debugging all**: Displays all debugging functions.
Ctrl+P	**display_the_previous_command_in_the_history_buffer**: Displays the previous command in the history buffer.
Ctrl+R	**redisplay_the_current_line**: Redisplays the current line.
Ctrl+T	N/A

Hotkey	Function or command
Ctrl+U	N/A
Ctrl+V	**paste_text_from_the_clipboard**: Pastes text from the clipboard. This hotkey is not supported in the current software version.
Ctrl+W	**delete_the_word_to_the_left_of_the_cursor**: Deletes the word to the left of the cursor.
Ctrl+X	**delete_all_characters_from_the_beginning_of_the_line_to_the_cursor**: Deletes all characters to the left of the cursor.
Ctrl+Y	**delete_all_characters_from_the_cursor_to_the_end_of_the_line** : Deletes all characters from the cursor to the end of the line.
Ctrl+Z	**return_to_the_User_View**: Returns to user view.
Ctrl+]	**kill_incoming_connection_or_redirect_connection**: Terminates the current connection.
Esc+B	**move_the_cursor_back_one_word**: Moves the cursor back one word.
Esc+D	**delete_all_characters_from_the_cursor_to_the_end_of_the_word**: Deletes all characters from the cursor to the end of the word.
Esc+F	**move_the_cursor_forward_one_word**: Moves the cursor forward one word.
Esc+N	**move_the_cursor_down_a_line**: Moves the cursor down one line. You can use this hotkey before pressing **Enter**. This hotkey is not supported in the current software version.
Esc+P	**move_the_cursor_up_a_line**: Moves the cursor up one line. You can use this hotkey before pressing **Enter**. This hotkey is not supported in the current software version.
Esc+<	**move_the_cursor_to_the_beginning_of_the_clipboard**: Moves the cursor to the beginning of the clipboard. This hotkey is not supported in the current software version.
Esc+>	**move_the_cursor_to_the_end_of_the_clipboard**: Moves the cursor to the end of the clipboard. This hotkey is not supported in the current software version.

Views

System view

Predefined user roles

network-admin

Parameters

hotkey: Specifies a hotkey. To display the supported hotkeys, enter **hotkey ?** or see Table 1-3 .

command: Specifies the command to be assigned to the hotkey.

function *function*: Specifies the function to be assigned to the hotkey. To display the supported functions, enter **hotkey** *hotkey* **function ?** or see Table 1-3 .

none: Removes the command or function assignment for the hotkey. After you remove the assignment for a hotkey, pressing the hotkey does not execute any command or function.

Usage guidelines

The device supports a set of hotkeys. Pressing a hotkey executes the command or function assigned to the hotkey.

A hotkey can correspond to only one command or function. If you assign multiple commands or functions to the same hotkey, the most recently assigned command or function takes effect.

A command or function can be assigned to multiple hotkeys. You can use any of those hotkeys to execute the command or function.

If a hotkey is also defined by the terminal software you are using to interact with the device, the terminal software definition takes effect.

Examples

Assign the **display tcp statistics** command to hotkey **Ctrl+T**.

```
<Switch> system-view
[Switch] hotkey ctrl_t display tcp statistics
```

Assign move_the_cursor_to_the_beginning_of_the_line function to hotkey **Ctrl+U**.

```
<Switch> system-view
[Switch] hotkey ctrl_u function move_the_cursor_to_the_beginning_of_the_line
```

Disable the configurable command or function assigned to hotkey **Ctrl+A**.

```
<Switch> system-view
[Switch] hotkey ctrl_a none
```

Related commands

display hotkey

1.1.11. quit

Use **quit** to return to the upper-level view.

Syntax

quit

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Executing this command in user view disconnects you from the device.

Examples

Return from GigabitEthernet 1/0/1 interface view to system view and then to user view.

```
[Switch-GigabitEthernet1/0/1] quit
[Switch] quit
<Switch>
```

1.1.12. return

Use **return** to return to user view from any other view.

Syntax

return

Views

Any view except user view

Predefined user roles

network-admin

network-operator

Usage guidelines

Pressing **Ctrl+Z** has the same effect as the **return** command.

Examples

Return to user view from GigabitEthernet 1/0/1 interface view.

```
[Switch-GigabitEthernet1/0/1] return
<Switch>
```

1.1.13. screen-length disable

Use **screen-length disable** to disable pausing between screens of output for the current CLI session.

Use **undo screen-length disable** to enable pausing between screens of output for the current CLI session.

Syntax

screen-length disable

undo screen-length disable

Default

The default depends on the configuration of the **screen-length** command in user line view.

The following are the default settings for the **screen-length** command:

- Pausing between screens of output.
- Displaying up to 24 lines on a screen.

Views

User view

Predefined user roles

network-admin

Usage guidelines

If you disable pausing between screens of output, all output is displayed. The screen is refreshed continuously until the final screen is displayed.

This command takes effect only for the current CLI session. When you are logged out, the default is restored.

Examples

Disable pausing between screens of output for the current CLI session.

```
<Switch> screen-length disable
```

Related commands

screen-length

1.1.14. system-view

Use **system-view** to enter system view from user view.

Syntax

system-view

Views

User view

Predefined user roles

network-admin

network-operator

Examples

Enter system view from user view.

```
<Switch> system-view
System View: return to User View with Ctrl+Z.
[Switch]
```

Table 2-1 Command output

Field	Description
Role	User role name. Predefined user role names: • network-admin. • network-operator. • level-*n* (where *n* represents an integer in the range of 0 to 15). • security-audit. • guest-manager. This user role is not supported in the current software version.
Description	User role description.
VLAN policy	VLAN policy of the user role: • **deny**—Denies access to any VLANs except for permitted VLANs. • **permit (default)**—Default VLAN policy, which enables the user role to access all VLANs.
Permitted VLANs	VLANs accessible to the user role.
Interface policy	Interface policy of the user role: • **deny**—Denies access to any interfaces except for permitted interfaces. • **permit (default)**—Default interface policy, which enables the user role to access all interfaces.
Permitted interfaces	Interfaces accessible to the user role.

Field	Description
VPN instance policy	VPN instance policy of the user role: • **deny**—Denies access to any VPN instances except for permitted VPN instances. • **permit (default)**—Default VPN instance policy, which enables the user role to access all VPN instances.
Permitted VPN instances	VPN instances accessible to the user role.
Rule	User role rule number. Predefined user role rules are identified by sys-*n*, where *n* represents an integer.
Perm	Access control type: • **permit**—User role has access to the items in the **Entity** field. • **deny**—User role does not have access to the items in the **Entity** field.
Type	Controlled type: • **R**—Read-only. • **W**—Write. • **X**—Execute.
Scope	Rule control scope: • **command**—Controls access to the command or commands, as specified in the **Entity** field. • **feature**—Controls access to the commands of the feature, as specified in the **Entity** field. • **feature-group**—Controls access to the commands of the features in the feature group, as specified in the **Entity** field. • **web-menu**—Controls access to Web menus. This rule control scope is not supported in the current software version. • **xml-element**—Controls access to XML elements. • **oid**—Controls access to MIB nodes.
Entity	Command string, feature name, feature group, XML element, or OID specified in the user role rule: • An en dash (–) represents any feature. • An asterisk (*) represents zero or more characters.

role

2.1.3. display role feature

Use **display role feature** to display features available in the system.

Syntax

display role feature [**name** *feature-name* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *feature-name*: Specifies a feature by feature name. The *feature-name* argument represents the feature name, and all letters must be in lower case.

verbose: Displays the commands of each feature.

Usage guidelines

If you do not specify any parameters, the command displays only the list of features available in the system.

Examples

Display the list of feature names.

```
<Switch> display role feature
Feature: device           (Device configuration related commands)
Feature: interface        (Interface related commands)
Feature: syslog           (Syslog related commands)
…
```

Display the commands of each feature.

```
<Switch> display role feature verbose
Feature: device           (Device configuration related commands)
  display clock    (R)
  debugging dev    (W)
  display debugging dev    (R)
  display device *    (R)
  display diagnostic-information *    (R)
  display environment *    (R)
  display fan *    (R)
  display power *    (R)
  display current-configuration *    (R)
  display saved-configuration *    (R)
  display default-configuration *    (R)
  display startup    (R)
  display this *    (R)
…
```

Display the commands of feature **aaa**.

```
<Switch> display role feature name aaa
Feature: aaa              (AAA related commands)
  system-view ; domain *    (W)
  system-view ; header *    (W)
  system-view ; aaa *    (W)
  display domain *    (R)
  display aaa *    (R)
  system-view ; user-group *    (W)
  system-view ; local-user *    (W)
  display local-user *    (R)
```

```
display user-group *    (R)
display debugging local-server    (R)
debugging local-server *    (W)
super *    (X)
display password-control *    (R)
reset password-control *    (W)
system-view ; password-control *    (W)
```

…

Table 2-2 Command output (display role feature name aaa)

Field	Description
Feature	Displays the name and brief function description of the feature.
system-view ; domain *	All commands that start with the **domain** keyword in system view, and all commands in ISP domain view.
system-view ; header *	All commands that start with the **header** keyword in system view.
system-view ; aaa *	All commands that start with the **aaa** keyword in system view.
display domain *	All commands that start with the **display domain** keywords in user view.
system-view ; user-group *	All commands that start with the **user-group** keyword in system view, and all commands in user group view.
system-view ; local-user *	All commands that start with the **local-user** keyword in system view, and all commands in local user view.
display local-user *	All commands that start with the **display local-user** keywords in user view.
display user-group *	All commands that start with the **display user-group** keywords in user view.
display debugging local-server	All commands that start with the **display debugging local-server** keywords in user view.
debugging local-server *	All commands that start with the **debugging local-server** keywords in user view.
super *	All commands that start with the **super** keyword in user view.
display password-control *	All commands that start with the **display password-control** keywords in user view.
reset password-control *	All commands that start with the **reset password-control** keywords in user view.
system-view ; password-control *	All commands that start with the **password-control** keyword in system view.
(W)	Command type is Write. A write command configures the system.
(R)	Command type is Read. A read command displays configuration or maintenance information.

Field	Description
(X)	Command type is Execute. An execute command executes a specific function.

Related commands

feature

2.1.4. display role feature-group

Use **display role feature-group** to display feature group information.

Syntax

display role feature-group [**name** *feature-group-name*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *feature-group-name*: Specifies a feature group. The *feature-group-name* argument represents the feature group name, a case-sensitive string of 1 to 31 characters. If you do not specify a feature group, the command displays information about all feature groups.

verbose: Displays the commands of each feature in feature groups. If you do not specify this keyword, the command displays only the feature lists of feature groups.

Usage guidelines

Feature groups **L2** and **L3** are predefined feature groups.

Examples

Display the feature lists of feature groups.

```
<Switch> display role feature-group
Feature group: L2
Feature: igmp-snooping    (IGMP-Snooping related commands)
Feature: mld-snooping     (MLD-Snooping related commands)

Feature: msdp            (Multicast Source Discovery Protocol related commands)
```

Related commands

feature

role feature-group

2.1.5. feature

Use **feature** to add a feature to a feature group.

Use **undo feature** to remove a feature from a feature group.

Syntax

feature *feature-name*

undo feature *feature-name*

Default

A user-defined feature group does not have any features.

Views

Feature group view

Predefined user roles

network-admin

Parameters

feature-name: Specifies a feature name. You must enter the feature name in lower case.

Usage guidelines

Repeat the **feature** command to add multiple features to a feature group.

Examples

Add the AAA and ACL features to feature group **security-features**.

```
<Switch> system-view
[Switch] role feature-group name security-features
[Switch-featuregrp-security-features] feature aaa
[Switch-featuregrp-security-features] feature acl
```

Related commands

display role feature

display role feature-group

role feature-group

2.1.6. interface policy deny

Use **interface policy deny** to enter user role interface policy view.

Use **undo interface policy deny** to restore the default.

Syntax

interface policy deny

undo interface policy deny

Default

A user role has access to all interfaces.

Views

User role view

Predefined user roles

network-admin

Usage guidelines

To restrict the interface access of a user role to a set of interfaces, perform the following tasks:

1. Use **interface policy deny** to enter user role interface policy view.
2. Use **permit interface** to specify accessible interfaces.

NOTE:

The **interface policy deny** command denies the access of the user role to any interfaces if the **permit interface** command is not configured.

To configure an interface, make sure the interface is permitted by the user role interface policy in use. You can perform the following tasks on an accessible interface:

- Create, remove, or configure the interface.
- Enter interface view.
- Specify the interface in feature commands.

The create and remove operations are available only for logical interfaces.

Any change to a user role interface policy takes effect only on users who log in with the user role after the change.

Examples

Enter user role interface policy view of **role1**, and deny **role1** to access any interfaces.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] interface policy deny
[Switch-role-role1-ifpolicy] quit
```

Enter user role interface policy view of **role1**, and deny **role1** to access any interfaces except for GigabitEthernet 1/0/1 to GigabitEthernet 1/0/4.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] interface policy deny
[Switch-role-role1-ifpolicy] permit interface gigabitethernet 1/0/1 to gigabitethernet
1/0/4
```

Related commands

display role

permit interface

role

2.1.7. permit interface

Use **permit interface** to configure a list of interfaces accessible to a user role.

Use **undo permit interface** to disable the access of a user role to specific interfaces.

Syntax

permit interface *interface-list*

undo permit interface [*interface-list*]

Default

No permitted interfaces are configured in user role interface policy view.

Views

User role interface policy view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 10 interface items. Each interface item specifies one interface in the *interface-type interface-number* form or a range of interfaces in the *interface-type interface-number* **to** *interface-type interface-number* form. If you specify an interface range, the end interface must meet the following requirements:

- Be the same type as the start interface.
- Have a higher interface number than the start interface.

Usage guidelines

To permit a user role to access an interface after you configure the **interface policy deny** command, you must add the interface to the permitted interface list of the policy. With the user role, you can perform the following tasks to the interfaces in the permitted interface list:

- Create, remove, or configure the interfaces.
- Enter the interface views.
- Specify the interfaces in feature commands.

The create and remove operations are available only for logical interfaces.

You can repeat the **permit interface** command to add multiple permitted interfaces to a user role interface policy.

The **undo permit interface** command removes the entire list of permitted interfaces if you do not specify an interface.

Any change to a user role interface policy takes effect only on users who log in with the user role after the change.

Examples

1. Configure user role **role1**:

   # Permit user role **role1** to execute all commands available in interface view and VLAN view.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] rule 1 permit command system-view ; interface *
[Switch-role-role1] rule 2 permit command system-view ; vlan *
```

   # Permit the user role to access GigabitEthernet 1/0/1, and GigabitEthernet 1/0/3 to GigabitEthernet 1/0/5.

```
[Switch-role-role1] interface policy deny
[Switch-role-role1-ifpolicy] permit interface gigabitethernet 1/0/1 gigabitethernet
1/0/3 to gigabitethernet 1/0/5
[Switch-role-role1-ifpolicy] quit
[Switch-role-role1] quit
```

2. Verify that you cannot use user role **role1** to work on all interfaces except for GigabitEthernet 1/0/1 and GigabitEthernet 1/0/3 to GigabitEthernet 1/0/5:

   # Verify that you can enter GigabitEthernet 1/0/1 interface view.

   ```
   [Switch] interface gigabitethernet 1/0/1
   [Switch-GigabitEthernet1/0/1] quit
   ```

   # Verify that you can assign GigabitEthernet 1/0/5 to VLAN 10. In this example, the user role can access all VLANs because the default VLAN policy of the user role is used.

   ```
   [Switch] vlan 10
   [Switch-vlan10] port gigabitethernet 1/0/5
   [Switch-vlan10] quit
   ```

   # Verify that you cannot enter interface view of GigabitEthernet 1/0/2.

   ```
   [Switch] interface gigabitethernet 1/0/2
   Permission denied.
   ```

role

2.1.8. permit vlan

Use **permit vlan** to configure a list of VLANs accessible to a user role.

Use **undo permit vlan** to remove the permission for a user role to access specific VLANs.

Syntax

permit vlan *vlan-id-list*

undo permit vlan [*vlan-id-list*]

Default

No permitted VLANs are configured in user role VLAN policy view.

Views

User role VLAN policy view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each VLAN item specifies a VLAN by VLAN ID or specifies a range of VLANs in the form of *vlan-id1* **to** *vlan-id2*. The value range for the VLAN IDs is 1 to 4094. If you specify a VLAN range, the value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument.

Usage guidelines

To permit a user role to access a VLAN after you configure the **vlan policy deny** command, you must add the VLAN to the permitted VLAN list of the policy. With the user role, you can perform the following tasks on the VLANs in the permitted VLAN list:

- Create, remove, or configure the VLANs.
- Enter the VLAN views.
- Specify the VLANs in feature commands.

You can repeat the **permit vlan** command to add multiple permitted VLANs to a user role VLAN policy.

The **undo permit vlan** command removes the entire list of permitted VLANs if you do not specify a VLAN.

Any change to a user role VLAN policy takes effect only on users who log in with the user role after the change.

Examples

1. Configure user role **role1**:

   # Permit user role **role1** to execute all commands available in interface view and VLAN view.

   ```
   <Switch> system-view
   [Switch] role name role1
   [Switch-role-role1] rule 1 permit command system-view ; interface *
   [Switch-role-role1] rule 2 permit command system-view ; vlan *
   ```

   # Permit user role **role1** to access VLANs 2, 4, and 50 to 100.

   ```
   [Switch-role-role1] vlan policy deny
   [Switch-role-role1-vlanpolicy] permit vlan 2 4 50 to 100
   [Switch-role-role1-vlanpolicy] quit
   [Switch-role-role1] quit
   ```

2. Verify that you cannot use user role **role1** to work on all VLANs except for VLANs 2, 4, and 50 to 100:

   # Verify that you can create VLAN 100 and enter VLAN view.

   ```
   [Switch] vlan 100
   [Switch-vlan100] quit
   ```

   # Verify that you can add GigabitEthernet 1/0/1 to VLAN 100 as an access port.

   ```
   [Switch] interface gigabitethernet 1/0/1
   [Switch-GigabitEthernet1/0/1] port access vlan 100
   [Switch-GigabitEthernet1/0/1] quit
   ```

   # Verify that you cannot create VLAN 101 or enter VLAN view.

   ```
   [Switch] vlan 101
   Permission denied.
   ```

2.1.9. permit vpn-instance

Use **permit vpn-instance** to configure a list of VPN instances accessible to a user role.

Use **undo permit vpn-instance** to disable the access of a user role to specific VPN instances.

Syntax

permit vpn-instance *vpn-instance-name*&<1-10>

undo permit vpn-instance [*vpn-instance-name*&<1-10>]

Default

No permitted VPN instances are configured in user role VPN instance policy.

Views

User role VPN instance policy view

Predefined user roles

network-admin

Parameters

vpn-instance-name&<1-10>: Specifies a space-separated list of up to 10 VPN instance names. Each name is a case-sensitive string of 1 to 31 characters.

Usage guidelines

To permit a user role to access a VPN instance after you configure the **vpn-instance policy deny** command, you must add the VPN instance to the permitted VPN instance list of the policy. With the user role, you can perform the following tasks on the VPN instances in the permitted VPN instance list:

- Create, remove, or configure the VPN instances.
- Enter the VPN instance views.
- Specify the VPN instances in feature commands.

You can repeat the **permit vpn-instance** command to add multiple permitted VPN instances to a user role VPN instance policy.

The **undo permit vpn-instance** command removes the entire list of permitted VPN instances if you do not specify a VPN instance.

Any change to a user role VPN instance policy takes effect only on users who log in with the user role after the change.

Examples

1. Configure user role **role1**:

   # Permit the user role to execute all commands available in system view and in the child views of system view.

   ```
   <Switch> system-view
   [Switch] role name role1
   [Switch-role-role1] rule 1 permit command system-view ; *
   ```

   # Permit the user role to access VPN instance **vpn1**.

   ```
   [Switch-role-role1] vpn policy deny
   [Switch-role-role1-vpnpolicy] permit vpn-instance vpn1
   [Switch-role-role1-vpnpolicy] quit
   [Switch-role-role1] quit
   ```

2. Verify that you cannot use user role **role1** to work on all VPN instances except for **vpn1**:

   # Verify that you can enter the view of **vpn1**.

   ```
   [Switch] ip vpn-instance vpn1
   [Switch-vpn-instance-vpn1] quit
   ```

   # Verify that you can specify the primary accounting server at 10.110.1.2 in VPN instance **vpn1** for RADIUS scheme **radius1**.

   ```
   [Switch] radius scheme radius1
   [Switch-radius-radius1] primary accounting 10.110.1.2 vpn-instance vpn1
   [Switch-radius-radius1] quit
   ```

   # Verify that you cannot create VPN instance **vpn2** or enter VPN instance view.

   ```
   [Switch] ip vpn-instance vpn2
   Permission denied.
   ```

Related commands

display role

role

vpn-instance policy deny

2.1.10. role

Use **role** to create a user role and enter its view, or enter the view of an existing user role.

Use **undo role** to delete a user role.

Syntax

role name *role-name*

undo role name *role-name*

Default

The system has the following predefined user roles: network-admin, network-operator, level-*n* (where *n* represents an integer in the range of 0 to 15), and security-audit.

Views

System view

Predefined user roles

network-admin

Parameters

name *role-name*: Specifies a username. The *role-name* argument is a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can create a maximum of 64 user roles in addition to the predefined user roles.

You cannot delete the predefined user roles or change the permissions assigned to network-admin, network-operator, level-15, or security-audit.

You cannot assign the security-audit user role to non-AAA authentication users.

The access permissions of the level-0 to level-14 user roles can be modified through user role rules and resource access policies. However, you cannot make changes on the predefined access permissions of these user roles. For example, you cannot change the access permission of these user roles to the **display history-command all** command.

Examples

Create user role **role1** and enter its view.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1]
```

2.1.11. role default-role enable

Use **role default-role enable** to enable the default user role feature for remote AAA users.

Use **undo role default-role enable** to restore the default.

Syntax

role default-role enable [*role-name*]

undo role default-role enable

Default

The default user role feature is disabled. AAA users who do not have a user role cannot log in to the device.

Views

System view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role by its name for the default user role. The user role must already exist. The argument is a case-sensitive string of 1 to 63 characters.

Usage guidelines

The default user role feature assigns the default user role to AAA-authenticated users if the authentication server (local or remote) does not assign any user roles to the users. These users are allowed to access the system with the default user role.

For local authorization, this command is required if you do not use the **authorization-attribute user role** command to assign user roles to local users.

If AAA users have been assigned user roles, they log in with the user roles.

If you do not specify the *role-name* argument, the default user role is network-operator.

Examples

Enable the default user role feature.

```
<Switch> system-view
[Switch] role default-role enable
```

Related commands

2.1.12. role feature-group

Use **role feature-group** to create a user role feature group and enter its view, or enter the view of an existing user role feature group.

Use **undo role feature-group** to delete a user role feature group.

Syntax

role feature-group name *feature-group-name*

undo role feature-group name *feature-group-name*

Default

Two user role feature groups **L2** and **L3** exist.

Views

System view

Predefined user roles

network-admin

Parameters

name *feature-group-name*: Specifies a feature group name. The *feature-group-name* argument is a case-sensitive string of 1 to 31 characters.

Usage guidelines

The **L2** feature group includes all Layer 2 feature commands, and the **L3** feature group includes all Layer 3 feature commands. These predefined feature groups are not user configurable.

In addition to the predefined feature groups **L2** and **L3**, you can create a maximum of 64 user role feature groups.

Examples

Create feature group **security-features** and enter its view.

```
<Switch> system-view
[Switch] role feature-group name security-features
[Switch-featuregrp-security-features]
```

Related commands

2.1.13. rule

Use **rule** to create or change a user role rule.

Use **undo rule** to delete user role rules.

Syntax

rule *number* { **deny** | **permit** } { **command** *command-string* | { **execute** | **read** | **write** } * { **feature** [*feature-name*] | **feature-group** *feature-group-name* | **oid** *oid-string*} }

undo rule { *number* | **all** }

Default

A user-defined user role does not have any rules and cannot access any resources.

Views

User role view

Predefined user roles

network-admin

Parameters

number: Specifies a rule number in the range of 1 to 256.

deny: Denies access to the specified commands, XML elements, or MIB nodes.

permit: Permits access to the specified commands, XML elements, or MIB nodes.

command *command-string*: Specifies a command string. The command string can represent a command or a group of commands. The *command-string* argument is a case-sensitive string of 1 to 128 characters, including the following characters:

- The wildcard asterisk (*).
- The delimiters space and tab.
- All printable characters.

execute: Specifies the execute commands, XML elements, or MIB nodes to execute a specific function or program. The **ping** command is an example of execute commands.

read: Specifies the read commands, XML elements, or MIB nodes to display configuration or maintenance information. The **display**, **dir**, **more**, and **pwd** commands are examples of read commands.

write: Specifies the write commands, XML elements, or MIB nodes to configure the system. The **ssh server enable** command is an example of write commands.

feature [*feature-name*]: Specifies one or all features. The *feature-name* argument is a case-sensitive character string. If you do not specify a feature name, you specify all the features in the system.

feature-group *feature-group-name*: Specifies a user-defined or predefined feature group. The *feature-group-name* argument represents the feature group name, a case-sensitive string of 1 to 31 characters. If the feature group has not been created, the rule takes effect after the group is created. To display the feature groups that have been created, use the **display role feature-group** command.

oid *oid-string*: Specifies an OID of a MIB node. The *oid-string* argument represents the OID, a case-insensitive string of 1 to 255 characters. The OID is a dotted numeric string that uniquely identifies the path from the root node to this node. For example, 1.3.6.1.4.1.25506.8.35.14.19.1.1.

all: Specifies all the user role rules.

Usage guidelines

You can define the following types of rules for different access control granularities:

- **Command rule**—Controls access to a command or a set of commands that match a regular expression.
- **Feature rule**—Controls access to the commands of a feature by command type.
- **Feature group rule**—Controls access to the commands of a group of features by command type.
- **OID rule**—Controls access to the specified MIB node and its child nodes by node type.

A user role can access the set of permitted resources specified in the user role rules. User role rules include predefined (identified by sys-n) and user-defined user role rules.

You can configure a maximum of 256 user-defined rules for a user role. The total number of user-defined user role rules cannot exceed 1024.

Any rule modification, addition, or removal for a user role takes effect only on the users who log in with the user role after the change.

Access to the file system commands is controlled by both the file system command rules and the file system feature rule.

A command with output redirection to the file system is permitted only when the command type write is assigned to the file system feature.

The following guidelines apply to non-OID rules:

- If two user-defined rules of the same type conflict, the rule with the higher ID takes effect. For example, a user role can use the **tracert** command but not the **ping** command if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit command** *ping*
  - **rule** *2* **permit command** *tracert*
  - **rule** *3* **deny command** *ping*
- If a predefined user role rule and a user-defined user role rule conflict, the user-defined user role rule takes effect.

The following guidelines apply to OID rules:

- The system compares an OID with the OIDs specified in rules, and it uses the longest match principle to select a rule for the OID. For example, a user role cannot access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit read write oid** *1.3.6*
  - **rule** *2* **deny read write oid** *1.3.6.1.4.1*
  - **rule** *3* **permit read write oid** *1.3.6.1.4*
- If the same OID is specified in multiple rules, the rule with the higher ID takes effect. For example, a user role can access the MIB node with OID 1.3.6.1.4.1.25506.141.3.0.1 if the user role contains rules configured by using the following commands:
  - **rule** *1* **permit read write oid** *1.3.6*
  - **rule** *2* **deny read write oid** *1.3.6.1.4.1*
  - **rule** *3* **permit read write oid** *1.3.6.1.4.1*

When you specify a command string, follow the guidelines in Table 2-3 .

Table 2-3 Command string configuration rules

Rule	Guidelines
Semicolon (;) is the delimiter.	Use a semicolon to separate the command of each view that you must enter before you access a command or a set of commands. However, do not use a semicolon to separate commands available in user view or any view, for example, **display** and **dir**. Each semicolon-separated segment must have a minimum of one printable character. To specify the commands in a view but not the commands in the view's subviews, use a semicolon as the last printable character in the last segment. To specify the commands in a view and the view's subviews, the last printable character in the last segment must not be a semicolon. For example, you must enter system view before you enter interface view. To specify all commands starting with the **ip** keyword in any interface view, you must use the "system ; interface * ; ip * ;" command string. For another example, the "system ; radius scheme * ;" command string represents all commands that start with the

Rule	Guidelines
	radius scheme keywords in system view. The "system ; radius scheme *" command string represents all commands that start with the **radius scheme** keywords in system view and all commands in RADIUS scheme view.
Asterisk (*) is the wildcard.	An asterisk represents zero or multiple characters. In a non-last segment, you can use an asterisk only at the end of the segment. In the last segment, you can use an asterisk in any position of the segment. If the asterisk appears at the beginning, you cannot specify a printable character behind the asterisk. For example, the "system ; *" command string represents all commands available in system view and all subviews of the system view. The "debugging * event" command string represents all event debugging commands available in user view.
Keyword abbreviation is allowed.	You can specify a keyword by entering the first few characters of the keyword. Any command that starts with this character string matches the rule. For example, "rule 1 deny command dis arp source *" denies access to the commands **display arp source-mac interface** and **display arp source-suppression**.
To control the access to a command, you must specify the command immediately after the view that has the command.	To control access to a command, you must specify the command immediately behind the view to which the command is assigned. The rules that control command access for any subview do not apply to the command. For example, the "rule 1 deny command system ; interface * ; *" command string disables access to any command that is assigned to interface view. However, you can still execute the **acl advanced** command in interface view, because this command is assigned to system view rather than interface view. To disable access to this command, use "rule 1 deny command system ; acl *;".
Do not include the vertical bar (|), greater-than sign (>), or double greater-than sign (>>) when you specify **display** commands in a user role command rule.	The system does not treat the redirect signs and the parameters that follow the signs as part of command lines. However, in user role command rules, these redirect signs and parameters are handled as part of command lines. As a result, no rule that includes any of these signs can find a match. For example, "rule 1 permit command display debugging > log" can never find a match. This is because the system has a **display debugging** command but not a **display debugging > log** command.

Examples

Permit user role **role1** to execute the **display acl** command.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] rule 1 permit command display acl
```

Permit user role **role1** to execute all commands that start with the **display** keyword.

```
[Switch-role-role1] rule 2 permit command display *
```

Permit user role **role1** to execute the **radius scheme aaa** command in system view and use all commands assigned to RADIUS scheme view.

```
[Switch-role-role1] rule 3 permit command system ; radius scheme aaa
```

Deny the access of **role1** to the read or write commands of any features.

```
[Switch-role-role1] rule 4 deny read write feature
```

Deny the access of **role1** to the read commands of the **aaa** feature.

```
[Switch-role-role1] rule 5 deny read feature aaa
```

Permit **role1** to access all read, write, and execute commands of feature group **security-features**.

```
[Switch-role-role1] rule 6 permit read write execute feature-group security-features
```

Permit **role1** to access all read and write MIB nodes starting from the node with OID 1.1.2.

```
[Switch-role-role1] rule 7 permit read write oid 1.1.2
```

role

2.1.14. super

Use **super** to obtain another user role without reconnecting to the device.

Syntax

super [*role-name*]

Views

User view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit. If you do not specify a user role, you obtain the default target user role which is set by using the **super default role** command.

Usage guidelines

The obtained user role is a temporary user role, because this command is effective only on the current login. The next time you are logged in with the user account, the original user role settings take effect.

To enable a user to obtain another user role without reconnecting to the device, you must configure user role authentication.

- If no local password is configured in the local password authentication (**local**), an AUX user can obtain the user role by either entering a string or not entering anything.
- If no local password is configured in the local-then-remote authentication (**local scheme**), the following rules apply:
  - A VTY user performs remote authentication.
  - An AUX user can obtain user role authorization by either entering a string or not entering anything.

Examples

Obtain the user role network-operator.

```
<Switch> super network-operator
Password:
User privilege role is network-operator, and only those commands that authorized to the role can be used.
```

Related commands

authentication super (*Security Command Reference*)

super authentication-mode

2.1.15. super authentication-mode

Use **super authentication-mode** to set an authentication mode for temporary user role authorization.

Use **undo super authentication-mode** to restore the default.

Syntax

super authentication-mode { **local** | **scheme** } *

undo super authentication-mode

Default

Local password authentication applies.

Views

System view

Predefined user roles

network-admin

Parameters

local: Enables local password authentication.

scheme: Enables remote AAA authentication.

Usage guidelines

For local password authentication, use the **super password** command to set a password.

For remote AAA authentication, set the username and password on the RADIUS server.

If you specify both **local** and **scheme** keywords, the keyword first entered in the command takes precedence.

- **scheme local**—Enables remote-then-local authentication mode. The device first performs AAA authentication to obtain a temporary user role. Local password authentication is performed if the remote RADIUS server does not respond, or if the AAA configuration on the device is invalid.
- **local scheme**—Enables local-then-remote authentication mode. The device first performs local password authentication. If no password is configured for the user role, the device performs remote authentication for VTY users. An AUX user can obtain another user role by either entering a string or not entering anything.

For more information about AAA, see *Security Configuration Guide*.

Examples

Enable local-only authentication for temporary user role authorization.

```
<Switch> system-view
[Switch] super authentication-mode local
```

Enable remote-then-local authentication for temporary user role authorization.

```
<Switch> system-view
[Switch] super authentication-mode scheme local
```

Related commands

2.1.16. super default role

Use **super default role** to specify the default target user role for temporary user role authorization.

Use **undo super default role** to restore the default.

Syntax

super default role *role-name*

undo super default role

Default

The default target user role is network-admin.

Views

System view

Predefined user roles

network-admin

Parameters

role-name: Specifies the name of the default target user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit.

Usage guidelines

The default target user role is applied to the **super** or **super password** command when you do not specify a user role for the command.

Examples

Specify **network-operator** as the default target user role for temporary user role authorization.

```
<Switch> system-view
[Switch] super default role network-operator
```

Related commands

2.1.17. super password

Use **super password** to set a password for a user role.

Use **undo super password** to delete the password for a user role.

Syntax

super password [**role** *role-name*] [{ **hash** | **simple** } *string*]

undo super password [**role** *role-name*]

Default

No password is set for a user role.

Views

System view

Predefined user roles

network-admin

Parameters

role *role-name*: Specifies a user role, a case-sensitive string of 1 to 63 characters. The user role must exist in the system and cannot be security-audit. If you do not specify a user role, the command sets a password for the default target user role which is set by using the **super default role** command.

hash: Specifies a password in hashed form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in hashed form.

string: Specifies the password. The plaintext form of the password is a case-sensitive string of 1 to 63 characters. The hashed form of the password is a case-sensitive string of 1 to 110 characters.

Usage guidelines

If you do not specify any parameters, you specify a plaintext password in the interactive mode.

Set a password if you configure local password authentication for temporary user role authorization.

It is a good practice to specify different passwords for different user roles.

Examples

Set the password to **123456TESTplat&!** in plaintext form for user role network-operator.

```
<Switch> system-view
[Switch] super password role network-operator simple 123456TESTplat&!
```

Set the password to **123456TESTplat&!** in the interactive mode for user role network-operator.

```
<Switch> system-view
[Switch] super password role network-operator
Password:
Confirm :
Updating user information. Please wait... ...
```

Related commands

super default role

2.1.18. vlan policy deny

Use **vlan policy deny** to enter user role VLAN policy view.

Use **undo vlan policy deny** to restore the default.

Syntax

vlan policy deny

undo vlan policy deny

Default

A user role has access to all VLANs.

Views

User role view

Predefined user roles

network-admin

Usage guidelines

To restrict the VLAN access of a user role to a set of VLANs, perform the following tasks:

1. Use **vlan policy deny** to enter user role VLAN policy view.
2. Use **permit vlan** to specify accessible VLANs.

NOTE:

The **vlan policy deny** command denies the access of the user role to any VLANs if the **permit vlan** command is not configured.

To configure a VLAN, make sure the VLAN is permitted by the user role VLAN policy in use. You can perform the following tasks on an accessible VLAN:

- Create, remove, or configure the VLAN.
- Enter VLAN view.
- Specify the VLAN in feature commands.

Any change to a user role VLAN policy takes effect only on users who log in with the user role after the change.

Examples

Enter user role VLAN policy view of **role1**, and deny the access of **role1** to any VLANs.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] vlan policy deny
[Switch-role-role1-vlanpolicy] quit
```

Enter user role VLAN policy view of **role1**, and deny the access of **role1** to any VLANs except for VLANs 50 to 100.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] vlan policy deny
[Switch-role-role1-vlanpolicy] permit vlan 50 to 100
```

Usage guidelines

To restrict the VPN instance access of a user role to a set of VPN instances, perform the following tasks:

1. Use **vpn-instance policy deny** to enter user role VPN instance policy view.
2. Use **permit vpn-instance** to specify accessible VPN instances.

NOTE:

The **vpn-instance policy deny** command denies the access of the user role to any VPN instances if the **permit vpn-instance** command is not configured.

To configure a VPN instance, make sure the VPN instance is permitted by the user role VPN instance policy in use. You can perform the following tasks on an accessible VPN instance:

- Create, remove, or configure the VPN instance.
- Enter VPN instance view.
- Specify the VPN instance in feature commands.

Any change to a user role VPN instance policy takes effect only on users who log in with the user role after the change.

Examples

Enter user role VPN instance policy view of **role1**, and deny the access of **role1** to any VPN instances.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] vpn-instance policy deny
[Switch-role-role1-vpnpolicy] quit
```

Enter user role VPN instance policy view of **role1**, and deny the access of **role1** to any VPN instances except for **vpn2**.

```
<Switch> system-view
[Switch] role name role1
[Switch-role-role1] vpn-instance policy deny
[Switch-role-role1-vpnpolicy] permit vpn-instance vpn2
```

3. Login management commands

3.1. Login management commands

Some login management commands are available in both user line view and user line class view. For these commands, the device uses the following rules to determine the settings to be activated:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.
- A setting in user line class view takes effect for login sessions that are established after the setting is configured.

3.1.1. authentication-mode

Use **authentication-mode** to set the authentication mode for a user line.

Use **undo authentication-mode** to restore the default.

Syntax

authentication-mode { **none** | **password** | **scheme** }

undo authentication-mode

Default

none

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

none: Disables authentication.

password: Performs local password authentication.

scheme: Performs AAA authentication. For more information about AAA, see *Security Configuration Guide*.

Usage guidelines

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

When the authentication mode is **none**, a user can log in without authentication. To improve device security, use the password or scheme authentication mode.

In VTY line view, this command is associated with the **protocol inbound** command.

- If the settings of the two commands in VTY line view are both the default settings, the settings for the commands in VTY line class view take effect.

- If the settings of the two commands in VTY line view are both non-default settings, the non-default settings in VTY line view take effect.
- If only one command has a non-default setting in VTY line view, the other command uses the default setting, regardless of the setting in VTY line class view.

An authentication mode change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Enable the **none** authentication mode for VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] authentication-mode none
```

Enable password authentication for VTY line 0 and set the password to **321**.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] authentication-mode password
[Switch-line-vty0] set authentication password simple 321
```

Enable scheme authentication for VTY line 0. Configure the local user **123** and set the password to **321**. Assign the Telnet service and the user role network-admin to the user.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] authentication-mode scheme
[Switch-line-vty0] quit
[Switch] local-user 123
[Switch-luser-manage-123] password simple 321
[Switch-luser-manage-123] service-type telnet
[Switch-luser-manage-123] authorization-attribute user-role network-admin
```

Related commands

set authentication password

3.1.2. auto-execute command

Use **auto-execute command** to specify the command to be automatically executed for a login user.

Use **undo auto-execute command** to restore the default.

Syntax

auto-execute command *command*

undo auto-execute command

Default

No command is specified to be automatically executed for a login user.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

command: Specifies the command to be automatically executed.

Usage guidelines

CAUTION:

After configuring this command for a user line, you might be unable to access the CLI through the user line. Make sure you can access the CLI through a different user line before you configure this command and save the configuration.

The device will automatically execute the specified command when a user logs in through the user line, and close the user connection after the command is executed.

This command is not supported in AUX line view or AUX line class view.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A configuration change made by this command does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Configure the device to automatically execute the **telnet 192.168.1.41** command when a user logs in through VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] auto-execute command telnet 192.168.1.41
This action will lead to configuration failure through line-vty0. Are you sure?
[Y/N]:y
[Switch-line-vty0]
```

To verify the configuration, Telnet to the device (192.168.1.40).

The device automatically Telnets to 192.168.1.41. The following output is displayed on the configuration terminal:

```
C:\> telnet 192.168.1.40

<Switch>
Trying 192.168.1.41 ...
Press CTRL+K to abort
Connected to 192.168.1.41 ...
<Switch.41>
```

This operation is the same as directly logging in to the device at 192.168.1.41 through Telnet. When you close the Telnet connection to 192.168.1.41, the Telnet connection to 192.168.1.40 is closed at the same time.

3.1.3. databits

Use **databits** to specify the number of data bits for a character.

Use **undo databits** to restore the default.

Syntax

databits { **7** | **8** }

undo databits

Default

Eight data bits are used for a character.

Views

User line view

Predefined user roles

network-admin

Parameters

7: Uses seven data bits for a character.

8: Uses eight data bits for a character.

Usage guidelines

This command is not supported in VTY line class view.

This setting must be the same as the setting on the configuration terminal.

Examples

Configure AUX 0 to use seven data bits for a character.

```
<Switch> system-view
[Switch] line aux 0
[Switch-line-aux0] databits 7
```

3.1.4. display line

Use **display line** to display user line information.

Syntax

display line [*number1* | { **aux** | **vty** } *number2*] [**summary**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX line, and 0 to 63 for VTY lines.

summary: Displays summary information about user lines. If you do not specify this keyword, the command displays detailed information.

Examples

Display information about line 0.

```
<Switch> display line 0
  Idx  Type     Tx/Rx      Modem Auth  Int         Location
F 0    AUX 0    9600       -     N     -           1/0

  +    : Line is active.
  F    : Line is active and in async mode.
  Idx  : Absolute index of line.
  Type : Type and relative index of line.
  Auth : Login authentication mode.
  Int  : Physical port of the line.
  A    : Authentication use AAA.
  N    : No authentication is required.
  P    : Password authentication.
```

Table 3-1 Command output

Field	Description
Modem	Whether the modem allows calling in or out. By default, this attribute is not configured and this field displays a hyphen (-). This field is not supported in the current software version.
Int	Physical port for the line. If there is no physical port for the line or the port is a console port, this field displays a hyphen (-).
Location	Physical position of the line, in the form of *slot number*/*CPU number*.

Display summary information about all user lines.

```
<Switch> display line summary
  Line type : [AUX]
            0:XXXX XXXX XX
  Line type : [VTY]
           10:UXXX XXXX XXXX XXXX
           26:XXXX XXXX XXXX XXXX
           42:XXXX XXXX XXXX XXXX
           58:XXXX XXXX XXXX XXXX
  Line type : [USB]
           74:XXXX XXXX XX

   1 lines used.       (U)
  83 lines not used.   (X)
```

Table 3-2 Command output

Fields	Description
Line type	Type of the user line: • **AUX**–AUX line. • **VTY**–VTY line.
number:*status*	*number*: Absolute number of the first user line in the user line class.

Fields	Description
	status: User line status. **X** is for unused and **U** is for used.

3.1.5. display telnet client

Use **display telnet client** to display the packet source setting for the Telnet client.

Syntax

display telnet client

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command displays the source IPv4 address or source interface specified for the Telnet client to use in outgoing Telnet packets, depending on the **telnet client source** command.

Examples

Display the packet source setting for the Telnet client.

```
<Switch> display telnet client
 The source IP address is 1.1.1.1.
```

Related commands

telnet client source

3.1.6. display users

Use **display users** to display online CLI users.

Syntax

display users [**all**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays all user lines supported by the device.

Examples

Display online user information.

```
<Switch> display users
  Idx  Line      Idle        Time               Pid     Type
+ 10   VTY 0     00:00:00    Jan 01 00:33:10    484     TEL
```

```
  12   VTY 2    00:06:22   Jan 01 00:33:22   495     TEL

Following are more details.
VTY 0   :
        Location: 192.168.1.107
VTY 2   :
        Location: 192.168.1.134
 +    : Current operation user.
 F    : Current operation user works in async mode.
```

Table 3-3 Command output

Field	Description
Idx	Absolute number of the user line.
Line	Type and relative number of the user line.
Idle	Time elapsed after the user's most recent input, in the *hh*:*mm*:*ss* format.
Time	Login time of the user.
Pid	Process ID of the user session.
Type	User type: • **TEL**–Telnet user. • **SSH**–SSH user. • For a user who logged in through the console, USB port, this field does not display anything.
+	User line you are using.
Location	IP address of the user.

3.1.7. escape-key

Use **escape-key** to set the escape key.

Use **undo escape-key** to disable the escape key.

Syntax

escape-key { *key-string* | **default** }

undo escape-key

Default

The escape key is **Ctrl+C**.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

key-string: Specifies a shortcut key. It can be a character (case sensitive, except for **d** and **D**), or an ASCII code value in the range of 0 to 127. For example, if you configure **escape-key 1**, the

shortcut key is **Ctrl+A**. If you configure **escape-key a**, the shortcut key is **a**. If you specify the character **d** or **D** for this argument, the actual shortcut key is **Ctrl+C**. To use **d** or **D** as the shortcut key, you must specify the ASCII code value of the character for this argument. For information about ASCII code values of individual characters, see the standard ASCII code chart. For information about ASCII code values of combined keys that use the **Ctrl** key, see authentication-mode.

default: Restores the default escape key **Ctrl+C**.

Usage guidelines

You can press the escape key to abort a command that is being executed, for example, a **ping** or **tracert** command. Whether a command can be aborted by **Ctrl+C** by default depends on the software implementation of the command. For more information, see the usage guidelines for the command.

As a best practice, use a key sequence as the escape key. If you define a single character as the escape key, pressing the key while a command is being executed stops the command. If no command is being executed, pressing the key enters the character as a common character. If you Telnet from the device to a remote device, pressing the key enters the character as a common character on the remote device. The key acts as the escape key on the remote device only when the following conditions are met:

- You define the same character as the escape key on the remote device.
- You press the key while a command is being executed on the remote device.

The **undo escape-key** command disables the current escape key. After you execute this **undo** command, no escape key is available.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

To display the current escape key, use the **display current-configuration | include escape-key** command.

Examples

Configure character **a** as the escape key for VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] escape-key a
```

To verify the configuration:

1. Ping IP address 192.168.1.49, specifying the **-c** keyword to set the number of ICMP echo request packets to 20.

```
<Switch> ping -c 20 192.168.1.49
  PING 192.168.1.49: 56  data bytes, press a to break
    Reply from 192.168.1.49: bytes=56 Sequence=1 ttl=255 time=3 ms
    Reply from 192.168.1.49: bytes=56 Sequence=2 ttl=255 time=3 ms
```

2. Press **a**.

   The system aborts the command and returns to user view.

```
  --- 192.168.1.49 ping statistics ---
    2 packet(s) transmitted
    2 packet(s) received
    0.00% packet loss
    round-trip min/avg/max = 3/3/3 ms
```

```
<Switch>
```

3.1.8. free line

Use **free line** to release a user line.

Syntax

free line { *number1* | { **aux** | **vty** } *number2* }

Views

User view

Predefined user roles

network-admin

Parameters

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX line, and 0 to 63 for VTY lines.

Usage guidelines

This command does not release the line you are using.

Examples

Release VTY line 1.

```
<Switch> free line vty 1
Are you sure to free line vty1? [Y/N]:y
 [OK]
```

3.1.9. history-command max-size

Use **history-command max-size** to set the size of the command history buffer for a user line.

Use **undo history-command max-size** to restore the default.

Syntax

history-command max-size *size-value*

undo history-command max-size

Default

The command history buffer for a user line stores up to 10 history commands.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

size-value: Specifies the maximum number of history commands the buffer can store, in the range of 0 to 256.

Usage guidelines

Each user line uses a separate command history buffer to store commands successfully executed by its user. The buffer size determines how many history commands the buffer can store.

To display history commands in the buffer for your session, press the up or down arrow key, or execute the **display history-command** command. For more information about the command history buffer, see *Fundamentals Configuration Guide*.

Terminating a CLI session clears the commands in the command history buffer.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the command history buffer size to 20 for VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] history-command max-size 20
```

3.1.10. idle-timeout

Use **idle-timeout** to set the CLI connection idle-timeout timer.

Use **undo idle-timeout** to restore the default.

Syntax

idle-timeout *minutes* [*seconds*]

undo idle-timeout

Default

The CLI connection idle-timeout timer is 10 minutes.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

minutes: Specifies the number of minutes, in the range of 0 to 35791.

seconds: Specifies the number of seconds, in the range of 0 to 59. The default is 0 seconds.

Usage guidelines

The system automatically terminates a user connection if no information interaction occurs on the connection within the idle-timeout interval.

To disable the idle-timeout feature, execute the **idle-timeout 0** command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the CLI connection idle-timeout timer to 1 minute and 30 seconds for VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] idle-timeout 1 30
```

3.1.11. line

Use **line** to enter one or multiple user line views.

Syntax

line { *first-number1* [*last-number1*] | { **aux** | **vty** } *first-number2* [*last-number2*] }

Views

System view

Predefined user roles

network-admin

Parameters

first-number1: Specifies the absolute number of the first user line. The value range is 0 to 83.

last-number1: Specifies the absolute number of the last user line. The value range is 1 to 83. This number must be greater than *first-number1*.

aux: Specifies the AUX line.

vty: Specifies the VTY line.

first-number2: Specifies the relative number of the first user line. The value range is 0 to 9 for AUX line, and 0 to 63 for VTY lines.

last-number2: Specifies the relative number of the last user line. The value range is 1 to 9 for AUX line, and 1 to 63 for VTY lines. This number must be greater than *first-number2*.

Examples

Enter the view of VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0]
```

Enter the views of VTY lines 0 to 63.

```
<Switch> system-view
[Switch] line vty 0 63
[Switch-line-vty0-63]
```

Related commands

line class

3.1.12. line class

Use **line class** to enter user line class view.

Syntax

line class { **aux** | **vty** }

Views

System view

Predefined user roles

network-admin

Parameters

aux: Specifies the AUX line class view.

vty: Specifies the VTY line class view.

Usage guidelines

To configure the same settings for all user lines of a line class, use this command to enter the user line class view.

In user line class view, you can execute the following commands:

- **auto-execute command**
- **authentication-mode**
- **escape-key**
- **history-command max-size**
- **idle-timeout**
- **protocol inbound**
- **screen-length**
- **set authentication password**
- **shell**
- **terminal type**
- **user-role**

For commands that are available in both user line view and user line class view, the device uses the following rules to determine the settings to use:

- A setting in user line view applies only to the user line. A setting in user line class view applies to all user lines of the class.
- A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.
- A setting in user line class view does not take effect for current online users. It takes effect only for new login users.

Examples

Set the CLI connection idle-timeout timer to 15 minutes in VTY line class view.

```
<Switch> system-view
[Switch] line class vty
[Switch-line-class-vty] idle-timeout 15
```

Related commands

line

3.1.13. lock

Use **lock** to lock the current user line and set the password for unlocking the line.

Syntax

lock

Default

The system does not lock any user lines.

Views

User view

Predefined user roles

network-admin

Usage guidelines

This command locks the current user line to prevent unauthorized users from using the line. You must set the password for unlocking the line as prompted. The user line is locked after you enter the password and confirm the password.

To unlock the user line, press **Enter** and enter the password you set.

Examples

Lock the current user line and set the password for unlocking the line.

```
<Switch> lock
Please input password<1 to 16> to lock current line:
Password:
Again:

                    locked !
```

// The user line is locked. To unlock it, press **Enter** and enter the password:

```
Password:
<Switch>
```

3.1.14. parity

Use **parity** to specify the parity.

Use **undo parity** to restore the default.

Syntax

parity { **even** | **mark** | **none** | **odd** | **space** }

undo parity

Default

The setting is **none**. No parity is used.

Views

User line view

Predefined user roles

network-admin

Parameters

even: Uses even parity.

mark: Uses mark parity.

none: Uses no parity.

odd: Uses odd parity.

space: Uses space parity.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must use the same parity.

Examples

Configure AUX line 0 to use odd parity.

```
<Switch> system-view
[Switch] line aux 0
[Switch-line-aux0] parity odd
```

3.1.15. protocol inbound

Use **protocol inbound** to specify the supported protocols.

Use **undo protocol inbound** to restore the default.

Syntax

protocol inbound { **all** | **ssh** | **telnet** }

undo protocol inbound

Default

All protocols are supported.

Views

VTY line view

VTY line class view

Predefined user roles

network-admin

Parameters

all: Supports all protocols, including SSH and Telnet.

ssh: Supports SSH only.

telnet: Supports Telnet only.

Usage guidelines

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

A configuration change in user line view does not take effect for the current session. It takes effect for subsequent login sessions.

Before configuring a user line to support SSH, set the authentication mode to **scheme** for the user line.

In VTY line view, this command is associated with the **authentication-mode** command. If you specify a non-default value for one of the two commands, the other command uses the default setting, regardless of the setting in VTY line class view.

- If the settings of the two commands in VTY line view are both the default settings, the settings for the commands in VTY line class view take effect.
- If the settings of the two commands in VTY line view are both non-default settings, the non-default settings in VTY line view take effect.
- If only one command has a non-default setting in VTY line view, the other command uses the default setting, regardless of the setting in VTY line class view.

Examples

Enable user lines VTY 0 through VTY 4 to support only SSH.

```
<Switch> system-view
[Switch] line vty 0 4
[Switch-line-vty0-4] authentication-mode scheme
[Switch-line-vty0-4] protocol inbound ssh
```

Enable SSH support and set the authentication mode to scheme in VTY line class view. Enable user lines VTY 0 through VTY 4 to support all protocols and disable authentication for the user lines.

```
<Switch> system-view
[Switch] line class vty
[Switch-line-class-vty] authentication-mode scheme
[Switch-line-class-vty] protocol inbound ssh
[Switch-line-class-vty] line vty 0 4
[Switch-line-vty0-4] authentication-mode none
```

To verify the configuration:

1. Telnet to the device.

```
<Client> telnet 192.168.1.241
Trying 192.168.1.241 ...
Press CTRL+K to abort
Connected to 192.168.1.241 ...

<Server>
```

You are logged in without authentication.

2. Display online CLI user information.

```
<Server> display users
  Idx  Line      Idle        Time               Pid      Type
+ 50   VTY 0     00:00:00    Jan 17 15:29:27    189      TEL

Following are more details.
```

```
VTY 0    :
         Location: 192.168.1.186
 +       : Current operation user.
 F       : Current operation user works in async mode.
```

The output shows that you are using VTY 0. The configuration in user line view is effective.

Related commands

authentication-mode

3.1.16. restful https enable

Use **restful https enable** to enable RESTful access over HTTPS.

Use **undo restful https enable** to disable RESTful access over HTTPS.

Syntax

restful https enable

undo restful https enable

Default

RESTful access over HTTPS is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For users to access the device through the HTTPS-based RESTful API, you must enable RESTful access over HTTPS.

Examples

Enable RESTful access over HTTPS.

```
<Switch> system-view
[Switch] restful https enable
```

NOTE:

The **restful https enable** command are only supported when used in combination with UNIVERGE Network Operation Engine Overlay Network Extension.

3.1.17. screen-length

Use **screen-length** to set the maximum number of lines of command output to send to the terminal at a time when the screen pausing feature is enabled.

Use **undo screen-length** to restore the default.

Syntax

screen-length *screen-length*

undo screen-length

Default

A maximum of 24 lines are sent.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

screen-length: Specifies the maximum number of lines to send, in the range of 0 to 512. To send command output without pausing, set the number to 0 or execute the **screen-length disable** command.

Usage guidelines

The number of lines that can be displayed on the terminal screen is restricted by both this setting and the display specification of the terminal. For example, if this setting is 40, the device sends 40 lines to the terminal at a time. If the terminal display specification is 24 lines, only the last 24 lines are displayed on the terminal screen. To view the previous 16 lines, you must press **PgUp**.

To continue to display command output after a pause, press the space bar.

By default, pausing between screens of output is enabled.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

The setting in user line view takes effect immediately for the current session. The setting in user line class view takes effect for login sessions that are established after the setting is configured.

Examples

Set the maximum number of lines to send at a time to 30 for VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] screen-length 30
```

Related commands

screen-length disable

3.1.18. send

Use **send** to send messages to online login users.

Syntax

send { **all** | *number1* | { **aux** | **vty** } *number2* }

Views

User view

Predefined user roles

network-admin

Parameters

all: Specifies all user lines.

number1: Specifies the absolute number of a user line. The value range is 0 to 83.

aux: Specifies the AUX line.

vty: Specifies the VTY line.

number2: Specifies the relative number of a user line. The value range is 0 to 9 for AUX line, and 0 to 63 for VTY lines.

Usage guidelines

You can use this command to send notifications to online users before performing an operation that might affect other online users, for example, before rebooting the device.

To end a message, press **Enter**. To abort the send operation, press **Ctrl+C**.

Examples

Send a notification to the user on VTY 1.

```
<Switch> send vty 1
Input message, end with Enter; abort with CTRL+C:
Your attention, please. I will reboot the system in 3 minutes.
Send message? [Y/N]:y
```

The message should appear on the user's terminal screen as follows:

```
[Switch]

***
***
***Message from vty0 to vty1
***
Your attention, please. I will reboot the system in 3 minutes.
```

3.1.19. set authentication password

Use **set authentication password** to set the password for local password authentication.

Use **undo set authentication password** to restore the default.

Syntax

set authentication password { **hash** | **simple** } *string*

undo set authentication password

Default

No password is set for local password authentication.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

hash: Specifies a password in hashed form.

simple: Sets a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in hashed form.

string:

Before V7.2.18 and Version 7.2.23:

Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its hashed form is a case-sensitive string of 1 to 110 characters.

After v7.3.21:

Specifies the password. Its plaintext form is a case-sensitive string of 4 to 16 characters and must contain two character types. Its hashed form is a case-sensitive string of 1 to 110 characters.

Usage guidelines

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A password change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Set the password to **hello** for local password authentication on VTY line 0.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] authentication-mode password
[Switch-line-vty0] set authentication password simple hello
```

Related commands

authentication-mode

3.1.20. shell

Use **shell** to enable the terminal service for user lines.

Use **undo shell** to disable the terminal service for user lines.

Syntax

shell

undo shell

Default

The terminal service is enabled on all user lines.

Views

User line view

User line class view

Predefined user roles

network-admin

Usage guidelines

The **undo shell** command is not supported in AUX line view or AUX line class view.

You cannot disable the terminal service on the user line you are using.

When the device acts as a Telnet or SSH server, you cannot configure the **undo shell** command.

If the **undo shell** command is configured in user line class view, you cannot configure the **shell** command in the view of a user line in the class.

Examples

Disable the terminal service for VTY lines VTY 0 through 4 so no user can log in to the device through the user lines.

```
<Switch> system-view
[Switch] line vty 0 4
[Switch-line-vty0-4] undo shell
Disable ui-vty0-4 , are you sure? [Y/N]:y
[Switch-line-vty0-4]
```

3.1.21. speed

Use **speed** to set the transmission rate (also called the baud rate) on a user line.

Use **undo speed** to restore the default.

Syntax

speed *speed-value*

undo speed

Default

The transmission rate is 9600 bps on a user line.

Views

User line view

Predefined user roles

network-admin

Parameters

speed-value: Specifies the transmission rate in bps. Supported transmission rates depend on the network environment. The transmission rates for asynchronous serial interfaces might include:

- 300 bps.
- 600 bps.
- 1200 bps.
- 2400 bps.
- 4800 bps.
- 9600 bps.
- 19200 bps.
- 38400 bps.
- 57600 bps.
- 115200 bps.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must be configured with the same transmission rate to communicate.

Examples

Set the transmission rate to 19200 bps for AUX line 0.

```
<Switch> system-view
[Switch] line aux 0
[Switch-line-aux0] speed 19200
```

3.1.22. stopbits

Use **stopbits** to specify the number of stop bits for a character.

Use **undo stopbits** to restore the default.

Syntax

stopbits { **1** | **1.5** | **2** }

undo stopbits

Default

One stop bit is used.

Views

User line view

Predefined user roles

network-admin

Parameters

1: Uses one stop bit.

1.5: Uses one and a half stop bits. The device does not support using one and a half stop bits. If you specify this keyword, two stop bits are used.

2: Uses two stop bits.

Usage guidelines

This command is not supported in VTY line view.

The configuration terminal and the device must use the same number of stop bits to communicate.

Examples

Set the number of stop bits to 1 for AUX line 0.

```
<Switch> system-view
[Switch] line aux 0
[Switch-line-aux0] stopbits 1
```

3.1.23. telnet

Use **telnet** to Telnet to a host in an IPv4 network.

Syntax

telnet *remote-host* [*service-port*] [**vpn-instance** *vpn-instance-name*] [**source** { **interface** *interface-type interface-number* | **ip** *ip-address* } | **dscp** *dscp-value*] *

Views

User view

Predefined user roles

network-admin

Parameters

remote-host: Specifies the IPv4 address or host name of a remote host. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number for the Telnet service on the remote host. The value range is 0 to 65535 and the default is 23.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the remote host belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the remote host belongs to the public network, do not specify this option.

source: Specifies a source IPv4 address or source interface for outgoing Telnet packets. If you do not specify this option, the device uses the primary IPv4 address of the output interface for the route to the server as the source address.

interface *interface-type interface-number*: Specifies the source interface. The primary IPv4 address of the interface will be used as the source IPv4 address for outgoing Telnet packets.

ip *ip-address*: Specifies the source IPv4 address for outgoing Telnet packets.

dscp *dscp-value*: Specifies a DSCP value for outgoing Telnet packets. The value range is 0 to 63. The default is 48.

Usage guidelines

To terminate the current Telnet connection, press **Ctrl+K** or execute the **quit** command.

The source address or interface specified by this command is applied only to the Telnet connection that is being established.

Examples

Telnet to host 1.1.1.2, using 1.1.1.1 as the source IP address for outgoing Telnet packets.

```
<Switch> telnet 1.1.1.2 source ip 1.1.1.1
```

Related commands

telnet client source

3.1.24. telnet client source

Use **telnet client source** to specify a source IPv4 address or source interface for the Telnet client to use for outgoing Telnet packets.

Use **undo telnet client source** to restore the default.

Syntax

telnet client source { **interface** *interface-type interface-number* | **ip** *ip-address* }

undo telnet client source

Default

No source IPv4 address or source interface is specified. The Telnet client uses the primary IPv4 address of the output interface for the route to the server as the source IPv4 address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a source interface. The primary IPv4 address of the interface will be used as the source IPv4 address for outgoing Telnet packets.

ip *ip-address*: Specifies a source IPv4 address.

Usage guidelines

The setting configured by this command applies to all Telnet connections but has a lower precedence than the source setting specified for the **telnet** command.

Examples

Set the source IPv4 address to 1.1.1.1 for outgoing Telnet packets.

```
<Switch> system-view
[Switch] telnet client source ip 1.1.1.1
```

Related commands

display telnet client configuration

3.1.25. telnet ipv6

Use **telnet ipv6** to Telnet to a host in an IPv6 network.

Syntax

telnet ipv6 *remote-host* [**-i** *interface-type interface-number*] [*port-number*] [**vpn-instance** *vpn-instance-name*] [**dscp** *dscp-value*] *

Views

User view

Predefined user roles

network-admin

Parameters

remote-host: Specifies the IPv6 address or host name of a remote host. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

-i *interface-type interface-number*: Specifies the interface for sending Telnet packets. This option is required when the remote host address is a link-local address. When the server address is a global unicast address, you cannot specify this option.

port-number: Specifies the TCP port number for the Telnet service on the remote host. The value range is 0 to 65535 and the default is 23.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the remote host belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the remote host belongs to the public network, do not specify this option.

dscp *dscp-value*: Specifies a DSCP value for outgoing Telnet packets. The value range is 0 to 63. The default is 48.

Usage guidelines

To terminate the current Telnet connection, press **Ctrl+K** or execute the **quit** command.

Examples

Telnet to the host at 5000::1.

```
<Switch> telnet ipv6 5000::1
```

3.1.26. telnet server acl

Use **telnet server acl** to apply an ACL to filter Telnet logins.

Use **undo telnet server acl** to restore the default.

Syntax

telnet server acl [**mac**] *acl-number*

undo telnet server acl

Default

No ACL is used to filter Telnet logins.

Views

System view

Predefined user roles

network-admin

Parameters

mac: Specifies a Layer 2 ACL. To specify an ACL of a different type, do not specify this keyword.

acl-number: Specifies an ACL by its number. If you specify the **mac** keyword, the value range of this argument is 4000 to 4999. If you do not specify the **mac** keyword, the value range of this argument is 2000 to 3999.

Usage guidelines

You can specify an ACL that does not exist for this command. However, this command takes effect only after you create the ACL and configure rules for the ACL. For more information about ACL, see *ACL and QoS Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

This command does not take effect on existing Telnet connections.

Examples

Permit only the user at 1.1.1.1 to Telnet to the device.

```
<Switch> system-view
[Switch] acl basic 2001
```

```
[Switch-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
[Switch-acl-ipv4-basic-2001] quit
[Switch] telnet server acl 2001
```

3.1.27. telnet server dscp

Use **telnet server dscp** to specify the DSCP value for IPv4 to use for Telnet packets sent to a Telnet client.

Use **undo telnet server dscp** to restore the default.

Syntax

telnet server dscp *dscp-value*

undo telnet server dscp

Default

IPv4 uses the DSCP value 48 for Telnet packets sent to a Telnet client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the ToS field of an IPv4 packet to indicate the packet transmission priority.

Examples

Set the DSCP value for IPv4 to use for outgoing Telnet packets to 30 on a Telnet server.

```
<Switch> system-view
[Switch] telnet server dscp 30
```

3.1.28. telnet server enable

Use **telnet server enable** to enable the Telnet server.

Use **undo telnet server enable** to disable the Telnet server.

Syntax

telnet server enable

undo telnet server enable

Default

The Telnet server is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Users can Telnet to the device only when the Telnet server is enabled.

Examples

Enable the Telnet server.

```
<Switch> system-view
[Switch] telnet server enable
```

3.1.29. telnet server ipv6 acl

Use **telnet server ipv6 acl** to apply an IPv6 ACL to filter IPv6 Telnet logins.

Use **undo telnet server ipv6 acl** to restore the default.

Syntax

telnet server ipv6 acl { **ipv6** | **mac** } *acl-number*

undo telnet server ipv6 acl

Default

No IPv6 ACL is used to filter IPv6 Telnet logins.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6: Specifies an IPv6 ACL.

mac: Specifies a Layer 2 ACL. To specify an ACL of a different type, do not specify this keyword.

acl-number: Specifies an ACL by its number. If you specify the **ipv6** keyword, the value range of this argument is 2000 to 3999. If you specify the **mac** keyword, the value range of this argument is 4000 to 4999.

Usage guidelines

You can specify an ACL that does not exist for this command. However, this command takes effect only after you create the ACL and configure rules for the ACL. For more information about ACL, see *ACL and QoS Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

This command does not take effect on existing Telnet connections.

Examples

Permit only the user at 2000::1 to Telnet to the device.

```
<Switch> system-view
[Switch] acl ipv6 basic 2001
[Switch-acl6-ipv6-basic-2001] rule permit source 2000::1 128
[Switch-acl6-ipv6-basic-2001] quit
[Switch] telnet server ipv6 acl ipv6 2001
```

3.1.30. telnet server ipv6 dscp

Use **telnet server ipv6 dscp** to specify the DSCP value for IPv6 to use for Telnet packets sent to a Telnet client.

Use **undo telnet server ipv6 dscp** to restore the default.

Syntax

telnet server ipv6 dscp *dscp-value*

undo telnet server ipv6 dscp

Default

IPv6 uses the DSCP value 48 for Telnet packets sent to a Telnet client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the Traffic class field of an IPv6 packet to indicate the packet transmission priority.

Examples

Set the DSCP value for IPv6 to use for outgoing Telnet packets to 30 on a Telnet server.

```
<Switch> system-view
[Switch] telnet server ipv6 dscp 30
```

3.1.31. terminal type

Use **terminal type** to specify the terminal display type.

Use **undo terminal type** to restore the default.

Syntax

terminal type { **ansi** | **vt100** }

undo terminal type

Default

The terminal display type is ANSI.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

ansi: Specifies the ANSI type.

vt100: Specifies the VT100 type.

Usage guidelines

The device supports two terminal display types: ANSI and VT100. As a best practice, specify the VT100 type on both the device and the configuration terminal. If either side uses the ANSI type, a display problem might occur when a command line has more than 80 characters. For example, a cursor positioning error might occur.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A terminal display type change does not take effect for the current session. It takes effect for subsequent login sessions.

Examples

Set the terminal display type to VT100.

```
<Switch> system-view
[Switch] line vty 0
[Switch-line-vty0] terminal type vt100
```

3.1.32. user-role

Use **user-role** to assign a user role to a user line. The device assigns the user role to a user of the line when the user logs in.

Use **undo user-role** to remove a user role or restore the default.

Syntax

user-role *role-name*

undo user-role [*role-name*]

Default

A console user is assigned the network-admin user role. Other users are assigned the network-operator user role.

Views

User line view

User line class view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role name, a case-sensitive string of 1 to 63 characters. The user role can be user-defined or predefined. Available predefined user roles include network-admin, network-operator, and level-0 to level-15. The predefined security-audit and guest-manager user roles are not supported in user line view or user line class view. If you do not specify this argument, the **undo user-role** command restores the default user role.

Usage guidelines

Only users assigned the network-admin, or level-15 user role can execute this command. Other users cannot execute this command, even if they are granted the right to execute this command.

This command is available in both user line view and user line class view. A non-default setting in either view takes precedence over a default setting in the other view. A non-default setting in user line view takes precedence over a non-default setting in user line class view.

A user role change does not take effect for the current session. It takes effect for subsequent login sessions.

You can assign up to 64 user roles to a user line.

For more information about user roles, see *Fundamentals Configuration Guide*.

Examples

Assign user role network-admin to AUX line 0.

```
<Switch> system-view
[Switch] line aux 0
[Switch-line-aux0] user-role network-admin
```

4. FTP commands

4.1. FTP server commands

4.1.1. display ftp-server

Use **display ftp-server** to display FTP server configuration and status information.

Syntax

display ftp-server

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display FTP server configuration and status information.

```
<Switch> display ftp-server
FTP server is running.
User count:                          1
Idle-timeout timer (in minutes):  30
```

Table 4-1 Command output

Field	Description
User count	Number of the current logged-in users.
Idle-timeout timer (in minutes)	If no packet is exchanged between the FTP server and client during this period, the FTP connection is closed.

Related commands

ftp server enable

ftp timeout

4.1.2. display ftp-user

Use **display ftp-user** to display detailed information about online FTP users.

Syntax

display ftp-user

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display detailed information about online FTP users.

```
<Switch> display ftp-user
UserName      HostIP             Port     HomeDir
root          192.168.20.184     46539    flash:
```

A field value is wrapped if its length exceeds the limit. The segments are left justified.

The following are the length limits for fields:

- **UserName**—10 characters.
- **HostIP**—15 characters.
- **HomeDir**—37 characters.

```
<Switch> display ftp-user
UserName      HostIP             Port     HomeDir
user2         2000:2000:2000:    1499     flash:/user2
              2000:2000:2000:
              2000:2000
administra    100.100.100.100    10001    flash:/123456789/123456789/123456789/
tor                                       123456789/123456789/123456789/1234567
                                          89/123456789
```

Table 4-2 Command output

Field	Description
UserName	Name of the user.
HostIP	IP address of the user.
Port	Port number of the user.
HomeDir	Authorized directory for the user.

4.1.3. free ftp user

Use **free ftp user** to manually release the FTP connections established by using a specific user account.

Syntax

free ftp user *username*

Views

User view

Predefined user roles

network-admin

Parameters

username: Specifies a username. To display online FTP users, execute the **display ftp-user** command.

Examples

Release the FTP connections established by using user account **ftpuser**.

```
<Switch> free ftp user ftpuser
Are you sure to free FTP connection? [Y/N]:y
<Switch>
```

4.1.4. free ftp user-ip

Use **free ftp user-ip** to manually release the FTP connections established from a specific IPv4 address.

Syntax

free ftp user-ip *ip-address* [**port** *port*]

Views

User view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the source IP address of an FTP connection. To view the source IP addresses of FTP connections, execute the **display ftp-user** command.

port *port*: Specifies the source port of an FTP connection. To view the source ports of FTP connections, execute the **display ftp-user** command.

Examples

Release the FTP connections established from the IP address 192.168.20.184.

```
<Switch> free ftp user-ip 192.168.20.184
Are you sure to free FTP connection? [Y/N]:y
<Switch>
```

4.1.5. free ftp user-ip ipv6

Use **free ftp user-ip ipv6 to** manually release the FTP connections established from a specific IPv6 address.

Syntax

free ftp user-ip ipv6 *ipv6-address* [**port** *port*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the source IPv6 address of an FTP connection. To view the source IPv6 addresses of FTP connections, execute the **display ftp-user** command.

port *port*: Specifies the source port of an FTP connection. To view the source ports of FTP connections, execute the **display ftp-user** command.

Examples

Release the FTP connections established from IPv6 address 2000::154.

```
<Switch> free ftp user-ip ipv6 2000::154
Are you sure to free FTP connection? [Y/N]:y
<Switch>
```

4.1.6. ftp server acl

Use **ftp server acl** to use an ACL to control FTP clients' access to the FTP server.

Use **undo ftp server acl** to restore the default.

Syntax

ftp server acl { *advanced-acl-number* | *basic-acl-number* | **ipv6** { *advanced-acl-number* | *basic-acl-number* } }

undo ftp server acl [**ipv6**]

Default

No ACL is used to control FTP clients' access to the FTP server.

Views

System view

Predefined user roles

network-admin

Parameters

advanced-acl-number: Specifies an advanced IPv4 ACL number in the range of 3000 to 3999.

basic-acl-number: Specifies a basic IPv4 ACL number in the range of 2000 to 2999.

ipv6 *advanced-acl-number*: Specifies an advanced IPv6 ACL number in the range of 3000 to 3999.

ipv6 *basic-acl-number*: Specifies a basic IPv6 ACL number in the range of 2000 to 2999.

Usage guidelines

You can use this command to permit only FTP requests from specific FTP clients. This configuration takes effect only for FTP connections to be established. It does not impact existing FTP connections.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Use ACL 2001 to allow only client 1.1.1.1 to access the FTP server.

```
<Switch> system-view
[Switch] acl basic 2001
[Switch-acl-ipv4-basic-2001] rule 0 permit source 1.1.1.1 0
[Switch-acl-ipv4-basic-2001] rule 1 deny source any
[Switch-acl-ipv4-basic-2001] quit
[Switch] ftp server acl 2001
```

4.1.7. ftp server dscp

Use **ftp server dscp** to set the DSCP value for IPv4 to use for FTP packets sent to an FTP client.

Use **undo ftp server dscp** to restore the default.

Syntax

ftp server dscp *dscp-value*

undo ftp server dscp

Default

IPv4 uses the DSCP value 0 for FTP packets sent to an FTP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the ToS field of an IP packet to indicate the transmission priority of the packet.

Examples

Set the DSCP value for IPv4 to use for outgoing FTP packets to 30 on an FTP server.

```
<Switch> system-view
[Switch] ftp server dscp 30
```

4.1.8. ftp server enable

Use **ftp server enable** to enable the FTP server.

Use **undo ftp server enable** to disable the FTP server.

Syntax

ftp server enable

undo ftp server enable

Default

The FTP server is disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable the FTP server.

```
<Switch> system-view
[Switch] ftp server enable
```

4.1.9. ftp server ipv6 dscp

Use **ftp server ipv6 dscp** to set the DSCP value for IPv6 to use for FTP packets sent to an FTP client.

Use **undo ftp server ipv6 dscp** to restore the default.

Syntax

ftp server ipv6 dscp *dscp-value*

undo ftp server ipv6 dscp

Default

IPv6 uses the DSCP value 0 for FTP packets sent to an FTP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value is carried in the Traffic class field of an IPv6 packet to indicate the transmission priority of the packet.

Examples

Set the DSCP value for IPv6 to use for outgoing FTP packets to 30 on an FTP server.

```
<Switch> system-view
[Switch] ftp server ipv6 dscp 30
```

4.1.10. ftp timeout

Use **ftp timeout** to set the FTP connection idle-timeout timer.

Use **undo ftp timeout** to restore the default.

Syntax

ftp timeout *minute*

undo ftp timeout

Default

The FTP connection idle-timeout timer is 30 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

minute: Specifies a time interval in the range of 1 to 35791 minutes.

Usage guidelines

If no data transfer occurs on an FTP connection within the idle-timeout interval, the FTP server closes the FTP connection to release resources.

Examples

Set the FTP connection idle-timeout timer to 36 minutes.

```
<Switch> system-view
[Switch] ftp timeout 36
```

4.2. FTP client commands

For FTP users to execute FTP client configuration commands, you must configure authorization settings for users on the FTP server. Authorized operations include viewing the files in the working directory, reading/downloading/uploading/renaming/removing files, and creating directories.

The FTP client commands in this section are supported by the device, but whether they can be executed successfully depends on the FTP server.

The output in the examples of this section varies by FTP server type.

4.2.1. ?

Use **?** to display all commands supported by an FTP client.

Use **?** *command-name* to display the help information for a command.

Syntax

? [*command-name*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

command-name: Specifies a command supported by the FTP client.

Usage guidelines

In FTP client view, entering **?** is the same as executing the **help** command.

Examples

Display all commands supported by the FTP client.

```
ftp> ?
Commands may be abbreviated.  Commands are:

append          delete          ls              quit            rmdir
ascii           debug           mkdir           reget           status
binary          dir             newer           rstatus         system
bye             disconnect      open            rhelp           user
cd              get             passive         rename          verbose
cdup            help            put             reset           ?
close           lcd             pwd             restart
```

Display the help information for the **dir** command.

```
ftp> ? dir
dir              list contents of remote directory
```

Related commands

help

4.2.2. ascii

Use **ascii** to set the file transfer mode to ASCII.

Syntax

ascii

Default

The file transfer mode is binary.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

FTP transfers files in either of the following modes:

- **Binary mode**—Transfers non-text files.
- **ASCII mode**—Transfers text files.

When the device acts as the FTP server, the transfer mode is determined by the FTP client. When the device acts as the FTP client, you can set the transfer mode. The transfer mode is binary by default.

Examples

Set the file transfer mode to ASCII.

```
ftp> ascii
200 TYPE is now ASCII
```

Related commands

binary

4.2.3. binary

Use **binary** to set the file transfer mode to binary, which is also called the flow mode.

Syntax

binary

Default

The file transfer mode is binary.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

FTP transfers files in either of the following modes:

- **Binary mode**—Transfers program file or pictures.
- **ASCII mode**—Transfers text files.

When the device acts as the FTP server, the transfer mode is determined by the FTP client. When the device acts as the FTP client, you can set the transfer mode. The default transfer mode is binary.

Examples

Set the file transfer mode to binary.

```
ftp> binary
200 TYPE is now 8-bit binary
```

Related commands

ascii

4.2.4. bye

Use **bye** to terminate the connection to the FTP server and return to user view. If no connection is established between the device and the FTP server, use this command to return to user view.

Syntax

bye

Views

FTP client view

Predefined user roles

network-admin

Examples

Terminate the connection to the FTP server and return to user view.

```
ftp> bye
221-Goodbye. You uploaded 2 and downloaded 2 kbytes.
221 Logout.
<Switch>
```

Related commands

quit

4.2.5. cd

Use **cd** to change the current working directory to another directory on the FTP server.

Syntax

cd { *directory* | **..** | **/** }

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies the target directory. If the target directory does not exist, the **cd** command does not change the current working directory.

..: Specifies the upper directory. Executing the **cd ..** command is the same as executing the **cdup** command. If the current working directory is the FTP root directory, the **cd ..** command does not change the current working directory.

/: Specifies the FTP root directory.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

The directory that can be accessed must be authorized by the FTP server.

Examples

Change the working directory to the **logfile** subdirectory of the current directory.

```
ftp> cd logfile
250 OK. Current directory is /logfile
```

Change the working directory to the **folder** subdirectory of the FTP root directory.

```
ftp> cd /folder
250 OK. Current directory is /folder
```

Change the working directory to the upper directory of the current directory.

```
ftp> cd ..
250 OK. Current directory is /
```

Change the working directory to the FTP root directory.

```
ftp> cd /
250 OK. Current directory is /
```

Related commands

cdup

pwd

4.2.6. cdup

Use **cdup** to enter the upper directory of the FTP server.

Syntax

cdup

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

This command does not change the working directory if the current directory is the FTP root directory.

Examples

Change the working directory to the upper directory.

```
ftp> pwd
257 "/ftp/subdir" is your current location
ftp> cdup
250 OK. Current directory is /ftp
ftp> pwd
257 "/ftp" is your current location
```

Related commands

cd

pwd

4.2.7. close

Use **close** to terminate the connection to the FTP server without exiting FTP client view.

Syntax

close

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Terminate the connection to the FTP server without exiting the FTP client view.

```
ftp> close
221-Goodbye. You uploaded 0 and downloaded 0 kbytes.
221 Logout.
ftp>
```

Related commands

disconnect

4.2.8. debug

Use **debug** to enable or disable FTP client debugging.

Syntax

debug

Default

FTP client debugging is disabled.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

When FTP client debugging is enabled, executing this command disables FTP client debugging.

When FTP client debugging is disabled, executing this command enables FTP client debugging.

Examples

Enable and then disable FTP client debugging.

```
ftp> debug
Debugging on (debug=1).
ftp> debug
Debugging off (debug=0).
```

4.2.9. delete

Use **delete** to permanently delete a file from the FTP server.

Syntax

delete *remotefile*

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To perform this operation, you must have delete permission on the FTP server.

Examples

Delete the **b.txt** file.

```
ftp> delete b.txt
250 Deleted b.txt
```

4.2.10. dir

Use **dir** to display or save detailed information about files and directories on the FTP server.

Syntax

dir [*remotefile* [*localfile*]]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file or directory on the FTP server.

localfile: Specifies the name of the local file used to save the displayed information.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To display detailed information about the files and subdirectories in the working directory on the FTP server, use the **dir** command.

To display detailed information about a file or directory on the FTP server, use the **dir** *remotefile* command.

To save detailed information about a file or directory on the FTP server to a local file, use the **dir** *remotefile localfile* command.

In FTP client view, executing the **dir** command is the same as executing the **ls** command.

Examples

Display detailed information about the files and subdirectories in the working directory on the FTP server.

```
ftp> dir
150 Connecting to port 50201
-rwxr-xr-x    1 0          0               1481 Jul  7 15:36 a.txt

4.2.12. display ftp client source

Use **display ftp client source** to display the source address settings on the FTP client.

Syntax

display ftp client source

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the source address settings on the FTP client.

```
<Switch> display ftp client source
The source IP address of the FTP client is 1.1.1.1.
```

4.2.13. ftp

Use **ftp** to log in to an IPv4 FTP server and enter FTP client view.

Syntax

ftp [*ftp-server* [*service-port*] [**vpn-instance** *vpn-instance-name*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* }] *]

Views

User view

Predefined user roles

network-admin

Parameters

ftp-server: Specifies the IPv4 address or host name of an FTP server. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters for a host name include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the FTP server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the FTP server belongs to the public network, do not specify this option.

dscp *dscp-value*: Specifies the DSCP value for IPv4 to use in outgoing FTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }: Specifies the source address used to establish the FTP connection.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. To establish the FTP connection successfully, make sure the interface is up and has the primary IPv4 address configured.
- **ip** *source-ip-address*: Specifies an IPv4 address. To establish the FTP connection successfully, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

This command is only applicable to IPv4 networks.

If no parameters are specified, this command enters the FTP client view without logging in to an FTP server.

If the server parameters are specified, you are prompted to enter the username and password for logging in to the FTP server.

Examples

Log in to FTP server 192.168.0.211. Use 192.168.0.212 as the source IPv4 address for outgoing FTP packets.

```
<Switch>ftp 192.168.0.211 source ip 192.168.0.212
Press CTRL+C to abort.
Connected to 192.168.0.211 (192.168.0.211).

4.2.14. ftp client ipv6 source

Use **ftp client ipv6 source** to specify the source IPv6 address for FTP packets sent to an IPv6 FTP server.

Use **undo ftp client ipv6 source** to restore the default.

Syntax

ftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

undo ftp client ipv6 source

Default

No source address is specified for FTP packets sent to an IPv6 FTP server. The device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source address. For successful FTP packet transmission, make sure the interface is up and is configured with an IPv6 address.

ipv6 *source-ipv6-address*: Specifies an IPv6 address. For successful FTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **ftp ipv6** command takes precedence over the source address specified with the **ftp client ipv6 source** command.

The source address specified with the **ftp client ipv6 source** command applies to all FTP connections. The source address specified with the **ftp ipv6** command applies only to the FTP connection that is being established.

Examples

Specify the source IPv6 address of 2000::1 for FTP packets sent to an IPv6 FTP server.

```
<Switch> system-view
[Switch] ftp client ipv6 source ipv6 2000::1
```

Related commands

ftp ipv6

4.2.15. ftp client source

Use **ftp client source** to specify the source IPv4 address for FTP packets sent to an IPv4 FTP server.

Use **undo ftp client source** to restore the default.

Syntax

ftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

undo ftp client source

Default

No source IPv4 address is specified for FTP packets sent to an IPv4 FTP server. The device uses the primary IPv4 address of the output interface for the route to the server as the source address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. For successful FTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.

ip *source-ip-address*: Specifies an IPv4 address. For successful FTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **ftp** command takes precedence over the source address specified with the **ftp client source** command.

The source address specified with the **ftp client source** command applies to all FTP connections. The source address specified with the **ftp** command applies only to the FTP connection that is being established.

Examples

Specify the source IPv4 address of 192.168.20.222 for FTP packets sent to an IPv4 FTP server.

```
<Switch> system-view
[Switch] ftp client source ip 192.168.20.222
```

Related commands

4.2.16. ftp ipv6

Use **ftp ipv6** to log in to an IPv6 FTP server and enter FTP client view.

Syntax

ftp ipv6 [*ftp-server* [*service-port*] [**vpn-instance** *vpn-instance-name*] [**dscp** *dscp-value* | **source** { **ipv6** *source-ipv6-address* | **interface** *interface-type interface-number* }] * [**-i** *interface-type interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

ftp-server: Specifies the IPv6 address or host name of an FTP server. A host name can be a case-insensitive string of 1 to 253 characters. Valid characters for a host name include letters, digits, hyphens (-), underscores (_), and dots (.).

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

dscp *dscp-value*: Specifies the DSCP value for IPv6 to use in outgoing FTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **ipv6** *source-ipv6-address* | **interface** *interface-type interface-number* }: Specifies the source address used to establish the FTP connection.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. This option can be used only when the FTP server address is a link local address and the specified output interface has a link local address. For information about link local addresses, see *Layer 3—IP Services Configuration Guide*.
- **ipv6** *source-ipv6-address*: Specifies an IPv6 address. To establish the FTP connection successfully, make sure this address is the IPv6 address of an interface in up state on the device.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the FTP server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the FTP server belongs to the public network, do not specify this option.

-i *interface-type interface-number*: Specifies an output interface by its type and number. This option can be used only when the FTP server address is a link local address and the specified output interface has a link local address.

Usage guidelines

This command is only applicable to IPv6 networks.

If no parameters are specified, this command enters the FTP client view.

If the FTP server parameters are specified, you are prompted to enter the username and password for logging in to the FTP server.

Examples

Log in to FTP server 2000::154.

```
<Switch>ftp ipv6 2000::154
Press CTRL+C to abort.
Connected to 2000::154 (2000::154).
220 FTP service ready.
User (2000::154): root
331 Password required for root.
Password:

4.2.17. get

Use **get** to download a file from the FTP server and save the file.

Syntax

get *remotefile* [*localfile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies the file to be downloaded.

localfile: Specifies a name for the downloaded file. If you do not specify this argument, the system uses the name of the source file.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To save the downloaded file to the working directory accessed by the **ftp** command, perform one of the following tasks:

- Execute the command without specifying the *localfile* argument.
- Specify a file name without any path information for the *localfile* argument, for example, a.cfg.

To save the downloaded file to some other directory, you must specify a fully qualified file name for the *localfile* argument, for example, flash:/subdirectory/a.cfg.

Examples

Download the **a.txt** file and save it as **b.txt** in the working directory accessed by the **ftp** command.

```
ftp> get a.txt b.txt
local: b.txt remote: a.txt
150 Connecting to port 47457
226 File successfully transferred
1569 bytes received in 0.00527 seconds (290.6 kbyte/s)
```

Download the **a.txt** file to the **test** directory in the working directory accessed by the **ftp** command.

```
ftp> get a.txt flash:/test/b.txt
local: flash:/test/b.txt remote: a.txt
150 Connecting to port 47457
226 File successfully transferred
1569 bytes received in 0.00527 seconds (290.6 kbyte/s)
```

Download the **a.txt** file to the root directory of the flash memory on a member device. Save the file as **c.txt**.

```
ftp> get a.txt slot1#flash:/c.txt
local: slot1#flash:/c.txt remote: a.txt
150 Connecting to port 47460
226 File successfully transferred
1569 bytes received in 0.0564 seconds (27.2 kbyte/s)
```

Related commands

put

4.2.18. help

Use **help** to display all commands supported by the FTP client.

Use **help** *command-name* to display the help information for a command.

Syntax

help [*command-name*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

command-name: Specifies a command supported by the FTP client.

Usage guidelines

In FTP client view, executing the **help** command is the same as entering **?**.

Examples

Display all commands supported by the FTP client.

```
ftp> help
```

```
append          delete          ls              quit            rmdir
ascii           debug           mkdir           reget           status
binary          dir             newer           rstatus         system
bye             disconnect      open            rhelp           user
cd              get             passive         rename          verbose
cdup            help            put             reset           ?
close           lcd             pwd             restart
```

Display the help information for the **dir** command.

```
ftp> help dir
dir              list contents of remote directory
```

Related commands

?

4.2.19. lcd

Use **lcd** to display or change the local working directory of the FTP client.

Syntax

lcd [*directory* | **/**]

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Changes the local working directory of the FTP client to the specified local directory. There must be a slash sign (/) before the name of the storage medium, for example, /flash:/logfile.

/: Changes the local working directory of the FTP client to the local root directory.

Usage guidelines

To display the local working directory of the FTP client, do not specify the *directory* or **/** argument.

Examples

Display the local working directory.

```
ftp> lcd
Local directory now /flash:
```

Change the local working directory to **flash:/logfile**.

```
ftp> lcd /flash:/logfile
Local directory now /flash:/logfile
```

4.2.20. ls

Use **ls** to display or save detailed information about files and directories on the FTP server.

Syntax

ls [*remotefile* [*localfile*]]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file or directory on the FTP server.

localfile: Specifies the name of the local file used to save the displayed information.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To display detailed information about the files and subdirectories in the working directory on the FTP server, use the **ls** command.

To display detailed information about a file or directory on the FTP server, use the **ls** *remotefile* command.

To save detailed information about a file or directory on the FTP server to a local file, use the **ls** *remotefile localfile* command.

In FTP client view, executing the **ls** command is the same as executing the **dir** command.

Examples

Display detailed information about the files and subdirectories in the working directory on the FTP server.

```
ftp> ls
150 Connecting to port 50201
-rwxr-xr-x    1 0          0               1481 Jul  7 15:36 a.txt
drwxr-xr-x    2 0          0               8192 Jul  2 14:33 diagfile
drwxr-xr-x    3 0          0               8192 Jul  7 15:21 ftp
drwxr-xr-x    2 0          0               8192 Jul  5 09:15 logfile
drwxr-xr-x    2 0          0               8192 Jul  2 14:33 seclog
-rwxr-xr-x    1 0          0           40808448 Jul  2 14:33 system-a1801.bin
-rwxr-xr-x    1 0          0               3050 Jul  7 12:26 startup.cfg
-rwxr-xr-x    1 0          0              54674 Jul  4 09:24 startup.mdb
-rwxr-xr-x    1 0          0               1481 Jul  7 12:34 x.cfg
226 9 matches total
```

Save detailed information about the file **a.txt** to **s.txt**.

```
ftp> ls a.txt s.txt
output to local-file: s.txt ? [Y/N]y
150 Connecting to port 50203
226-Glob: s.txt
```

Display the content of the file **s.txt**.

```
ftp> bye
221-Goodbye. You uploaded 0 and downloaded 2 kbytes.
221 Logout.
<Switch> more s.txt
-rwxr-xr-x    1 0          0               1481 Jul  7 12:34 a.txt
```

Related commands

dir

4.2.21. mkdir

Use **mkdir** to create a subdirectory in the current directory on the FTP server.

Syntax

mkdir *directory*

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies the name for the directory to be created.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

You must have permission to perform this operation on the FTP server.

Examples

Create a subdirectory named **newdir** in the current directory of the FTP server.

```
ftp> mkdir newdir
257 "newdir" : The directory was successfully created
```

4.2.22. newer

Use **newer** to update a local file by using a file on the FTP server.

Syntax

newer *remotefile* [*localfile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

remotefile: Specifies a file on the FTP server.

localfile: Specifies the local file to be updated.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

If the local file does not exist, this command downloads the file from the FTP server and saves it locally.

If the file on the FTP server is not newer than the local file, this command does not update the local file.

Examples

Update the local file with the **a.txt** file on the FTP server.

```
ftp> newer a.txt
local: a.txt remote: a.txt
150 Connecting to port 63513
226 File successfully transferred
1573 bytes received in 0.0293 seconds (52.3 kbyte/s)
```

4.2.23. open

Use **open** to log in to an FTP server from FTP client view.

Syntax

open *server-address* [*service-port*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

server-address: Specifies the IPv4 address, IPv6 address, or host name of the FTP server.

service-port: Specifies the TCP port number of the FTP server, in the range of 0 to 65535. The default is 21.

Usage guidelines

After you issue this command, the system will prompt you to enter the username and password.

After you log in to one FTP server, you must disconnect from the server before you can use the **open** command to log in to another server.

Examples

In FTP client view, log in to FTP server 192.168.40.7.

```
<Switch>ftp
ftp> open 192.168.40.7
Press CTRL+C to abort.
Connected to 192.168.40.7 (192.168.40.7).
220 FTP service ready.
User (192.168.40.7:(none)): root
331 Password required for root.
Password:
230 User logged in.
Remote system type is NEC.
ftp>
```

4.2.24. passive

Use **passive** to change the FTP operation mode.

Syntax

passive

Default

The FTP operation mode is passive.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

FTP can operate in either of the following modes:

- **Active mode**—The FTP server initiates the TCP connection.
- **Passive mode**—The FTP client initiates the TCP connection.

When the FTP operation mode is passive, executing this command changes the mode to active.

When the FTP operation mode is active, executing this command changes the mode to passive.

This command is typically used together with a firewall to control FTP session establishment between private network users and public network users.

Examples

Change the FTP operation mode to passive.

```
ftp> passive
Passive mode on.
ftp> passive
Passive mode off.
```

4.2.25. put

Use **put** to upload a file from the FTP client to the FTP server.

Syntax

put *localfile* [*remotefile*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

localfile: Specifies the local file to be uploaded.

remotefile: Specifies the name of the file for saving the uploaded file on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To upload a file in the current working directory, specify a file name without the path for the *localfile* argument, for example, a.cfg.

To upload a file in some other directory, specify a fully qualified file name for the *localfile* argument, for example, flash:/subdirectory/a.cfg.

Examples

Upload the **a.txt** file from the local working directory to the FTP server. Save the file as **b.txt**.

```
ftp> put a.txt b.txt
local: a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Upload the **a.txt** file from the **test** directory of the local working directory to the FTP server. Save the file as **b.txt**.

```
ftp> put flash:/test/a.txt b.txt
local: flash:/test/a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Upload file **a.txt** from the **test** directory of the storage medium on a member device. Save the file as **b.txt** on the FTP server.

```
ftp> put slot2#flash:/test/a.txt b.txt
local: slot2#flash:/test/a.txt remote: b.txt
150 Connecting to port 47461
226 File successfully transferred
1569 bytes sent in 0.000671 seconds (2.23 Mbyte/s)
```

Related commands

get

4.2.26. pwd

Use **pwd** to display the currently accessed directory on the FTP server.

Syntax

pwd

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Display the currently accessed directory on the FTP server.

```
ftp> cd subdir
250 OK. Current directory is /subdir
ftp> pwd
257 "/subdir" is your current location
```

4.2.27. quit

Use **quit** to terminate the connection to the FTP server and return to user view.

Syntax

quit

Views

FTP client view

Predefined user roles

network-admin

Examples

Terminate the connection to the FTP server and return to user view.

```
ftp> quit
221-Goodbye. You uploaded 0 and downloaded 0 kbytes.
221 Logout.
<Switch>
```

Related commands

bye

4.2.28. rhelp

Use **rhelp** to display the FTP commands supported by the FTP server.

Use **rhelp** *protocol-command* to display the help information for an FTP command supported by the FTP server.

Syntax

rhelp [*protocol-command*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

protocol-command: Specifies an FTP command.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

Examples

Display the FTP-related commands supported by the FTP server.

```
ftp> rhelp
214-The following FTP commands are recognized
 USER PASS NOOP QUIT SYST TYPE
 HELP CWD  XCWD PWD  CDUP XCUP
 XPWD LIST NLST MLSD PORT EPRT
 PASV EPSV REST RETR STOR APPE
```

```
 DELE MKD  XMKD RMD  XRMD ABOR
 SIZE RNFR RNTO
214 UNIX Type: L8
```

Table 4-3 Command output

Field	Description
USER	Username.
PASS	Password.
NOOP	Null operation.
SYST	System parameters.
TYPE	Request type.
CWD	Changes the current working directory.
XCWD	Extended command with the meaning of CWD.
PWD	Prints the working directory.
CDUP	Changes the directory to the upper directory.
XCUP	Extended command with the meaning of CDUP.
XPWD	Extended command with the meaning of PWD.
LIST	Lists files.
NLST	Lists brief file description.
MLSD	Lists file content.
PORT	Active mode (IPv4).
EPRT	Active mode (IPv6).
PASV	Passive mode (IPv4).
EPSV	Passive mode (IPv6).
REST	Restarts.
RETR	Downloads files.
STOR	Uploads files.
APPE	Appends uploading.
DELE	Deletes files.
MKD	Creates folders.
XMKD	Extended command with the meaning of MKD.
RMD	Deletes folders.
XRMD	Extended command with the meaning of RMD.
ABOR	Aborts the transmission.
SIZE	Size of the transmission file.
RNFR	Original name.
RNTO	New name.

4.2.29. rmdir

Use **rmdir** to permanently delete a directory from the FTP server.

Syntax

rmdir *directory*

Views

FTP client view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory on the FTP server.

Usage guidelines

You can perform this operation only after you log in to the FTP server.

To perform this operation, you must have delete permission on the FTP server.

Delete all files and subdirectories in a directory before you delete the directory. For more information about how to delete files, see the **delete** command.

The **rmdir** command does not delete the files of the specified directory from the recycle bin.

Examples

Delete empty directory **subdir1**.

```
ftp>rmdir subdir1
250 The directory was successfully removed
```

Related commands

delete

4.2.30. user

Use **user** to initiate an FTP authentication on the current FTP connection.

Syntax

user *username* [*password*]

Views

FTP client view

Predefined user roles

network-admin

Parameters

username: Specifies the username.

password: Specifies the password.

Usage guidelines

If you tried to access an FTP server but failed to pass the authentication, you can use this command to try again before the connection to the FTP server expires.

After you log in to an FTP server, you can initiate an FTP authentication to change to a new account. By changing to a new account, you can get a different privilege without re-establishing the FTP connection.

Make sure the specified username and password have been configured on the FTP server. If the username or password is not configured, this command fails and the FTP connection is closed.

Examples

After logging in to the FTP server, use username **ftp** and password **123456** to log in again to the FTP server.

- Method 1:

```
ftp> user ftp 123456
331 Password required for ftp.
230 User logged in.
```

- Method 2:

```
ftp> user ftp
331 Password required for ftp.
Password:
230 User logged in.
```

4.2.31. verbose

Use **verbose** to enable or disable the device to display detailed information about FTP operations.

Syntax

verbose

Default

The device displays detailed information about FTP operations.

Views

FTP client view

Predefined user roles

network-admin

Usage guidelines

This command affects only the current FTP session.

Examples

Disable the device from displaying detailed information about FTP operations.

```
ftp> verbose
Verbose mode off.
```

Execute the **get** command.

```
ftp> get a.cfg 1.cfg
```

Enable the device to display detailed information about FTP operations.

```
ftp> verbose
Verbose mode on.
```

Execute the **get** command.

```
ftp> get a.cfg 2.cfg
227 Entering Passive Mode (192,168,1,58,68,14)
```

```
150-Accepted data connection
150 The computer is your friend. Trust the computer
226 File successfully transferred
3796 bytes received in 0.00762 seconds (486.5 kbyte/s)
```

5.1.6. tftp-server ipv6 acl 5-6

5. TFTP commands

5.1. TFTP commands

5.1.1. tftp

Use **tftp** to download a file from a TFTP server or upload a file to a TFTP server in an IPv4 network.

Syntax

tftp *tftp-server* { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**vpn-instance** *vpn-instance-name*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ip** *source-ip-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

tftp-server: Specifies the IPv4 address or host name of a TFTP server. The host name can be a case-insensitive string of 1 to 253 characters and can contain only letters, digits, hyphens (-), underscores (_), and dots (.).

get: Downloads a file and writes the file directly to the destination folder. If the destination folder already has a file with the same name, the system deletes the existing file before starting the download operation. The existing file is permanently deleted even if the download operation fails.

put: Uploads a file.

sget: Downloads a file and saves the file to memory before writing it to the destination folder. The system starts to write the file to the destination folder only after the file is downloaded and saved to memory successfully. If the destination folder already has a file with the same name, the system overwrites the existing file. If the download or save-to-memory operation fails, the existing file in the destination folder is not overwritten.

source-filename: Specifies the source file name, a case-insensitive string of 1 to 1 to 255 characters.

destination-filename: Specifies the destination file name, a case-insensitive string of 1 to 255 characters. If this argument is not specified, the file uses the source file name.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the TFTP server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the TFTP server belongs to the public network, do not specify this option.

dscp *dscp-value*: Specifies the DSCP value for IPv4 to use for outgoing TFTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }: Specifies the source address for outgoing TFTP packets. If you do not specify this option, the device uses the primary IPv4 address of the output interface for the route to the TFTP server as the source address.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source IPv4 address. For successful TFTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.
- **ip** *source-ip-address*: Specifies an IPv4 address. For successful TFTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

The source address specified with the **tftp** command takes precedence over the source address specified with the **tftp client source** command.

The source address specified with the **tftp client source** command applies to all TFTP connections. The source address specified with the **tftp** command applies only to the current TFTP connection.

Examples

Download the **new.bin** file from TFTP server 192.168.1.1 and save the file as **new.bin**.

```
<Switch> tftp 192.168.1.1 get new.bin
Press CTRL+C to abort.
   % Total    % Received % Xferd  Average Speed   Time    Time     Time   Current
                                   Dload  Upload   Total   Spent    Left   Speed
100 13.9M  100 13.9M    0     0  1206k      0  0:00:11  0:00:11  --:--:-- 1206k
Writing file...Done.
<System>
```

Table 5-1 Command output

Field	Description
%	Percentage of file transmission progress.
Total	Size of files to be transmitted, in bytes.
%	Percentage of received file size to total file size.
Received	Received file size, in bytes.
%	Percentage of sent file size to total file size.
Xferd	Sent file size, in bytes.
Average Dload	Average download speed, in bps.
Speed Upload	Average upload speed, in bps.
Writing file…	The system was writing the downloaded file to the storage medium. This field is displayed only when the **get** or **sget** keyword is specified. If the operation succeeded, this command displays **Done** at the end of this field. If the operation failed, this command displays **Failed**.

Related commands

tftp client source

5.1.2. tftp client ipv6 source

Use **tftp client ipv6 source** to specify the source IPv6 address for TFTP packets sent to an IPv6 TFTP server.

Use **undo tftp client ipv6 source** to restore the default.

Syntax

tftp client ipv6 source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }

undo tftp client ipv6 source

Default

No source address is specified for TFTP packets sent to an IPv6 TFTP server. The device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source address. For successful TFTP packet transmission, make sure the interface is up and is configured with an IPv6 address.

ipv6 *source-ipv6-address*: Specifies an IPv6 address . For successful TFTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **tftp ipv6** command takes precedence over the source address specified with the **tftp client ipv6 source** command.

The source address specified with the **tftp client ipv6 source** command applies to all TFTP connections. The source address specified with the **tftp ipv6** command applies only to the TFTP connection that is being established.

Examples

Specify the source IPv6 address of 2000::1 for TFTP packets sent to an IPv6 TFTP server.

```
<Switch> system-view
[Switch] tftp client ipv6 source ipv6 2000::1
```

Related commands

tftp ipv6

5.1.3. tftp client source

Use **tftp client source** to specify the source IPv4 address for TFTP packets sent to an IPv4 TFTP server.

Use **undo tftp client source** to restore the default.

Syntax

tftp client source { **interface** *interface-type interface-number* | **ip** *source-ip-address* }

undo tftp client source

Default

No source IPv4 address is specified for TFTP packets sent to an IPv4 TFTP server. The device uses the primary IPv4 address of the output interface for the route to the server as the source address.

Views

System view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's primary IPv4 address as the source address. For successful TFTP packet transmission, make sure the interface is up and has the primary IPv4 address configured.

ip *source-ip-address*: Specifies an IPv4 address. For successful TFTP packet transmission, make sure this address is the IPv4 address of an interface in up state on the device.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The source address specified with the **tftp** command takes precedence over the source address specified with the **tftp client source** command.

The source address specified with the **tftp client source** command applies to all TFTP connections. The source address specified with the **tftp** command applies only to the TFTP connection that is being established.

Examples

Specify the source IP address of 192.168.20.222 for TFTP packets sent to an IPv4 TFTP server.

```
<Switch> system-view
[Switch] tftp client source ip 192.168.20.222
```

Related commands

tftp

5.1.4. tftp ipv6

Use **tftp ipv6** to download a file from a TFTP server or upload a file to a TFTP server in an IPv6 network.

Syntax

tftp ipv6 *tftp-server* [**-i** *interface-type interface-number*] { **get** | **put** | **sget** } *source-filename* [*destination-filename*] [**vpn-instance** *vpn-instance-name*] [**dscp** *dscp-value* | **source** { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }] *

Views

User view

Predefined user roles

network-admin

Parameters

tftp-server: Specifies the IPv6 address or host name of a TFTP server. The host name can be a case-insensitive string of 1 to 253 characters and can contain only letters, digits, hyphens (-), underscores (_), and dots (.).

-i *interface-type interface-number*: Specifies an output interface by its type and number. This option can be used only when the TFTP server address is a link local address and the specified output interface has a link local address. For information about link local addresses, see *Layer 3—IP Services Configuration Guide*.

get: Downloads a file and writes the file directly to the destination folder. If the destination folder already has a file with the same name, the system deletes the existing file before starting the download operation. The existing file is permanently deleted even if the download operation fails.

put: Uploads a file.

sget: Downloads a file and saves the file to memory before writing it to the destination folder. The system starts to write the file to the destination folder only after the file is downloaded and saved to memory successfully. If the destination folder already has a file using the same name, the system overwrites the existing file. If the download or save-to-memory operation fails, the existing file in the destination folder is not overwritten.

source-filename: Specifies the source file name, a case-insensitive string of 1 to 255 characters.

destination-filename: Specifies the destination file name, a case-insensitive string of 1 to 255 characters. If this argument is not specified, the file uses the source file name.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the TFTP server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the TFTP server belongs to the public network, do not specify this option.

dscp *dscp-value*: Specifies the DSCP value for IPv6 to use in outgoing TFTP packets to indicate the packet transmission priority. The value range is 0 to 63. The default is 0.

source { **interface** *interface-type interface-number* | **ipv6** *source-ipv6-address* }: Specifies the source address for outgoing TFTP packets. If you do not specify this option, the device selects a source IPv6 address as defined in RFC 3484.

- **interface** *interface-type interface-number*: Specifies an interface by its type and number. The device will use the interface's IPv6 address as the source IPv6 address. For successful TFTP packet transmission, make sure the interface is up and is configured with an IPv6 address.
- **ipv6** *source-ipv6-address*: Specifies an IPv6 address. For successful TFTP packet transmission, make sure this address is the IPv6 address of an interface in up state on the device.

Usage guidelines

The source address specified with the **tftp ipv6** command takes precedence over the source address specified with the **tftp client ipv6 source** command.

The source address specified with the **tftp client ipv6 source** command applies to all TFTP connections. The source address specified with the **tftp ipv6** command applies only to the current TFTP connection.

Examples

Download the **new.bin** file from TFTP server 2001::1 and save the file as **new.bin**.

```
<Switch> tftp ipv6 2001::1 get new.bin new.bin
Press CTRL+C to abort.
   % Total    % Received % Xferd  Average Speed   Time    Time     Time   Current
                                  Dload  Upload   Total   Spent    Left   Speed
100 13.9M  100 13.9M    0     0  1206k      0  0:00:11  0:00:11  --:--:-- 1206k
Writing file...Done.
```

For more information about the command output, see Table 5-1 .

5.1.5. tftp-server acl

Use **tftp-server acl** to use an ACL to control the device's access to TFTP servers in an IPv4 network.

Use **undo tftp-server acl** to restore the default.

Syntax

tftp-server acl *acl-number*

undo tftp-server acl

Default

No ACL is used to control the device's access to TFTP servers.

Views

System view

Predefined user roles

network-admin

Parameters

acl-number: Specifies the number of a basic ACL, in the range of 2000 to 2999.

Usage guidelines

You can use an ACL to deny or permit the device's access to specific TFTP servers.

Examples

Allow the device to access only TFTP server 1.1.1.1.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Switch-acl-ipv4-basic-2000] quit
[Switch] tftp-server acl 2000
```

5.1.6. tftp-server ipv6 acl

Use **tftp-server ipv6 acl** to use an ACL to control the device's access to TFTP servers in an IPv6 network.

Use **undo tftp-server ipv6 acl** to restore the default.

Syntax

tftp-server ipv6 acl *ipv6-acl-number*

undo tftp-server ipv6 acl

Default

No ACL is used to control the device's access to TFTP servers.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies the number of a basic ACL, in the range of 2000 to 2999.

Usage guidelines

You can use an ACL to deny or permit the device's access to specific TFTP servers.

Examples

Allow the device to access only TFTP server 2001::1.

```
<Switch> System-view
[Switch] acl ipv6 basic 2001
[Switch-acl-ipv6-basic-2001] rule permit source 2001::1/128
[Switch-acl-ipv6-basic-2001] quit
[Switch] tftp-server ipv6 acl 2001
```

6. File system management commands

6.1. File system management commands

IMPORTANT:

- Before managing storage media, file systems, directories, and files, make sure you know the possible impact.
- A file or directory whose name starts with a dot character (.) is a hidden file or directory. To prevent the system from hiding a file or directory, make sure the file or directory name does not start with a dot character.
- Some system files and directories are hidden. For correct system operation and full functionality, do not modify or delete hidden files or directories.

File system names, directory names, and file names must be compliant with the naming conventions. For more information about the naming conventions and the methods for specifying the names, see *Fundamentals Configuration Guide*.

Before you use the **copy**, **delete**, **fixdisk**, **format**, **gunzip**, **gzip**, **mkdir**, **move**, **rename**, **rmdir**, or **undelete** command on a file system, make sure the file system is not write protected.

You cannot access a storage medium that is being partitioned, or a file system that is being formatted or repaired. To access the file system, wait for the ongoing operation to be completed and then use one of the following methods:

- Use the absolute path to specify a file or directory. For example, use the **dir flash:/** command to display the files and directories in the **flash:** file system.
- Use the **cd** command to change the working directory to the root directory of the file system before accessing a file or directory in the file system. For example, to display the files and directories in the root directory of the **flash:** file system, perform the following tasks:
  a. Use the **cd flash:/** command to change the working directory to the root directory of the file system.
  b. Execute the **dir** command.

6.1.1. cd

Use **cd** to change the working directory.

Syntax

cd { *directory* | **..** }

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies the destination directory.

..: Specifies the parent directory. If the working directory is the root directory, an error message appears when you execute the **cd ..** command. No online help information is available for this keyword.

Examples

Access the **test** directory after logging in to the device.

```
<Switch> cd test
```

Change to the parent directory.

```
<Switch> cd ..
```

6.1.2. copy

Use **copy** to copy a file.

Syntax

copy *source-file* { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name or URL of the file to be copied. If the file resides on an FTP, TFTP, or HTTP server rather than on the device, specify the URL of the file. Whether a URL is case sensitive depends on the server.

dest-file: Specifies the name or URL for the destination file. To copy the source file to an FTP, TFTP, or HTTP server, specify a URL. Whether a URL is case sensitive depends on the server.

dest-directory: Specifies the destination directory or URL. To copy the source file to an FTP, TFTP, or HTTP server, specify a URL. The device copies the source file to the destination location and saves the file with its original file name. Whether a URL is case sensitive depends on the server.

Usage guidelines

You can use the **copy** command to perform the following tasks:

- Copy a local file and save it locally.
- Copy a local file and save it to an FTP, TFTP, or HTTP server.
- Copy a file from an FTP, TFTP, or HTTP server and save it locally.

To specify a file or directory, use the following guidelines:

Location	Name format	Remarks
On the device	Use the file name guidelines in *Fundamentals Configuration Guide*.	N/A
On an FTP server	Enter the URL in the format of **ftp://***FTP username*[**:***password*]**@***server address*[**:***port number*]*/file path*[*/file name*].	The username and password must be the same as the username and password configured on the FTP server. If the server authenticates users only by the username, you are not required to enter the password. For example, to use the username a and

Location	Name format	Remarks
		password 1 and specify the startup.cfg file in the authorized working directory on the FTP server 1.1.1.1, enter ftp://a:1@1.1.1.1/startup.cfg.
On a TFTP server	Enter the URL in the format of **tftp://***server address*[**:***port number*]*/file path*[*/file name*].	For example, to specify the startup.cfg file in the working directory on TFTP server 1.1.1.1, enter the URL tftp://1.1.1.1/startup.cfg.
On an HTTP server	Enter the URL in the format of **http://**[*HTTP username*[**:***password*]**@**]*server address*[**:***port number*]*/filepath*[*/file name*].	The username and password in the URL must be the same as the username and password configured on the server. If only the username is required for authentication, you do not need to enter the password. If authentication is not required, you do not need to enter the username or password. For example, the **startup.cfg** file is saved in the authorized directory on the HTTP server at 1.1.1.1. The HTTP account username and password are **a** and **1**, respectively. To copy the file, enter the URL http://a:1@1.1.1.1/startup.cfg. If authentication is not required, enter the URL http://1.1.1.1/startup.cfg.

To specify an IPv6 address, enclose the IPv6 address in square brackets ([ ]), for example, ftp://test:test@[2001::1]:21/test.cfg.

Examples

Copy the **test.cfg** file in the current directory and save it to the current directory as **testbackup.cfg**.

```
<Switch> copy test.cfg testbackup.cfg
Copy flash:/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to flash:/testbackup.cfg...Done.
```

Copy the **1.cfg** file from the **flash:** file system's **test** directory to the USB disk. Save the copy to the **testbackup** directory on the first partition as **1backup.cfg**.

```
<Switch> copy flash:/test/1.cfg usba0:/testbackup/1backup.cfg
Copy flash:/test/1.cfg to usba0:/testbackup/1backup.cfg? [Y/N]:y
Copying file flash:/test/1.cfg to usba0:/testbackup/1backup.cfg...Done.
```

Copy the **test.cfg** file in the current directory and save it to the root directory of a file system in a specific slot as **testbackup.cfg**.

```
<Switch> copy test.cfg slot2#flash:/
Copy flash:/test.cfg to slot2#flash:/test.cfg? [Y/N]:y
Copying file flash:/test.cfg to slot2#flash:/test.cfg...Done.
```

Copy **test.cfg** from the working directory on FTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg.** The FTP username is **user**. The password is **private**.

```
<Switch> copy ftp://user:private@1.1.1.1/test.cfg testbackup.cfg
Copy ftp://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file ftp://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the working directory on FTP server 1.1.1.1 as **testbackup.cfg**. The FTP username is **user**. The password is **private**.

```
<Switch> copy test.cfg ftp://user:private@1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to ftp://user:private@1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to ftp://user:private@1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on TFTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg**.

```
<Switch> copy tftp://1.1.1.1/test.cfg testbackup.cfg
Copy tftp://1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file tftp://1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the working directory on TFTP server 1.1.1.1 as **testbackup.cfg**.

```
<Switch> copy test.cfg tftp://1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to tftp://1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to tftp://1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on FTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**. The FTP username is **user**. The password is **private**.

```
<Switch> copy ftp://user:private@[2001::1]/test.cfg testbackup.cfg
Copy ftp://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file ftp://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the working directory on TFTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**.

```
<Switch> copy tftp://[2001::1]/test.cfg testbackup.cfg
Copy tftp://[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file tftp://[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the authorized directory on HTTP server 1.1.1.1. Save the copy to the local current directory as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Switch> copy http://user:private@1.1.1.1/test.cfg testbackup.cfg
Copy http://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file http://user:private@1.1.1.1/test.cfg to flash:/testbackup.cfg... Done.
```

Copy **test.cfg** from the current directory. Save the copy to the authorized directory on HTTP server 1.1.1.1 as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Switch> copy test.cfg http://user:private@1.1.1.1/testbackup.cfg
Copy flash:/test.cfg to http://user:private@1.1.1.1/testbackup.cfg? [Y/N]:y
Copying file flash:/test.cfg to http://user:private@1.1.1.1/testbackup.cfg... Done.
```

Copy **test.cfg** from the authorized directory on HTTP server 2001::1. Save the copy to the local current directory as **testbackup.cfg**. The HTTP login username is **user**. The password is **private**.

```
<Switch> copy http://user:private@[2001::1]/test.cfg testbackup.cfg
Copy http://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg? [Y/N]:y
Copying file http://user:private@[2001::1]/test.cfg to flash:/testbackup.cfg... Done.
```

6.1.3. delete

Use **delete** to delete a file.

Syntax

delete [**/unreserved**] *file*

Views

User view

Predefined user roles

network-admin

Parameters

/unreserved: Permanently deletes the specified file. If you do not specify this keyword, the command moves the file to the recycle bin.

file: Specifies the name of the file to be deleted. Asterisks (*) are acceptable as wildcards. For example, to remove files with the **.txt** extension in the current directory, enter **delete *.txt**.

Usage guidelines

The **delete /unreserved** *file* command deletes a file permanently. The file cannot be restored.

The **delete** *file* command (without **/unreserved**) moves a file to the recycle bin.

A file moved to the recycle bin can be restored by using the **undelete** command.

Do not use the **delete** command to delete files from the recycle bin. To delete files from the recycle bin, use the **reset recycle-bin** command.

If you delete two files that have the same name from different directories, both files are retained in the recycle bin. If you successively delete two files that have the same name from the same directory, only the most recently deleted file is retained in the recycle bin.

Examples

Remove the **1.cfg** file from the current directory.

```
<Switch> delete 1.cfg
Delete flash:/1.cfg? [Y/N]:y
Deleting file flash:/1.cfg...Done.
```

Permanently delete the **1.cfg** file from the current directory.

```
<Switch> delete /unreserved 1.cfg
The file cannot be restored. Delete flash:/1.cfg? [Y/N]:y
Deleting the file permanently will take a long time. Please wait...
Deleting file flash:/1.cfg...Done.
```

Related commands

reset recycle-bin

undelete

6.1.4. dir

Use **dir** to display files or directories.

Syntax

dir [**/all**] [*file* | *directory* | **/all-filesystems**]

Views

User view

Predefined user roles

network-admin

Parameters

/all: Displays all files and directories in the current directory, visible or hidden. If you do not specify this option, only visible files and directories are displayed.

file: Displays a specific file. This argument can use the asterisk (*) as a wildcard. For example, to display files with the **.txt** extension in the current directory, enter **dir *.txt**.

directory: Displays a specific directory.

/all-filesystems: Displays files and directories in the root directories of all file systems on the device.

Usage guidelines

If no option is specified, the command displays all visible files and directories in the current directory.

The directory name of the recycle bin is **.trash**. To display files in the recycle bin, use either of the following methods:

- Execute the **dir /all .trash** command.
- Execute the **cd .trash** command and then the **dir** command.

If multiple users perform file operations (for example, creating or deleting files or directories) at the same time, the output for this command might be incorrect.

Examples

Display information about all files and directories in the current directory.

```
<Switch> dir /all
Directory of flash:/
...
```

Display files and directories in the root directories of all file systems on the device.

```
<Switch> dir /all-filesystems
Directory of flash:/
...

Directory of usba0:/
...
```

Table 6-1 Command output

Field	Description
Directory of	Current directory.
0 -rwh 3144 Apr 26 2014 13:45:28 xx.xx	File or directory information: • **0**—File or directory number, which is automatically allocated by the system. • **-rwh**—Attributes of the file or directory. The first character is the directory indicator (**d** for directory and **–** for file). The second character indicates whether the file or directory is readable (**r** for readable). The third character indicates whether the file or directory is writable (**w** for writable). The fourth character indicates whether the file or directory is hidden (**h** for hidden, **-** for visible). Modifying, renaming, or deleting hidden files might affect functions. • **3144**—File size in bytes. For a directory, a hyphen (-) is displayed. • **Apr 26 2014 13:45:28**—Last date and time when the file or directory was modified.

Field	Description
	• **xx.xx**—File or directory name.

6.1.5. file prompt

Use **file prompt** to set the operation mode for files and directories.

Use **undo file prompt** to restore the default.

Syntax

file prompt { **alert** | **quiet** }

undo file prompt

Default

The operation mode is **alert**. The system prompts for confirmation when you perform a destructive file or directory operation.

Views

System view

Predefined user roles

network-admin

Parameters

alert: Prompts for confirmation when a destructive file or directory operation is being performed.

quiet: Gives no confirmation prompt for file or directory operations.

Usage guidelines

In quiet mode, the system does not prompt for confirmation when a user performs a file or directory operation. The **alert** mode provides an opportunity to cancel a disruptive operation.

Examples

Set the file and directory operation mode to **alert**.

```
<Switch> system-view
[Switch] file prompt alert
```

6.1.6. fixdisk

Use **fixdisk** to check a file system for damage and repair any damage.

Syntax

fixdisk *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

Use this command to fix a file system when space in the file system cannot be used or released.

You can repair a file system only when no other users are accessing the file system.

Examples

Repair file system **flash:**.

```
<Switch> fixdisk flash:
Restoring flash: may take some time...
Restoring flash:...Done.
```

6.1.7. format

Use **format** to format a file system.

Syntax

format *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

The device requires that the file systems on hot swappable storage media be VFAT file systems. To use a file system of a different type on the device, you must use this command to format the file system.

Formatting a file system permanently deletes all files in the file system. If a startup configuration file exists in the file system, back up the file if necessary.

You can format a file system only when no other users are accessing the file system.

Examples

Format file system **flash:**.

```
<Switch> format flash:
All data on flash: will be lost, continue? [Y/N]:y
Formatting flash:... Done.
```

Format the file system on the third partition of the USB disk.

```
<Switch> format usba2:
All data on usba2: will be lost, continue? [Y/N]:y
Formatting usba2:... Done.
```

6.1.8. gunzip

Use **gunzip** to decompress a file.

Syntax

gunzip *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be decompressed. This argument must use the **.gz** extension.

Usage guidelines

This command deletes the specified file after decompressing it.

Examples

Decompress file **system.bin.gz**:

1. Before decompressing the file, you can display files whose names start with the **system.** string.

```
<Switch> dir system.*
Directory of flash:
   1 -rw-          20 Jun 14 2012 10:18:53   system.bin.gz

524288 KB total (184664 KB free)
```

2. Decompress the file **system.bin.gz**.

```
<Switch> gunzip system.bin.gz
Decompressing file flash:/system.bin.gz..... Done.
```

3. Verify the decompress operation.

```
<Switch> dir system.*
Directory of flash:
   1 -rw-           0 May 30 2012 11:42:25   system.bin

524288 KB total (184664 KB free)
```

6.1.9. gzip

Use **gzip** to compress a file.

Syntax

gzip *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be compressed.

Usage guidelines

This command saves the compressed file to the *file***.gz** file and deletes the source file.

Examples

Compress file **system.bin**:

1. Before compressing the file, you can display files whose names start with the **system.** string.

```
<Switch> dir system.*
Directory of flash:
   1 -rw-           0 May 30 2012 11:42:24   system.bin

524288 KB total (184664 KB free)
```

2. Compress the file **system.bin**.

```
<Switch> gzip system.bin
Compressing file flash:/system.bin..... Done.
```

3. Verify the compress operation.

```
<Switch> dir system.*
Directory of flash:
   1 -rw-          20 Jun 14 2012 10:18:53   system.bin.gz

524288 KB total (184664 KB free)
```

6.1.10. mkdir

Use **mkdir** to create a directory.

Syntax

mkdir *directory*

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory.

Usage guidelines

The name of the directory to be created must be unique in the parent directory.

You can create a directory only in an existing directory. For example, to create the **flash:/test/mytest** directory, make sure the **test** directory already exists.

Examples

Create the **test** directory in the current directory.

```
<Switch> mkdir test
Creating directory flash:/test... Done.
```

Create the **test/subtest** directory in the current directory.

```
<Switch> mkdir test/subtest
Creating directory flash:/test/subtest... Done.
```

6.1.11. more

Use **more** to display the contents of a text file.

Syntax

more *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of a file.

Examples

Display the contents of the **test.txt** file.

```
<Switch> more test.txt
Have a nice day.
```

Display the contents of the **testcfg.cfg** file.

```
<Switch> more testcfg.cfg

#
 version 7.1.0
#
 sysname Switch
#
vlan 2
#
return
<Switch>
```

6.1.12. mount

Use **mount** to mount a file system.

Syntax

mount *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

Generally, file systems on a hot-swappable storage medium are automatically mounted when the storage medium is connected to the device. If the system cannot recognize a file system, however, you must mount the file system before you can access it.

To avoid file system corruption, do not perform the following tasks while the system is mounting a file system:

- Reboot, power cycle, or power off the device.
- Install or remove storage media.
- Perform a switchover.

To remove a hot-swappable storage medium from the device, you must first unmount all file systems on the storage medium. Removing a mounted hot-swappable storage medium might damage files on the storage medium or even the storage medium.

Examples

Mount a file system on the USB disk.

```
<Switch> mount usba0:
```

Related commands

umount

6.1.13. move

Use **move** to move a file.

Syntax

move *source-file* { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name of the source file.

dest-file: Specifies the name of the destination file.

dest-directory: Specifies the name of the destination directory.

Usage guidelines

If you specify a destination directory, the system moves the source file to the specified directory without changing the file name.

Examples

Move the **flash:/test/sample.txt** file to **flash:/**, and save it as **1.txt**.

```
<Switch> move test/sample.txt 1.txt
Move flash:/test/sample.txt to flash:/1.txt? [Y/N]:y
Moving file flash:/test/sample.txt to flash:/1.txt ...Done.
```

Move the **b.cfg** file to the **test2** directory.

```
<Switch> move b.cfg test2
Move flash:/b.cfg to flash:/test2/b.cfg? [Y/N]:y
```

```
Moving file flash:/b.cfg to flash:/test2/b.cfg... Done.
```

6.1.14. pwd

Use **pwd** to display the working directory.

Syntax

pwd

Views

User view

Predefined user roles

network-admin

Examples

Display the working directory.

```
<Switch> pwd
flash:
```

6.1.15. rename

Use **rename** to rename a file or directory.

Syntax

rename { *source-file* | *source-directory* } { *dest-file* | *dest-directory* }

Views

User view

Predefined user roles

network-admin

Parameters

source-file: Specifies the name of the source file.

source-directory: Specifies the name of the source directory.

dest-file: Specifies the name of the destination file.

dest-directory: Specifies the name of the destination directory.

Usage guidelines

This command is not executed if the destination file or directory name is already used by an existing file or directory in the working directory.

Examples

Rename the **copy.cfg** file as **test.cfg**.

```
<Switch> rename copy.cfg test.cfg
Rename flash:/copy.cfg as flash:/test.cfg? [Y/N]:y
Renaming flash:/copy.cfg as flash:/test.cfg... Done.
```

6.1.16. reset recycle-bin

Use **reset recycle-bin** to delete files from the recycle bin.

Syntax

reset recycle-bin [**/force**]

Views

User view

Predefined user roles

network-admin

Parameters

/force: Deletes all files in the recycle bin without prompting for confirmation. If you do not specify this option, the command prompts you to confirm the deletion operation for each file.

Usage guidelines

The **delete** *file* command only moves a file to the recycle bin. To permanently delete the file, use the **reset recycle-bin** command to delete the file from the recycle bin.

Examples

Empty the recycle bin. (In this example there are two files in the recycle bin.)

```
<Switch> reset recycle-bin
Clear flash:/a.cfg? [Y/N]:y
Clearing file flash:/a.cfg... Done.
Clear flash:/b.cfg? [Y/N]:y
Clearing file flash:/b.cfg... Done.
```

Delete the **b.cfg** file from the recycle bin. (In this example there are two files in the recycle bin.)

```
<Switch> reset recycle-bin
Clear flash:/a.cfg? [Y/N]:n
Clear flash:/b.cfg? [Y/N]:y
Clearing file flash:/b.cfg... Done.
```

Related commands

delete

6.1.17. rmdir

Use **rmdir** to delete a directory.

Syntax

rmdir *directory*

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies a directory.

Usage guidelines

To delete a directory, you must delete all files and subdirectories in the directory permanently or move them to the recycle bin. If you move them to the recycle bin, executing the **rmdir** command permanently deletes them.

Examples

Delete the **subtest** directory.

```
<Switch>rmdir subtest/
Remove directory flash:/test/subtest and the files in the recycle-bin under this directory
will be deleted permanently. Continue? [Y/N]:y
Removing directory flash:/test/subtest... Done.
```

6.1.18. tar create

Use **tar create** to archive files and directories.

Syntax

tar create [**gz**] **archive-file** *dest-file* [**verbose**] **source** { *source-file* | *source-directory* }&<1-5>

Views

User view

Predefined user roles

network-admin

Parameters

gz: Uses gzip to compress the files and directories before archiving them. If you do not specify this keyword, the command archives the files and directories without compressing them.

archive-file *dest-file*: Specifies the archive file name. If you specified the **gz** keyword, the extension of the archive file name must be **.tar.gz**. If you did not specify the **gz** keyword, the extension of the archive file name must be **.tar**.

verbose: Displays the names of the successfully archived files and directories. If you do not specify this keyword, the command does not display the names of the successfully archived files and directories.

source { *source-file* | *source-directory* }&<1-5>: Specifies the files and directories to be archived. The argument can be a space-separated list of up to five items. Each item can be a file or directory name.

Examples

Archive the **1.cfg** and **2.cfg** files and the **test** directory to **a.tar**.

```
<Switch> tar create archive-file a.tar source 1.cfg 2.cfg test
Creating archive flash:/a.tar Done.
```

Compress and archive the **1.cfg** and **2.cfg** files and the **test** directory to **b.tar.gz**.

```
<Switch> tar create gz archive-file b.tar.gz source 1.cfg 2.cfg test
Creating archive flash:/b.tar.gz Done.
```

Compress and archive files and directories, and display the successfully archived files and directories.

```
<Switch> tar create gz archive-file c.tar.gz verbose source 1.cfg 2.cfg test
1.cfg
```

```
2.cfg
test/
test/a.log
test/subtest/
test/subtest/aa.log
```

Related commands

tar extract

tar list

6.1.19. tar extract

Use **tar extract** to extract files and directories.

Syntax

tar extract archive-file *file* [**verbose**] [**screen** | **to** *directory*]

Views

User view

Predefined user roles

network-admin

Parameters

archive-file *file*: Specifies the archive file name. The extension can be **.tar** or **.tar.gz**.

verbose: Displays the names of the successfully extracted files and directories.

screen: Displays the content of the extracted files and directories on the screen. The extracted files are not saved.

to *directory*: Saves the extracted files and directories to a different directory. The *directory* argument specifies the directory.

Usage guidelines

If you do not specify the **screen** keyword or the **to** *directory* option, the command saves the extracted files and directories to the working directory.

The command saves the extracted files and directories by using their original names. If a file or directory that has the same name as an extracted file or directory already exists in the destination directory, the file or directory is overwritten.

Examples

Extract files and directories from archive file **a.tar**.

```
<Switch> tar extract archive-file a.tar
Extracting archive flash:/a.tar Done.
```

Extract files and directories from archive file **a.tar**, and display the names of the successfully extracted files and directories.

```
<Switch> tar extract archive-file b.tar.gz verbose
1.cfg
2.cfg
test/
test/a.log
test/subtest/
```

```
test/subtest/aa.log
```

Extract files and directories from archive file **a.tar**, and display the content of the files on the screen.

```
<Switch> tar extract archive-file c.tar.gz screen
#
 version 7.1.070, Release 1201
#
 sysname Switch
#
...
```

Related commands

tar create

tar list

6.1.20. tar list

Use **tar list** to display the names of archived files and directories.

Syntax

tar list archive-file *file*

Views

User view

Predefined user roles

network-admin

Parameters

archive-file *file*: Specifies the archive file name. The extension can be **.tar** or **.tar.gz**.

Examples

Display the names of archived files and directories.

```
<Switch> tar list archive-file a.tar
1.cfg
2.cfg
test/
test/a.log
test/subtest/
test/subtest/aa.log
```

Related commands

tar create

tar extract

6.1.21. umount

Use **umount** to unmount a file system.

Syntax

umount *filesystem*

Views

User view

Predefined user roles

network-admin

Parameters

filesystem: Specifies the name of a file system.

Usage guidelines

File systems on a storage medium are automatically mounted when the storage medium is connected to the device. To remove a hot-swappable storage medium from the device, you must first unmount all file systems on the storage medium. Removing a mounted hot-swappable storage medium might damage files on the storage medium or even the storage medium.

You can unmount a file system only when no other users are accessing the file system.

To avoid file system corruption, do not perform the following tasks while the system is unmounting a file system:

- Reboot, power cycle, or power off the device.
- Install, remove, or access storage media.
- Perform a switchover.

Examples

Unmount a file system on a USB disk.

```
<Switch> umount usba0:
```

Related commands

mount

6.1.22. undelete

Use **undelete** to restore a file from the recycle bin.

Syntax

undelete *file*

Views

User view

Predefined user roles

network-admin

Parameters

file: Specifies the name of the file to be restored.

Usage guidelines

If a file with the same name already exists in the directory, the system prompts whether or not you want to overwrite the existing file. If you enter **Y**, the existing file is overwritten. If you enter **N**, the command is not executed.

Examples

Restore the **copy.cfg** file, which was moved from the root directory of the **flash:** file system to the recycle bin.

```
<Switch>undelete copy.cfg
Undelete flash:/copy.cfg? [Y/N]:y
Undeleting file flash:/copy.cfg... Done.
```

Restore the **startup.cfg** file, which was moved from the **flash:/seclog** directory to the recycle bin.

- Method 1:

```
<Switch>undelete seclog/startup.cfg
Undelete flash:/seclog/startup.cfg? [Y/N]:y
Undeleting file flash:/seclog/startup.cfg... Done.
<Switch>
```

- Method 2:

```
<Switch> cd seclog
<Switch> undelete startup.cfg
Undelete flash:/seclog/startup.cfg? [Y/N]:y
Undeleting file flash:/seclog/startup.cfg... Done.
```

7. Configuration file management commands

7.1. Configuration file management commands

7.1.1. backup startup-configuration

Use **backup startup-configuration** to back up the main next-startup configuration file to a TFTP server.

Syntax

backup startup-configuration to *ipv4-server* [*dest-filename*] [**vpn-instance** *vpn-instance-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv4-server: Specifies a TFTP server by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

dest-filename: Specifies the name of the target file used for saving the file on the server. The file must be a .cfg file. The file name is a case-insensitive string of up to 255 characters. If you do not specify a target file name, the source file name is used.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the TFTP server is on the public network, do not specify this option.

Examples

Back up the main next-startup configuration file to the IPv4 TFTP server at 2.2.2.2 in the public network, and set the target file name to **192-168-1-26.cfg**.

```
<Switch> backup startup-configuration to 2.2.2.2 192-168-1-26.cfg
Backing up the main startup configuration file to 2.2.2.2...
Done.
```

Back up the main next-startup configuration file to the IPv4 TFTP server at 2.2.2.2 in VPN instance **VPN1**, and set the target file name to **192-168-1-26.cfg**.

```
<Switch> backup startup-configuration to 2.2.2.2 192-168-1-26.cfg vpn-instance VPN1
Backing up the main startup configuration file to 2.2.2.2 in VPN VPN1...
Done.
```

Related commands

restore startup-configuration

7.1.2. display current-configuration

Use **display current-configuration** to display the running configuration.

Syntax

display current-configuration [[**configuration** [*module-name*] | **interface** [*interface-type* [*interface-number*]]]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

configuration [*module-name*]: Displays the feature configuration. The *module-name* argument specifies a feature module. If you do not specify a feature module, the command displays all feature settings you have made.

interface [*interface-type* [*interface-number*]]: Displays interface configuration, where the *interface-type* argument represents the interface type and the *interface-number* argument represents the interface number. If you do not specify the *interface-type* *interface-number* arguments, the command displays the running configuration for all interfaces. If you specify only the *interface-type* argument, the command displays the running configuration for all interfaces of this type.

Usage guidelines

Use this command to verify the configuration you have made.

If the system has automatically changed the setting you have made for a parameter, this command displays the effective setting instead of the configured one. An automatic change typically occurs because of system restrictions. This command does not display parameters that are using the default settings.

Examples

Display local user configuration.

```
<Switch> display current-configuration configuration local-user
#
local-user ftp
 password hash
$h$6$Twd73mLrN8O2vvD5$Cz1vgdpR4KoTiRQNE9pg33gU14Br2p1VguczLSVyJLO2huV5Syx/LfDIf8ROLtV

ErJ/C31oq2rFtmNuyZf4STw==
 service-type ssh telnet terminal
 authorization-attribute user-role network-admin
#
return
```

Display VLAN interface configuration.

```
<Switch> display current-configuration interface Vlan-interface
#
```

```
interface Vlan-interface1
 ip address 192.168.1.84 255.255.255
#
Return
```

7.1.3. display current-configuration diff

Use **display current-configuration diff** to display the differences that the running configuration has as compared with the next-startup configuration.

Syntax

display current-configuration diff

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the differences that the running configuration has as compared with the next-startup configuration.

```
<Switch> display current-configuration diff
--- Startup configuration
+++ Current configuration
@@ -5,7 +5,7 @@
 #
  sysname Switch
 #
-alias dhc display history-command
+alias dh display hotkey
 #
  system-working-mode standard
<Switch>
```

Table 7-1 Command output

Field	Description
--- *A* +++ *B*	• *A* represents the source configuration for comparison, which can be **Startup configuration**, **Current configuration**, or the name of the source configuration file with its directory information. • *B* represents the target configuration for comparison, which can be **Current configuration**, **Startup configuration**, or the name of the target configuration file with its directory information. In this example, the startup configuration and the current configuration are the source and target, respectively.

7.1.4. display default-configuration

Use **display default-configuration** to display the factory defaults.

Syntax

display default-configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Factory defaults are custom basic settings that came with the device. Factory defaults vary by device models and might differ from the initial default settings for the commands.

The device starts up with the factory defaults if no next-startup configuration files are available.

Examples

Display the factory defaults.

```
<Switch> display default-configuration
```

7.1.5. display diff

Use **display diff** to display differences between configurations.

Syntax

display diff configfile *file-name-s* { **configfile** *file-name-d* | **current-configuration** | **startup-configuration** }

display diff current-configuration { **configfile** *file-name-d* | **startup-configuration** }

display diff startup-configuration { **configfile** *file-name-d* | **current-configuration** }

Views

Any view

Predefined user roles

```

The output shows that the **alias dhc display history-command** command is contained only in the running configuration, and the **alias dh display hotkey** command is contained only in the next-startup configuration.

For the command output description, see Table 7-1 .

Related commands

display current-configuration

display current-configuration diff

display saved-configuration

7.1.6. display saved-configuration

Use **display saved-configuration** to display the contents of the configuration file for the next system startup.

Syntax

display saved-configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Use this command to verify that important settings have been saved to the configuration file for the next system startup.

This command selects the configuration file to display in the following order:

1. If the main startup configuration file is available, this command displays the contents of the main startup configuration file.
2. If only the backup startup configuration file is available, this command displays the contents of the backup file.
3. If both the main and backup startup configuration files are not available, this command does not display anything.

Examples

Display the contents of the configuration file for the next system startup.

```
<Switch> display saved-configuration
#
 version 7.1.070, Release 1201
#
 sysname Switch
#
 ftp server enable
#
 telnet server enable
#
 domain default enable system
#
vlan 1
#
domain system
#
  ---- More ----
```

Related commands

reset saved-configuration

save

7.1.7. display startup

Use **display startup** to display the names of the current startup configuration file and the next-startup configuration files.

Syntax

display startup

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

All IRF members use the same current startup configuration file as the master.

After a master/subordinate switchover, it is normal that the current startup configuration files on all IRF members are displayed as NULL. This is because the new master continues to run with the running configuration rather than rebooting with a startup configuration file.

Examples

Display names of the startup configuration files.

```
<Switch> display startup
 Current startup saved-configuration file: flash:/startup.cfg
 Next main startup saved-configuration file: flash:/startup.cfg
```

```
Next backup startup saved-configuration file: NULL
```

Table 7-2 Command output

Field	Description
Current startup saved-configuration file	Configuration file that the device has started up with.
Next main startup saved-configuration file	Primary configuration file to be used at the next startup.
Next backup startup saved-configuration file	Backup configuration file to be used at the next startup.

Related commands

startup saved-configuration

7.1.8. display this

Use **display this** to display the running configuration in the current view.

Syntax

display this

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Use this command to verify the configuration you have made in a certain view.

This command does not display parameters that are using the default settings.

Some parameters can be successfully set even if their dependent features are not enabled. For these parameters, this command displays their settings after the dependent features are enabled.

This command can be executed in any user line view to display the running configuration of all user lines.

Examples

Display the running configuration on VLAN-interface 1.

```
<Switch> system-view
[Switch] interface vlan-interface 1
[Switch-Vlan-interface1] display this
#
interface Vlan-interface1
#
return
```

7.1.9. reset saved-configuration

Use **reset saved-configuration** to delete a next-startup configuration file.

Syntax

reset saved-configuration [**backup** | **main**]

Views

User view

Predefined user roles

network-admin

Parameters

backup: Specifies the backup next-startup configuration file.

main: Specifies the main next-startup configuration file.

Usage guidelines

CAUTION:
This command permanently deletes the specified next-startup configuration file from all IRF member devices.

You can delete the main file, the backup file, or both.

To delete a file that is set as both main and backup next-startup configuration files, you must execute both the **reset saved-configuration backup** command and the **reset saved-configuration main** command. Using only one of the commands sets the target file attribute to NULL instead of deleting the file.

If you do not specify a configuration file attribute, the **reset saved-configuration** command deletes the main next-startup configuration file.

Examples

Delete the main next-startup configuration file.

```
<Switch> reset saved-configuration
The saved configuration file will be erased. Are you sure? [Y/N]:y
Configuration file in flash: is being cleared.
Please wait ..........
Configuration file is cleared.
```

Related commands

display saved-configuration

7.1.10. restore startup-configuration

Use **restore startup-configuration** to download a configuration file from a TFTP server and specify it as the main next-startup configuration file.

Syntax

restore startup-configuration from *ipv4-server src-filename* [**vpn-instance** *vpn-instance-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv4-server: Specifies a TFTP server by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), and dots (.).

src-filename: Specifies the name of the configuration file to be downloaded. The file must be a .cfg file. The file name is a case-insensitive string of up to 255 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the TFTP server is on the public network, do not specify this option.

Usage guidelines

Before restoring the configuration file for the next startup, make sure the following requirements are met:

- The server is reachable.
- The server is enabled with TFTP service.
- You have read and write permissions to the server.

This command downloads the configuration file to the root directory of the default storage medium on each member device and specifies the file as the main next-startup configuration file. If a partitioned USB disk is used as the default storage medium, the configuration file is saved on the first partition. Make sure all IRF members use the same type of default storage media. If a subordinate device uses a different type of default storage medium than the master, the command cannot propagate the configuration file to the subordinate device. For example, the subordinate device uses a USB disk, but the master uses a flash memory. In this situation, you must manually restore the main next-startup configuration file on the subordinate device.

Examples

Download **test.cfg** from the IPv4 TFTP server at 2.2.2.2 in the public network, and specify the file as the main next-startup configuration file.

```
<Switch> restore startup-configuration from 2.2.2.2 test.cfg
Restoring the next startup-configuration file from 2.2.2.2. Please wait...finished.
```

Download **test.cfg** from the IPv4 TFTP server at 2.2.2.2 in VPN instance **VPN1**, and specify the file as the main next-startup configuration file.

```
<Switch> restore startup-configuration from 2.2.2.2 test.cfg vpn-instance VPN1
Restoring the next startup-configuration file from 2.2.2.2. Please wait...finished.
```

Related commands

backup startup-configuration

7.1.11. save

Use **save** *file-url* [**all** | **slot** *slot-number*] to save the running configuration to a configuration file, without specifying the file as a next-startup configuration file.

Use **save** [**safely**] [**backup** | **main**] [**force**] to save the running configuration to a file in the root directory of the storage medium. This command automatically saves the file on each IRF member device and specifies the file as a next-startup configuration file.

Syntax

save *file-url* [**all** | **slot** *slot-number*]

save [**safely**] [**backup** | **main**] [**force**]

Views

Any view

Predefined user roles

network-admin

Parameters

file-url: Specifies a file path, a string of up to 255 characters. The file must be a .cfg file. If you specify the **all** keyword or the **slot** *slot-number* option, the file path cannot include a member ID. If the file path includes a folder name, the folder must already exist on all IRF member devices.

all: Saves the running configuration to all member devices. If you do not specify this keyword or the **slot** *slot-number* option, the command saves the running configuration only to the master.

slot *slot-number*: Specifies a subordinate device by its member ID. If you do not specify a subordinate device or the **all** keyword, this command saves the running configuration only to the master.

safely: Saves the configuration file in safe mode. If you do not specify this keyword, the device saves the configuration file in fast mode.

backup: Saves the running configuration to a configuration file, and specifies the file as the backup next-startup configuration file. If you do not specify this keyword or the **main** keyword, the command specifies the saved file as the main next-startup configuration file.

main: Saves the running configuration to a configuration file, and specifies the file as the main next-startup configuration file. If you do not specify this keyword or the **backup** keyword, the command specifies the saved file as the main next-startup configuration file.

force: Saves the running configuration to the existing next-startup configuration file without prompting for confirmation. If you do not specify this keyword, the system prompts you to confirm the operation. If you do not confirm the operation within 30 seconds, the system automatically aborts the operation. If you enter **Y** within the time limit, you can continue the save process and change the target file name during the process.

Usage guidelines

If the file specified for this command does not exist, the system creates the file before saving the configuration. If the file already exists, the system prompts you to confirm whether to overwrite the file. If you choose to not overwrite the file, the system cancels the save operation.

This command saves the running configuration to an .mdb binary file as well as a .cfg text file. The two files use the same file name. An .mdb file takes less time to load than a .cfg file.

When you use the **save** [**safely**] [**backup** | **main**] [**force**] command, follow these guidelines:

- In safe mode, the system saves configuration in a temporary file and starts overwriting the target next-startup configuration file after the save operation is complete. If a reboot, power failure, or out of memory or storage space event occurs during the save operation, the next-startup configuration file is retained.
- In fast mode, the device directly overwrites the target next-startup configuration file. If a reboot, power failure, or out of memory or storage space event occurs during this process, all settings in the next-startup configuration file are lost.

Safe mode is slower than fast mode, but more secure. As a best practice, specify the **safely** keyword for reliable configuration saving.

Examples

Save the running configuration to **backup.cfg**, without specifying the file as a next-startup configuration file.

```
<Switch> save backup.cfg
The current configuration will be saved to flash:/backup.cfg. Continue? [Y/N]:y
Now saving current configuration to the device.
Saving configuration flash:/backup.cfg. Please wait...
Configuration is saved to device successfully.
```

Save the running configuration to the main next-startup configuration file without any confirmation required.

```
<Switch> save force
Validating file. Please wait....
Saved the current configuration to mainboard device successfully.
```

Save the running configuration to a file in the root directory of the default storage medium, and specify the file as the main next-startup configuration file.

Before V7.2.18 :

```
<Switch> save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/backup.cfg]
(To leave the existing filename unchanged, press the enter key):test.cfg
Validating file. Please wait.....
```

Saved the current configuration to mainboard device successfully.

After V7.3.21 :

[Switch] save

```
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/ startup.cfg]
(To leave the existing filename unchanged, press the enter key):
Validating file. Please wait...
The startup.cfg file already exists.
Compared with the startup.cfg file, The current configuration adds 0 commands and deletes
0 commands.
If you want to see the configuration differences, please cancel this operation, and then
use the display diff command to show the details.
If you continue the save operation, the file will be overwritten.
Are you sure you want to continue the save operation? [Y/N]:y
Saving the current configuration to the file. Please wait...
Saved the current configuration to mainboard device successfully.
Compared with the startup.cfg file, The current configuration adds 0 commands and deletes
0 commands.
If you want to see the configuration differences, please cancel this operation, and then
use the display diff command to show the details.
If you continue the save operation, the file will be overwritten.
Are you sure you want to continue the save operation? [Y/N]:y
Saving the current configuration to the file. Please wait...
Saved the current configuration to mainboard device successfully.
```

display saved-configuration

7.1.12. startup saved-configuration

Use **startup saved-configuration** to specify a file as a next-startup configuration file.

Use **undo startup saved-configuration** to configure the system to start up with the factory defaults at the next startup.

Syntax

startup saved-configuration *cfgfile* [**backup** | **main**]

undo startup saved-configuration

Default

No next-startup configuration files are specified.

Views

User view

Predefined user roles

network-admin

Parameters

cfgfile: Specifies the path of a configuration file, a string of up to 255 characters. The file must be a .cfg file. The file path can include only the file name, or the storage medium information and file name. If the file is not on the default storage medium, you must specify the file name with storage medium information.

backup: Specifies the configuration file as the backup next-startup configuration file.

main: Specifies the configuration file as the main next-startup configuration file. This is the primary configuration file that the device attempts to load at startup. If the loading attempt fails, the device tries the backup next-startup configuration file.

Usage guidelines

CAUTION:
In an IRF fabric, the **undo startup saved-configuration** command can cause an IRF split after the IRF fabric or an IRF member reboots.

The **startup saved-configuration** command applies to all IRF members. To successfully execute this command, make sure the specified file has been saved in the root directory of the storage medium on each member.

If you do not specify the **backup** or **main** keyword, the **startup saved-configuration** command specifies the main next-startup configuration file.

As a best practice, specify different files as the main and backup next-startup configuration files.

The **undo startup saved-configuration** command changes the file attribute of the main and backup next-startup configuration files to NULL. However, the command does not delete the two configuration files.

You can also specify a configuration file as a next startup file when you use the **save** command to save the running configuration.

Examples

Specify the main next-startup configuration file.

```
<Switch> startup saved-configuration testcfg.cfg
Please wait ....... Done.
```

8.1.3. display boot-loader 8-4

8. Software upgrade commands

8.1. Software upgrade commands

As a best practice, store the startup images in a fixed storage medium. If you store the startup images in a hot swappable storage medium, do not remove the hot swappable storage medium during the startup process.

8.1.1. boot-loader file

Use **boot-loader file** to specify startup image files.

Syntax

boot-loader file boot *filename* **system** *filename* [**feature** *filename*&<1-30>] { **all** | **slot** *slot-number* } { **backup** | **main** }

boot-loader file *ipe-filename* { **all** | **slot** *slot-number* } { **backup** | **main** }

Views

User view

Predefined user roles

network-admin

Parameters

boot: Specifies a boot image file.

system: Specifies a system image file.

feature: Specifies a space-separated list of up to 30 feature image files.

filename: Specifies a .bin file in the *filesystemname*/*filename*.**bin** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any), the value string can have a maximum of 63 characters. For more information about specifying a file, see *Fundamentals Configuration Guide*.

ipe-filename: Specifies an .ipe image package file in the *filesystemname*/*filename*.**ipe** format. The file must be stored in the root directory of a file system on the device. Excluding the file system location section (if any), the value string can have a maximum of 63 characters. For more information about specifying a file, see *Fundamentals Configuration Guide*.

all: Specifies all IRF member devices.

slot *slot-number*: Specifies the IRF member ID of a member device.

backup: Specifies the files as backup startup image files. Backup images are used only when main images are not available.

main: Specifies the files as main startup image files. The device always first attempts to start up with main startup files.

Usage guidelines

The **boot-loader file** command overwrites the entire startup image list. To add new startup feature images, specify all feature image files in the old startup image list, including feature image files. The new startup image list will contain only the feature image files that are specified in the command.

To load the specified startup software images, you must reboot the system.

If the upgrade images are not found in the file system on the slot specified to upgrade, the system automatically copies the images to that file system. The destination directory is the root directory of the file system. If the destination root directory already contains a startup image with the same name as an upgrade image, you must choose whether to overwrite the image.

Examples

Specify **flash:/all.ipe** as the main startup image file for IRF member device 1.

```
<Switch> boot-loader file flash:/all.ipe slot 1 main
Verifying the file flash:/all.ipe on slot 1.....Done.
NEC QX-S5624GT-4X1C images in IPE:
  boot.bin
  system.bin
This command will set the main startup software images. Continue? [Y/N]:Y
Add images to slot 1.
File flash:/boot.bin already exists on slot 1.
File flash:/system.bin already exists on slot 1.
Overwrite the existing files? [Y/N]:Y
Decompressing file boot.bin to flash:/boot.bin.....Done.
Decompressing file system.bin to flash:/system.bin.....Done.
Verifying the file flash:/boot.bin on slot 1...Done.
Verifying the file flash:/system.bin on slot 1.....Done.
The images that have passed all examinations will be used as the main startup software
images at the next reboot on slot 1.
```

Specify **flash:/all.ipe** as the main startup image file for all IRF member devices.

```
<Switch> boot-loader file slot1#flash:/all.ipe all main
Verifying the file flash:/all.ipe on slot 1.....Done.
NEC QX-S5624GT-4X1C Switch images in IPE:
  boot.bin
  system.bin
This command will set the main startup software images. Continue? [Y/N]:y
Add images to slot 1.
File flash:/boot.bin already exists on slot 1.
File flash:/system.bin already exists on slot 1.
Overwrite the existing files? [Y/N]:y
Decompressing file boot.bin to flash:/boot.bin.....Done.
Decompressing file system.bin to flash:/system.bin.....Done.
The images that have passed all examinations will be used as the main startup software
images at the next reboot on slot 1.
File flash:/boot.bin already exists on slot 2.
Do you want to overwrite the file?
 Y: Overwrite the file.
 N: Not overwrite the file.
 A: From now on, overwrite or not overwrite without prompt.
Please make a choice. [Y/N/A]:a
What type of overwrite operation do you want to perform?
 Y: Overwrite without prompt.
 N: Not overwrite or display prompt.
```

```
 Q: Return to the previous step.
Please make a choice. [Y/N/Q]:y
An existing file will be overwritten without prompt if it has the same name as any upgrade
file.

Related commands

display boot-loader

8.1.2. bootrom update

Use **bootrom update** to load the BootWare image from a file system to the Normal BootWare area.

Syntax

bootrom update file *file* **slot** *slot-number-list*

Views

User view

Predefined user roles

network-admin

Parameters

file *file*: Specifies the file that contains the BootWare image. The *file* argument represents the file name, a string of 1 to 63 characters.

slot *slot-number-list*: Specifies a space-separated list of up to seven slot number items. An item specifies an IRF member device by its member ID or a range of IRF member devices in the form of *start-slot-number* **to** *end-slot-number*. The end slot number must be equal to or greater than the start slot number.

Usage guidelines

BootWare images are contained in the .bin Comware boot image file. You can specify a Comware boot image file in this command to upgrade the BootWares in the system before you upgrade the Comware images. If you do not upgrade BootWares before upgrading Comware images, the system automatically upgrades BootWares as necessary when loading Comware images.

The new BootWare images take effect after you reboot the device.

Examples

Use the file **a.bin** in the root directory of the flash memory to upgrade the BootWare image.

```
<Switch> bootrom update file flash:/a.bin slot 1
```

```
This command will update the Boot ROM file on the specified board(s), Continue? [Y/N]:y
Now updating the Boot ROM, please wait.............Done.
```

Related commands

boot-loader file

8.1.3. display boot-loader

Use **display boot-loader** to display current software images and startup software images.

Syntax

display boot-loader [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies the member ID of an IRF member device. If you do not specify a member device, this command displays the software images on each IRF member device.

Examples

Display the current software images and startup software images.

```
<Switch> display boot-loader
Software images on slot 1:
Current software images:
  flash:/boot.bin
  flash:/system.bin
Main startup software images:
  flash:/boot.bin
  flash:/system.bin
Backup startup software images:
  flash:/boot.bin
  flash:/system.bin
```

Table 8-1 Command output

Field	Description
Current software images	Comware images that have been loaded.
Main startup software images	Primary Comware images for the next startup.
Backup startup software images	Backup Comware images for the next startup.

9.1. ISSU commands

9.1.1. display issu rollback-timer

Use **display issu rollback-timer** to display automatic rollback timer information.

Syntax

display issu rollback-timer

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Change to the automatic rollback interval does not take effect on the ongoing ISSU process. The current remaining rollback time might be greater than the specified automatic rollback interval.

Examples

Display automatic rollback timer information after the **issu run switchover** command is executed.

```
<Switch> display issu rollback-timer
Rollback timer: Working
Rollback interval: 45 minutes
Rollback time remaining : 40 minutes
```

Display automatic rollback timer information after the **issu accept** command is executed.

```
<Switch> display issu rollback-timer
Rollback timer: Not working
Rollback interval: 30 minutes
```

Display automatic rollback timer information when no ISSU process is taking place.

```
<Switch> display issu rollback-timer
Rollback timer: Not working
Rollback interval: 45 minutes
```

Related commands

issu rollback-timer

9.1.2. display issu state

Use **display issu state** to display ISSU status information.

Syntax

display issu state

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

During an ISSU that uses **issu** commands, you can use this command to verify the ISSU status and determine what to do next.

This command does not apply to an ISSU that uses **install** commands, because the ISSU state machine is not involved.

Examples

Display ISSU status information when no upgrade is taking place.

```
<Switch> display issu state
ISSU state: Init
Compatibility: Unknown
Work state: Normal
Upgrade method: Card by card
Upgraded slot: None
Current upgrading slot: None
Current version list:
  boot: 7.1.070, Test 0001015
  system: 7.1.070, Test 0001015
  feature1: 7.1.070, Test 0001015
Current software images:
  flash:/boot-t0001015.bin
  flash:/system-t0001015.bin
  flash:/feature1-t0001015.bin
```

Display ISSU status information while the **issu load** command is being executed.

```
<Switch> display issu state
ISSU state: Loading
Compatibility: Incompatible
Work state: Normal
Upgrade method: Card by card
Upgraded slot: None
Current upgrading slot:
  slot 1
Previous version list:
  boot: 7.1.070, Test 0001015
  system: 7.1.070, Test 0001015
  feature1: 7.1.070, Test 0001015
Previous software images:
  flash:/boot-t0001015.bin
  flash:/system-t0001015.bin
  flash:/feature1-t0001015.bin
Upgrade version list:
```

```
  boot: 7.1.070, Test 0001016
  system: 7.1.070, Test 0001016
  feature1: 7.1.070, Test 0001016
Upgrade software images:
  flash:/boot-t0001016.bin
  flash:/system-t0001016.bin
  flash:/feature1-t0001016.bin
```

Table 9-1 Command output

Field	Description
ISSU state	ISSU status: • **Init**—The ISSU process has not started or has finished. • **Loading**—The system is executing the **issu load** command. • **Loaded**—The **issu load** command is completed. • **Switching**—The system is executing the **issu run switchover** command. • **Switchover**—The **issu run switchover** command is completed. • **Accepted**—The **issu accept** command is completed. • **Committing**—The system is executing the **issu commit** command. • **Rollbacking**—A rollback is in progress. • **Unknown**—An upgrade is in progress. This value is displayed if you execute the command on an original subordinate member.
Compatibility	Version compatibility: • **Compatible**—Upgrade to a compatible version. • **Incompatible**—Upgrade to an incompatible version. • **Unknown**—No upgrade is in progress.
Work state	Operating status of the device: • **Normal**—The device is operating correctly. • **Independent active**—When you perform an ISSU to an incompatible version, a subordinate member that is upgraded first enters this state. In this state, member devices are not running the same software versions.
Upgrade method	Upgrade mode. The value of this field is fixed at **Card by card**. In this mode, member devices are upgraded one by one.
Upgraded slot	Upgraded members. During a rollback, this field displays **Unknown**.
Current upgrading slot	Members that are being upgraded. During a rollback, this field displays **Unknown**.
Current version list	Versions of currently running images. This field is displayed if no upgrade is taking place.
Current software images	File names of currently running images. This field is displayed if no upgrade is taking place.
Previous version list	Versions of the images that were running on the device before the ISSU. If you execute the command on an original subordinate member while the member is being upgraded to an incompatible version, this field

Field	Description
	displays **Unknown**.
Previous software images	File names of the images that were running on the device before the ISSU. If you execute the command on an original subordinate member while the member is being upgraded to an incompatible version, this field displays **Unknown**.
Upgrade version list	Versions of the upgrade images. If you execute the command on an original subordinate member while the member is being upgraded to an incompatible version, this field displays **Unknown**.

9.1.3. display version comp-matrix file

Use **display version comp-matrix file** to display the recommended ISSU methods.

Syntax

display version comp-matrix file { **boot** *filename* | **system** *filename* } *

display version comp-matrix file ipe *ipe-filename*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

boot: Specifies a boot image file.

system: Specifies a system image file.

filename: Specifies a .bin file in the *filesystemnamelfilename***.bin** format. The file must be stored in the root directory of a file system on the device. The value string excluding the file system location section (if any) can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide.*

ipe-filename: Specifies an .ipe file in the *filesystemnamelfilename***.ipe** format. The file must be stored in the root directory of a file system on the device. The value string excluding the file system

location section (if any) can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide.*

Usage guidelines

If one or more images are incompatible, the incompatible upgrade method applies. The entire system needs to be rebooted during an incompatible upgrade.

Examples

Display the recommended ISSU methods. In this example, the specified images are compatible with the running images.

```
<Switch> display version comp-matrix file boot flash:/boot-t0001015.bin system
flash:/system-t0001015.bin feature flash:/feature1-t0001015.bin
Verifying the file flash:/feature1-t0001015.bin on slot 1.....Done.
Verifying the file flash:/boot-t0001015.bin on slot 1.....Done.
Verifying the file flash:/system-t0001015.bin on slot 1.....Done.
Identifying the upgrade methods.........Done.

  Slot     Upgrade Way
  1        File Upgrade
```

Table 9-2 Command output

Field	Description
Verifying the file	The system was verifying the validity of the file.
Upgrade Way	ISSU method: • **Service Upgrade**. • **File Upgrade**. • **Reboot**. This field is displayed only for compatible versions. For more information about ISSU methods, see *Fundamentals Configuration Guide*.
Influenced service according to following table	Services that will be affected by the upgrade. This field is displayed only for compatible versions.

Related commands

issu load

9.1.4. issu accept

Use **issu accept** to accept the upgrade to a compatible version and delete the automatic rollback timer.

Syntax

issu accept

Views

User view

Predefined user roles

network-admin

Usage guidelines

The system cannot perform automatic rollback for the ISSU process after you execute this command. However, you can use the **issu rollback** command to perform a manual rollback.

The **issu accept** command does not apply to an ISSU to an incompatible version.

Examples

Accept the upgrade to a compatible version.

```
<Switch> issu accept
```

Related commands

issu load

issu run switchover

9.1.5. issu commit

Use **issu commit** to upgrade the original master and the subordinate members that have not been upgraded and complete the ISSU upgrade.

Syntax

issu commit slot *slot-number*

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies the member ID of the original master or a subordinate member that has not been upgraded.

Usage guidelines

At reboot, a subordinate device automatically synchronizes the master device's configuration and status data. You must wait for the synchronization to complete before using the **issu commit** command on the subordinate device. To identify whether the synchronization is complete, use the **display system stable state** command. The synchronization is complete if the **System State** field displays **Stable**.

Use this command to upgrade the original master and the subordinate members that have not been upgraded, one by one. You must wait for one upgraded member to start up again and join the IRF fabric before upgrading another member. After all members are upgraded, the ISSU status changes to Init, and the ISSU process ends and cannot be rolled back.

Examples

After member 2 is upgraded and becomes the new master, upgrade the original master (member 3) and the other subordinate members that have not been upgraded (member 4 and member 1).

```
<Switch> issu commit slot 3
Upgrade summary according to following table:

flash:/feature1.bin
  Running Version              New Version
  Test 0001015                 Test 0001016
```

```
  Slot                        Upgrade Way
  3                           Service Upgrade
Upgrading software images to compatible versions. Continue? [Y/N]:y

flash:/feature1.bin
  Running Version             New Version
  Test 0001015                Test 0001016

  Slot                        Upgrade Way
  4                           Service Upgrade
Upgrading software images to compatible versions. Continue? [Y/N]:y
This operation might take several minutes, please wait...Done.
<Switch> issu commit slot 1
Verifying the file flash:/feature1.bin on slot 1..............Done.
Copying file flash:/feature1.bin to slot1#flash:/feature1.bin...Done.
Upgrade summary according to following table:

flash:/feature1.bin
  Running Version             New Version
  Test 0001015                Test 0001016

  Slot                        Upgrade Way
  1                           Service Upgrade
Upgrading software images to compatible versions. Continue? [Y/N]:y
This operation might take several minutes, please wait...Done.
```

For information about the command output, see Table 9-2 .

Related commands

issu accept

issu load

issu run switchover

9.1.6. issu load

Use **issu load** to upgrade the software images of subordinate members and configure the new images as main startup software images for those members.

Syntax

issu load file { **boot** *filename* | **system** *filename*| **feature** *filename*&<1-30> } * **slot** *slot-number*&<1-9>

issu load file ipe *ipe-filename* **slot** *slot-number*&<1-9>

Views

User view

Predefined user roles

network-admin

Parameters

boot: Specifies a boot image file.

system: Specifies a system image file.

feature: Specifies a space-separated list of up to 30 feature image files.

filename: Specifies a .bin file in the *filesystemname*/*filename***.bin** format. The file must be stored in the root directory of a file system on the master device. The value string excluding the file system location section (if any) can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide.*

ipe-filename: Specifies an .ipe file in the *filesystemname*/*filename***.ipe** format. The file must be stored in the root directory of a file system on the master device. The value string excluding the file system location section (if any) can have a maximum of 63 characters. For more information about specifying a file, see file system management in *Fundamentals Configuration Guide.*

slot *slot-number*: Specifies the member ID of a subordinate member. You can specify a space-separated list of up to nine member IDs. On a single-chassis IRF fabric, enter the member ID of the member device to upgrade the entire fabric. On a multichassis IRF fabric, you can specify only one member ID for a compatible upgrade and can specify multiple member IDs for an incompatible upgrade. As a best practice, specify half of the subordinate members if the member devices form a ring. Make sure the specified subordinate members are directly connected by physical links.

Usage guidelines

You may upgrade all or some of the software images. If you are upgrading only some of the images, make sure the new images are compatible with the images that are not to be upgraded. The upgrade will fail if a conflict exists.

This command performs the following operations:

- Checks the version compatibility.
- Identifies the upgrade method.
- Loads the new images to upgrade the member devices.
- Sets the new images as the main startup software images so the upgrade can survive a reboot.

At reboot, a subordinate device automatically synchronizes the master device's configuration and status data. You must wait for the synchronization to complete before using the **issu load** command on the subordinate device. To identify whether the synchronization is complete, use the **display system stable state** command. The synchronization is complete if the **System State** field displays **Stable**.

Examples

Upgrade member device 1 (a subordinate member) with system image file **flash:/ soft-system-V714.bin**, boot image file **flash:/ soft-boot-V714.bin** and feature image file **soft-freeradius-V714.bin**. (In this example, the image is compatible with the running images.)

<Switch> issu load file boot flash:/soft-boot-V714.bin system flash:/soft-system-V714.bin feature flash:/soft-freeradius-V714.bin slot 1

```
This operation will delete the rollback point information for the previous upgrade and
maybe get unsaved configuration lost. Continue? [Y/N]:y
Verifying the file flash:/soft-freeradius-V714.bin on slot 1...Done.
Verifying the file flash:/soft-boot-V714.bin on slot 1...Done.
```

```
Verifying the file flash:/soft-system-V714.bin on slot 1........Done.
Identifying the upgrade methods...Done.
Upgrade summary according to following table:

flash:/soft-boot-V714.bin
  Running Version             New Version
  7.1.3                       7.1.4

flash:/soft-system-V714.bin
  Running Version             New Version
  7.1.3                       7.1.4

flash:/soft-freeradius-V714.bin
  Running Version             New Version
  7.1.3                       7.1.4

  Slot                        Upgrade Way
  1                           Reboot
Upgrading software images to compatible versions. Continue? [Y/N]:y
This operation might take several minutes, please wait.....
```

Table 9-3 Command output

Field	Description
Verifying the file	The system was verifying the validity of the file.
Copying file	The system was copying the upgrade file to a subordinate member. This field is displayed if you specified a subordinate member for the command.
Upgrade Way	ISSU method: • **Service Upgrade**. • **File Upgrade**. • **Reboot**. This field is displayed only for an upgrade to a compatible version. For more information about ISSU methods, see *Fundamentals Configuration Guide*.

NOTE:

When you upgrade the software by ISSU, you cannot upgrade only the boot package and system package, and you must upgrade the Freeradius package at the same time. Please use **issu load file boot** *filename* **system** *filename* **feature** *filename* **slot** *slot-number* command.

QX-S5600G series does not support the Radius server feature.

9.1.7. issu rollback

Use **issu rollback** to cancel the ISSU and roll back to the original software versions.

Syntax

issu rollback

Views

User view

Predefined user roles

network-admin

Usage guidelines

The device supports automatic rollback and manual rollback. This command performs a manual rollback.

You can perform a manual rollback while an ISSU is in one of the following states:

- Loaded.
- Switching (during an upgrade to a compatible version).
- Switchover (during an upgrade to a compatible version).
- Accepted.

If the ISSU is in Loading state, the rollback might fail. Use the **display version** command to examine the rollback result after the rollback is completed.

If a rollback occurs while an ISSU is in Switching state, the entire system reboots automatically.

A rollback performed for a multichassis IRF fabric after you execute the **issu run switchover** command cancels all operations performed during the ISSU process, including the master/subordinate switchover.

Examples

Roll back to the original software versions.

```
<Switch> issu rollback
This command will quit the ISSU process and roll back to the previous version. Continue? [Y/N]:y
```

Related commands

issu accept

issu commit

issu load

issu run switchover

9.1.8. issu rollback-timer

Use **issu rollback-timer** to set the automatic rollback timer.

Use **undo issu rollback-timer** to restore the default.

Syntax

issu rollback-timer *minutes*

undo issu rollback-timer

Default

The automatic rollback timer is set to 45 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

minutes: Specifies the automatic rollback interval in minutes. The value range is 0 to 120. Setting it to 0 disables automatic rollback.

Usage guidelines

The automatic software version rollback feature is available only during an ISSU to a compatible version when the IRF fabric has multiple members.

The system starts the automatic rollback timer when you execute the **issu run switchover** command in a scenario where automatic rollback is supported. If you do not execute the **issu accept** or **issu commit** command before the timer expires, the system automatically rolls back to the software version used before the ISSU.

Change to the automatic rollback interval does not take effect on the ongoing ISSU process.

Examples

Set the automatic rollback timer to 50 minutes.

```
<Switch> system-view
[Switch] issu rollback-timer 50
```

Related commands

issu rollback

9.1.9. issu run switchover

Use **issu run switchover** to perform an ISSU switchover.

Syntax

issu run switchover

Views

User view

Predefined user roles

network-admin

Usage guidelines

Use this command on a multichassis IRF fabric.

- For a compatible upgrade, this command performs operations depending on the ISSU method.
  - **Incremental upgrade**—Performs a process-level master/subordinate switchover for the processes to be upgraded.
  - **Reboot upgrade**—Reboots the current master with the old software version, causing the upgraded subordinate member to be elected as the new master.
- For an incompatible upgrade, the **issu load** command splits the IRF fabric into two fabrics, with the upgraded members forming a new fabric. The **issu run switchover** command reboots the members in the old IRF fabric with the upgrade images to upgrade the members. After startup, the members join the new IRF fabric as subordinate members.

At reboot, a subordinate device automatically synchronizes the master device's configuration and status data. You must wait for the synchronization to complete before using the **issu run switchover** command on the subordinate device. To identify whether the synchronization is

complete, use the **display system stable state** command. The synchronization is complete if the **System State** field displays **Stable**.

When you execute the **issu run switchover** command during an ISSU to a compatible version, the system starts the automatic rollback timer. If you do not execute the **issu accept** or **issu commit** command before the timer expires, the system automatically rolls back to the original software versions.

Examples

On a multichassis IRF fabric, perform a master/subordinate switchover during an ISSU to a compatible version.

```
<Switch> issu run switchover
Upgrade summary according to following table:

flash:/feature1.bin
  Running Version             New Version
  Test 0001015                Test 0001016

  Slot                        Switchover Way
  1                           Active standby process switchover
Upgrading software images to compatible versions. Continue? [Y/N]:y
This operation might take several minutes, please wait...Done.
```

On a multichassis IRF fabric, perform a master/subordinate switchover, and upgrade members that have not been upgraded (member 1 and member 2) during an ISSU to an incompatible version.

```
<Switch> issu run switchover
Upgrade summary according to following table:

flash:/feature1.bin
  Running Version             New Version
  Test 0001015                Test 0001016

  Slot                        Upgrade Way
  1                           Reboot
  2                           Reboot
Upgrading software images to incompatible versions. Continue? [Y/N]:y
This operation might take several minutes, please wait...Done.
```

Table 9-4 Command output

Field	Description
Switchover Way	Switchover method: • **Active standby process switchover**—Switch from the active process to the standby process. • **Master subordinate switchover**—Switch from the master to a subordinate member.

For more information about the command output, see Table 9-2 .

10. Device management commands

10.1. Device management commands

10.1.1. clock datetime

Use **clock datetime** to set the system time.

Syntax

clock datetime *time date*

Default

The system time is UTC time 00:00:00 01/01/2013.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies a time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

date: Specifies a date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

For the device to use the local system time, execute the **clock protocol none** command and this command in turn. The specified system time takes effect immediately. Then, the device uses the clock signals generated by its built-in crystal oscillator to maintain the system time.

A device power cycling operation restores the local system time to the default. After the device is power cycled, you must execute this command again to set the local system time.

Examples

Set the system time to 08:08:08 01/01/2015.

```
<Switch> clock datetime 8:8:8 1/1/2015
```

Set the system time to 08:10:00 01/01/2015.

```
<Switch> clock datetime 8:10 2015/1/1
```

Related commands

clock protocol

clock summer-time

clock timezone

display clock

10.1.2. clock protocol

Use **clock protocol** to specify the system time source.

Use **undo clock protocol** to restore the default.

Syntax

clock protocol { **none** | **ntp** }

undo clock protocol

Default

The device obtains the UTC time from an NTP time source.

Views

System view

Predefined user roles

network-admin

Parameters

none: Uses the system time set by using the **clock datetime** command.

ntp: Uses NTP to obtain the UTC time. You must configure NTP correctly. For more information about NTP and NTP configuration, see *Network Management and Monitoring Configuration Guide*.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

The device can use the locally set system time, or obtain the UTC time from a time source on the network and calculate the system time.

If you configure the **clock protocol none** command, the device uses the locally set system time. The device then uses the clock signals generated by its built-in crystal oscillator to maintain the system time.

If you configure the **clock protocol ntp** command, the device obtains the UTC time through NTP and calculates the system time. The device then periodically synchronizes the UTC time and recalculates the system time.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the device to use the local UTC time.

```
<Switch> system-view
[Switch] clock protocol none
```

10.1.3. clock summer-time

Use **clock summer-time** to set the daylight saving time.

Use **undo clock summer-time** to restore the default.

Syntax

clock summer-time *name start-time start-date end-time end-date add-time*

undo clock summer-time

Default

The daylight saving time is not set.

Views

System view

Predefined user roles

network-admin

Parameters

name: Specifies a name for the daylight saving time schedule, a case-sensitive string of 1 to 32 characters.

start-time: Specifies the start time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

start-date: Specifies the start date in one of the following formats:

- *MM/DD*. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.
- *month week day*, where:
  - *month*—Takes **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November** or **December**.
  - *week*—Represents week of the month. It takes **first**, **second**, **third**, **fourth**, **fifth**, or **last**.
  - *day*—Takes **Sunday**, **Monday**, **Tuesday**, **Wednesday**, **Thursday**, **Friday**, or **Saturday**.

end-time: Specifies the end time in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

end-date: Specifies the end date in one of the following formats:

- *MM/DD*. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.
- *month week day*, where:
  - *month*—Takes **January**, **February**, **March**, **April**, **May**, **June**, **July**, **August**, **September**, **October**, **November** or **December**.
  - *week*—Represents week of the month. It takes **first**, **second**, **third**, **fourth**, **fifth**, or **last**.
  - *day*—Takes **Sunday**, **Monday**, **Tuesday**, **Wednesday**, **Thursday**, **Friday**, or **Saturday**.

add-time: Specifies the time to be added to the standard time, in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

After you set the daylight saving time, the device recalculates the system time. To view the system time, use the **display clock** command.

Make sure all devices on the network are using the same daylight saving time as the local time.

Examples

Set the system time ahead 1 hour for the period between 06:00:00 on 08/01 and 06:00:00 on 09/01.

```
<Switch> system-view
[Switch] clock summer-time PDT 6 08/01 6 09/01 1
```

Related commands

clock datetime

clock timezone

display clock

10.1.4. clock timezone

Use **clock timezone** to set the time zone.

Use **undo clock timezone** to restore the default.

Syntax

clock timezone *zone-name* { **add** | **minus** } *zone-offset*

undo clock timezone

Default

The UTC time zone is used.

Views

System view

Predefined user roles

network-admin

Parameters

zone-name: Specifies a time zone by its name, a case-sensitive string of 1 to 32 characters.

add: Adds an offset to the UTC time.

minus: Decreases the UTC time by an offset.

zone-offset: Specifies an offset to the UTC time, in the *hh:mm:ss* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. The value range for *ss* is 0 to 59. The leading zero in a segment can be omitted. If the seconds segment is 0 (*hh*:*mm*:00), you can omit it. If both the minutes and seconds segments are 0 (*hh*:00:00), you can omit both of the segments. For example, to specify 08:00:00, you can enter 8.

Usage guidelines

Correct system time is essential to network management and communication. You must configure the system time correctly before you run the device on the network.

After you set the time zone, the device recalculates the system time. To view the system time, use the **display clock** command.

Make sure all devices on the network are using the same time zone as the local time.

Examples

Set the name of the time zone to **Z5**, and add 5 hours to the UTC time.

```
<Switch> system-view
```

```
[Switch] clock timezone Z5 add 5
```

Related commands

clock datetime

clock summer-time

display clock

10.1.5. command

Use **command** to assign a command to a job.

Use **undo command** to revoke a command.

Syntax

command *id command*

undo command *id*

Default

No command is assigned to a job.

Views

Job view

Predefined user roles

network-admin

Parameters

id: Specifies an ID for the command, in the range of 0 to 4294967295. A command ID uniquely identifies a command in a job. Commands in a job are executed in ascending order of their command IDs.

command: Specifies the command to be assigned to the job.

Usage guidelines

To assign a command (command A) to a job, you must first assign the job the command or commands for entering the view of command A.

If you specify the ID of an existing command for another command, the existing command is replaced.

Make sure all commands in a schedule are compliant to the command syntax. The system does not examine the syntax when you assign a command to a job.

If a command requires a yes or no answer, the system always assumes that a **Y** or **Yes** is entered. If a command requires a character string input, the system assumes that either the default character string (if any) or a null string is entered.

A job cannot contain the **telnet**, **ftp**, **ssh2**, or **monitor process** command.

Examples

Assign commands to the **backupconfig** job to back up the **startup.cfg** file to the TFTP server at 192.168.100.11.

```
<Switch> system-view
[Switch] scheduler job backupconfig
[Switch-job-backupconfig] command 2 tftp 192.168.100.11 put flash:/startup.cfg backup.cfg
```

Assign commands to the **shutdownGE** job to shut down GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] scheduler job shutdownGE
[Switch-job-shutdownGE] command 1 system-view
[Switch-job-shutdownGE] command 2 interface gigabitethernet 1/0/1
[Switch-job-shutdownGE] command 3 shutdown
```

Related commands

scheduler job

10.1.6. copyright-info enable

Use **copyright-info enable** to enable copyright statement display.

Use **undo copyright-info enable** to disable copyright statement display.

Syntax

copyright-info enable

undo copyright-info enable

Default

Copyright statement display is disabled.

Views

System view

Predefined user roles

Usage guidelines

To use a command to enable copyright statement display.

10.1.7. display clock

Use **display clock** to display the system time, date, time zone, and daylight saving time.

Syntax

display clock

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the system time and date when the time zone is not specified.

```
<Switch> display clock
10:09:00.258 UTC Fri 03/16/2015
```

The time is in the *hour*:*minute*:*second*.*milliseconds* format.

Display the system time and date when the time zone Z5 is specified.

```
<Switch> display clock
```

```
15:10:00.152 Z5 Fri 03/16/2015
Time Zone : Z5 add 05:00:00
```

Display the system time and date when the time zone Z5 and daylight saving time PDT are specified.

```
<Switch> display clock
15:11:00.211 Z5 Fri 03/16/2015
Time Zone : Z5 add 05:00:00
Summer Time : PDT 06:00:00 08/01 06:00:00 09/01 01:00:00
```

10.1.8. display cpu-usage

Use **display cpu-usage** to display the current CPU usage statistics.

Syntax

display cpu-usage [**slot** *slot-number* [**cpu** *cpu-number*]]

display cpu-usage [**control-plane** | **data-plane**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

control-plane: Displays CPU usage statistics for the control plane. If you do not specify this keyword or the **data-plane** keyword, the command displays the total CPU usage statistics.

data-plane: Displays CPU usage statistics for the data plane. If you do not specify this keyword or the **control-plane** keyword, the command displays the total CPU usage statistics.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays CPU usage statistics for all member devices.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

IMPORTANT:

- If you do not specify the **control-plane** keyword or the **data-plane** keyword, the command displays the total CPU usage statistics.
- Maximum of the total CPU usage statistics is 100%.
- If control-plane is 45% and data-plane is 5%, total CPU usage statistics is 25%.

Examples

Display the current CPU usage statistics in text form.

```
<Switch> display cpu-usage
Slot 1 CPU 0 CPU usage:
```

```
        1% in last 5 seconds
        1% in last 1 minute
        1% in last 5 minutes
```

Display the current CPU usage statistics in table form.

```
<Switch> display cpu-usage
Slot CPU        Last 5 sec        Last 1 min        Last 5 min
1    0          17%               29%               28%
```

Table 10-1 Command output

Field	Description
x% in last 5 seconds Last 5 sec	Average CPU or CPU core usage during the most recent 5-second interval.
y% in last 1 minute Last 1 min	Average CPU or CPU core usage during the most recent 1-minute interval.
z% in last 5 minutes Last 5 min	Average CPU or CPU core usage during the most recent 5-minute interval.

10.1.9. display cpu-usage configuration

Use **display cpu-usage configuration** to display CPU usage monitoring settings.

Syntax

display cpu-usage configuration [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the CPU usage monitoring settings for the master device.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Examples

Display the CPU usage monitoring settings.

```
<Switch> display cpu-usage configuration
CPU usage monitor is enabled.
Current monitor interval is 60 seconds.
Current severe alarm threshold is 90%.
Current minor alarm threshold is 80%.
Current recovery-threshold is 40%.
```

Related commands

monitor cpu-usage enable

monitor cpu-usage interval

monitor cpu-usage threshold

10.1.10. display cpu-usage history

Use **display cpu-usage history** to display the historical CPU usage statistics in a coordinate system.

Syntax

display cpu-usage history [**job** *job-id*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job *job-id*: Specifies a process by its ID. The value range for *job-id* is 1 to 2147483647. If you do not specify a process, this command displays the statistics for the entire system's CPU usage (the total CPU usage of all processes). To view the IDs and names of the running processes, use the **display process** command. For more information, see *Network Management and Monitoring Configuration Guide*.

slot *slot-number*: Specifies an IRF member device by its member ID. If you specify a process but do not specify a member device, this command displays the statistics for the process on the master device. If you do not specify any options, this command displays the statistics for all processes on all member devices.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0. If you specify a process but do not specify a CPU, this command displays the statistics for the default CPU. If you do not specify a process or CPU, this command displays the historical statistics for all CPUs.

Usage guidelines

After CPU usage monitoring is enabled, the system regularly samples CPU usage and saves the samples to the history record buffer. This command displays the most recent 60 samples in a coordinate system as follows:

The vertical axis represents the CPU usage. If a statistic is not a multiple of the usage step, it is rounded up or down to the closest multiple of the usage step. For example, if the CPU usage step is 5%, the statistic 53% is rounded up to 55%, and the statistic 52% is rounded down to 50%.

The horizontal axis represents the time.

Pound signs (#) indicate the CPU usage. The value on the vertical axis for the topmost pound sign at a specific time represents the CPU usage at that time.

Examples

Display the historical CPU usage statistics.

```
<Switch> display cpu-usage history
100%|
 95%|
 90%|
 85%|
 80%|
 75%|
 70%|
```

```
 65%|
 60%|
 55%|
 50%|
 45%|
 40%|
 35%|
 30%|
 25%|
 20%|
 15%|              #
 10%|             ###  #
  5%|            ########
     ------------------------------------------------------------
               10        20        30        40        50        60   (minutes)
                       cpu-usage (Slot 1 CPU 0) last 60 minutes (SYSTEM)
```

The output shows the following items:

- Process name. The name **SYSTEM** represents the entire system.
- CPU that is holding the process: CPU 0 in slot 1.
- Historical CPU usage statistics for the entire system during the last 60 minutes.
  - **12 minutes ago**—Approximately 5%.
  - **13 minutes ago**—Approximately 10%.
  - **14 minutes ago**—Approximately 15%.
  - **15 minutes ago**—Approximately 10%.
  - **16 and 17 minutes ago**—Approximately 5%.
  - **18 minutes ago**—Approximately 10%.
  - **19 minutes ago**—Approximately 5%.
  - **Other time**—2% or lower.

Related commands

monitor cpu-usage interval

10.1.11. display device

Use **display device** to display device information.

Syntax

display device [**usb**] [**slot** *slot-number* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

usb: Displays USB interface information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

verbose: Displays detailed information. If you do not specify this keyword, this command displays brief information, and does not display firewall card information.

Usage guidelines

If you do not specify the **usb** keywords, this command displays information about member devices.

Examples

Display device information.

```
<Switch> display device
Slot 1
Slot Type             State    Subslot  Soft Ver             Patch Ver
1    QX-S5628GT-4X2Q Master   1        1115                 None
```

Table 10-2 Command output

Field	Description
Type	Device type.
State	Role of the device in an IRF fabric: • **Master**—The device is the master. • **Standby**—The device is a subordinate member.
Soft Ver	Software version of the device.
Patch Ver	Patch version of the device. If no patch is installed, the value of this field is **None**.

10.1.12. display device manuinfo

Use **display device manuinfo** to display electronic label information for the device.

Syntax

display device manuinfo [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays electronic label information for all member devices.

Usage guidelines

An electronic label contains the permanent configuration information, including the hardware serial number, manufacturing date, MAC address, and vendor name. The data is written to the storage

component during hardware debugging or testing. This command displays only part of the electronic label information.

Examples

Display electronic label information for the device.

```
<Switch> display device manuinfo
...
```

10.1.13. display diagnostic-information

Use **display diagnostic-information** to display or save operating information for features and hardware modules.

Syntax

display diagnostic-information [**hardware** | **infrastructure** | **l2** | **l3** | **service**] [*filename*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

hardware: Specifies hardware-related operating information.

infrastructure: Specifies operating information for the fundamental features.

l2: Specifies operating information for the Layer 2 features.

l3: Specifies operating information for the Layer 3 features.

service: Specifies operating information for Layer 4 and upper-layer features.

filename: Saves the information to a file. The *filename* argument must use the **.tar.gz** extension. If you do not specify this argument, the command prompts you to choose whether to save the information to a file or display the information.

Usage guidelines

You can use one of the following methods to collect operating statistics for diagnostics and troubleshooting:

- Use separate **display** commands to collect operating information feature by feature or module by module.
- Use the **display diagnostic-information** command to collect operating information for multiple or all features and hardware modules.

To save storage space, this command automatically compresses the information before saving the information to a file. To view the file content:

1. Use the **tar extract** command to extract the file.
2. Use the **gunzip** command to decompress the extracted file.
3. Use the **more** command to view the content of the decompressed file.

If you abort the **display diagnostic-information** command, the **gunzip** command might not be able to decompress the extracted file. To decompress the extracted file, export the extracted file to a PC that is running Linux, and use the **gunzip -c** command.

If you do not specify a file name for the command, the system prompts you to choose whether to display or save the information. If you choose to save the information, the system automatically assigns a file name and displays the file name in brackets. For file name uniqueness, the file name includes the device name and the current system time. If the device name contains any of the following special characters, the system uses an underscore (_) to replace each special character: forward slashes (/), backward slashes (\), colons (:), asterisks (*), question marks (?), less than signs (<), greater than signs (>), pipeline signs (|), and quotation marks ("). For example, device name **A/B** will change to **A_B** in the file name, as in **flash:/diag_A_B_20160101-000438.tar.gz**.

If you do not specify any feature parameters, this command displays or saves the operating information for all features and modules.

This command does not support the |, **>**, and **>>** options.

While the device is executing this command, do not execute any other commands. Executing other commands might affect the collected operating information.

Examples

Display the operating information for all features and modules.

```
<Switch> display diagnostic-information
Save or display diagnostic information (Y=save, N=display)? [Y/N]:n
================================================
  ===============display clock===============
14:03:55 UTC Thu 01/05/2015
================================================
  ===============display version===============
...
```

Save the operating information to the default file.

```
<Switch> display diagnostic-information
Save or display diagnostic information (Y=save, N=display)? [Y/N]:y
Please input the file name(*.tar.gz)[flash:/diag_Switch_20160101-024601.tar.gz]:
Diagnostic information is outputting to flash:/diag_Switch_20160101-024601.tar.gz.
Please wait...
Save successfully.
```

Press **Enter** when the system prompts you to enter the file name.

Save the operating information for all features and modules to file **test.tar.gz**.

```
<Switch> display diagnostic-information test.tar.gz
Diagnostic information is outputting to flash:/test.tar.gz.
Please wait...
Save successfully.
```

10.1.14. display environment

Use **display environment** to display temperature information.

Syntax

display environment [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays temperature information for all member devices.

Examples

Display information about all temperature sensors on the device.

```
<Switch> display environment
 System temperature information (degree centigrade):
 ---------------------------------------------------------------------
 Slot   Sensor    Temperature  Lower  Warning  Alarm  Shutdown
 1      hotspot 1 31           0      63       68     NA
 1      hotspot 2 0            0      110      130    137
```

Table 10-3 Command output

Field	Description
System Temperature information (degree centigrade)	Temperature information (°C).
sensor	Temperature sensor, which is fixed at **hotspot**.
Slot	Sensor position.
Temperature	Current temperature.
Lower	Lower temperature limit. If the device does not support this field, this field displays **NA**.
Warning	Warning temperature threshold. If the device does not support this field, this field displays **NA**.
Alarm	Alarming temperature threshold. If the device does not support this field, this field displays **NA**.
Shutdown	Shutdown temperature threshold. When the sensor temperature reaches the limit, the system shuts down automatically. If the device does not support this field, this field displays **NA**.

10.1.15. display fan

Use **display fan** to display fan tray operating status information.

Syntax

display fan [**slot** *slot-number* [*fan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays fan tray operating status information for all member devices.

fan-id: Specifies a fan tray by its ID. If you do not specify a fan tray, this command displays operating status information for all fan trays at the specified position.

Examples

Display the operating states of all fan trays.

```
<Switch> display fan
 Slot 1:
 Fan 1:
 State    : Normal
 Airflow Direction: Port-to-power
 Prefer Airflow Direction: Port-to-power
```

Table 10-4 Command output

Field	Description
Slot 1	Number of the member device.
Fan 1	Fan tray number.
State	Fan status: • **Absent**—The slot is not installed with a fan tray. • **Fault**—The fan is faulty. • **Normal**—The fan is operating correctly. • **FanDirectionFault**—The actual airflow direction is not the preferred direction.
Airflow Direction	Actual airflow direction: • **Port-to-power**—From the port side to the power supply side. • **Power-to-port**—From the power supply side to the port side.
Prefer Airflow Direction	Preferred airflow direction: • **Port-to-power**—From the port side to the power supply side. • **Power-to-port**—From the power supply side to the port side.

10.1.16. display memory

Use **display memory** to display memory usage information.

Syntax

display memory [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays memory usage for all member devices.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Examples

Display detailed memory usage information.

```
<Switch> display memory
Memory statistics are measured in KB:
Slot 1:
             Total       Used       Free     Shared    Buffers     Cached   FreeRatio
Mem:       2036536     496116    1540420          0       1436     113644       75.7%
-/+ Buffers/Cache:     381036    1655500
Swap:            0          0          0
LowMem:    1651512     279856    1371656         --         --         --       83.1%
HighMem:    385024     216260     168764         --         --         --       43.8%
```

Table 10-5 Command output

Field	Description
Mem	Memory usage information.
Total	Total size of the physical memory space that can be allocated. The memory space is virtually divided into two parts. Part 1 is solely used for kernel code, kernel management, and ISSU functions. Part 2 can be allocated and used for such tasks as running service modules and storing files. The size of part 2 equals the total size minus the size of part 1.
Used	Used physical memory.
Free	Free physical memory.
Shared	Physical memory shared by processes. If this field is not supported, two hyphens (--) are displayed.
Buffers	Physical memory used for buffers. If this field is not supported, two hyphens (--) are displayed.
Cached Caches	Physical memory used for caches. If this field is not supported, two hyphens (--) are displayed.
FreeRatio	Free memory ratio.
-/+ Buffers/Cache	-/+ Buffers/Cache:used = Mem:Used – Mem:Buffers – Mem:Cached, which indicates the physical memory used by applications. -/+ Buffers/Cache:free = Mem:Free + Mem:Buffers + Mem:Cached, which indicates the physical memory available for applications.
Swap	Memory space for swapping.
LowMem	Low-memory usage information.
HighMem	High-memory usage information.

10.1.17. display memory-threshold

Use **display memory-threshold** to display memory alarm thresholds and statistics.

Syntax

display memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the memory usage thresholds and statistics for the master device.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Usage guidelines

For more information about memory usage notifications, see log information containing **MEM_EXCEED_THRESHOLD** or **MEM_BELOW_THRESHOLD**.

Examples

Display memory alarm thresholds and statistics.

```
<Switch> display memory-threshold
Memory usage threshold: 100%
Free-memory thresholds:
    Minor: 96M
    Severe: 64M
    Critical: 48M
    Normal: 128M
    Early-warning: 192M
    Secure: 304M

Current free-memory state: Normal (secure)
Free-memory event statistics:
 [Back to secure state]
    First notification: 0.0
    Latest notification: 0.0
    Total number of notifications sent: 0
 [Entered early-warning state]
    First notification at: 0.0
    Latest notification at: 0.0
    Total number of notifications sent: 0
 [Back to normal state]
    First notification: 0.0
    Latest notification: 0.0
    Total number of notifications sent: 0
```

```
[Entered minor alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
[Back to minor alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
[Entered severe alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
[Back to severe alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
[Entered critical alarm state]
   First notification at: 0.0
   Latest notification at: 0.0
   Total number of notifications sent: 0
```

10.1.18. display power

Use **display power** to display power supply information.

Syntax

display power [**slot** *slot-number* [*power-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays power supply information for all member devices.

power-id: Specifies a power supply by its ID. If you do not specify a power supply, this command displays information about all power supplies at the specified position.

Examples

Display power supply information.

```
<Switch> display power
 Slot 1:
 PowerID State    Mode   Current(A)  Voltage(V)  Power(W)
 1       Absent   --       --          --          --
 2       Normal   AC       --          --          --
```

Table 10-6 Command output

Field	Description
PowerID	Power supply ID.
State	Power supply status. • **Absent**—The slot is not installed with a power supply. • **Fault**—The power supply is faulty. • **Normal**—The power supply is operating correctly.
Mode	Mode of the power supply: • **AC**–AC power supply. • **DC**–DC power supply.
Current(A)	Output current of the power supply, in amperes. This field is not supported.
Voltage(V)	Output voltage of the power supply, in volts. This field is not supported.
Power(W)	Output power of the power supply, in watts. This field is not supported.

10.1.19. display resource-monitor

Use **display resource-monitor** to display resource monitoring information.

Syntax

display resource-monitor [**resource** *resource-name*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

resource *resource-name*: Specifies a resource type by its name. For information about available resource types, see Table 10-13 .

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays resource monitoring information for all member devices.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display ARP resource monitoring information.

```
<Switch> display resource-monitor resource arp
Minor alarms resending: Enabled

Slot 1:
Resource                          Minor Severe Free/Total
                                  (%)   (%)    (absolute)
```

```
arp                                 50    20      90095/90098
```

Command output

Field	Description
Minor alarms resending	Status of the minor resource depletion alarm resending feature, **Enabled** or **Disabled.**
Resource	Monitored resource type.
Minor (%)	Minor resource depletion threshold, in percentage.
Severe (%)	Severe resource depletion threshold, in percentage.
Free/Total (absolute)	Numbers of available resources and total resources, in absolute values.

10.1.20. display scheduler job

Use **display scheduler job** to display job configuration information.

Syntax

display scheduler job [*job-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

job-name: Specifies a job by its name, a case-sensitive string of 1 to 47 characters. If you do not specify a job, this command displays configuration information for all jobs.

Examples

Display configuration information for all jobs.

```
<Switch> display scheduler job
Job name: saveconfig
 copy startup.cfg backup.cfg

Job name: backupconfig

Job name: creat-VLAN100
 system-view
 vlan 100
```

// The output shows that the device has three jobs: the first has one command, the second does not have any commands, and the third has two commands. Jobs are separated by blank lines.

10.1.21. display scheduler logfile

Use **display scheduler logfile** to display job execution log information.

Syntax

display scheduler logfile

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display job execution log information.

```
<Switch> display scheduler logfile
Logfile Size: 1902 Bytes.

Job name        : shutdown
Schedule name   : shutdown
Execution time  : Tue Dec 27 10:44:42 2015
Completion time : Tue Dec 27 10:44:47 2015
---------------------------------- Job output ----------------------------------
<Switch>system-view
System View: return to User View with Ctrl+Z.
[Switch]interface rang gigabitethernet 1/0/1 to gigabitethernet 1/0/3
[Switch-if-range]shutdown
```

Table 10-7 Command output

Field	Description
Logfile Size	Size of the log file, in bytes.
Schedule name	Schedule to which the job belongs.
Execution time	Time when the job was started.
Completion time	Time when the job was completed. If the job has never been executed or the job does not have any commands, this field is blank.
Job output	Commands in the job and their output.

Related commands

10.1.22. display scheduler reboot

Use **display scheduler reboot** to display the automatic reboot schedule.

Syntax

display scheduler reboot

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the automatic reboot schedule.

```
<Switch> display scheduler reboot
System will reboot at 16:32:00 05/23/2015 (in 1 hours and 39 minutes).
```

Related commands

scheduler reboot at

scheduler reboot delay

10.1.23. display scheduler schedule

Use **display scheduler schedule** to display schedule information.

Syntax

display scheduler schedule [*schedule-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

schedule-name: Specifies a schedule by its name, a case-sensitive string of 1 to 47 characters. If you do not specify a schedule, this command displays information about all schedules.

Examples

Display information about all schedules.

```
<Switch> display scheduler schedule
Schedule name        : shutdown
Schedule type        : Run once after 0 hours 2 minutes
Start time           : Tue Dec 27 10:44:42 2015
Last execution time  : Tue Dec 27 10:44:42 2015
Last completion time : Tue Dec 27 10:44:47 2015
Execution counts     : 1
------------------------------------------------------------------------
Job name                                        Last execution status
shutdown                                        Successful
```

Table 10-8 Command output

Field	Description
Schedule type	Execution time setting of the schedule. If no execution time is specified, this field is not displayed.
Start time	Time to execute the schedule for the first time. If no execution time is specified, this field is not displayed.
Last execution time	Last time when the schedule was executed. If no execution time is specified, this field is not displayed. If the schedule has never been executed, "Yet to be executed" is displayed for this field.
Last completion time	Last time when the schedule was completed. If no execution time is specified, this field is not displayed.
Execution counts	Number of times the schedule has been executed. If the schedule has never been executed, this field is not displayed.
Job name	Name of a job under the schedule.
Last execution status	Result of the most recent execution: • **Successful**. • **Failed**. • **Waiting**—The device is executing the schedule and the job is waiting to be executed. • **In process**—The job is being executed. • **-NA-**—The execution time has not arrived yet. To view information about whether the commands in the job has been executed and the execution results, execute the **display scheduler logfile** command.

10.1.24. display switch-mode status

Use **display switch-mode status** to display the operating mode of the device.

Syntax

display switch-mode status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display operating mode about the device.

<Switch> display switch-mode status

```
Switch-mode in use: NORMAL MODE(default).
Switch-mode for next reboot:: VXLAN MODE.
Switch-mode for next reboot: VXLAN MODE.
```

10.1.25. display transceiver alarm

Use **display transceiver alarm** to display transceiver alarms.

Syntax

display transceiver alarm interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If no interface is specified, this command displays the alarms present on every transceiver module.

Usage guidelines

Table 10-9 shows the common transceiver alarm components. If no error occurs, "None" is displayed.

Table 10-9 Common transceiver alarm components

Field	Description
APD	Avalanche photo diode
PCS	Physical coding sublayer
PHY XS	PHY extended sublayer
PMA/PMD	Physical medium attachment/physical medium dependent
power	Optical power
REFCLK	Reference clock
RX	Receive
TEC	Thermoelectric cooler
Temp	Temperature
TX	Transmit
WIS	WAN interface sublayer

Examples

Display the alarms present on the transceiver module in interface GigabitEthernet 1/0/1.

```
<Switch> display transceiver alarm interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 transceiver current alarm information:
  RX signal loss
  RX power low
```

Table 10-10 Common output

Field	Description
transceiver current alarm information	Alarms present on the transceiver module.
RX signal loss	Inbound signal loss occurred.
RX power low	Received power is low.

NOTE:
The **display transceiver alarm** command is supported on Ver7.4.45 and later.

10.1.26. display transceiver diagnosis

Use **display transceiver diagnosis** to display the current values of the digital diagnosis parameters on transceiver modules.

Syntax

display transceiver diagnosis interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If no interface is specified, this command displays the current values of the digital diagnosis parameters on every transceiver module.

Examples

Display the current values of the digital diagnosis parameters on the transceiver module in interface GigabitEthernet 1/0/1.

```
<Switch> display transceiver diagnosis interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 transceiver diagnostic information:
  Current diagnostic parameters:
    Temp(°C)  Voltage(V)  Bias(mA)  RX power(dBm)  TX power(dBm)
    36        3.31        6.13      -35.64          -5.19
  Alarm thresholds:
            Temp(°C)   Voltage(V)  Bias(mA)  RX power(dBM)  TX power(dBM)
    High    50         3.55        1.44      -10.00         5.00
    Low     30         3.01        1.01      -30.00         0.00
```

Table 10-11 Common output

Field	Description
transceiver diagnostic information	Digital diagnosis information for the transceiver module in

Field	Description
	the interface.
Temp.(°C)	Temperature in °C, accurate to 1°C.
Voltage(V)	Voltage in V, accurate to 0.01 V.
Bias(mA)	Bias current in mA, accurate to 0.01 mA.
RX power(dBm)	Receive power in dBm, accurate to 0.01 dBm.
TX power(dBm)	Transmit power in dBm, accurate to 0.01 dBm.

NOTE:
The **display transceiver diagnosis** command is supported on Ver7.4.45 and later.

10.1.27. display transceiver interface

Use **display transceiver interface** to display the key parameters of transceiver modules.

Syntax

display transceiver interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the key parameters of every transceiver module.

Examples

Display the key parameters of the transceiver module in interface Ten-GigabitEthernet 1/0/50.

<Switch> display transceiver interface ten-gigabitethernet 1/0/50

```
Ten-GigabitEthernet1/0/50 transceiver information:
  Transceiver Type              : 10G_BASE_SR_SFP
  Connector Type                : LC
  Wavelength(nm)                : 850
  Transfer Distance(m)          : 80(OM2),20(OM1),300(OM3)
  Digital Diagnostic Monitoring : YES
  Vendor Name                   : Hisense
  Ordering Name                 : SFP-XG-SX-MM850-D
  Part Number                   : LTF8502-BC+
  Serial Number                 : U8AC2H029BP
```

NOTE:
The “Ordering Name” may not be displayed for some modules.

10.1.28. display transceiver manuinfo

Use **display transceiver manuinfo** to display electronic label information for transceiver modules.

Syntax

display transceiver manuinfo interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If no interface is specified, this command displays electronic label information for all transceiver modules.

Examples

Display the key parameters of the transceiver module in interface Ten-GigabitEthernet 1/0/50.

```
<Switch> display transceiver interface Ten-gigabitethernet 1/0/50
Ten-GigabitEthernet1/0/50 transceiver manufacture information:
  Manu. Serial Number : 210231A1RPN22600345K
  Manufacturing Date  : 2022-06-27
  Vendor Name         : Hisense
```

NOTE:

- The **display transceiver manuinfo** command is supported on Ver7.4.45 and later.
- For modules that do not support this command, the following message is displayed. To view transceiver information, use the **display transceiver interface** command.

```
The transceiver does not support this function.
```

10.1.29. display version

Use **display version** to display system version information.

Syntax

display version

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display system version information.

```
<Switch> display version
...
```

Table 10-12 Command output

Field	Description
Last reboot reason	Reason for the last reboot: • **User reboot**–The reboot was manually initiated from a user interface, such as the CLI or SNMP. • **Cold reboot**–The reboot was caused by a power cycle. • **Kernel abnormality reboot**–The reboot was caused by kernel exceptions. • **DeadLoop reboot**–The reboot was caused by a kernel thread dead loop. • **DEV HandShake reboot**–The reboot was caused by a device management handshake failure. • **SlaveSwitch reboot**–The reboot was caused by a master/subordinate switchover. • **IRF Merge reboot**–The reboot was caused by an IRF merge. • **Auto Update reboot**–The reboot was caused by an automatic software upgrade. • **Memory exhaust reboot**–The reboot was caused by a memory-exhausted event.

10.1.30. dying-gasp host

Use **dying-gasp host** to configure poweroff alarm destination host settings.

Use **undo dying-gasp host** to remove poweroff alarm destination host settings.

Syntax

dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] **snmp-trap version** { **v1** | **v2c** | **v3** [**authentication** | **privacy**] } **securityname** *security-string*

dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] **syslog**

undo dying-gasp host { *ip-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] { **snmp-trap** | **syslog** }

Default

No poweroff alarm destination host settings are configured.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of the destination host to which the device sends the poweroff alarm.

ipv6 *ipv6-address*: Specifies the IPv6 address of the destination host to which the device sends the poweroff alarm.

vpn-instance *vpn-instance-name*: Specifies the **MPLS L3VPN** instance to which the destination host belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination host belongs to the public network, do not specify this option.

snmp-trap: Uses an SNMP notification to send the poweroff alarm.

version: Specifies the SNMP version.

- **v1**: Uses SNMPv1.
- **v2c**: Uses SNMPv2c.
- **v3**: Uses SNMPv3. If you do not specify the **authentication** or **privacy** keyword, no authentication or encryption is performed.
  - **authentication**: Performs only authentication on packets.
  - **privacy**: Performs both authenticaiton and encrypton on packets.

securityname *security-string*: Specifies an SNMPv1 or SNMPv2c community name, or SNMPv3 username, a case-sensitive string of 1 to 32 characters.

syslog: Uses a log message to send the poweroff alarm.

Usage guidelines

The device can send the poweroff alarm by using either or both of an SNMP notification and a log message.

The device can send the poweroff alarm to multiple destination hosts at the same time.

When you configure the device to send poweroff alarms in SNMP v3 traps to the NMS, execute the **snmp-agent usm-user** command to create an SNMP v3 user. Make sure the authentication mode for the group to which the SNMP v3 user belongs is the same as the authentication mode configured by the **dying-gasp host** command. In addition, the authentication and encryption parameters must match those configured on the NMS side. If you fail to do so, the device cannot send poweroff alarms in SNMP v3 traps to the NMS.

Examples

Configure the device to send the poweroff alarm to the host at 1.1.1.1 by using an SNMPv1 notification. The community name is **public**.

```
<Sysname> system-view
[Sysname] dying-gasp host 1.1.1.1 snmp-trap version v1 securityname public
```

Related commands

dying-gasp source

10.1.31. dying-gasp source

Use **dying-gasp source** to specify the source interface for sending the poweroff alarm.

Use **undo dying-gasp source** to restore the default.

Syntax

dying-gasp source *interface-type* { *interface-number* | *interface-number.subnumber* }

undo dying-gasp source

Default

No source interface is specified. On an IPv4 network, the device uses the primary IPv4 address of the output interface for the route to the destination host as the source address. On an IPv6 network, the device selects a source IPv6 address as defined in RFC 3484.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type { *interface-number* | *interface-number.subnumber* }: Specifies a Layer 3 interface. The *interface-type* argument specifies the interface type. The *interface-number* argument specifies the interface number. The *subnumber* argument specifies the subinterface number and is in the range of 1 to 4094. Support for the *interface-number.subnumber* argument depends on the device model.

Usage guidelines

The device uses the IPv6 address or primary IPv4 address of the specified source interface as the source address for outgoing poweroff alarm packets. The destination hosts use this address to identify SNMP notifications or log messages received from the device.

If no address is configured for the specified source interface, this command does not take effect. For this command to take effect, assign an address to the source interface.

Examples

Use the Vlan-interface 1 interface as the source interface for sending the poweroff alarm.

```
<Sysname> system-view
[Sysname] dying-gasp source vlan-interface 1
```

Related commands

dying-gasp host

10.1.32. fan prefer-direction

Use **fan prefer-direction** to specify the preferred airflow direction for the device.

Use **undo fan prefer-direction** to restore the default.

Syntax

fan prefer-direction slot *slot-number* { **port-to-power** | **power-to-port** }

undo fan prefer-direction slot *slot-number*

Default

The preferred airflow direction is from the port side to the power supply side.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

port-to-power: Specifies the airflow direction from the port side to the power supply side.

power-to-port: Specifies the airflow direction from the power supply side to the port side.

Usage guidelines

QX-S5628GT-4X2Q and QX-S5648GT-4X2Q switches do not support this command.

Examples

Set the preferred airflow direction to **port-to-power** for member device 1.

```
<Switch> system-view
[Switch] fan prefer-direction slot 1 port-to-power
```

Related commands

display fan

10.1.33. header

Use **header** to configure a banner.

Use **undo header** to delete a banner.

Syntax

header { **legal** | **login** | **motd** | **shell** } *text*

undo header { **legal** | **login** | **motd** | **shell** }

Default

The device does not have banners.

Views

System view

Predefined user roles

network-admin

Parameters

legal: Configures the banner to be displayed before a user inputs the username and password to access the CLI.

login: Configures the banner to be displayed before password or scheme authentication is performed for a login user.

motd: Configures the greeting banner to be displayed before the legal banner appears.

shell: Configures the banner to be displayed before a user accesses user view.

text: Specifies the banner message. You can enter the banner message on the same line as the keywords or on different lines. For more information, see *Fundamentals Configuration Guide*.

Examples

Configure the legal banner.

```
<Switch> system-view
```

```
[Switch] header legal
Please input banner content, and quit with the character '%'.
Welcome to use the legal banner%
```

10.1.34. job

Use **job** to assign a job to a schedule.

Use **undo job** to revoke a job.

Syntax

job *job-name*

undo job *job-name*

Default

No job is assigned to a schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

job-name: Specifies the job name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

You can assign multiple jobs to a schedule. The jobs in a schedule are executed concurrently.

The jobs to be assigned to a schedule must already exist. To create a job, use the **scheduler job** command.

Examples

Assign job **save-job** to schedule **saveconfig**.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] job save-job
```

Related commands

scheduler job

scheduler schedule

10.1.35. memory-threshold

Use **memory-threshold** to set free-memory thresholds.

Use **undo memory-threshold** to restore the defaults.

Syntax

memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]] **minor** *minor-value* **severe** *severe-value* **critical** *critical-value* **normal** *normal-value*

undo memory-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Minor alarm threshold: 96 MB.

Severe alarm threshold: 64 MB.

Critical alarm threshold: 48 MB.

Normal state threshold: 128 MB.

Views

System view

Predefined user roles

network-admin

Parameters

minor *minor-value*: Specifies the minor alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *minor-value* argument. Setting this threshold to 0 disables the minor alarm feature.

severe *severe-value*: Specifies the severe alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *severe-value* argument. Setting this threshold to 0 disables the severe alarm feature.

critical *critical-value*: Specifies the critical alarm threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *critical-value* argument. Setting this threshold to 0 disables the critical alarm feature.

normal *normal-value*: Specifies the normal state threshold. To view the value range for this threshold, enter a question mark (?) in the place of the *normal-value* argument.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets free-memory thresholds for the master device.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Usage guidelines

To ensure correct operation and improve memory efficiency, the system monitors the amount of free memory space in real time. If the amount of free memory space decreases to or below the minor, severe, or critical alarm threshold, the system issues an alarm to affected service modules or processes.

The early warning feature warns you of an approaching insufficient-memory condition.

For more information about the thresholds, see *Fundamentals Configuration Guide*.

Examples

Set the minor alarm, severe alarm, critical alarm, and normal state thresholds to 64 MB, 48 MB, 32 MB, and 96 MB, respectively.

```
<Switch> system-view
[Switch] memory-threshold minor 64 severe 48 critical 32 normal 96
```

Set the minor alarm, severe alarm, critical alarm, and normal state thresholds to 3%, 2%, 1%, and 5% of the total memory size, respectively.

```
<Switch> system-view
[Switch] memory-threshold ratio minor 3 severe 2 critical 1 normal 5
```

Related commands

display memory-threshold

10.1.36. monitor cpu-usage enable

Use **monitor cpu-usage enable** to enable CPU usage monitoring.

Use **undo monitor cpu-usage enable** to disable CPU usage monitoring.

Syntax

monitor cpu-usage enable [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

CPU usage monitoring is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command enables CPU usage monitoring for the master device.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Usage guidelines

After CPU usage monitoring is enabled, the system samples and saves CPU usage at the interval specified by the **monitor cpu-usage interval** command. You can use the **display cpu-usage history** command to view recent CPU usage.

Examples

Enable CPU usage monitoring.

```
<Switch> system-view
[Switch] monitor cpu-usage enable
```

Related commands

display cpu-usage configuration

display cpu-usage history

monitor cpu-usage interval

10.1.37. monitor cpu-usage interval

Use **monitor cpu-usage interval** to set the sampling interval for CPU usage monitoring.

Use **undo monitor cpu-usage interval** to restore default settings.

Syntax

monitor cpu-usage interval *interval* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage interval [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The system samples CPU usage every 1 minute.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the sampling interval for CPU usage monitoring. Valid values include **5Sec** (5 seconds), **1Min** (1 minute), and **5Min** (5 minutes), case insensitive.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets the interval for the master device.

cpu *cpu-number*: Specifies a CPU by its number. The *cpu-number* argument must be 0.

Usage guidelines

After CPU usage monitoring is enabled, the system samples and saves CPU usage at the specified interval. You can use the **display cpu-usage history** command to view recent CPU usage.

Examples

Set the sampling interval for CPU usage monitoring to 5 seconds.

```
<Switch> system-view
[Switch] monitor cpu-usage interval 5Sec
```

Related commands

display cpu-usage configuration

display cpu-usage history

monitor cpu-usage enable

10.1.38. monitor cpu-usage threshold

Use **monitor cpu-usage threshold** to set CPU usage alarm thresholds.

Use **undo monitor cpu-usage threshold** to restore default settings.

IMPORTANT:

- The **monitor cpu-usage threshold** command checks total CPU usage statistics.
- Maximum of the total CPU usage statistics is 100%.
- If control-plane is 45% and data-plane is 5%, total CPU usage statistics is 25%.

Syntax

monitor cpu-usage threshold *severe-threshold* **minor-threshold** *minor-threshold* **recovery-threshold** *recovery-threshold* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor cpu-usage threshold minor-threshold recovery-threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The default settings are as follows:

- **Severe CPU usage alarm threshold**—99%.
- **Minor CPU usage alarm threshold**—80%.
- **CPU usage recovery threshold**—60%.

Views

System view

Predefined user roles

network-admin

Parameters

severe-threshold: Specifies the severe CPU usage alarm threshold in percentage. The value range for this argument is 2 to 100.

minor-threshold *minor-threshold*: Specifies the minor CPU usage alarm threshold in percentage. The value range for this argument is 1 to the severe CPU usage alarm threshold minus 1.

recovery-threshold *recovery-threshold*: Specifies the CPU usage recovery threshold in percentage. The value range for this argument is 0 to the minor CPU usage alarm threshold minus 1.

cpu-threshold: Specifies the CPU usage threshold in percentage. The value range is 0 to 100.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets the CPU usage threshold for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples CPU usage at 1-minute intervals. If the sample is greater than the CPU usage threshold, the device sends a trap.

Examples

Set the severe CPU usage alarm threshold to 90%, minor CPU usage alarm threshold to 80%, and CPU usage recovery threshold to 70%.

```
<Switch> system-view
[Switch] monitor cpu-usage threshold 90 minor-threshold 80 recovery-threshold 70
```

Related commands

display cpu-usage configuration

10.1.39. monitor resend cpu-usage

Use **monitor resend cpu-usage** to set CPU usage alarm resending intervals.

Use **undo monitor resend cpu-usage** to restore default settings.

Syntax

monitor resend cpu-usage { **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor resend cpu-usage [**minor-interval** | **severe-interval**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The minor alarm resending interval is 300 seconds. The severe alarm resending interval is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

minor-interval *minor-interval*: Specifies the minor alarm resending interval in seconds, a multiple of five in the range of 10 to 3600.

severe-interval *severe-interval*: Specifies the severe alarm resending interval in seconds, a multiple of five in the range of 10 to 3600.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets alarm resending intervals for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples CPU usage periodically and compares the sample with the CPU usage threshold. If the sample increases above an alarm threshold, the CPU usage enters an alarm state and the device sends an alarm.

While the CPU usage is in minor alarm state, the device sends minor alarms periodically until the CPU usage increases above the severe threshold or the minor alarm is removed.

While the CPU usage is in severe alarm state, the device sends severe alarms periodically until the severe alarm is removed.

You can use this command to change CPU usage alarm resending intervals.

If you do not specify the **minor-interval** or **severe-interval** keyword, the **undo monitor resend cpu-usage** command restores default settings for both the minor and severe alarm resending intervals.

Examples

Set the CPU usage minor alarm resending interval to 60 seconds for CPU 0 in slot 1.

```
<Switch> system-view
[Switch] monitor resend cpu-usage minor-interval 60 slot 1 cpu 0
```

10.1.40. monitor resend memory-threshold

Use **monitor resend memory-threshold** to set memory depletion alarm resending intervals.

Use **undo monitor resend memory-threshold** to restore default settings.

Syntax

monitor resend memory-threshold { **critical-interval** *critical-interval* | **early-warning-interval** *early-warning-interval* | **minor-interval** *minor-interval* | **severe-interval** *severe-interval* } * [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor resend memory-threshold [**critical-interval** | **early-warning-interval** | **minor-interval** | **severe-interval**] * [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

- Early warning resending interval: 1 hour.
- Minor alarm resending interval: 12 hours.
- Severe alarm resending interval: 3 hours.
- Critical alarm resending interval: 1 hour.

Views

System view

Predefined user roles

network-admin

Parameters

critical-interval *critical-interval*: Specifies the critical alarm resending interval in hours, in the range of 1 to 48.

early-warning-interval *early-warning-interval*: Specifies the early warning resending interval in hours, in the range of 1 to 48.

minor-interval *minor-interval*: Specifies the minor alarm resending interval in hours, in the range of 1 to 48.

severe-interval *severe-interval*: Specifies the severe alarm resending interval in hours, in the range of 1 to 48.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command sets alarm resending intervals for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The device samples the amount of free memory space periodically and compares the sample with free-memory thresholds. If the sample decreases to or below a threshold, the device enters a memory depletion alarm state and sends an alarm.

In critical alarm state, the device sends critical alarm notifications periodically until the critical alarm is removed.

In a lower alarm state, the device sends notifications for the alarm state periodically until it enters a higher alarm state or the current alarm is removed.

You can use this command to change the alarm resending intervals.

Examples

Set the minor memory depletion alarm resending interval to 12 hours for CPU 0 in slot 1.

```
<Switch> system-view
[Switch] monitor resend memory-threshold minor-interval 12 slot 1 cpu 0
```

10.1.41. parity-error monitor log enable

Use **parity-error monitor log enable** to enable parity error logging for entries on forwarding chips.

Use **undo parity-error monitor log enable** to disable parity error logging for entries on forwarding chips.

Syntax

parity-error monitor log enable

undo parity-error monitor log enable

Default

Parity error logging is enabled for entries on forwarding chips.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The device detects parity errors in entries on forwarding chips. The parity error logging feature generates logs for the detected parity errors.

Examples

Enable parity error logging for entries on forwarding chips.

```
<Switch> system-view
[Switch] parity-error monitor log enable
```

10.1.42. parity-error monitor period

Use **parity-error monitor period** to set the parity error statistics interval for entries on forwarding chips.

Use **undo parity-error monitor period** to restore the default.

Syntax

parity-error monitor period *value*

undo parity-error monitor period

Default

The parity error statistics interval is 60 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the parity error statistics interval in the range of 1 to 86400 seconds.

Usage guidelines

The device detects parity errors in entries on forwarding chips, and collects parity error statistics at the interval set by using this command.

Examples

Set the parity error statistics interval to 120 seconds.

```
<Switch> system-view
[Switch] parity-error monitor period 120
```

Related commands

parity-error monitor threshold

10.1.43. parity-error monitor threshold

Use **parity-error monitor threshold** to set the parity error alarm threshold for entries on forwarding chips.

Use **undo parity-error monitor threshold** to restore the default.

Syntax

parity-error monitor threshold *value*

undo parity-error monitor threshold

Default

The parity error alarm threshold is 5000.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the parity error alarm threshold in the range of 1 to 1000000.

Usage guidelines

The device detects and collects statistics for parity errors in entries on forwarding chips. If the number of parity errors in a parity error statistics interval exceeds the parity error alarm threshold, the system issues an alarm.

Examples

Set the parity error alarm threshold to 8000.

```
<Switch> system-view
[Switch] parity-error monitor threshold 8000
```

Related commands

parity-error monitor period

10.1.44. password-recovery enable

Use **password-recovery enable** to enable password recovery capability.

Use **undo password-recovery enable** to disable password recovery capability.

Syntax

password-recovery enable

undo password-recovery enable

Default

Password recovery capability is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Password recovery capability controls console user access to the device configuration and SDRAM from BootWare menus.

If password recovery capability is enabled, a console user can access the device configuration without authentication to configure new passwords.

If password recovery capability is disabled, console users must restore the factory-default configuration before they can configure new passwords. Restoring the factory-default configuration deletes the next-startup configuration files.

To enhance system security, disable password recovery capability.

Availability of BootWare menu options depends on the password recovery capability setting. For more information, see the release notes.

Examples

Disable password recovery capability.

```
<Switch> system-view
[Switch] undo password-recovery enable
```

10.1.45. reboot

Use **reboot** to reboot the device.

Syntax

reboot [**slot** *slot-number*] [**force**]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, the command reboots all IRF member devices.

force: Reboots the device immediately without performing software or hard disk check. If this keyword is not specified, the system first identifies whether the reboot might result in data loss or a system failure. For example, the system identifies whether the main system software image file exists and whether a write operation is in progress on a storage medium. If the reboot might cause problems, the system does not reboot the device.

Usage guidelines

CAUTION:

- A reboot might interrupt network services.
- Use the **force** keyword only when the device fails or a **reboot** command without the **force** keyword cannot perform a reboot correctly. A **reboot** command with the **force** keyword might result in file system corruption because it does not perform data protection.

If the main startup software images are corrupt or missing, you must re-specify a set of main startup software images before executing the **reboot** command.

For data security, the device does not reboot if you reboot the device while the device is performing file operations.

If the IRF fabric has only one member device, rebooting the member device reboots the entire IRF fabric. If the IRF fabric has a subordinate member and the member is operating correctly, rebooting the master triggers a master/subordinate switchover.

To ensure correct operation of the IRF fabric and member devices, do not trigger a switchover by rebooting the master if no subordinate member devices are in **Stable** state. To view the status of subordinate member devices, execute the **display system stable state** command.

Examples

Reboot the device. Save the running configuration at prompt.

```
<Switch> reboot
Start to check configuration with next startup configuration file, please
wait.........DONE!
Current configuration will be lost after the reboot, save current configuration? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait...
Configuration is saved to mainboard device successfully.
This command will reboot the device. Continue? [Y/N]:y
Now rebooting, please wait...
```

Reboot the device immediately without performing software check.

```
<Switch> reboot force
A forced reboot might cause the storage medium to be corrupted. Continue? [Y/N]:y
Now rebooting, please wait...
```

Related commands

display system stable state

10.1.46. reset scheduler logfile

Use **reset scheduler logfile** to clear job execution log information.

Syntax

reset scheduler logfile

Views

User view

Predefined user roles

network-admin

Examples

Clear job execution log information.

```
<Switch> reset scheduler logfile
```

Related commands

display scheduler logfile

10.1.47. resource-monitor minor resend enable

Use **resource-monitor minor resend enable** to enable resending of minor resource depletion alarms.

Use **undo resource-monitor minor resend enable** to disable resending of minor resource depletion alarms.

Syntax

resource-monitor minor resend enable

undo resource-monitor minor resend enable

Default

Resending of minor resource depletion alarms is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When a resource type enters minor alarm state, the device issues a minor alarm. If the resource type stays in minor alarm state or changes from severe alarm state to minor alarm state, the device identifies whether resending of minor resource depletion alarms is enabled. If the feature is disabled, the device does not issue additional minor alarms. If the feature is enabled, the device resends minor alarms periodically.

Examples

Enable resending of minor resource depletion alarms.

```
<Switch> system-view
[Switch] resource-monitor minor resend enable
```

Related commands

display resource-monitor

resource-monitor output

resource-monitor resource

10.1.48. resource-monitor output

Use **resource-monitor output** to specify destinations for resource depletion alarms.

Use **undo resource-monitor output** to remove destinations for resource depletion alarms.

Syntax

resource-monitor output { **netconf-event** | **snmp-notification** | **syslog** } *

undo resource-monitor output [**netconf-event** | **snmp-notification** | **syslog**] *

Default

Resource depletion alarms are sent to NETCONF, SNMP, and the information center.

Views

System view

Predefined user roles

network-admin

Parameters

netconf-event: Sends resource depletion alarms to the NETCONF feature to encapsulate the alarms in NETCONF events. For more information, see NETCONF in *Network Management and Monitoring Configuration Guide*.

snmp-notification: Sends resource depletion alarms to the SNMP feature to encapsulate the alarms in SNMP traps and informs. For more information, see SNMP in *Network Management and Monitoring Configuration Guide*.

syslog: Sends resource depletion alarms to the information center to encapsulate the alarms in log messages. For more information, see information center in *Network Management and Monitoring Configuration Guide*.

Usage guidelines

If you do not specify any keywords for the **undo resource-monitor output** command, the command disables resource depletion alarm output.

Examples

Specify the information center module as the output destination for resource depletion alarms.

```
<Switch> system-view
[Switch] resource-monitor output syslog
```

Related commands

resource-monitor minor resend enable

resource-monitor resource

10.1.49. resource-monitor resource

Use **resource-monitor resource** to set resource depletion thresholds.

Use **undo resource-monitor resource** to disable resource depletion thresholds.

Syntax

resource-monitor resource *resource-name* **slot** *slot-number* **cpu** *cpu-number* **by-percent minor-threshold** *minor-threshold* **severe-threshold** *severe-threshold*

undo resource-monitor resource *resource-name* **slot** *slot-number* **cpu** *cpu-number*

Default

The default settings vary by resource type. Use the **display resource-monitor** command to display the resource depletion thresholds.

Views

System view

Predefined user roles

network-admin

Parameters

resource-name: Specifies a resource type by its name. The values for this argument are case insensitive and cannot be abbreviated. Table 10-13 lists the resource types that can be monitored.

Table 10-13 Resource types that can be monitored

Resource type	Description
ac	Ethernet service instances.
agg_group	Aggregation group resources.

Resource type	Description
arp	ARP resources.
ecmpgroup	ECMP group resources.
mac	MAC address table resources.
mqcin	Inbound MQC resources.
mqcout	Outbound MQC resources.
nexthoppool1	Next-hop pool resources for the underlay network.
openflowin	OpenFlow resources.
pbr	PBR resources.
pfilterin	Inbound packet filter resources.
pfilterout	Outbound packet filter resources.
rport	Layer 3 Ethernet interface resources.
subrport	Layer 3 Ethernet subinterface resources.
vlan	VLANs.
vlaninterface	VLAN interface resources.
vrf	VPN instance resources.
vsi	VSIs.
vsiintf	VSI interface resources.

slot *slot-number*: Specifies an IRF member device by its member ID.

cpu *cpu-number*: Specifies a CPU by its number.

by-percent: Specifies resource depletion thresholds in percentage.

minor-threshold *minor-threshold*: Specifies the minor resource depletion threshold. To view the value range, enter a question mark (?) in the place of the *minor-threshold* argument.

severe-threshold *severe-threshold*: Specifies the severe resource depletion threshold. To view the value range, enter a question mark (?) in the place of the *severe-threshold* argument.

Usage guidelines

After you execute this command for a resource type, the device monitors the available amount of the type of resources. The device samples the available amount at intervals, compares the sample with the resource depletion thresholds to identify the resource depletion status, and sends alarms as configured.

Examples

Set the minor resource depletion threshold to 30% and the severe resource depletion threshold to 10% for ARP entry resources on slot 1.

```
<Switch> system-view
[Switch] resource-monitor resource arp slot 1 cpu 0 by-percent minor-threshold 30
severe-threshold 10
```

Related commands

resource-monitor minor resend enable

resource-monitor output

10.1.50. scheduler job

Use **scheduler job** to create a job and enter its view, or enter the view of an existing job.

Use **undo scheduler job** to delete a job.

Syntax

scheduler job *job-name*

undo scheduler job *job-name*

Default

No job exists.

Views

System view

Predefined user roles

network-admin

Parameters

job-name: Specifies the job name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

A job can be referenced by multiple schedules. In job view, you can assign commands to the job.

Examples

Create a job named **backupconfig** and enter job view.

```
<Switch> system-view
[Switch] scheduler job backupconfig
[Switch-job-backupconfig]
```

Related commands

command

scheduler schedule

10.1.51. scheduler logfile size

Use **scheduler logfile size** to set the size of the job execution log file.

Syntax

scheduler logfile size *value*

Default

The size of the job execution log file is 16 KB.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the size of the job execution log file, in KB. The value range is 16 to 1024.

Usage guidelines

The job execution log file saves the execution information of jobs. If the file is full, old records are deleted to make room for new records. If the size of the log information to be written to the file is greater than the file size, the excessive information is not written to the file.

Examples

Set the size of the job execution log file to 32 KB.

```
<Switch> system-view
[Switch] scheduler logfile size 32
```

Related commands

display scheduler logfile

10.1.52. scheduler reboot at

Use **scheduler reboot at** to specify the reboot date and time.

Use **undo scheduler reboot** to delete the reboot schedule configuration.

Syntax

scheduler reboot at *time* [*date*]

undo scheduler reboot

Default

No reboot date or time is specified.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies the reboot time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

date: Specifies the reboot date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

CAUTION:
Device reboot interrupts network services.

When the *date* argument is not specified, the system uses the following rules to determine the reboot time:

- If the reboot time is later than the current time, a reboot occurs at the reboot time of the current day.
- If the reboot time is earlier than the current time, a reboot occurs at the reboot time the next day.

The device supports only one device reboot schedule. If you execute both the **scheduler reboot delay** and **scheduler reboot at** commands or execute one of the commands multiple times, the most recent configuration takes effect.

For data security, the system does not reboot at the reboot time if a file operation is being performed.

Examples

Configure the device to reboot at 12:00 p.m. This example assumes that the current time is 11:43 a.m. on June 6, 2015.

```
<Switch> scheduler reboot at 12:00
Reboot system at 12:00:00 06/06/2015 (in 0 hours and 16 minutes). Confirm? [Y/N]:
```

Related commands

scheduler reboot delay

10.1.53. scheduler reboot delay

Use **scheduler reboot delay** to specify the reboot delay time.

Use **undo scheduler reboot** to delete the reboot schedule configuration.

Syntax

scheduler reboot delay *time*

undo scheduler reboot

Default

No reboot delay time is specified.

Views

User view

Predefined user roles

network-admin

Parameters

time: Specifies the reboot delay time in the *hh:mm* or *mm* format. This argument can contain up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59.

Usage guidelines

CAUTION:
Device reboot interrupts network services.

The device supports only one device reboot schedule. If you execute both the **scheduler reboot delay** and **schedule reboot at** commands or execute one of the commands multiple times, the most recent configuration takes effect.

For data security, the system does not reboot at the reboot time if a file operation is being performed.

Examples

Configure the device to reboot after 88 minutes. This example assumes that the current time is 11:48 a.m. on June 6, 2015.

```
<Switch> scheduler reboot delay 88
Reboot system at 13:16 06/06/2015(in 1 hours and 28 minutes). Confirm? [Y/N]:
```

10.1.54. scheduler schedule

Use **scheduler schedule** to create a schedule and enter its view, or enter the view of an existing schedule.

Use **undo scheduler schedule** to delete a schedule.

Syntax

scheduler schedule *schedule-name*

undo scheduler schedule *schedule-name*

Default

No schedule exists.

Views

System view

Predefined user roles

network-admin

Parameters

schedule-name: Specifies the schedule name, a case-sensitive string of 1 to 47 characters.

Usage guidelines

You can configure a schedule to have the device automatically run a command or a set of commands without administrative interference.

To configure a schedule:

1. Use the **scheduler job** command to create a job and enter job view.
2. Use the **command** command to assign commands to the job.
3. Use the **scheduler schedule** command to create a schedule and enter schedule view.
4. Use the **job** command to assign the job to the schedule. You can assign multiple jobs to a schedule. The jobs must already exist.
5. Use the **user-role** command to assign user roles to the schedule. You can assign up to 64 user roles to a schedule.
6. Use the **time at**, **time once**, or **time repeating** command to specify an execution time for the schedule. You can specify only one execution time for a schedule.

Examples

Create a schedule named **saveconfig**.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
```

Related commands

job

time at

time once

10.1.55. shutdown-interval

Use **shutdown-interval** to set the port status detection timer.

Use **undo shutdown-interval** to restore the default.

Syntax

shutdown-interval *interval*

undo shutdown-interval

Default

The port status detection timer setting is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the port status detection timer value in seconds. The value range is 0 to 300. To disable port status detection, set this argument to 0.

Usage guidelines

The device starts a port status detection timer when a port is shut down by a protocol. Once the timer expires, the device brings up the port so the port status reflects the port's physical status.

If you change the timer setting during port detection, the device compares the new setting (T1) with the time that elapsed since the port was shut down (T).

If T < T1, the port will be brought up after T1 – T seconds.

If T ≥ T1, the port is brought up immediately.

For example, the timer setting is 30 seconds. If you change it to 10 seconds 2 seconds after the port is shut down, the port will come up 8 seconds later. If you change the timer setting to 2 seconds 10 seconds after the port is shut down, the port comes up immediately.

Examples

Set the port status detection timer to 100 seconds.

```
<Switch> system-view
[Switch] shutdown-interval 100
```

10.1.56. switch-mode

Use **switch-mode** to specify an operating mode for the device.

Syntax

switch-mode { **0** | **1** }

Default

The device operates in standard mode.

Views

System view

Predefined user roles

network-admin

Parameters

0: Specifies the standard mode.

1: Specifies the VXLAN mode.

Usage guidelines

Change to the operating mode takes effect after you reboot the device.

Examples

Set the operating mode to VXLAN mode for the device.

<Switch> system-view

[Switch] switch-mode 1

```
Reboot device to make the configuration take effect.
```

Related commands

display switch-mode status

10.1.57. sysname

Use **sysname** to set the device name.

Use **undo sysname** to restore the default.

Syntax

sysname *sysname*

undo sysname

Default

The default device name is the device name.

Views

System view

Predefined user roles

network-admin

Parameters

sysname: Specifies a name for the device, a string of 1 to 64 characters.

Usage guidelines

A device name identifies a device in a network and is used in CLI view prompts. For example, if the device name is **Sysname**, the user view prompt is <Sysname>.

Examples

Set the name of the device to **R2000**.

```
<Switch> system-view
[Switch] sysname R2000
[R2000]
```

10.1.58. temperature-limit

Use **temperature-limit** to set the temperature alarm thresholds.

Use **undo temperature-limit** to restore the default.

Syntax

temperature-limit slot *slot-number* **hotspot** *sensor-number lowlimit warninglimit* [*alarmlimit*]

undo temperature-limit slot *slot-number* **hotspot** *sensor-number*

Default

Switch	Sensor	Recommended value of warning temperature	Default value of warning temperature	Recommended value of alarm temperature	Default value of alarm temperature
QX-S5628GT-4X2Q	Hotspot 1	53	60	58	65
QX-S5648GT-4X2Q	Hotspot 1	59	60	64	65
QX-S5624GT-4X1C	Hotspot 1	52	66	57	71
QX-S5648GT-4X1C	Hotspot 1	56	61	61	66
QX-S5624GP-4X1C	Hotspot 1	54	62	59	68

NOTE:

It's recommended to change the preset temperature to a threshold value of the recommendation temperature from a threshold value of default.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

hotspot: Configures temperature alarm thresholds for hotspot sensors. A hotspot sensor is typically near the chip that generates a great amount of heat and used to monitor the chip.

sensor-number: Specifies a sensor by its number. To view the value range, enter a question mark (?) in the place of this argument.

lowlimit: Specifies the low-temperature threshold in Celsius degrees. The value range varies by temperature sensor. To view the value range, enter a question mark (?) in the place of this argument.

warninglimit: Specifies the high-temperature warning threshold in Celsius degrees. This threshold must be greater than the low-temperature threshold. To view the value range, enter a question mark (?) in the place of this argument.

alarmlimit: Specifies the high-temperature alarming threshold in Celsius degrees. This threshold must be greater than the warning threshold. To view the value range, a enter question mark (?) in the place of this argument.

Usage guidelines

When the device temperature drops below the low-temperature threshold or reaches the high-temperature warning or alarming threshold, the device performs the following operations:

- Sends log messages and traps.
- Sets LEDs on the device panel.

Examples

Set temperature alarm thresholds for hotspot sensor 1 in a slot.

```
<Sysname> system-view
[Switch] temperature-limit slot 1 hotspot 1 -10 50 60
```

Related commands

display environment

10.1.59. time at

Use **time at** to specify an execution date and time for a non-periodic schedule.

Use **undo time** to delete the execution date and time configuration for a non-periodic schedule.

Syntax

time at *time date*

undo time

Default

No execution time or date is specified for a non-periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

time: Specifies the schedule execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

date: Specifies the schedule execution date in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month.

Usage guidelines

The specified time (date plus time) must be later than the current system time.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another. The most recently configured command takes effect.

Examples

Configure the device to execute schedule **saveconfig** at 01:01 a.m. on May 11, 2015.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time at 1:1 2015/05/11
```

Related commands

scheduler schedule

10.1.60. time once

Use **time once** to specify one or more execution days and the execution time for a non-periodic schedule.

Use **undo time** to delete the execution day and time configuration for a non-periodic schedule.

Syntax

time once at *time* [**month-date** *month-day* | **week-day** *week-day*&<1-7>]

time once delay *time*

undo time

Default

No execution time or day is specified for a non-periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

at *time*: Specifies the execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59.

month-date *month-day*: Specifies a day in the current month, in the range of 1 to 31. If you specify a day that does not exist in the current month, the configuration takes effect on that day in the next month.

week-day *week-day*&<1-7>: Specifies a space-separated list of up to seven week days for the schedule. Valid week day values include **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, **Sat**, and **Sun**.

delay *time*: Specifies the delay time for executing the schedule, in the *hh:mm* or *mm* format. This argument can have up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59.

Usage guidelines

If the specified time has already occurred, the schedule will be executed at the specified time the following day.

If the day in the month has already occurred, the schedule will be executed at the specified day in the following month.

If the specified day in a week has already occurred, the schedule will be executed at the specified day in the following week.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another. The most recently configured command takes effect.

Examples

Configure the device to execute schedule **saveconfig** once at 15:00.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time once at 15:00
```

```
Schedule starts at 15:00 5/11/2011.
```

Configure the device to execute schedule **saveconfig** once at 15:00 on the coming 15th day in a month.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time once at 15:00 month-date 15
```

Configure the device to execute schedule **saveconfig** at 12:00 p.m. on the coming Monday and Friday.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time once at 12:00 week-day mon fri
```

Configure the device to execute schedule **saveconfig** after 10 minutes.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time once delay 10
```

Related commands

scheduler schedule

10.1.61. time repeating

Use **time repeating** to specify an execution time table for a periodic schedule.

Use **undo time** to delete the execution time table configuration for a periodic schedule.

Syntax

time repeating [**at** *time* [*date*]] **interval** *interval*

time repeating at *time* [**month-date** [*month-day* | **last**] | **week-day** *week-day*&<1-7>]

undo time

Default

No execution time table is specified for a periodic schedule.

Views

Schedule view

Predefined user roles

network-admin

Parameters

at *time*: Specifies the execution time in the *hh:mm* format. The value range for *hh* is 0 to 23. The value range for *mm* is 0 to 59. If you do not specify this option, the current system time is used as the execution time.

date: Specifies the start date for the periodic schedule, in the *MM/DD/YYYY* or *YYYY/MM/DD* format. The value range for *YYYY* is 2000 to 2035. The value range for *MM* is 1 to 12. The value range for *DD* varies by month. If you do not specify this argument, the execution start date is the first day when the specified time arrives.

interval *interval*: Specifies the execution time interval in the *hh:mm or mm* format. This argument can have up to six characters. When in the *hh:mm* format, *mm* must be in the range of 0 to 59. When in the *mm* format, this argument must be equal to or greater than 1 minute.

month-date [*month-day* | **last**]: Specifies a day in a month, in the range 1 to 31. The **last** keyword indicates the last day of a month. If you specify a day that does not exist in a month, the configuration takes effect on that day in the next month.

week-day *week-day&<1-7>*: Specifies a space-separated list of up to seven week days for the schedule. Valid week day values include **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, **Sat**, and **Sun**.

Usage guidelines

The **time repeating** [**at** *time* [*date*]] **interval** *interval* command configures the device to execute a schedule at intervals from the specified time on.

The **time repeating at** *time* [**month-date** [*month-day* | **last**] | **week-day** *week-day&<1-7>*] command configures the device to execute a schedule at the specified time on every specified day in a month or week.

The **time at** command, the **time once** command, and the **time repeating** command overwrite one another, whichever is configured most recently takes effect.

Examples

Configure the device to execute schedule **saveconfig** once an hour from 8:00 a.m. on.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time repeating at 8:00 interval 60
```

Configure the device to execute schedule **saveconfig** at 12:00 p.m. every day.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time repeating at 12:00
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. on the 5th of every month.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time repeating at 8:00 month-date 5
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. on the last day of every month.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time repeating at 8:00 month-date last
```

Configure the device to execute schedule **saveconfig** at 8:00 a.m. every Friday and Saturday.

```
<Switch> system-view
[Switch] scheduler schedule saveconfig
[Switch-schedule-saveconfig] time repeating at 8:00 week-day fri sat
```

Related commands

scheduler schedule

10.1.62. usb disable

Use **usb disable** to disable USB interfaces.

Use **undo usb disable** to enable USB interfaces.

Syntax

usb disable

undo usb disable

Default

All USB interfaces are enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

You can use USB interfaces to upload or download files. By default, all USB interfaces are enabled.

Before executing this command, use the **umount** command to unmount all USB file systems.

Examples

Enable USB interfaces.

```
<Switch> system-view
[Switch] undo usb disable
```

10.1.63. user-role

Use **user-role** to assign user roles to a schedule.

Use **undo user-role** to remove user roles from a schedule.

Syntax

user-role *role-name*

undo user-role *role-name*

Default

A schedule has the user roles of the schedule creator.

Views

Schedule view

Predefined user roles

network-admin

Parameters

role-name: Specifies a user role name, a case-sensitive string of 1 to 63 characters. The user role can be user-defined or predefined. Predefined user roles include network-admin, network-operator, and level-0 to level-15.

Usage guidelines

A schedule must have one or more user roles. A command in a schedule can be executed if it is permitted by one or more user roles of the schedule. For more information about user roles, see the RBAC configuration in *Fundamentals Configuration Guide*.

A schedule can have a maximum of 64 user roles. After the limit is reached, you cannot assign additional user roles to the schedule.

Examples

Assign user role **rolename** to schedule **test**.

```
<Switch> system-view
[Switch] scheduler schedule test
```

```
[Switch-schedule-test] user-role rolename
```

python *filename* [*param*]

Views

User view

Predefined user roles

network-admin

Parameters

filename: Specifies the name of a Python script on a storage medium of the device. The script name is case sensitive and must use the extension .py. The extension .py is case insensitive.

param: Specifies the parameters to be passed to the script. To enter multiple parameters, use spaces as the delimiter.

Usage guidelines

You cannot perform any operations while you are executing a Python script.

Make sure the statements in the script meet the syntax requirements. The system stops executing a Python script if it finds a statement with syntax errors.

When executing a script, the system uses the defaults for interactive statements. The system does not stop for human input.

Examples

Execute Python script **test.py**.

```
<Switch> python test.py 1 2
['/flash:/test.py', '1', '2']
```

1. IRF commands

1.1. IRF commands

1.1.1. display irf

Use **display irf** to display IRF fabric information.

Syntax

display irf

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Table 1-1 shows the fields of IRF fabric information.

Table 1-1 Command output

Field	Description
MemberID	IRF member ID: • ID of the master is prefixed with an asterisk (*) sign. • ID of the device where you are logged in is prefixed with a plus (+) sign.
Role	Role of the member device in the IRF fabric: • **Standby**—Subordinate device. • **Master**—Master device. • **Loading**—The device is loading software images.
Priority	IRF member priority.
CPU-MAC	MAC address of the CPU in the device.
Description	Description you have configured for the member device. • If no description is configured, this field displays a dashed line (-----). • If the description exceeds the maximum number of characters that can be displayed, an ellipsis (…) is displayed in place of the exceeding text. To display the complete description, use the **display current-configuration** command.
Auto upgrade	Status of the software auto-update feature: • **yes**—Enabled. • **no**—Disabled.
MAC persistent	IRF bridge MAC persistence setting: • **6 min**—Bridge MAC address of the IRF fabric remains unchanged for 6 minutes after the address owner leaves. • **always**—Bridge MAC address of the IRF fabric does not

Field	Description
	change after the address owner leaves. • **no**—Bridge MAC address of the current master replaces the original bridge MAC address as soon as the owner of the original address leaves.
Domain ID	Domain ID of the IRF fabric. The domain ID you assign to an IRF fabric must uniquely identify the fabric in a multi-IRF fabric network.

Related commands

display irf configuration

display irf topology

1.1.2. display irf configuration

Use **display irf configuration** to display basic IRF settings for each member device.

Syntax

display irf configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display basic IRF settings for all members.

```
<Switch> display irf configuration
 MemberID  NewID    IRF-Port1                    IRF-Port2
 1         1        Ten-GigabitEthernet1/0/49    Ten-GigabitEthernet1/0/51
 2         2        Ten-GigabitEthernet2/0/49    Ten-GigabitEthernet2/0/51
                    Ten-GigabitEthernet2/0/50
 4         4        Ten-GigabitEthernet4/0/49    Ten-GigabitEthernet4/0/51
                                                 Ten-GigabitEthernet4/0/52
```

Table 1-2 Command output

Field	Description
MemberID	Current member ID of the device.
NewID	Member ID assigned to the device. This member ID takes effect at reboot.
IRF-Port1	Physical interfaces bound to IRF-port 1. This field displays **disable** if no physical interfaces are bound to the IRF port.
IRF-Port2	Physical interfaces bound to IRF-port 2. This field displays **disable** if no physical interfaces are bound to the IRF port.

Related commands

display irf

display irf topology

1.1.3. display irf link

Use **display irf link** to display IRF link information.

Syntax

display irf link

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display IRF link information.

```
<Switch> display irf link
Member 1
 IRF Port     Interface                           Status
 1            disable                             --
 2            Ten-GigabitEthernet1/0/49           UP
              Ten-GigabitEthernet1/0/50           ADM
Member 2
 IRF Port     Interface                          Status
 1            Ten-GigabitEthernet2/0/49           UP
              Ten-GigabitEthernet2/0/50           DOWN
 2            disable                            --
```

Table 1-3 Command output

Field	Description
Member *ID*	IRF member ID.
IRF Port	IRF port number: • **1**—IRF-port 1. • **2**—IRF-port 2.
Interface	Physical interfaces bound to the IRF port. This field displays **disable** if no physical interfaces have been bound to the IRF port.
Status	Link state of the IRF physical interface: • **UP**—The link is up. • **DOWN**—The link is down. • **ADM**—The interface has been manually shut down by using the **shutdown** command. • **ABSENT**—Expansion interface card that hosts the interface is not present.

1.1.4. display irf topology

Use **display irf topology** to display IRF fabric topology information.

Syntax

display irf topology

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Table 1-4 shows the fields of IRF fabric information.

Table 1-4 Command output

Field	Description
IRF-Port1	Information about IRF-port 1, including its link state and neighbor.
IRF-Port2	Information about IRF-port 2, including its link state and neighbor.
MemberID	IRF member ID.
Link	Link state of the IRF port: • **UP**—The IRF link is up. • **DOWN**—The IRF link is down because the port has no physical link or has not been activated by the **irf-port-configuration active** command. • **DIS**—No physical interfaces have been bound to the IRF port. • **TIMEOUT**—IRF hello interval has timed out. • **ISOLATE**—The device is isolated from the IRF fabric. This issue might be caused by the following reasons: ○ The IRF fabric does not support the device model. ○ The maximum number of member devices has exceeded the upper limit.
neighbor	IRF member ID of the device connected to the IRF port. This field displays three hyphens (---) if no device is connected to the port.
Belong To	IRF fabric that has the device, represented by the CPU MAC address of the master in the IRF fabric.

Related commands

display irf

display irf configuration

1.1.5. display mad

Use **display mad** to display MAD status and settings.

Syntax

display mad [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed MAD information. If you do not specify this keyword, the command only displays whether a MAD mechanism is enabled or disabled.

Examples

Display brief MAD information.

```
<Switch> display mad
MAD ARP enabled.
MAD ND disabled.
MAD LACP disabled.
MAD BFD disabled.
```

Display detailed MAD information.

```
<Switch> display mad verbose
Multi-active recovery state: No
Excluded ports (user-configured):
  Bridge-Aggregation4
  Vlan-interface999
Excluded ports (system-configured):
  IRF physical interfaces:
    Ten-GigabitEthernet1/0/49
    Ten-GigabitEthernet1/0/50
    Ten-GigabitEthernet1/0/51
    Ten-GigabitEthernet1/0/52
  BFD MAD interfaces:
    GigabitEthernet1/0/10
    GigabitEthernet2/0/10
    Vlan-interface3
  Member interfaces of excluded interface Bridge-Aggregation 4:
    GigabitEthernet1/0/11
    GigabitEthernet2/0/11
MAD ARP enabled interface:
  Vlan-interface2
MAD ND enabled interface:
  Vlan-interface2
MAD LACP enabled interface: Bridge-Aggregation 1
  MAD status                 : Normal
  Member ID       Port                       MAD status
  1               GigabitEthernet1/0/1       Normal
  2               GigabitEthernet2/0/1       Normal
```

```
MAD BFD enabled interface: VLAN-interface 3
  MAD status                 : Normal
  Member ID   MAD IP address       Neighbor    MAD status
  1           192.168.1.1/24       2           Normal
  2           192.168.1.2/24       1           Normal
```

Table 1-5 Command output

Field	Description
MAD ARP enabled.	Status of ARP MAD. This field displays **MAD ARP disabled** if ARP MAD is disabled.
MAD ND disabled.	Status of ND MAD. This field displays **MAD ND enabled** if ND MAD is enabled.
MAD LACP disabled.	Status of LACP MAD. This field displays **MAD LACP enabled** if LACP MAD is enabled.
MAD BFD disabled.	Status of BFD MAD. This field displays **MAD BFD enabled** if BFD MAD is enabled.
Multi-active recovery state	Whether the IRF fabric is in Recovery state: • **Yes**—The IRF fabric is in Recovery state. When MAD detects that an IRF fabric has split into multiple IRF fabrics, it allows one fabric to forward traffic. All the other IRF fabrics are set to the Recovery state. In Recovery state, MAD shuts down all service interfaces in the fabric except for the system- and user-excluded service interfaces. • **No**—The IRF fabric is not in Recovery state. It is active and can forward traffic.
Excluded ports (user-configured)	Service interfaces manually configured to not shut down when the IRF fabric transits to the Recovery state.
Excluded ports (system-configured)	Service interfaces set to not shut down by the system when the IRF fabric transits to the Recovery state. These service interfaces are not manually configured. • IRF physical interfaces. • BFD MAD interfaces: ○ VLAN interfaces used for BFD MAD and the Layer 2 Ethernet ports in the VLANs. ○ Management Ethernet ports used for BFD MAD. • Member interfaces of a Layer 2 aggregate interface if the aggregate interface is excluded from the MAD shutdown action.
MAD ARP enabled interface:	Interfaces on which ARP MAD is enabled.
MAD ND enabled interface:	Interfaces on which ND MAD is enabled.
MAD LACP enabled interface	Interface on which LACP MAD is enabled. This field is displayed for each interface enabled with LACP MAD.
MAD status	LACP MAD operating status: • **Normal**—LACP MAD is operating correctly. • **Faulty**—LACP MAD is not operating correctly. Verify the following items: ○ Verify that the ports on LACP MAD links are up.

Field	Description
	○ Verify that the intermediate device supports extended LACPDUs. ○ Verify that all member devices have member ports used for LACP MAD.
Member ID Port MAD status	LACP MAD details: • **Member ID**—IRF member ID of a device. • **Port**—Member ports of the aggregate interface used for LACP MAD. • **MAD status**—LACP MAD operating state on a member port. Options include **Normal** and **Faulty**.
MAD BFD enabled interface:	Layer 3 interface on which BFD MAD is enabled.
MAD status	BFD MAD operating status: • **Normal**—BFD MAD is operating correctly. • **Faulty**—BFD MAD is not operating correctly. Check the BFD MAD link connectivity. • **N/A**—BFD MAD link status cannot be detected. If BFD MAD is enabled on a management Ethernet port, it is normal that this field displays **N/A**.
Member ID MAD IP address Neighbor MAD status	BFD MAD details: • **Member ID**—IRF member ID of the local device. • **MAD IP address**—MAD IP address of a member device. • **Neighbor**—IRF member ID of the neighboring member device. • **MAD status**—BFD MAD link state. Options include **Normal** and **Faulty**. • **N/A**—BFD MAD link status cannot be detected. If BFD MAD is enabled on a management Ethernet port, it is normal that this field displays **N/A**.

1.1.6. irf auto-update enable

Use **irf auto-update enable** to enable the software auto-update feature.

Use **undo irf auto-update enable** to disable the software auto-update feature.

Syntax

irf auto-update enable

undo irf auto-update enable

Default

Software auto-update is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command automatically propagates the current software images of the master device in the IRF fabric to any devices you are adding to the IRF fabric.

To ensure a successful software update, verify that the new device you are adding to the IRF fabric has sufficient storage space for the new software images. If sufficient storage space is not available, the device automatically deletes the current software images. If the reclaimed space is still insufficient, the device cannot complete the auto-update. You must reboot the device, and then access the BootWare menu to delete files.

Examples

Enable the software auto-update feature.

```
<Switch> system-view
[Switch] irf auto-update enable
```

1.1.7. irf domain

Use **irf domain** to assign a domain ID to the IRF fabric.

Use **undo irf domain** to restore the default.

Syntax

irf domain *domain-id*

undo irf domain

Default

The IRF domain ID is 0.

Views

System view

Predefined user roles

network-admin

Parameters

domain-id: Specifies a domain ID for the IRF fabric. The value range is 0 to 4294967295.

Usage guidelines

One IRF fabric forms one IRF domain. IRF uses IRF domain IDs to uniquely identify IRF fabrics and prevent IRF fabrics from interfering with one another.

If one IRF fabric uses another IRF fabric as the intermediate device for LACP MAD, or ARP MAD, you must assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Set the IRF domain ID to 10.

```
<Switch> system-view
[Switch] irf domain 10
```

1.1.8. irf link-delay

Use **irf link-delay** to set a delay for the IRF ports to report a link down event.

Use **undo irf link-delay** to set 4 seconds.

Syntax

irf link-delay *interval*

undo irf link-delay

Default

The delay time is 500 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the IRF link down report delay, in the range of 0 to 10000 milliseconds. If the interval is set to 0, link down events are reported without any delay.

Usage guidelines

When you configure the IRF link down report delay, follow these restrictions and guidelines:

- Make sure the IRF link down report delay is shorter than the heartbeat or hello timeout settings of upper-layer protocols (for example, CFD and OSPF). If the report delay is longer than the timeout setting of a protocol, unnecessary recalculations might occur.
- Set the delay to 0 seconds in the following situations:
  - The IRF fabric requires a fast master/subordinate or IRF link switchover.
  - The RRPP, BFD, or GR feature is used.
  - You want to shut down an IRF physical interface or reboot an IRF member device. (After you complete the operation, reconfigure the delay depending on the network condition.)

Using **undo irf link-delay interval** cannot restore the default. You must use the **irf link-delay interval 500** command to reconfigure the irf link-delay.

Examples

Set the IRF link down report delay to 300 milliseconds.

```
<Switch> system-view
[Switch] irf link-delay 300
```

1.1.9. irf mac-address persistent

Use **irf mac-address persistent** to configure IRF bridge MAC persistence.

Use **undo irf mac-address persistent** to disable IRF bridge MAC persistence.

Syntax

irf mac-address persistent { **always** | **timer** }

undo irf mac-address persistent

Default

The IRF bridge MAC address remains unchanged for 6 minutes after the address owner leaves.

Views

System view

Predefined user roles

network-admin

Parameters

always: Enables the IRF bridge MAC address to be permanent. The IRF bridge MAC address does not change after the address owner leaves the fabric.

timer: Enables the IRF bridge MAC address to remain unchanged for 6 minutes after the address owner leaves. If the owner rejoins the IRF fabric with the time limit, the IRF bridge MAC address does not change. If the owner does not rejoin the IRF fabric within the time limit, the IRF fabric uses the bridge MAC address of the current master as the bridge MAC address.

Usage guidelines

If the **undo** form of this command is used, bridge MAC address of the current master replaces the original IRF bridge MAC as soon as the original address owner leaves.

This command does not take effect if the IRF bridge MAC address is configured by using the **irf mac-address** *mac-address* command.

If ARP MAD is used with the spanning tree feature, disable IRF bridge MAC persistence by using the **undo irf mac-address persistent** command. In addition, do not specify an IRF bridge MAC address by using the **irf mac-address** *mac-address* command.

If the IRF fabric uses a daisy-chain topology and has aggregate links with upstream or downstream devices, do not execute the **undo irf mac-address persistent** command. Any violation results in transmission delay or packet loss after the address owner leaves or reboots.

If the IRF fabric has multichassis aggregate links, do not use the **undo irf mac-address persistent** command. A violation might cause traffic disruption.

By default, an IRF fabric uses the bridge MAC address of the master device as its bridge MAC address.

On a switched LAN, the IRF bridge MAC address must be unique for correct traffic transmission.

When IRF fabrics merge, IRF ignores the IRF bridge MAC address and checks the bridge MAC address of each member device in the IRF fabrics. IRF merge fails if any two member devices have the same bridge MAC address.

Examples

Enable the IRF bridge MAC address to persist forever.

```
<Switch> system-view
[Switch] irf mac-address persistent always
```

1.1.10. irf member description

Use **irf member description** to configure a description for an IRF member device.

Use **undo irf member description** to restore the default.

Syntax

irf member *member-id* **description** *text*

undo irf member *member-id* **description**

Default

No description is configured for an IRF member device.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies the ID of an IRF member.

text: Specifies a description, a string of 1 to 127 characters.

Examples

Configure the description as **F1Num001** for IRF member 1.

```
<Switch> system-view
[Switch] irf member 1 description F1Num001
```

1.1.11. irf member priority

Use **irf member priority** to change the priority of an IRF member device.

Use **undo irf member priority** to restore the default.

Syntax

irf member *member-id* **priority** *priority*

undo irf member *member-id* **priority**

Default

The IRF member priority is 1.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies an IRF member ID. The value range for IRF member IDs is 1 to 10.

priority: Sets priority in the range of 1 to 32. The greater the priority value, the higher the priority. A member with higher priority is more likely to be the master.

Usage guidelines

The new priority setting takes effect at the next master election, but it does not trigger a master election.

Examples

Set the priority of IRF member 2 to 32.

```
<Switch> system-view
[Switch] irf member 2 priority 32
```

1.1.12. irf member renumber

Use **irf member renumber** to change the member ID of an IRF member device.

Use **undo irf member renumber** to restore the previous IRF member ID of the device.

Syntax

irf member *member-id* **renumber** *new-member-id*

undo irf member *member-id* **renumber**

Default

The IRF member ID is 1.

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies the ID of an IRF member. The value range for IRF member IDs is 1 to 10.

new-member-id: Assigns a new ID to the IRF member. The value range for IRF member IDs is 1 to 10.

Usage guidelines

CAUTION:
IRF member ID change can invalidate member ID-related settings, including interface and file path settings, and cause data loss. Make sure you fully understand its impact on your live network.

To have the new ID take effect, you must reboot the IRF member. To cancel the member ID change before you reboot the member device, use the **undo irf member renumber** command. In the command, set the new member ID to be the same as the old member ID.

When adding a device into an IRF fabric, you must assign a unique IRF member ID to the device. If its IRF member ID has been used in the IRF fabric, the device cannot join the IRF fabric.

Interchanging member IDs between IRF member devices might cause undesirable configuration changes and data loss. For example, the IRF member IDs of Device A and Device B are 2 and 3, respectively. After you interchange their member IDs, their port settings also interchange.

Examples

Change the ID of an IRF member device from 1 to 2.

```
<Switch> display irf
[Switch] irf member 1 renumber 2
Renumbering the member ID may result in configuration change or loss. Continue?[Y/N]Y
```

Before rebooting the device, cancel the change in the preceding example.

```
[Switch] undo irf member 1 renumber
Renumbering the member ID may result in configuration change or loss. Continue?[Y/N]y
```

If you reboot the device after executing the **irf member 1 renumber 2** command, the device member ID changes to 2 at system reboot. Using **undo irf member 1 renumber** cannot restore the member ID to 1. You must use the **irf member 2 renumber 1** command to reconfigure the member ID.

1.1.13. irf-port

Use **irf-port** to enter IRF port view.

Use **undo irf-port** to remove all port bindings on an IRF port.

Syntax

irf-port *member-id/irf-port-number*

undo irf-port *member-id/irf-port-number*

Views

System view

Predefined user roles

network-admin

Parameters

member-id: Specifies an IRF member device by its member ID.

irf-port-number: Specifies an IRF port on the member device. The *irf-port-number* argument represents the IRF port index and must be 1 or 2.

Usage guidelines

To bind physical interfaces to an IRF port, you must enter IRF port view.

Examples

Enter IRF-port 2/1 view.

```
<Switch> system-view
[Switch] irf-port 2/1
[Switch-irf-port2/1]
```

Related commands

port group interface

1.1.14. irf-port-configuration active

Use **irf-port-configuration active** to activate IRF ports.

Syntax

irf-port-configuration active

Views

System view

Predefined user roles

network-admin

Usage guidelines

After connecting the physical interfaces between two devices and binding them to the correct IRF ports, you must use this command to activate the settings on the IRF ports. This command merges the two devices into one IRF fabric.

The system activates the IRF port settings automatically in the following situations:

- The configuration file that the device starts with contains IRF port bindings.

- You are binding physical interfaces to an IRF port after an IRF fabric is formed.

Examples

To configure and activate IRF-port 1/2 when the port is in DIS state:

Bind Ten-GigabitEthernet 1/0/49 to IRF-port 1/2.

```
<Switch> system-view
[Switch] interface ten-gigabitethernet 1/0/49
[Switch-Ten-GigabitEthernet1/0/49] shutdown
[Switch-Ten-GigabitEthernet1/0/49] quit
[Switch] irf-port 1/2
[Switch-irf-port1/2] port group interface ten-gigabitethernet 1/0/49
You must perform the following tasks for a successful IRF setup:
Save the configuration after completing IRF configuration.
Execute the "irf-port-configuration active" command to activate the IRF ports.
[Switch-irf-port1/2] quit
[Switch] interface ten-gigabitethernet 1/0/49
[Switch-Ten-GigabitEthernet1/0/49] undo shutdown
[Switch-Ten-GigabitEthernet1/0/49] quit
```

Save the configuration so the IRF port settings can take effect after the device reboots.

```
[Switch] save
The current configuration will be written to the device. Are you sure? [Y/N]:y
Please input the file name(*.cfg)[flash:/startup.cfg]
(To leave the existing filename unchanged, press the enter key):
flash:/startup.cfg exists, overwrite? [Y/N]:y
Validating file. Please wait.....................
Saved the current configuration to mainboard device successfully.
```

Activate the IRF port.

```
[Switch] irf-port-configuration active
```

1.1.15. mad arp enable

Use **mad arp enable** to enable ARP MAD.

Use **undo mad arp enable** to disable ARP MAD.

Syntax

mad arp enable

undo mad arp enable

Default

ARP MAD is disabled.

Views

Management Ethernet interface view

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

Do not configure ARP MAD together with LACP MAD or BFD MAD, because they handle collisions differently.

When you configure ARP MAD on a VLAN interface, follow these restrictions and guidelines:

Category	Restrictions and guidelines
ARP MAD VLAN	• Do not enable ARP MAD on VLAN-interface 1. • If you are using an intermediate device, perform the following tasks: ○ On both the IRF fabric and the intermediate device, create a VLAN for ARP MAD. ○ On both the IRF fabric and the intermediate device, assign the ports of ARP MAD links to the ARP MAD VLAN. ○ On the IRF fabric, create a VLAN interface for the ARP MAD VLAN. • As a best practice, do not use the ARP MAD VLAN for any other purposes.
ARP MAD and feature configuration	If an intermediate device is used, make sure the following requirements are met: • Run the spanning tree feature between the IRF fabric and the intermediate device to ensure that there is only one ARP MAD link in forwarding state. For more information about the spanning tree feature and its configuration, see *Layer 2—LAN Switching Configuration Guide*. • Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you configure ARP MAD that uses management Ethernet ports, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for ARP MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.
ARP MAD VLAN	On the intermediate device, create a VLAN for ARP MAD, and assign the ports used for ARP MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN.
ARP MAD and feature configuration	• Enable the IRF fabric to change its bridge MAC address as soon as the address owner leaves. • If the intermediate device is also an IRF fabric, assign the two IRF fabrics different domain IDs for correct split detection.

When you use the **mad arp enable** command, the system prompts you to enter a domain ID. If you do not want to change the current domain ID, press **enter** at the prompt.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Enable ARP MAD on VLAN-interface 3.

```
<Switch> system-view
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] mad arp enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 0]: 1
The assigned domain ID is: 1
```

Related commands

irf domain

1.1.16. mad bfd enable

Use **mad bfd enable** to enable BFD MAD.

Use **undo mad bfd enable** to disable BFD MAD.

Syntax

mad bfd enable

undo mad bfd enable

Default

BFD MAD is disabled.

Views

VLAN interface view

Management Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Do not configure BFD MAD together with ARP MAD, because they handle collisions differently.

When you configure BFD MAD on a VLAN interface, follow these guidelines:

Category	Restrictions and guidelines
BFD MAD VLAN	• Do not enable BFD MAD on VLAN-interface 1. • If you are using an intermediate device, perform the following tasks: ○ On both the IRF fabric and the intermediate device, create a VLAN for BFD MAD. ○ On both the IRF fabric and the intermediate device, assign the ports of BFD MAD links to the BFD MAD VLAN. ○ On the IRF fabric, create a VLAN interface for the BFD MAD VLAN. ○ Make sure the IRF fabrics on the network use different BFD MAD VLANs. • Make sure the BFD MAD VLAN contains only ports on the BFD MAD links. Exclude a port from the BFD MAD VLAN if the port is not on the BFD MAD link. For example, if you have assigned the port to all VLANs by using the **port trunk**

Category	Restrictions and guidelines
	permit vlan all command, use the **undo port trunk permit** command to exclude the port from the BFD MAD VLAN.
BFD MAD VLAN and feature compatibility	Do not use the BFD MAD VLAN for any purposes other than configuring BFD MAD. • Configure only the **mad bfd enable** and **mad ip address** commands on the BFD MAD-enabled VLAN interface. If you configure other features, both BFD MAD and other features on the interface might run incorrectly. • Disable the spanning tree feature on any Layer 2 Ethernet ports in the BFD MAD VLAN. The MAD feature is mutually exclusive with the spanning tree feature.
MAD IP address	• To avoid problems, only use the **mad ip address** command to configure IP addresses on the BFD MAD-enabled VLAN interface. Do not configure an IP address by using the **ip address** command or configure a VRRP virtual address on the BFD MAD-enabled VLAN interface. • Make sure all the MAD IP addresses are on the same subnet.

When you configure BFD MAD that uses management Ethernet ports, follow these restrictions and guidelines:

Category	Restrictions and guidelines
Management Ethernet ports for BFD MAD	Connect a management Ethernet port on each member device to the common Ethernet ports on the intermediate device.
BFD MAD VLAN	• On the intermediate device, create a VLAN for BFD MAD, and assign the ports used for BFD MAD to the VLAN. On the IRF fabric, you do not need to assign the management Ethernet ports to the VLAN. • Make sure the IRF fabrics on the network use different BFD MAD VLANs. • Make sure the BFD MAD VLAN on the intermediate device contains only ports on the BFD MAD links.
MAD IP address	• Use the **mad ip address** command instead of the **ip address** command to configure MAD IP addresses on the BFD MAD-enabled management Ethernet ports. • Make sure all the MAD IP addresses are on the same subnet.

Examples

Enable BFD MAD on VLAN-interface 3.

```
<Switch> system-view
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] mad bfd enable
```

1.1.17. mad enable

Use **mad enable** to enable LACP MAD.

Use **undo mad enable** to disable LACP MAD.

Syntax

mad enable

undo mad enable

Default

LACP MAD is disabled.

Views

Aggregate interface view

Predefined user roles

network-admin

Usage guidelines

LACP MAD handles collisions differently than ARP MAD. To avoid conflicts, do not enable LACP MAD together with ARP MAD on an IRF fabric.

LACP MAD requires an NEC device that supports extended LACPDUs to act as the intermediate device. You must configure all IRF stack member devices to participate in a single dynamic link aggregation group when connected to the intermediate device. To enable dynamic link aggregation, configure the **link-aggregation mode dynamic** command on the aggregate interface.

If one IRF fabric uses another IRF fabric as the intermediate device for LACP MAD, you must assign the two IRF fabrics different domain IDs for correct split detection. False detection causes IRF split.

When you use the **mad enable** command, the system prompts you to enter a domain ID. If you do not want to change the current domain ID, press **enter** at the prompt.

An IRF fabric has only one IRF domain ID. You can change the IRF domain ID by using the following commands: **irf domain**, **mad enable**, **mad arp enable**, or **mad nd enable**. The IRF domain IDs configured by using these commands overwrite each other.

Examples

Enable LACP MAD on Bridge-Aggregation 1, a Layer 2 dynamic aggregate interface.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] link-aggregation mode dynamic
[Switch-Bridge-Aggregation1] mad enable
You need to assign a domain ID (range: 0-4294967295)
[Current domain is: 0]: 1
The assigned domain ID is: 1
MAD LACP only enable on dynamic aggregation interface.
```

Related commands

irf domain

1.1.18. mad exclude interface

Use **mad exclude interface** to exclude a service interface from being shut down when the IRF fabric transits to the Recovery state upon detection of a multi-active collision.

Use **undo mad exclude interface** to configure the IRF fabric to shut down a service interface when it transits to the Recovery state upon detection of a multi-active collision.

Syntax

mad exclude interface *interface-type interface-number*

undo mad exclude interface *interface-type interface-number*

Default

Except for the service interfaces automatically excluded by the system, all service interfaces are shut down when the IRF fabric transits to the Recovery state. The system automatically excludes the following service interfaces from being shut down:

- IRF physical interfaces.
- Interfaces used for BFD MAD.
- Member interfaces of an aggregate interface if the aggregate interface is excluded from being shut down.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a service interface by its type and number.

Usage guidelines

If a service interface must be kept in up state for special purposes such as Telnet connection, exclude the service interface from the shutdown action. As a best practice to avoid incorrect traffic forwarding, do not exclude any service interfaces except for the interfaces used for Telnet.

The service interfaces that have been shut down by MAD come up when the member devices reboot to join the recovered IRF fabric. If the active IRF fabric fails before the IRF link is recovered, use the **mad restore** command on the inactive IRF fabric to recover the inactive IRF fabric. This command also brings up all service interfaces that were shut down by MAD.

Examples

Exclude GigabitEthernet 1/0/1 from being shut down when the MAD status transits to Recovery.

```
<Switch> system-view
[Switch] mad exclude interface gigabitethernet 1/0/1
```

Related commands

mad restore

1.1.19. mad ip address

Use **mad ip address** to assign a MAD IP address to an IRF member device for BFD MAD.

Use **undo mad ip address** to delete the MAD IP address for an IRF member device.

Syntax

mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

undo mad ip address *ip-address* { *mask* | *mask-length* } **member** *member-id*

Default

No MAD IP address is configured for an IRF member device.

Views

VLAN interface view

Management Ethernet interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address in dotted decimal notation.

mask: Specifies a subnet mask in decimal dotted notation.

mask-length: Specifies a subnet mask in length, in the range of 0 to 32.

member *member-id*: Specifies the ID of an IRF member.

Usage guidelines

To use BFD MAD, configure a MAD IP address for each IRF member. Make sure all the MAD IP addresses are on the same subnet.

Do not configure a MAD IP address by using the **ip address** command or configure a VRRP virtual address on the BFD MAD-enabled port or interface.

The master attempts to establish BFD sessions with other member devices by using its MAD IP address as the source IP address.

- If the IRF fabric is integrated, only the MAD IP address of the master takes effect. The master cannot establish a BFD session with any other member. If you execute the **display bfd session** command, the state of the BFD sessions is **Down**.
- When the IRF fabric splits, the IP addresses of the masters in the partitioned IRF fabrics take effect. The masters can establish a BFD session. If you execute the **display bfd session** command, the state of the BFD session between the two devices is **Up**.

Examples

Assign a MAD IP address to IRF member 1 on VLAN-interface 3.

```
<Switch> system-view
[Switch] interface vlan-interface 3
[Switch-Vlan-interface3] mad ip address 192.168.0.1 255.255.255.0 member 1
```

Assign a MAD IP address to IRF member 2 on VLAN-interface 3.

```
[Switch-Vlan-interface3] mad ip address 192.168.0.2 255.255.255.0 member 2
```

Related commands

mad bfd enable

1.1.20. mad restore

Use **mad restore** to restore the normal MAD state of the IRF fabric in Recovery state.

Syntax

mad restore

Views

System view

Predefined user roles

network-admin

Usage guidelines

If the active IRF fabric has failed to work before the IRF split problem is fixed, use this command to restore an IRF fabric in Recovery state. The recovered IRF fabric will take over the active IRF fabric role.

Examples

Restore the normal MAD state of the IRF fabric in Recovery state.

```
<Switch> system-view
[Switch] mad restore
This command will restore the device from multi-active conflict state. Continue? [Y/N]:Y
Restoring from multi-active conflict state, please wait...
```

1.1.21. port group interface

Use **port group interface** to bind a physical interface to an IRF port.

Use **undo port group interface** to remove the binding of a physical interface to an IRF port.

Syntax

port group interface *interface-type interface-number*

undo port group interface *interface-name*

Default

No physical interfaces are bound to an IRF port.

Views

IRF port view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies a physical interface by its type and number.

interface-name: Specifies a physical interface in the *interface-typeinterface-number* format. No space is allowed between the *interface-type* and *interface-number* arguments.

Usage guidelines

Execute this command multiple times to bind multiple physical interfaces to an IRF port. You can bind a maximum of four physical interfaces to an IRF port.

Use the **shutdown** command to shut down a physical interface before you bind it to or remove it from an IRF port. To bring up the physical interface after a binding or binding removal operation, use the **undo shutdown** command.

The system does not dynamically remove IRF port bindings when IRF links are lost, for example, because an interface card is removed. To remove IRF port bindings, you must use the **undo port group interface** command.

For more information about IRF port binding requirements, see *Virtual Technologies Configuration Guide*.

Examples

Bind Ten-GigabitEthernet 1/0/49 to IRF-port 1/1 on IRF member 1.

```
<Switch> system-view
[Switch] interface ten-gigabitethernet 1/0/49
[Switch-Ten-GigabitEthernet1/0/49] shutdown
[Switch-Ten-GigabitEthernet1/0/49] quit
[Switch] irf-port 1/1
[Switch-irf-port1/1] port group interface ten-gigabitethernet 1/0/49
[Switch-irf-port1/1] quit
[Switch] interface ten-gigabitethernet 1/0/49
[Switch-Ten-GigabitEthernet1/0/49] undo shutdown
```

1. Ethernet interface commands

1.1. Common Ethernet interface commands

1.1.1. broadcast-suppression

Use **broadcast-suppression** to enable broadcast suppression and set the broadcast suppression threshold.

Use **undo broadcast-suppression** to disable broadcast suppression.

Syntax

broadcast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo broadcast-suppression

Default

Ethernet interfaces do not suppress broadcast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the broadcast suppression threshold as a percentage of the interface bandwidth. The value range for this argument is 0 to 100. A smaller value means that less broadcast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of broadcast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of broadcast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The broadcast storm suppression features limits the size of broadcast traffic to a threshold on an interface. When the broadcast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **broadcast-suppression** command can suppress broadcast storms on a port. The **broadcast-suppression** command uses the chip to physically suppress broadcast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress broadcast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain broadcast** command and the **broadcast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.

- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

For the suppression threshold that takes effect, see the prompt on the device.

Examples

Set the broadcast suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] broadcast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

Related commands

multicast-suppression

unicast-suppression

1.1.2. combo enable

Use **combo enable** to activate the copper or fiber combo port of a combo interface.

Syntax

combo enable { **auto** | **copper** | **fiber** }

Default

Before v7.1.8

The copper combo port of a combo interface is activated.

After v7.2.16

The copper or fiber combo port is automatically activated depending on the medium inserted in the combo interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Automatically identifies the media inserted and activates the corresponding combo port.

copper: Activates the copper combo port. In this case, use twisted pairs to connect the port.

fiber: Activates the fiber combo port. In this case, use optical fibers to connect the port.

Usage guidelines

A combo interface is a logical interface that physically contains one fiber combo port and one copper combo port on the device panel. The two ports share one forwarding interface. As a result, they cannot work simultaneously. When you activate either port, the other port is automatically disabled. You can select to activate the copper combo port or fiber combo port.

Before using this command, perform the following tasks according to the marks on the device panel:

- Determine the combo interfaces on your device.

- Identify the two physical interfaces that belong to each combo interface.

Examples

Activate the copper combo port of combo interface GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] combo enable copper
```

Activate the fiber combo port of combo interface GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] combo enable fiber
```

1.1.3. description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is the interface name plus **Interface** (for example, **GigabitEthernet1/0/1 Interface**).

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

text: Specifies the interface description, a case-sensitive string of 1 to 255 characters.

Examples

Set the description of GigabitEthernet 1/0/1 to **lan-interface**.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] description lan-interface
```

1.1.4. display counters

Use **display counters** to display interface traffic statistics.

Syntax

display counters { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inbound: Displays inbound traffic statistics.

outbound: Displays outbound traffic statistics.

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

This command displays traffic statistics within a statistics polling interval specified by using the **flow-interval** command.

To clear the Ethernet interface traffic statistics, use the **reset counters interface** command.

If you do not specify an interface type, this command displays traffic statistics for all interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic statistics for all interfaces of the specified type.

If you specify an interface type and number, this command displays traffic statistics for the specified interface.

Examples

Display inbound traffic statistics for all interfaces.

```
<Switch> display counters inbound interface
Interface            Total (pkts)    Broadcast (pkts)    Multicast (pkts)  Err (pkts)
GE1/0/1                       100                 100                   0           0
GE1/0/2                  Overflow            Overflow            Overflow    Overflow

 Overflow: More than 14 digits (7 digits for column "Err").
       --: Not supported.
```

Table 1-1 Command output

Field	Description
Interface	Abbreviated interface name.
Total (pkts)	Total number of packets received or sent through the interface.
Broadcast (pkts)	Total number of broadcast packets received or sent through the interface.
Multicast (pkts)	Total number of multicast packets received or sent through the interface.
Err (pkts)	Total number of error packets received or sent through the interface.
Overflow: More than 14 digits (7 digits for column "Err")	The command displays **Overflow** when any of the following conditions exist: • The data length of an **Err** field value is greater than 7 decimal digits. • The data length of a non-Err field value is greater than 14 decimal digits.

Field	Description
--: Not supported	The statistical item is not supported.

Related commands

flow-interval

reset counters interface

1.1.5. display counters rate

Use **display counters rate** to display traffic rate statistics for interfaces in up state for the most recent statistics polling interval.

Syntax

display counters rate { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

inbound: Displays inbound traffic rate statistics.

outbound: Displays outbound traffic rate statistics.

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

If you do not specify an interface type, this command displays traffic rate statistics for all up interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic rate statistics for all up interfaces of the specified type.

If you specify an interface type and an interface, this command displays traffic rate statistics for the specified interface.

If an interface that you specify is always down for the most recent statistics polling interval, the system prompts that the interface does not support the command.

To set the statistics polling interval, use the **flow-interval** command.

Examples

Display the inbound traffic rate statistics for all interfaces.

```
<Switch> display counters rate inbound interface
Usage: Bandwidth utilization in percentage
Interface            Usage (%)    Total (pps)    Broadcast (pps)    Multicast (pps)
GE1/0/1                      0              0                 --                 --

 Overflow: More than 14 digits.
```

```
--: Not supported.
```

Table 1-2 Command output

Field	Description
Interface	Abbreviated interface name.
Usage (%)	Bandwidth usage (in percentage) of the interface for the last statistics polling interval.
Total (pkts/sec)	Average receiving or sending rate (in pps) for unicast packets for the last statistics polling interval.
Broadcast (pkts/sec)	Average receiving or sending rate (in pps) for broadcast packets for the last statistics polling interval.
Multicast (pkts/sec)	Average receiving or sending rate (in pps) for multicast packets for the last statistics polling interval. .
Overflow: more than 14 decimal digits	The command displays **Overflow** if the data length of a statistical item is greater than 14 decimal digits.
--: not supported	The statistical item is not supported.

Related commands

flow-interval

reset counters interface

1.1.6. display interface

Use **display interface** to display interface information.

Syntax

display interface [*interface-type* [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an interface type, this command displays information about all interfaces.

If you specify an interface type but do not specify an interface number, this command displays information about all interfaces of the specified type.

Examples

Display information about Layer 3 interface GigabitEthernet 1/0/1.

```
<Switch> display interface gigabitethernet 1/0/1
GigabitEthernet1/0/1
Current state: Administratively DOWN
Line protocol state: DOWN
Description: GigabitEthernet1/0/1 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Allow jumbo frames to pass
Broadcast max-ratio: 100%
Multicast max-ratio: 100%
Unicast max-ratio: 100%
Internet protocol processing: Disabled
IP packet frame type: Ethernet II, hardware address: 3822-d666-bd0c
IPv6 packet frame type: Ethernet II, hardware address: 3822-d666-bd0c
Loopback is not set
Media type is twisted pair, port hardware type is 1000_BASE_T
Port priority: 2
Unknown-speed mode, unknown-duplex mode
Link speed type is autonegotiation, link duplex type is autonegotiation
Flow-control is not enabled
Maximum frame length: 9216
Last link flapping: 6 hours 39 minutes 28 seconds
Last clearing of counters: Never
 Peak input rate: 0 bytes/sec, at 2013-07-07 16:07:11
 Peak output rate: 0 bytes/sec, at 2013-07-07 16:07:11
 Last 300 second input:  0 packets/sec 0 bytes/sec  0%
 Last 300 second output: 0 packets/sec 0 bytes/sec  0%
 Input  (total): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, - pauses
 Input  (normal): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Input: 0 input errors, 0 runts, 0 giants, 0 throttles
          0 CRC, 0 frame, 0 overruns, - aborts
          - ignored, - parity errors
 Output  (total): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, - pauses
 Output  (normal): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Output: 0 output errors, - underruns, - buffer failures
          0 aborts, 0 deferred, 0 collisions, 0 late collisions
          - lost carrier, - no carrier
```

Display detailed information about Layer 2 interface GigabitEthernet 1/0/1.

```
<Switch> display interface gigabitethernet 1/0/1
```

```
GigabitEthernet1/0/1
Current state: DOWN
Line protocol state: DOWN
IP packet frame type: Ethernet II, hardware address: 000c-2963-b767
Description: GigabitEthernet1/0/1 Interface
Bandwidth: 100000 kbps
Loopback is not set
Media type is twisted pair, port hardware type is 1000_BASE_T_AN_SFP
Unknown-speed mode, unknown-duplex mode
Link speed type is autonegotiation, link duplex type is autonegotiation
Flow-control is not enabled
Maximum frame length: 9216
Allow jumbo frame to pass
Broadcast max-ratio: 100%
Multicast max-ratio: 100%
Unicast max-ratio: 100%
PVID: 1
MDI type: Automdix
Port link-type: Access
 Tagged VLANs:   None
 UnTagged VLANs: 1
Port priority: 2
Last link flapping: 6 hours 39 minutes 25 seconds
Last clearing of counters:  14:34:09 Tue 11/01/2011
 Peak input rate: 0 bytes/sec, at 2013-07-17 22:06:19
 Peak output rate: 0 bytes/sec, at 2013-07-17 22:06:19
 Last 300 second input:  0 packets/sec 0 bytes/sec -%
 Last 300 second output:  0 packets/sec 0 bytes/sec -%
 Input (total):  0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Input (normal):  0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Input:  0 input errors, 0 runts, 0 giants, 0 throttles
          0 CRC, 0 frame, 0 overruns, 0 aborts
          0 ignored, 0 parity errors
 Output (total): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Output (normal): 0 packets, 0 bytes
          0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses
 Output: 0 output errors, 0 underruns, 0 buffer failures
          0 aborts, 0 deferred, 0 collisions, 0 late collisions
          0 lost carrier, 0 no carrier
```

Table 1-3 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been

Field	Description
	shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **DOWN (Link-Aggregation interface down)**—The aggregate interface to which the interface belongs has been shut down by using the **shutdown** command. • **Link-Flap DOWN**—The interface has been shut down by the link flapping protection feature. • **mac-address moving down**—The interface has been shut down by the MAC address move suppression feature. • **MAD ShutDown**—The interface has been shut down by IRF MAD. This state occurs if the interface is on an IRF fabric placed in Recovery state after an IRF split. • **Storm-Constrain**—The interface has been shut down because the storm control feature detected that unknown unicast traffic, multicast traffic, or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces. • **DOWN**—The data link layer protocol is down. • **DOWN (***protocols***)** —The data link layer has been shut down by protocols included in the parentheses. Available protocols include: ○ **DLDP**—Shuts down the data link layer when it detects that the link is unidirectional. ○ **OAM**—Shuts down the data link layer when it detects a remote link failure. ○ **LAGG**—Shuts down the data link layer when it detects that the aggregate interface does not have Selected ports. ○ **BFD**—Shuts down the data link layer when it detects a link failure.
Bandwidth	Expected bandwidth of the interface.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address	IP address of the interface. The **primary** attribute indicates that the address is the primary IP address.
IP packet frame type	IPv4 packet framing format.

Field	Description
hardware address	MAC address of the interface.
IPv6 packet frame type	IPv6 packet framing format.
Port priority	Port priority of the interface.
Loopback is set internal	An internal loopback test is running on the interface. This field depends on your configuration.
Loopback is set external	An external loopback test is running on the interface. This field depends on your configuration.
Loopback is not set	No loopback test is running on the interface. This field depends on your configuration.
10Mbps-speed mode	The interface is operating at 10 Mbps. This field depends on your configuration and the link parameter negotiation result.
100Mbps-speed mode	The interface is operating at 100 Mbps. This field depends on your configuration and the link parameter negotiation result.
1000Mbps-speed mode	The interface is operating at 1000 Mbps. This field depends on your configuration and the link parameter negotiation result.
10Gbps-speed mode	The interface is operating at 10 Gbps. This field depends on your configuration and the link parameter negotiation result.
40Gbps-speed mode	The interface is operating at 40 Gbps. This field depends on your configuration and the link parameter negotiation result.
Unknown-speed mode	The speed of the interface is unknown because the speed negotiation fails or the interface is physically disconnected.
half-duplex mode	The interface is operating in half duplex mode. This field depends on your configuration and the link parameter negotiation result.
full-duplex mode	The interface is operating in full duplex mode. This field depends on your configuration and the link parameter negotiation result.
unknown-duplex mode	The duplex mode of the interface is unknown because the duplex mode negotiation fails or the interface is physically disconnected.
Link speed type is autonegotiation	The interface is configured with the **speed auto** command.
Link speed type is force link	The interface is manually configured with a speed (for example, 1000 Mbps) by using the **speed** command.
link duplex type is autonegotiation	The interface is configured with the **duplex auto** command.
link duplex type is force link	The interface is manually configured with a duplex mode (for example, half or full) by using the **duplex** command.
Flow-control is not enabled	Generic flow control is disabled on the interface. This field depends on your configuration and the link

Field	Description
	parameter negotiation result.
Maximum frame length	Maximum length of Ethernet frames allowed to pass through the interface.
Allow jumbo frame to pass	The interface allows jumbo frames to pass through.
Broadcast max-	Broadcast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Multicast max-	Multicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Unicast max-	Unknown unicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
PVID	Port VLAN ID (PVID) of the interface.
MDI type	MDIX mode of the interface: • automdix. • mdi. • mdix.
Port link-type	Link type of the interface: • access. • trunk. • hybrid.
Tagged VLANs	VLANs for which the interface sends packets without removing VLAN tags.
Untagged VLANs	VLANs for which the interface sends packets after removing VLAN tags.
VLAN Passing	VLANs whose packets can be forwarded by the port. The VLANs must have been created.
VLAN permitted	VLANs whose packets are permitted by the port.
Trunk port encapsulation	Encapsulation protocol type for the trunk port.
Last link flapping	The amount of time that has elapsed since the most recent physical state change of the interface. This field displays **Never** if the interface has been physically down since device startup.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Last 300 second input: 0 packets/sec 0 bytes/sec 0% Last 300 second output: 0 packets/sec 0 bytes/sec 0%	Average inbound or outbound traffic rate (in pps and Bps) in the last 300 seconds, and the ratio of the actual rate to the interface bandwidth. A hyphen (-) indicates that the statistical item is not supported.
Input(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound traffic statistics (in packets and bytes) for the interface. All inbound normal packets, abnormal packets, and

Field	Description
	normal pause frames were counted. The four fields on the second line represent: • Number of inbound unicast packets. • Number of inbound broadcasts. • Number of inbound multicasts. • Number of inbound pause frames. A hyphen (-) indicates that the statistical item is not supported.
Input(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of inbound normal unicast packets. • Number of inbound normal broadcasts. • Number of inbound normal multicasts. • Number of inbound normal pause frames. A hyphen (-) indicates that the statistical item is not supported.
input errors	Statistics of incoming error packets.
runts	Number of inbound frames meeting the following conditions: • Shorter than 64 bytes. • In correct format. • Containing valid CRCs.
giants	Number of inbound giants. Giants refer to frames larger than the maximum frame length supported on the interface. For an Ethernet interface that does not permit jumbo frames, the maximum frame length is as follows: • 1518 bytes (without VLAN tags). • 1522 bytes (with VLAN tags). For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface.
throttles	Number of inbound frames that had a non-integer number of bytes.
CRC	Total number of inbound frames that had a normal length, but contained CRC errors.
frame	Total number of inbound frames that contained CRC errors and a non-integer number of bytes.
overruns	Number of packets dropped because the input rate of the port exceeded the queuing capability.
aborts	Total number of illegal inbound packets: • **Fragment frames**—CRC error frames shorter than 64 bytes. The length (in bytes) can be an integral or non-integral value. • **Jabber frames**—CRC error frames greater than the maximum frame length supported on the Ethernet interface (with an integral or non-integral

Field	Description
	length). ○ For an Ethernet interface that does not permit jumbo frames, the maximum frame length is 1518 bytes (without VLAN tags) or 1522 bytes (with VLAN tags). ○ For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface. • **Symbol error frames**—Frames that contained a minimum of one undefined symbol. • **Unknown operation code frames**—Non-pause MAC control frames. • **Length error frames**—Frames whose 802.3 length fields did not match the actual frame length (46 to 1500 bytes).
ignored	Number of inbound frames dropped because the receiving buffer of the port ran low.
parity errors	Total number of frames with parity errors.
Output(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound traffic statistics (in packets and bytes) for the interface. All outbound normal packets, abnormal packets, and normal pause frames were counted. The four fields on the second line represent: • Number of outbound unicast packets. • Number of outbound broadcasts. • Number of outbound multicasts. • Number of outbound pause frames. A hyphen (-) indicates that the statistical item is not supported.
Output(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of outbound normal unicast packets. • Number of outbound normal broadcasts. • Number of outbound normal multicasts. • Number of outbound normal pause frames. A hyphen (-) indicates that the statistical item is not supported.
output errors	Number of outbound packets with errors.
underruns	Number of packets dropped because the output rate of the interface exceeded the output queuing capability. This is a low-probability hardware anomaly.
buffer failures	Number of packets dropped because the transmitting buffer of the interface ran low.
aborts	Number of packets that failed to be transmitted, for example, because of Ethernet collisions.
deferred	Number of frames that the interface deferred to transmit because of detected collisions.

Field	Description
collisions	Number of frames that the interface stopped transmitting because Ethernet collisions were detected during transmission.
late collisions	Number of frames that the interface deferred to transmit after transmitting their first 512 bits because of detected collisions.
lost carrier	Number of carrier losses during transmission. This counter increases by one when a carrier is lost, and applies to serial WAN interfaces.
no carrier	Number of times that the port failed to detect the carrier when attempting to send frames. This counter increases by one when a port failed to detect the carrier, and applies to serial WAN interfaces.
Peak input rate	Peak rate of inbound traffic in Bps, and the time when the peak inbound traffic rate occurred.
Peak output rate	Peak rate of outbound traffic in Bps, and the time when the peak outbound traffic rate occurred.

Display brief information about all interfaces.

```

Table 1-4 Command output

Field	Description
Brief information on interfaces in route mode:	Brief information about Layer 3 interfaces.
Interface	Interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Brief information of interfaces in bridge mode:	Brief information about Layer 2 interfaces.
Type: A - access; T - trunk; H – hybrid	Link type options for interfaces.
Speed	Speed of the interface, in bps. This field displays the **(a)** flag next to the speed if the speed is automatically negotiated.

Field	Description
	This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex. • **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
PVID	Port VLAN ID.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **DOWN (Link-Aggregation interface down)**—The interface is a member port of an aggregate interface, and the aggregate interface is down. • **DOWN (Loopback detection down)**—The loopback detection module has detected loops. • **DOWN (Monitor-Link uplink down)**—The monitor link module has detected that the uplink is down. • **MAD ShutDown**—The interface is on an IRF fabric placed by IRF MAD in Recovery state after an IRF split. • **Not connected**—No physical connection exists (possibly because the network cable is disconnected or faulty). • **Storm-Constrain**—The storm control feature has detected that unknown unicast traffic, multicast traffic, or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **Port Security Disabled**—The interface has been shut down by the intrusion detection mechanism because the interface received illegal packets. • **Standby**—The interface is a backup interface in standby state.

Related commands

reset counters interface

1.1.7. duplex

Use **duplex** to set the duplex mode for an Ethernet interface.

Use **undo duplex** to restore the default.

Syntax

duplex { **auto** | **full** | **half** }

undo duplex

Default

An Ethernet interface operates in autonegotiation mode.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

auto: Configures the interface to autonegotiate the duplex mode with the peer.

full: Configures the interface to operate in full duplex mode. In this mode, the interface can receive and transmit packets simultaneously.

half: Configures the interface to operate in half duplex mode. In this mode, the interface can only receive or transmit packets at a given time. Fiber ports, 1000-Mbps Ethernet interfaces, and 10000-Mbps Ethernet interfaces do not support this keyword.

Examples

Configure GigabitEthernet 1/0/1 to operate in full duplex mode.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] duplex full
```

1.1.8. eee enable

IMPORTANT:
Fiber ports do not support this command.

Use **eee enable** to enable Energy Efficient Ethernet (EEE) on an interface.

Use **undo eee enable** to disable EEE on an interface.

Syntax

eee enable

undo eee enable

Default

EEE is disabled.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

With EEE enabled, a link-up interface enters low power state if it has not received any packet for a period of time. The time period depends on the chip specifications and is not configurable. When a packet arrives later, the interface restores to the normal state.

Examples

Enable EEE on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] eee enable
```

1.1.9. flow-control

Use **flow-control** to enable TxRx-mode generic flow control on an Ethernet interface.

Use **undo flow-control** to disable TxRx-mode generic flow control on the Ethernet interface.

Syntax

flow-control

undo flow-control

Default

TxRx-mode generic flow control is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

With TxRx-mode generic flow control configured, an interface can both send and receive flow control frames:

- When congested, the interface sends a flow control frame to its peer.
- Upon receiving a flow control frame from the peer, the interface suspends sending packets.

To implement flow control on a link, enable generic flow control at both ends of the link.

Examples

Enable TxRx-mode generic flow control on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] flow-control
```

1.1.10. flow-interval

Use **flow-interval** to set the statistics polling interval.

Use **undo flow-interval** to restore the default.

Syntax

flow-interval *interval*

undo flow-interval

Default

The statistics polling interval is 300 seconds.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

interval: Sets the statistics polling interval in seconds. The interval is in the range of 5 to 300 and must be a multiple of 5.

Examples

Set the statistics polling interval to 100 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] flow-interval 100
```

1.1.11. interface

Use **interface** to enter interface view.

Syntax

interface *interface-type interface-number*

Views

System view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Examples

Enter the view of GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1]
```

1.1.12. jumboframe enable

Use **jumboframe enable** to allow jumbo frames within the specified length to pass through.

Use **undo jumboframe enable** to prevent jumbo frames from passing through.

Use **undo jumboframe enable** *size* to restore the default.

Syntax

jumboframe enable [*size*]

undo jumboframe enable [*size*]

Default

The device allows jumbo frames within 10000 bytes to pass through.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

size: Sets the maximum length (in bytes) of Ethernet frames that are allowed to pass through. The value range for this argument is 1536 to 10000. The value must be an even integer.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Allow jumbo frames to pass through GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] jumboframe enable
```

1.1.13. link-delay

Use **link-delay** to set the physical state change suppression interval on an Ethernet interface.

Use **undo link-delay** to restore the default.

Syntax

Before v7.1.6

link-delay [**msec**] *delay-time* [**mode** { **up** | **updown** }]

undo link-delay [**msec**] *delay-time* [**mode** { **up** | **updown** }]

After v7.2.16

link-delay { **down** | **up** } [**msec**] *delay-time*

undo link-delay { **down** | **up** }

Default

Each time the physical link of a port goes up or comes down, the interface immediately reports the change to the CPU.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

Before v7.1.6

msec: Enables the physical state change suppression interval to be accurate to milliseconds. If you do not specify this keyword, the suppression interval is accurate to seconds.

delay-time: Sets the physical state change suppression interval on the Ethernet interface. A value of 0 means that physical state changes are immediately reported to the CPU and are not suppressed.

- If you do not specify the **msec** keyword, the value range is 0 to 30 seconds.
- If you specify the **msec** keyword, the value range is 0 to 10000 milliseconds, and the value must be a multiple of 100.

mode up: Suppresses the link-up events.

mode updown: Suppresses both the link-up and link-down events.

After v7.2.16

down: Suppresses link-down events.

up: Suppresses link-up events.

msec: Enables the physical state change suppression interval to be accurate to milliseconds. If you do not specify this keyword, the suppression interval is accurate to seconds.

delay-time: Sets the physical state change suppression interval on the Ethernet interface. A value of 0 means that physical state changes are immediately reported to the CPU and are not suppressed.

- If you do not specify the **msec** keyword, the value range is 0 to 120 seconds.

If you specify the **msec** keyword, the value range is 0 to 10000 milliseconds, and the value must be a multiple of 100.

Usage guidelines

Before v7.1.6

You can configure this feature to suppress only link-down events, only link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event.

When you configure this feature, follow these guidelines:

- To suppress only link-down events, configure the **link-delay** [**msec**] *delay-time* command.
- To suppress only link-up events, configure the **link-delay** [**msec**] *delay-time* **mode up** command.
- To suppress both link-down and link-up events, configure the **link-delay** [**msec**] *delay-time* **mode updown** command.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you configure the **link-delay** command multiple times for link-up or link-down events, the most recent configuration takes effect.

Do not configure this command on an interface that has RRPP, spanning tree protocols, or Smart Link enabled.

After v7.2.16

You can configure this feature to suppress only link-down events, only link-up events, or both. If an event of the specified type still exists when the suppression interval expires, the system reports the event.

When you configure this feature, follow these guidelines:

- To suppress link-down events, configure the **link-delay down** command.
- To suppress link-up events, configure the **link-delay up** command.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you execute the **link-delay** command multiple times on an interface, the following rules apply:

- You can configure the suppression intervals for link-up and link-down events separately.
- If you configure the suppression interval multiple times for link-up or link-down events, the most recent configuration takes effect.
- Do not execute this command on an interface that has RRPP, spanning tree protocols, or Smart Link enabled.

Examples

Before v7.1.6

Set the link-down event suppression interval to 8 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] link-delay 8
```

Set the link-up event suppression interval to 800 milliseconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

[Switch-GigabitEthernet1/0/1] link-delay msec 800 mode up

After v7.2.16

Set the link-down event suppression interval to 8 seconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] link-delay down 8
```

Set the link-up event suppression interval to 800 milliseconds on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] link-delay up msec 800
```

1.1.14. loopback

CAUTION:
After you enable loopback testing on an Ethernet interface, the interface does not forward data traffic.

Use **loopback** to enable loopback testing on an Ethernet interface.

Use **undo loopback** to disable loopback testing on an Ethernet interface.

Syntax

loopback { **external** | **internal** }

undo loopback

Default

Loopback testing is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

external: Enables external loopback testing on the Ethernet interface.

internal: Enables internal loopback testing on the Ethernet interface.

Usage guidelines

After you enable loopback testing on an Ethernet interface, the Ethernet interface switches to full duplex mode. After you disable loopback testing, the Ethernet interface restores to its duplex setting.

An Ethernet interface in a loopback test cannot correctly forward data packets.

You cannot perform a loopback test on the following Ethernet interfaces:

- Ethernet interfaces manually brought down (displayed as in **ADM** or **Administratively DOWN** state).
- Ethernet interfaces configured with the **port up-mode** command.

The **speed**, **duplex**, and **shutdown** commands cannot be configured on an Ethernet interface in a loopback test.

Examples

Enable internal loopback testing on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] loopback internal
```

1.1.15. multicast-suppression

Use **multicast-suppression** to enable multicast storm suppression and set the multicast storm suppression threshold.

Use **undo multicast-suppression** to disable multicast storm suppression.

Syntax

multicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo multicast-suppression

Default

Ethernet interfaces do not suppress multicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the multicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less multicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of multicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of multicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The multicast storm suppression feature limits the size of multicast traffic to a threshold on an interface. When the multicast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **multicast-suppression** command can suppress multicast storms on a port. The **multicast-suppression** command uses the chip to physically suppress multicast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress multicast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain multicast** command and the **multicast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.
- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

To determine the suppression threshold that takes effect, see the prompts on the switch.

Examples

Set the multicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] multicast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

Related commands

broadcast-suppression

unicast-suppression

1.1.16. port auto-power-down

IMPORTANT:
Fiber ports do not support this command.

Use **port auto-power-down** to enable auto power-down on an Ethernet interface.

Use **undo port auto-power-down** to disable auto power-down on an Ethernet interface.

Syntax

port auto-power-down

undo port auto-power-down

Default

Auto power-down is disabled on Ethernet interfaces.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

When an interface with auto power-down enabled has been down for a specific period of time, both of the following events occur:

- The device automatically stops supplying power to the interface.
- The interface enters the power save mode.

The time period depends on the chip specifications and is not configurable.

When the interface comes up, both of the following events occur:

- The device automatically restores the power supply to the interface.
- The interface restores to its normal state.

Examples

Enable auto power-down on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port auto-power-down
```

1.1.17. port link-mode

Use **port link-mode** to change the link mode of an Ethernet interface.

Use **undo port link-mode** to restore the default.

Syntax

port link-mode { **bridge** | **route** }

undo port link-mode

Default

Interfaces operate in bridge mode.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

bridge: Specifies the Layer 2 mode.

route: Specifies the Layer 3 mode.

Usage guidelines

Interfaces on the device can operate either as Layer 2 or Layer 3 Ethernet interfaces.

You can use commands to set the link mode to bridge or route.

Changing the link mode of an Ethernet interface also restores all commands (except **shutdown** and **combo enable**) on the Ethernet interface to their defaults in the new link mode.

For a device supporting interface grouping, changing the link mode of interfaces in a group restores all interfaces in the group to the default speed.

Examples

Configure GigabitEthernet 1/0/1 to operate in Layer 2 mode.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-mode bridge
```

1.1.18. reset counters interface

Use **reset counters interface** to clear the interface statistics.

Syntax

reset counters interface [*interface-type* [*interface-number*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

Usage guidelines

Use this command to clear history statistics if you want to collect traffic statistics for a specific time period.

If you do not specify an interface type, this command clears statistics for all interfaces.

If you specify an interface type but do not specify an interface number, this command clears statistics for all interfaces of the specified type.

Examples

Clear the statistics for GigabitEthernet 1/0/1.

```
<Switch> reset counters interface gigabitethernet 1/0/1
```

Related commands

display counters interface

display counters rate interface

display interface

1.1.19. shutdown

Use **shutdown** to shut down an Ethernet interface.

Use **undo shutdown** to bring up an Ethernet interface.

Syntax

shutdown

undo shutdown

Default

Ethernet interfaces are in up state.

Views

Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Some interface configurations might require an interface restart before taking effect.

The **shutdown** and **port up-mode** commands are mutually exclusive.

Examples

Shut down and then bring up GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] shutdown
[Switch-GigabitEthernet1/0/1] undo shutdown
```

1.1.20. speed

Use **speed** to set the speed of an Ethernet interface.

Use **undo speed** to restore the default.

Syntax

speed { **10** | **100** | **1000** | **10000** | **40000** | **auto** }

undo speed

Default

An Ethernet interface negotiates a speed with its peer.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

10: Sets the interface speed to 10 Mbps.

100: Sets the interface speed to 100 Mbps.

1000: Sets the interface speed to 1000 Mbps.

10000: Sets the interface speed to 10000 Mbps.

40000: Sets the interface speed to 40000 Mbps.

auto: Enables the interface to negotiate a speed with its peer.

Usage guidelines

For an Ethernet copper port, use the **speed** command to set its speed to match the speed of the peer interface.

For a fiber port, use the **speed** command to set its speed to match the rate of a transceiver module.

Support of an interface for the keywords depends on the interface type. For more information, use the **speed ?** command in interface view.

When an LSWM5SP2PM or LSWM5XGT2PM interface card is installed on the switch, interfaces on the card can operate only at 10 Gbps.

Examples

Configure GigabitEthernet 1/0/1 to autonegotiate the speed.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] speed auto
```

Related commands

speed auto

1.1.21. unicast-suppression

Use **unicast-suppression** to enable unknown unicast storm suppression and set the unknown unicast storm suppression threshold.

Use **undo unicast-suppression** to disable unknown unicast storm suppression.

Syntax

unicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo unicast-suppression

Default

Ethernet interfaces do not suppress unknown unicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

Parameters

ratio: Sets the unknown unicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less unknown unicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of unknown unicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of unknown unicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The unknown unicast storm suppression feature limits the size of unknown unicast traffic to a threshold on an interface. When the unknown unicast traffic on the interface exceeds this threshold, the system discards packets until the unknown unicast traffic drops below this threshold.

Both the **storm-constrain** command and the **unicast-suppression** command can suppress unknown unicast storms on a port. The **unicast-suppression** command uses the chip to physically suppress unknown unicast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress unknown unicast traffic.

For the unknown unicast traffic suppression result to be determined, do not configure both the **storm-constrain unicast** command and the **unicast-suppression** command on an interface.

When you configure the suppression threshold in kbps, the actual suppression threshold might be different from the configured one as follows:

- If the configured value is smaller than 64, the value of 64 takes effect.
- If the configured value is greater than 64 but not an integer multiple of 64, the integer multiple of 64 that is greater than and closest to the configured value takes effect.

To determine the suppression threshold that takes effect, see the prompts on the switch.

Examples

Set the unknown unicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] unicast-suppression kbps 10000
The actual value is 10048 on port GigabitEthernet1/0/1 currently.
```

The output shows that the value that takes effect is 10048 kbps (157 times of 64), because the chip only supports step 64.

Related commands

broadcast-suppression

multicast-suppression

1.1.22. using fortygige

Use **using fortygige** to combine 10-GE breakout interfaces split from a 40-GE interface into a 40-GE interface.

Use **undo using fortygige** to cancel the configuration.

Syntax

using fortygige

undo using fortygige

Default

The 10-GE breakout interfaces are not combined and operate as single interfaces.

Views

10-GE breakout interface view

Predefined user roles

network-admin

Usage guidelines

If you need higher bandwidth on a single interface, you can combine four 10-GE breakout interfaces split from a 40-GE interface into a 40-GE interface. To do so, execute this command on any of these 10-GE breakout interfaces.

Examples

Combine Ten-GigabitEthernet 1/0/1:1 through Ten-GigabitEthernet 1/0/1:4 into a 40-GE interface.

```
<System> system-view
[System] interface ten-gigabitethernet1/0/1:1
[System-Ten-GigabitEthernet1/0/1:1] using fortygige
The interfaces Ten-GigabitEthernet1/0/1:1 through Ten-GigabitEthernet1/0/1:4 will be
deleted. Continue? [Y/N]:y
```

Related commands

using tengige

1.1.23. using tengige

Use **using tengige** to split a high bandwidth interface into multiple 10-GE breakout interfaces.

Use **undo using tengige** to cancel the configuration.

Syntax

using tengige

undo using tengige

Default

A high bandwidth interface is not split and operates as a single interface.

Views

40-GE interface view

Predefined user roles

network-admin

Usage guidelines

To improve port density, reduce costs, and improve network flexibility, you can split a high bandwidth interface into multiple 10-GE breakout interfaces. For example, split a 40-GE interface FortyGigE 1/0/1 into four 10-GE breakout interfaces Ten-GigabitEthernet 1/0/1:1 through Ten-GigabitEthernet 1/0/1:4.

The 10-GE breakout interfaces support the same configuration and attributes as common 10-GE interfaces, except that they are numbered in a different way.

Examples

Split FortyGigE 1/0/1 into four 10-GE breakout interfaces.

```
<System> system-view
[System] interface fortygige 1/0/1
[System-FortyGigE1/0/1] using tengige
The interface FortyGigE1/0/1 will be deleted. Continue? [Y/N]:y
```

Related commands

using fortygige

1.2. Layer 2 Ethernet interface commands

1.2.1. display storm-constrain

Use **display storm-constrain** to display storm control settings and statistics.

Syntax

display storm-constrain [**broadcast** | **multicast** | **unicast**] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

broadcast: Displays broadcast storm control settings and statistics.

multicast: Displays multicast storm control settings and statistics.

unicast: Displays unknown unicast storm control settings and statistics.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays storm control settings and statistics for all storm control-enabled interfaces.

Usage guidelines

If you do not specify any keywords, this command displays all storm control settings on all storm control-enabled interfaces.

Examples

Display the storm control settings on all storm control-enabled ports.

```
<Switch> display storm-constrain
Abbreviation: BC - broadcast; MC - multicast; UC - unicast
              KNUC - known unicast; FW - forwarding
Flow Statistic Interval: 5 (in seconds)
Port          Type Lower     Upper     Unit CtrlMode Status   Trap Log SwitchNum
--------------------------------------------------------------------------------
GE1/0/1       MC   100       200       kbps shutdown shutdown off  on  10
```

Table 1-5 Command output

Field	Description
Flow Statistic Interval	Traffic polling interval (in seconds) of the storm control module.
Port	Abbreviated interface name.
Type	Type of traffic subjected to storm control: • **BC**—Broadcast packets.

Field	Description
	• **MC**—Multicast packets. • **UC**—Unknown unicast packets. • **KNUC**—Known unicast packets. This field is not supported in the current software version.
Lower	Lower storm control threshold, in pps, kbps, or percentage.
Upper	Upper storm control threshold, in pps, kbps, or percentage.
Unit	Storm control threshold unit: • pps. • kbps. • percentage.
CtrlMode	Action (block or shutdown) taken on the interface when the upper threshold is reached. N/A indicates that no action is configured.
Status	Packet forwarding status: • **forwarding**—The port is forwarding traffic correctly. • **shutdown**—The port has been shut down. • **block**—The port drops the type of traffic.
Trap	Status of the storm control threshold event trap switch: • **on**—The port sends threshold event traps. • **off**—The port does not send threshold event traps.
Log	Status of the storm control threshold event log switch: • **on**—The port sends threshold event log messages. • **off**—The port does not send threshold event log messages.
SwitchNum	Number of forwarding state changes of the interface. When the **SwitchNum** field reaches 65535, it resets automatically.

1.2.2. mdix-mode

IMPORTANT:
Fiber ports do not support this command.

Use **mdix-mode** to configure the Medium Dependent Interface Cross-Over (MDIX) mode of an Ethernet interface.

Use **undo mdix-mode** to restore the default.

Syntax

mdix-mode { **automdix** | **mdi** | **mdix** }

undo mdix-mode

Default

Ethernet interfaces operate in **automdix** mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

automdix: Specifies that the interface negotiates pin roles with its peer.

mdi: Specifies that pins 1 and 2 are transmit pins and pins 3 and 6 are receive pins.

mdix: Specifies that pins 1 and 2 are receive pins and pins 3 and 6 are transmit pins.

Examples

Configure GigabitEthernet 1/0/1 to operate in **automdix** mode.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mdix-mode automdix
```

1.2.3. speed auto

Use **speed auto** to set options for speed autonegotiation.

Use **undo speed** to restore the default.

Syntax

speed auto { **10** | **100** | **1000** } *

undo speed

Default

No option is set for speed autonegotiation.

Views

100-Mbps or 1000-Mbps Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

10: Configures 10 Mbps as an option for speed autonegotiation.

100: Configures 100 Mbps as an option for speed autonegotiation.

1000: Configures 1000 Mbps as an option for speed autonegotiation.

Usage guidelines

The **speed** command and the **speed auto** command supersede each other. The most recent command that you configure takes effect. For example:

- If you configure **speed auto 100 1000** and then **speed 100** on the interface, the interface speed is forcibly set to 100 Mbps.
- If you configure **speed 100** and then **speed auto 100 1000** on the interface, the interface negotiates with its peer for a speed. The negotiated speed is either 100 Mbps or 1000 Mbps.

Speed autonegotiation enables an Ethernet interface to negotiate with its peer for the highest speed that both ends support. You can narrow down the speed option list for negotiation. To avoid negotiation failures, make sure a minimum of one speed option is supported at both ends.

Examples

Configure GigabitEthernet 1/0/1 to use 10 Mbps and 1000 Mbps for speed negotiation.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] speed auto 10 1000
```

Related commands

speed

1.2.4. storm-constrain

Use **storm-constrain** to enable storm control and set thresholds for broadcast, multicast, or unknown unicast packets on an Ethernet interface.

Use **undo storm-constrain** to disable storm control for broadcast, multicast, unknown unicast, or all types of traffic.

Syntax

storm-constrain { **broadcast** | **multicast** | **unicast** } { **pps** | **kbps** | **ratio** } *upperlimit lowerlimit*

undo storm-constrain { **all** | **broadcast** | **multicast** | **unicast** }

Default

Traffic storm control is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

all: Disables storm control for all types of traffic: broadcast, known unicast, multicast, and unknown unicast.

broadcast: Enables or disables broadcast storm control.

multicast: Enables or disables multicast storm control.

unicast: Enables or disables unknown unicast storm control.

pps: Sets storm control thresholds in pps.

kbps: Sets storm control thresholds in kbps.

ratio: Sets storm control thresholds as a percentage of the transmission capacity of the interface.

upperlimit: Sets the upper threshold, in pps, kbps, or percentage.

- If you specify the **pps** keyword, the value range for the *upperlimit* argument is 1 to 1.4881 × the interface bandwidth（kbps）.

  For example, if the interface bandwidth is 1 Gbps (1,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 1,000,000 kbps = 1 to 1,488,100 pps.

  For example, if the interface bandwidth is 10 Gbps (10,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 10,000,000 kbps = 1 to 14,881,000 pps.

  For example, if the interface bandwidth is 40 Gbps (40,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 40,000,000 kbps = 1 to 59,524,000 pps.

- If you specify the **kbps** keyword, the value range for the *upperlimit* argument is 1 to the interface bandwidth.
- If you specify the **ratio** keyword, the value range for the *upperlimit* argument is 1 to 100.

lowerlimit: Sets the lower threshold, in pps, kbps, or percentage.

- If you specify the **pps** keyword, the value range for the *lowerlimit* argument is 1 to 1.4881 × the interface bandwidth（kbps）.

  For example, if the interface bandwidth is 1 Gbps (1,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 1,000,000 kbps = 1 to 1,488,100 pps.

  For example, if the interface bandwidth is 10 Gbps (10,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 10,000,000 kbps = 1 to 14,881,000 pps.

  For example, if the interface bandwidth is 40 Gbps (40,000,000 kbps), the range that can be controlled by this setting is 1 to 1.4881 × 40,000,000 kbps = 1 to 59,524,000 pps.
- If you specify the **kbps** keyword, the value range for the *lowerlimit* argument is 1 to the interface bandwidth.
- If you specify the **ratio** keyword, the value range for the *lowerlimit* argument is 1 to 100.

Usage guidelines

After you configure storm control for a type of traffic, the device collects the statistics for the type of traffic at the interval configured by using the **storm-constrain interval** command. When the type of traffic exceeds its upper threshold, the interface takes an action configured by using the **storm-constrain control** command.

The **storm-constrain**, **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands can suppress storms on an interface. The **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands use the chip to physically suppress traffic. They have less influence on the device performance than the **storm-constrain** command, which uses software to suppress traffic.

For the traffic suppression result to be determined, do not configure both storm control and storm suppression for the same type of traffic.

When configuring this command, make sure *upperlimit* is greater than *lowerlimit*.

Examples

Enable unknown unicast storm control on GigabitEthernet 1/0/1 and set the upper and lower thresholds to 200 pps and 150 pps, respectively.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] storm-constrain unicast pps 200 150
```

Enable broadcast storm control on GigabitEthernet 1/0/2, and set the upper and lower thresholds to 2000 kbps and 1500 kbps, respectively.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] storm-constrain broadcast kbps 2000 1500
```

Enable multicast storm control on GigabitEthernet 1/0/3, and set the upper and lower thresholds to 80% and 15%, respectively.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] storm-constrain multicast ratio 80 15
```

Related commands

storm-constrain interval

1.2.5. storm-constrain control

Use **storm-constrain control** to set the action to take on an Ethernet interface when a type of traffic (unknown unicast, multicast, or broadcast) exceeds the upper storm control threshold.

Use **undo storm-constrain control** to restore the default.

Syntax

storm-constrain control { **block** | **shutdown** }

undo storm-constrain control

Default

No action is taken on an Ethernet interface when a type of traffic exceeds the upper storm control threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

block: Blocks this type of traffic and forwards other types of traffic. Even though the interface does not forward the blocked traffic, it still counts the traffic. When the blocked traffic drops below the lower threshold, the port begins to forward the traffic.

shutdown: Goes down automatically. The interface goes down automatically and stops forwarding any traffic. When the blocked traffic drops below the lower threshold, the interface does not forward the traffic. To bring up the interface, use the **undo shutdown** command or disable storm control on the interface.

Examples

Configure GigabitEthernet 1/0/1 to block a specific type of traffic when the type of traffic exceeds the upper storm control threshold.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] storm-constrain control block
```

Related commands

storm-constrain

storm-constrain control

1.2.6. storm-constrain enable log

Use **storm-constrain enable log** to enable an Ethernet interface to output log messages when it detects storm control threshold events.

Use **undo storm-constrain enable log** to disable an Ethernet interface from outputting log messages for storm control threshold events.

Syntax

storm-constrain enable log

undo storm-constrain enable log

Default

An Ethernet interface outputs log messages when monitored traffic exceeds the upper threshold or drops below the lower threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable GigabitEthernet 1/0/1 to output log messages when it detects storm control threshold events.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] storm-constrain enable log
```

1.2.7. storm-constrain enable trap

Use **storm-constrain enable trap** to enable an Ethernet interface to send storm control threshold event traps.

Use **undo storm-constrain enable trap** to disable an Ethernet interface from sending storm control threshold event traps.

Syntax

storm-constrain enable trap

undo storm-constrain enable trap

Default

An interface sends out storm control threshold event traps when monitored traffic exceeds the upper threshold or drops below the lower threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable GigabitEthernet 1/0/1 to send traps when it detects storm control threshold events.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] storm-constrain enable trap
```

1.2.8. storm-constrain interval

Use **storm-constrain interval** to set the traffic polling interval of the storm control module.

Use **undo storm-constrain interval** to restore the default.

Syntax

storm-constrain interval *interval*

undo storm-constrain interval

Default

The storm control module polls traffic statistics every 10 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the traffic polling interval of the storm control module. The value range is 1 to 300 seconds. To ensure network stability, as a best practice, do not use a traffic polling interval shorter than 10 seconds.

Usage guidelines

The traffic polling interval set by using the **storm-constrain interval** command is specific to storm control. To set the statistics polling interval of an interface, use the **flow-interval** command.

Examples

Set the traffic statistics polling interval of the storm control module to 60 seconds.

```
<Switch> system-view
[Switch] storm-constrain interval 60
```

Related commands

storm-constrain

storm-constrain control

1.2.9. virtual-cable-test

IMPORTANT:
This command is not available on fiber ports.
It's not supported at the port link up by 10M and 100M.

Use **virtual-cable-test** to test the cable connection of an Ethernet interface and display the test result.

Syntax

virtual-cable-test

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

The test result is for reference only. The cable length detection error is up to 5 m (about 16 ft).

If a test item is not available, a hyphen (-) is displayed.

Examples

Test the cable connection of GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] virtual-cable-test
Cable status: abnormal(open), 140 metre(s)
Pair Impedance mismatch: -
Pair skew: - ns
Pair swap: -
Pair polarity: -
Insertion loss: - db
Return loss: - db
Near-end crosstalk: - db
```

Table 1-6 Command output

Field	Description
Cable status	Cable status: • **Normal**—The cable is in good condition. • **Abnormal**—The cable is abnormal. • **Abnormal (open)**—An open circuit is detected. • **Abnormal (short)**—A short circuit is detected. • **Failure**—The test failed.
n metre(s)	If the cable connection is working correctly, this field displays the total length of the cable. If the cable connection fails, this field displays the length from the local port to the faulty point.

2.1.7. reset counters interface null 2-7
2.1.8. shutdown 2-8

2. Loopback, null interface commands

2.1. Loopback, null interface commands

2.1.1. description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The interface description uses the *interface name* **Interface** format, for example, LoopBack1 **Interface**.

Views

Loopback interface view

Null interface view

Predefined user roles

network-admin

Parameters

text: Specifies the description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure a description for an interface for easy identification and management purposes.

You can use the **display interface** command to view the configured description.

Examples

Configure the description of Loopback 1 as **for RouterID**.

```
<Switch> system-view
[Switch] interface loopback 1
[Switch-LoopBack1] description for RouterID
```

2.1.2. display interface loopback

Use **display interface loopback** to display information about the specified or all existing loopback interfaces.

Syntax

display interface loopback [*interface-number*] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

loopback *interface-number*: Specifies a loopback interface by its number, which can be the number of any existing loopback interface. If you do not specify this argument, the command displays information about all existing loopback interfaces on the device.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

This command is supported only after a loopback interface is created.

Examples

Display detailed information about Loopback 0.

```
<Switch> display interface loopback 0
LoopBack0
Current state: UP
Line protocol state: UP(spoofing)
Description: LoopBack0 Interface
Bandwidth: 1000 kbps
Maximum transmission unit: 1536
Internet protocol processing: Disabled
Physical: Loopback
Last clearing of counters:  Never
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 2-1 Command output

Field	Description
Current state	Physical link state of the interface: • **UP**—The loopback interface can receive and transmit packets. • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command.
Line protocol state	Data link layer state of the interface. **UP (spoofing)** means that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the value is 0.

Field	Description
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: 1.1.1.1/32 (primary)	IP address of the interface. The **primary** attribute indicates that the address is the primary IP address.
Physical: Loopback	The physical type of the interface is loopback.
Last clearing of counters	Time when statistics on the logical interface were last cleared by using the **reset counters interface** command. If the statistics of the interface have never been cleared by using the **reset counters interface** command since the device started, this field displays **Never**.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate during the last 300 seconds (displayed when the interface supports traffic statistics collection): **bytes/sec**—Average number of bytes received per second. **bits/sec**—Average number of bits received per second. **packets/sec**—Average number of packets received per second.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate over the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes sent per second. • **bits/sec**—Average number of bits sent per second. • **packets/sec**—Average number of packets sent per second.
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of incoming packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of outgoing packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).

Display brief information about all loopback interfaces.

```
<Switch> display interface loopback brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
Loop1                UP   UP(s)    --              forLAN1
```

Display information about all loopback interfaces in down state and the causes.

```
<Switch> display interface loopback brief down
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Interface            Link Cause
Loop1                ADM  Administratively
```

Table 2-2 Command output

Field	Description
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface, which is always **UP(s)**. **UP(s)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface.
Description	Description of the interface.
Cause	Cause for the physical link state of the interface to be **DOWN**. **Administratively** represents that the interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command.

Related commands

interface loopback

reset counters interface loopback

2.1.3. display interface null

Use **display interface null** to display information about the null interface.

Syntax

display interface null [**0**] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

0: Specifies Null 0.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The device has only one null interface Null 0. If you specify the **null** keyword, the command displays information about the interface Null 0 regardless of whether you specify the **0** keyword.

Examples

Display detailed information about Null 0.

```
<Switch> display interface null 0
NULL0
Current state: UP
Line protocol state: UP(spoofing)
Description: NULL0 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Internet protocol processing: Disabled
Physical: NULL DEV
Last clearing of counters: Never
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Display brief information about Null 0.

```
<Switch> display interface null 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
NULL0                UP   UP(s)     --
```

For the command output, see Table 2-1 and Table 2-2 .

Related commands

interface null

reset counters interface null

2.1.4. interface loopback

Use **interface loopback** to create a loopback interface and enter its view, or enter the view of an existing loopback interface.

Use **undo interface loopback** to remove a loopback interface.

Syntax

interface loopback *interface-number*

undo interface loopback *interface-number*

Default

No loopback interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a loopback interface by its number. The value range for this argument is 0 to 127.

Usage guidelines

The physical layer state and link layer protocols of a loopback interface are always up unless the loopback interface is manually shut down. You can use a loopback interface to achieve the following purposes:

- Prevent the connection from being affected by the physical state of the interface.
- Improve the reliability of the connection.

For example, you can configure a loopback interface as the source interface for establishing an FTP connection, or use the loopback interface address as the Router ID in BGP.

Examples

Create Loopback 1.

```
<Switch> system-view
[Switch] interface loopback 1
[Switch-LoopBack1]
```

2.1.5. interface null

Use **interface null** to enter null interface view.

Syntax

interface null 0

Default

A device has only one null interface (Null 0), which cannot be created or deleted.

Views

System view

Predefined user roles

network-admin

Parameters

0: Specifies Null 0. The null interface number is always 0.

Examples

Enter Null 0 interface view.

```
<Switch> system-view
[Switch] interface null 0
[Switch-NULL0]
```

2.1.6. reset counters interface loopback

Use **reset counters interface loopback** to clear the statistics on the specified or all loopback interfaces.

Syntax

reset counters interface loopback [*interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a loopback interface by its number, which can be the number of any existing loopback interface. If you do not specify the *interface-number* argument, the command clears the statistics on all loopback interfaces.

Usage guidelines

To determine whether a loopback interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**loopback** [*interface-number*]] command to clear the statistics. Then have the interface automatically collect the statistics.

This command is available only if a minimum of one loopback interface has been created.

Examples

Clear the statistics on Loopback 1.

```
<Switch> reset counters interface loopback 1
```

Related commands

display interface loopback

2.1.7. reset counters interface null

Use **reset counters interface null** to clear the statistics on the null interface.

Syntax

reset counters interface null [**0**]

Views

User view

Predefined user roles

network-admin

Parameters

0: Specifies the number of the null interface, which is always 0.

Usage guidelines

To determine whether the null interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**null** [**0**]] command to clear the statistics. Then have the interface automatically collect the statistics.

Examples

Clear the statistics on Null 0.

```
<Switch> reset counters interface null 0
```

Related commands

display interface null

2.1.8. shutdown

Use **shutdown** to shut down a loopback interface.

Use **undo shutdown** to bring up a loopback interface.

Syntax

shutdown

undo shutdown

Default

A loopback interface is up.

Views

Loopback interface view

Predefined user roles

network-admin

Usage guidelines

Use the **shutdown** command with caution, because the command disconnects the connection of the interface and disables the interface from communicating.

Examples

Shut down Loopback 1.

```
<Switch> system-view
[Switch] interface loopback 1
[Switch-LoopBack1] shutdown
```

Contents

A page of this section is **3-x-x**

3. Bulk interface configuration commands 3-1
3.1. Bulk interface configuration commands 3-1
3.1.1. display interface range 3-1
3.1.2. interface range 3-1
3.1.3. interface range name 3-3

3. Bulk interface configuration commands

3.1. Bulk interface configuration commands

3.1.1. display interface range

Use **display interface range** to display information about named interface ranges created by using the **interface range name** command.

Syntax

display interface range [**name** *name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

name *name*: Specifies an interface range by its name, a case-sensitive string of 1 to 32 characters. If you do not specify an interface range name, this command displays information about all interface ranges created by using the **interface range name** command.

Examples

Display information about the interface ranges created by using the **interface range name** command.

```
<Switch> display interface range
Interface range name t2 GigabitEthernet1/0/1 GigabitEthernet1/0/2
Interface range name test GigabitEthernet1/0/3 GigabitEthernet1/0/4
```

The output shows the following:

- Interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are added to interface range **t2**.
- Interfaces GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are added to interface range **test**.

Related commands

interface range name

3.1.2. interface range

Use **interface range** to create an interface range and enter the interface range view.

Syntax

interface range *interface-list*

Views

System view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or specifies a subrange of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

Use this command to bulk configure multiple interfaces with the same feature instead of configuring them one by one. For example, execute the **shutdown** command in interface range view to shut down a range of interfaces.

The interface range created by using this command is not saved to the running configuration. You cannot use the interface range repeatedly. To create an interface range that can be used repeatedly, use the **interface range name** command.

In interface range view, only the commands supported by the first interface in the specified interface list (alphabetically sorted) are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first member interface, you can execute the **display this** command in interface range view.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type interface-number* command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.

Examples

Shut down interfaces GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5.

```
<Switch> system-view
[Switch] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

```
[Switch-if-range] shutdown
```

3.1.3. interface range name

Use **interface range name** *name* **interface** *interface-list* to create a named interface range and enter the interface range view.

Use **interface range name** *name* without the **interface** keyword to enter the view of a named interface range.

Use **undo interface range name** to delete the interface range with the specified name.

Syntax

interface range name *name* [**interface** *interface-list*]

undo interface range name *name*

Views

System view

Predefined user roles

network-admin

Parameters

name: Specifies an interface range name, a case-sensitive string of 1 to 32 characters.

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or a subrange of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

A named interface range is saved in the running configuration and can be used repeatedly to bulk configure its member interfaces.

In interface range view, only the commands supported by the first interface in the specified interface list (alphabetically sorted) are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first interface, you can execute the **display this** command in interface range view.

To view the member interfaces of a named interface range, use the **display interface range** command.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type interface-number* command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.
- To guarantee bulk interface configuration performance, configure fewer than 1000 interface range names.

Examples

Add GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to interface range **myEthPort**, and enter the interface range view.

```
<Switch> system-view
[Switch] interface range name myEthPort interface gigabitethernet 1/0/1 to gigabitethernet 1/0/5
[Switch-if-range-myEthPort]
```

Enter the view of interface range **myEthPort**.

```
<Switch> system-view
[Switch] interface range name myEthPort
[Switch-if-range-myEthPort]
```

Related commands

4. MAC address table commands

4.1. MAC address table commands

This document covers the configuration of unicast MAC address entries, including static, dynamic, blackhole, and multiport unicast MAC address entries. For more information about configuring static multicast MAC address entries, see IGMP snooping and IPv6 multicast routing and forwarding in *IP Multicast Configuration Guide*.

4.1.1. display mac-address

Use **display mac-address** to display MAC address entries.

Syntax

display mac-address [*mac-address* [**vlan** *vlan-id*] | [[**dynamic** | **static**] [**interface** *interface-type interface-number*] | **blackhole** | **multiport**] [**vlan** *vlan-id*] [**count**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

mac-address: Specifies a MAC address in the format of H-H-H. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

dynamic: Displays dynamic MAC address entries.

static: Displays static MAC address entries.

interface *interface-type interface-number*: Specifies an interface by its type and number.

blackhole: Displays blackhole MAC address entries.

multiport: Displays multiport unicast MAC address entries.

count: Displays only the number of MAC address entries that match all entry attributes you specify in the command. Detailed information about MAC address entries is not displayed. For example, you can use the **display mac-address vlan 20 dynamic count** command to display the number of dynamic entries for VLAN 20. If you do not specify an entry attribute, the command displays the number of entries in the MAC address table. If you do not specify this keyword, the command displays detailed information about the specified MAC address entries.

Usage guidelines

A MAC address entry includes a destination MAC address, an outgoing interface, and a VLAN ID.

If you do not specify any parameters, the command displays all MAC address entries.

This command displays dynamic MAC address entries for an aggregate interface only when the aggregate interface has a minimum of one Selected member port.

Multiport unicast MAC address entries have no impact on the MAC address learning. When receiving a frame whose source MAC address matches a multiport unicast entry, the device can still learn the MAC address of the frame and generate a dynamic entry. However, the generated dynamic entry has lower priority. The device prefers to use the multiport unicast entry to forward frames destined for the MAC address in the entry.

Examples

Display MAC address entries for VLAN 100.

```
<Switch> display mac-address vlan 100
MAC Address      VLAN ID    State           Port/Nickname           Aging
0001-0101-0101   100        Multiport       GE1/0/1                 N
                                            GE1/0/2
0033-0033-0033   100        Blackhole       N/A                     N
0000-0000-0002   100        Static          GE1/0/3                 N
f474-8800-5829   100        Learned         GE1/0/4                 Y
```

Display the number of MAC address entries.

```
<Switch> display mac-address count
1 mac address(es) found.
```

Table 4-1 Command output

Field	Description
VLAN ID	ID of the VLAN to which the outgoing interface of the MAC address entry belongs.
State	MAC address entry state: • **Static**—Static MAC address entry. • **Learned**—Dynamic MAC address entry. Dynamic entries can be learned or manually configured. • **Blackhole**—Blackhole MAC address entry. • **Multiport**—Multiport unicast MAC address entry. • **OpenFlow**—MAC address entry for an OpenFlow instance.
Port/Nickname	When the field displays an interface name, the field indicates the outgoing interface for packets that are destined for the MAC address. This field displays **N/A** for a blackhole MAC address entry.
Aging	Whether the entry can age out: • **Y**—The entry can age out. • **N**—The entry never ages out.
mac address(es) found	Number of matching MAC address entries.

Related commands

mac-address

mac-address timer

4.1.2. display mac-address aging-time

Use **display mac-address aging-time** to display the aging timer for dynamic MAC address entries.

Syntax

display mac-address aging-time

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the aging timer for dynamic MAC address entries.

```
<Switch> display mac-address aging-time
MAC address aging time: 300s.
```

Related commands

mac-address timer

4.1.3. display mac-address mac-learning

Use **display mac-address mac-learning** to display the global MAC address learning status and the MAC learning status of the specified interface or all interfaces.

Syntax

display mac-address mac-learning [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays the global MAC address learning status and the MAC address learning status of all interfaces.

Examples

Display the global MAC address learning status and the MAC learning status of all interfaces.

```
<Switch> display mac-address mac-learning
Global MAC address learning status: Enabled.

Port                        Learning Status
GE1/0/1                     Enabled
GE1/0/2                     Enabled
```

Table 4-2 Command output

Field	Description
Global MAC address learning status	Global MAC address learning status:

Field	Description
	• Enabled. • Disabled.
Learning Status	MAC address learning status of an interface: • Enabled. • Disabled.

Related commands

mac-address mac-learning enable

4.1.4. display mac-address mac-move

Use **display mac-address mac-move** to display the MAC address move records after the device is started.

Syntax

display mac-address mac-move [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, the command displays MAC address move records for all IRF member devices.

Usage guidelines

When a MAC address frequently moves between the specified two interfaces, Layer 2 loops might occur in the network. To discover and locate loops, you can view the MAC address move records.

In the MAC address move records, records with the same MAC address, VLAN, source port, and current port are considered to be one record.

An IRF member device can generate a maximum of 200 MAC address move records.

Examples

Display the MAC address move records for a slot.

```
<Switch> display mac-address mac-move slot 1
MAC address    VLAN Current port   Source port    Last time           Times
0000-0001-002c 1    GE1/0/1       GE1/0/2       2013-05-20 13:40:52 1
0000-0001-002c 1    GE1/0/2       GE1/0/1       2013-05-20 13:41:30 1
---  2 MAC address moving records found  ---
```

Display the MAC address move records for all slots.

```
<Switch> display mac-address mac-move
MAC address    VLAN Current port  Source port   Last time           Times
0000-0001-002c 1    GE1/0/1       GE1/0/2       2013-05-20 13:40:52 20
0000-0001-002c 1    GE1/0/2       GE1/0/1       2013-05-20 13:41:32 20
0000-0094-0001 1    GE1/0/3       GE1/0/4       2013-05-20 13:42:22 13
```

```
0000-0094-0001 1    GE1/0/4       GE1/0/3       2013-05-20 13:42:21 12
---  4 MAC address moving records found  ---
```

Table 4-3 Command output

Field	Description
VLAN	VLAN to which the outgoing interface of the MAC address entry belongs.
Current port	Interface to which the MAC address was moved.
Source port	Interface from which the MAC address was moved.
Last time	Last time when the MAC address was moved.
Times	Number of MAC address moves after the device is started. For a MAC address record, the number of MAC address moves is increased by 1 when a new MAC address move has the same **MAC address**, **VLAN**, **Current Port**, and **Source Port** fields as the MAC address record.

4.1.5. display mac-address statistics

Use **display mac-address statistics** to display MAC address table statistics.

Syntax

display mac-address statistics

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

This command displays the number of MAC address entries per type and the maximum number of MAC address entries allowed for each type.

Examples

Display MAC address table statistics.

```
<Switch> display mac-address statistics
MAC Address Count:
Dynamic Unicast Address (Learned) Count:                        3
Dynamic Unicast Address (Security-service-defined) Count:       4
Static Unicast Address (User-defined) Count:                    0
Static Unicast Address (System-defined) Count:                  3
Total Unicast MAC Addresses In Use:                             10
Total Unicast MAC Addresses Available:                          65536
Multicast and Multiport MAC Address Count:                      1
Static Multicast and Multiport MAC Address (User-defined) Count: 1
```

```
Total Multicast and Multiport MAC Addresses Available:          256
```

Table 4-4 Command output

Field	Description
Dynamic Unicast Address (Learned) Count	Number of dynamic unicast MAC address entries triggered by packets.
Dynamic Unicast Address (Security-service-defined) Count	Number of dynamic unicast MAC address entries triggered by the security service.
Static Unicast Address (User-defined) Count	Number of static unicast MAC address entries added by users.
Static Unicast Address (System-defined) Count	Number of static unicast MAC address entries added by the system.
Total Unicast MAC Addresses In Use	Number of unicast MAC address entries.
Total Unicast MAC Addresses Available	Maximum number of unicast MAC address entries allowed.
Multicast and Multiport MAC Address Count	Number of multicast and multiport unicast MAC address entries.
Static Multicast and Multiport MAC Address (User-defined) Count	Number of static multicast and multiport unicast MAC address entries added by users.
Total Multicast and Multiport MAC Addresses Available	Maximum number of multicast and multiport unicast MAC address entries allowed.

4.1.6. mac-address (interface view)

Use **mac-address** to add or modify a MAC address entry on an interface.

Use **undo mac-address** to delete a MAC address entry on an interface.

Syntax

mac-address { **dynamic** | **multiport** | **static** } *mac-address* **vlan** *vlan-id*

undo mac-address { **dynamic** | **multiport** | **static** } *mac-address* **vlan** *vlan-id*

Default

An interface is not configured with MAC address entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

multiport: Specifies multiport unicast MAC address entries. A frame whose destination MAC address matches a multiport unicast MAC address entry is sent out of multiple ports.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the specified interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Typically, the device automatically builds the MAC address table by learning the source MAC addresses of incoming frames on each interface. However, you can manually configure static MAC address entries. For a MAC address, a manually configured static entry takes precedence over a dynamically learned entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101 on GigabitEthernet 1/0/1 that belongs to VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address static 000f-e201-0101 vlan 2
```

Add a static entry for MAC address 000f-e201-0101 on Bridge-Aggregation 1 that belongs to VLAN 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] mac-address static 000f-e201-0102 vlan 1
```

Add a multiport unicast MAC address entry for MAC address 0001-0001-0101 on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 that belong to VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address multiport 0001-0001-0101 vlan 2
[Switch-GigabitEthernet1/0/1] quit
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] mac-address multiport 0001-0001-0101 vlan 2
```

Related commands

display mac-address

mac-address (system view)

4.1.7. mac-address (system view)

Use **mac-address** to add or modify a MAC address entry.

Use **undo mac-address** to delete one or all MAC address entries.

Syntax

mac-address { **dynamic** | **static** } *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*

mac-address blackhole *mac-address* **vlan** *vlan-id*

mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*

undo mac-address [[**dynamic** | **static**] *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*]

undo mac-address [**blackhole** | **dynamic** | **static**] [*mac-address*] **vlan** *vlan-id*

undo mac-address [**dynamic** | **static**] **interface** *interface-type interface-number*

undo mac-address multiport *mac-address* **interface** *interface-list* **vlan** *vlan-id*

undo mac-address [**multiport**] [[*mac-address*] **vlan** *vlan-id*]

Default

The system is not configured with MAC address entries.

Views

System view

Predefined user roles

network-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

blackhole: Specifies blackhole MAC address entries. Packets whose source or destination MAC addresses match blackhole MAC address entries are dropped.

multiport: Specifies multiport unicast MAC address entries. A frame whose destination MAC address matches a multiport unicast MAC address entry is sent out of multiple ports.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-type interface-number*: Specifies an outgoing interface by its type and number.

interface *interface-list*: Specifies a list of up to four interface items. Each interface item can be an individual interface in the format of *interface-type interface-number* or a range of interfaces in the format of *interface-type interface-number1* **to** *interface-type interface-number2*. The interfaces can only be Layer 2 Ethernet interfaces or Layer 2 aggregate interfaces. The value for the *interface-number2* argument cannot be lower than the value for the *interface-number1* argument.

Usage guidelines

You can use this command to configure the following types of MAC address entries:

- Dynamic entries.

  Dynamic entries include manually configured dynamic entries and automatically learned dynamic entries.
- Static entries.

For a MAC address, a manually configured static entry takes precedence over a dynamic entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

- Blackhole entries.

  To drop frames with the specified source MAC addresses or destination MAC addresses, you can configure blackhole entries.

- Multiport unicast entries.

  To send frames with a specific destination MAC address out of multiple ports, configure a multiport unicast entry. When you execute this command for the first time, the command adds an entry. When you execute the command again with the same MAC address and VLAN but with different interfaces, this command adds the specified interfaces for this entry.

A static or blackhole entry can overwrite a dynamic entry, but not vice versa.

If you execute the **undo mac-address** command without specifying any parameters, this command deletes all unicast MAC address entries and static multicast MAC address entries.

You can delete all the MAC address entries (including unicast and static multicast MAC address entries) from the specified VLAN. You can also delete only one type (dynamic, static, blackhole, or multiport unicast) of MAC address entries. You can single out an interface and delete the unicast MAC address entries on it, but not the static multicast MAC address entries.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101. Then, all frames that are destined for this MAC address are sent out of GigabitEthernet 1/0/1, which belongs to VLAN 2.

```
<Switch> system-view
[Switch] mac-address static 000f-e201-0101 interface gigabitethernet 1/0/1 vlan 2
```

Add a multiport unicast MAC address entry for MAC address 000f-e201-0101. Then, all frames that are destined for this MAC address are sent out of GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3, which belong to VLAN 2.

```
<Switch> system-view
[Switch] mac-address multiport 000f-e201-0101 interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/3 vlan 2
```

Related commands

mac-address (interface view)

4.1.8. mac-address mac-learning enable

Use **mac-address mac-learning enable** to enable MAC address learning globally, on an interface, or on a VLAN.

Use **undo mac-address mac-learning enable** to disable MAC address learning globally, on an interface, or on a VLAN.

Syntax

mac-address mac-learning enable

undo mac-address mac-learning enable

Default

MAC address learning is enabled.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

Usage guidelines

To prevent the MAC address table from becoming saturated, you can disable MAC address learning.

For example, a number of packets with different source MAC addresses reaching a device can affect the MAC address table update. To avoid such attacks, you can disable MAC address learning by following these guidelines:

- You can disable MAC address learning on a per-interface basis. If you disable MAC address learning globally, MAC address learning is disabled for all interfaces. The device then stops learning MAC addresses and cannot dynamically update the MAC address table.
- Because disabling MAC address learning can result in broadcast storms, enable broadcast storm suppression after you disable MAC address learning on an interface. For more information about broadcast storm suppression, see *Interface Configuration Guide*.
- With MAC address learning enabled globally, you can disable MAC address learning for an interface or VLAN.
- After MAC address learning is disabled, the device immediately deletes existing dynamic MAC address entries.

This command does not take effect on a VXLAN VSI. For information about VXLAN VSIs, see *VXLAN Configuration Guide*.

Examples

Disable MAC address learning globally.

```
<Switch> system-view
[Switch] undo mac-address mac-learning enable
```

Disable MAC address learning for VLAN 10.

```
<Switch> system-view
[Switch] vlan 10
[Switch-vlan10] undo mac-address mac-learning enable
```

Disable MAC address learning on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo mac-address mac-learning enable
```

Disable MAC address learning on Bridge-Aggregation 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] undo mac-address mac-learning enable
```

display mac-address mac-learning

4.1.9. mac-address mac-move fast-update

Use **mac-address mac-move fast-update** to enable ARP fast update for MAC address moves.

Use **undo mac-address mac-move fast-update** to disable ARP fast update for MAC address moves.

Syntax

mac-address mac-move fast-update

undo mac-address mac-move fast-update

Default

ARP fast update is enabled for MAC address moves.

Views

System view

Predefined user roles

network-admin

Examples

Enable ARP fast update for MAC address moves.

```
<Switch> system-view
[Switch] mac-address mac-move fast-update
```

4.1.10. mac-address max-mac-count

Use **mac-address max-mac-count** to set the MAC learning limit on an interface.

Use **undo mac-address max-mac-count** to restore the default.

Syntax

mac-address max-mac-count *count*

undo mac-address max-mac-count

Default

The number of MAC addresses that can be learned on an interface is not limited.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

count: Specifies the maximum number of MAC addresses that can be learned on an interface. When the argument is set to 0, the interface is not allowed to learn MAC addresses. The value range for this argument is 0 to 4096.

Usage guidelines

This command helps limit the MAC address table size. When the number of MAC address entries learned by an interface reaches the limit, the interface stops learning MAC address entries.

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 600 MAC address entries.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address max-mac-count 600
```

Related commands

mac-address

mac-address max-mac-count enable-forwarding

4.1.11. mac-address max-mac-count enable-forwarding

Use **mac-address max-mac-count enable-forwarding** to enable the device to forward unknown frames received on an interface after the MAC learning limit on the interface is reached. Unknown frames refer to frames whose source MAC addresses are not in the MAC address table.

Use **undo mac-address max-mac-count enable-forwarding** to disable the device from forwarding unknown frames received on an interface after the MAC learning limit on the interface is reached.

Syntax

mac-address max-mac-count enable-forwarding

undo mac-address max-mac-count enable-forwarding

Default

When the MAC learning limit on an interface is reached, the device can forward unknown frames received on the interface.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 600 MAC address entries.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address max-mac-count 600
```

Disable the device from forwarding unknown frames received on GigabitEthernet 1/0/1 after the MAC learning limit on GigabitEthernet 1/0/1 is reached.

```
[Switch-GigabitEthernet1/0/1] undo mac-address max-mac-count enable-forwarding
```

Related commands

mac-address

mac-address max-mac-count

4.1.12. mac-address notification mac-move

Use **mac-address notification mac-move** to enable MAC address move notifications and optionally specify a MAC move detection interval.

Use **undo mac-address notification mac-move** to disable MAC address move notifications.

Syntax

mac-address notification mac-move [**interval** *interval*]

undo mac-address notification mac-move

Default

MAC address move notifications are disabled.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the interval for detecting MAC address moves, in the range of 1 to 60 minutes. If you do not specify this option, the default setting of 1 minute is used.

Usage guidelines

With MAC address move notifications enabled, the system records the MAC address move logs every MAC move detection interval. Each record of the MAC address move logs contains the following information:

- MAC address.
- VLAN ID of the MAC address entry.
- Current port and source port of the MAC address moves.
- Number of MAC address moves within a detection interval.

A MAC address can have only one MAC address move record. If a MAC address moves multiple times, the new record overrides the old record.

Within a detection interval, an IRF member device can record MAC address move information for a maximum of 20 MAC addresses. The records are ranked in descending order of MAC move counts. When the MAC move count of a new record is higher than the MAC move count of any existing record, the device performs the following operations:

- Discards the record that has the lowest MAC move count.
- Ranks the MAC address move records in descending order of MAC move count.

Then in the next detection interval, the device discards all MAC address move records generated in the previous detection interval and starts another round of MAC move record generation.

After you execute this command, the system sends only syslog messages to the information center module. If the **snmp-agent trap enable mac-address** command is also executed, the system also sends SNMP notifications to the SNMP module.

Examples

Enable MAC address move notifications.

```
<Switch> system-view
[Switch] mac-address notification mac-move
[Switch]
%May 14 17:16:45:688 2013 Switch MAC/4/MAC_FLAPPING: MAC address 0000-0012-0034 in VLAN
500 has moved from port GE1/0/1 to port GE1/0/2 for 1 times
```

The output shows that:

- The VLAN ID of MAC address 0000-0012-0034 is VLAN 500.
- The MAC address moved from GigabitEthernet 1/0/1 to GigabitEthernet 1/0/2.
- The MAC address has moved once within a MAC move detection interval.

Related commands

display mac-address mac-move

4.1.13. mac-address notification mac-move suppression (interface view)

Use **mac-address notification mac-move suppression** to enable MAC address move suppression on an interface.

Use **undo mac-address notification mac-move suppression** to disable MAC address move suppression on an interface.

Syntax

mac-address notification mac-move suppression

undo mac-address notification mac-move suppression

Default

MAC address moves are not suppressed.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This feature shuts an interface down when a MAC address has been moved to or from the interface more than the suppression threshold within a MAC move detection interval. The shutdown interface automatically goes up after a suppression interval. Also, you can use the **shutdown** command and then the **undo shutdown** command to bring up the interface.

When MAC address move suppression shuts an interface down, the system sends only syslog messages to the information center module. If the **snmp-agent trap enable mac-address** command is also executed, the system also sends SNMP notifications to the SNMP module.

Examples

Enable MAC address move suppression on GigabitEthernet 1/0/1.

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-address notification mac-move suppression
```

Related commands

mac-address notification mac-move suppression (system view)

4.1.14. mac-address notification mac-move suppression (system view)

Use **mac-address notification mac-move suppression** to set the suppression interval or the suppression threshold.

Use **undo mac-address notification mac-move suppression** to restore the default.

Syntax

mac-address notification mac-move suppression { **interval** *interval* | **threshold** *threshold* }

undo mac-address notification mac-move suppression { **interval** | **threshold** }

Default

The suppression interval is 30 seconds. The suppression threshold is 3.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the MAC address move suppression interval during which a suppressed interface stays down. The value range for the *interval-value* argument is 30 to 86400 seconds. If you do not specify this option, the default suppression interval of 30 seconds is used.

threshold *threshold*: Specifies the suppression threshold for MAC address moves sourced from or destined for an interface within a MAC move detection interval. The value range for this argument is 0 to 1024. If you do not specify this option, the default suppression threshold of 3 is used.

Usage guidelines

For this command to take effect on an interface, you must also enable MAC address move suppression on the interface.

If you set the suppression interval or suppression threshold multiple times, the most recent configuration applies. The suppression interval setting is independent of the suppression threshold setting.

Examples

Set the suppression interval to 40 seconds and the suppression threshold to 1 for MAC address moves.

```
<Switch> system-view
[Switch] mac-address notification mac-move suppression interval 40
[Switch] mac-address notification mac-move suppression threshold 1
```

Related commands

```

4.1.16. mac-address timer

Use **mac-address timer** to set the aging timer for dynamic MAC address entries.

Use **undo mac-address timer** to restore the default.

Syntax

mac-address timer { **aging** *seconds* | **no-aging** }

undo mac-address timer

Default

The aging timer is 300 seconds for dynamic MAC address entries.

Views

System view

Predefined user roles

network-admin

Parameters

aging *seconds*: Specifies an aging timer for dynamic MAC address entries, in seconds. The value range for the *seconds* argument is 10 to 1000000.

memo:

It's possible to establish 10 to 630 in Version 7.1.6.

no-aging: Configures dynamic MAC address entries not to age.

Usage guidelines

To set the aging timer appropriately, follow these guidelines:

- A long aging interval causes the MAC address table to retain outdated entries and fail to accommodate the most recent network changes.
- A short aging interval results in removal of valid entries. Then, unnecessary broadcast packets appear and affect device performance.

Examples

Set the aging time to 500 seconds for dynamic MAC address entries.

```
<Switch> system-view
[Switch] mac-address timer aging 500
```

Related commands

display mac-address aging-time

4.1.17. snmp-agent trap enable mac-address

Use **snmp-agent trap enable mac-address** to enable SNMP notifications for the MAC address table.

Use **undo snmp-agent trap enable mac-address** to disable SNMP notifications for the MAC address table.

Syntax

snmp-agent trap enable mac-address [**mac-move**]

undo snmp-agent trap enable mac-address [**mac-move**]

Default

SNMP notifications are enabled for the MAC address table.

Views

System view

Predefined user roles

network-admin

Parameters

mac-move: Specifies notifications about the MAC address moves for the MAC address table. If you do not specify this keyword, the command enables all types of SNMP notifications for the MAC address table.

Usage guidelines

To report critical MAC address move events to an NMS, enable SNMP notifications for the MAC address table. For MAC address move event notifications to be sent correctly, you must also configure SNMP on the device.

When SNMP notifications are disabled for the MAC address table, the device sends the generated logs to the information center. To display the logs, configure the log destination and output rule configuration in the information center.

For information about SNMP and information center configuration, see the network management and monitoring configuration guide for the device.

The MAC address table supports only SNMP notifications about MAC address moves. When you enable or disable SNMP notifications about MAC address moves, you enable or disable all types of SNMP notifications for the MAC address table.

Examples

Disable SNMP notifications about MAC address moves for the MAC address table.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable mac-address mac-move
```

Related commands

mac-address information enable (system view)

5.1.2. mac-address information enable (system view)

Use **mac-address information enable** to enable MAC Information globally.

Use **undo mac-address information enable** to disable MAC Information globally.

Syntax

mac-address information enable

undo mac-address information enable

Default

MAC Information is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Before you enable MAC Information on an interface, enable MAC Information globally.

Examples

Enable MAC Information globally.

```
<Switch> system-view
[Switch] mac-address information enable
```

Related commands

mac-address information enable (interface view)

5.1.3. mac-address information interval

Use **mac-address information interval** to set the MAC change notification interval.

Use **undo mac-address information interval** to restore the default.

Syntax

mac-address information interval *interval*

undo mac-address information interval

Default

The MAC change notification interval is 1 second.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the MAC change notification interval in the range of 1 to 20000 seconds.

Usage guidelines

To prevent syslog messages or SNMP notifications from being sent too frequently, set the MAC change notification interval to a larger value.

Examples

Set the MAC change notification interval to 200 seconds.

```
<Switch> system-view
[Switch] mac-address information interval 200
```

5.1.4. mac-address information mode

Use **mac-address information mode** to set the MAC Information mode. The MAC Information mode specifies the type of messages (syslog messages or SNMP notifications) used to notify MAC changes.

Use **undo mac-address information mode** to restore the default.

Syntax

mac-address information mode { **syslog** | **trap** }

undo mac-address information mode

Default

SNMP notifications are sent to notify MAC changes.

Views

System view

Predefined user roles

network-admin

Parameters

syslog: Specifies that the device sends syslog messages to notify MAC changes.

trap: Specifies that the device sends SNMP notifications to notify MAC changes.

Examples

Configure the MAC Information mode as **trap**.

```
<Switch> system-view
[Switch] mac-address information mode trap
```

5.1.5. mac-address information queue-length

Use **mac-address information queue-length** to set the MAC Information queue length.

Use **undo mac-address information queue-length** to restore the default.

Syntax

mac-address information queue-length *value*

undo mac-address information queue-length

Default

The MAC Information queue length is 50.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the MAC Information queue length in the range of 0 to 1000. The MAC Information queue length indicates the number of MAC change messages.

Usage guidelines

If the MAC Information queue length is 0, the device sends a syslog message or SNMP notification immediately after learning or deleting a MAC address.

If the MAC Information queue length is not 0, the device stores MAC changes in the queue:

- The device overwrites the oldest MAC change written into the queue with the most recent MAC change when the following conditions exist:
  - The MAC change notification interval does not expire.
  - The queue has been exhausted.
- The device sends syslog messages or SNMP notifications only if the MAC change notification interval expires.

Examples

Set the MAC Information queue length to 600.

```
<Switch> system-view
[Switch] mac-address information queue-length 600
```

6. Ethernet link aggregation commands

6.1. Ethernet link aggregation commands

6.1.1. description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is *interface-name* **Interface**. For example, the default description of Bridge-Aggregation 1 is **Bridge-Aggregation1 Interface**.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure the description as **connect to the lab** for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] description connect to the lab
```

6.1.2. display interface

Use **display interface** to display aggregate interface information.

Syntax

display interface [**bridge-aggregation** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes for the down state. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an aggregate interface type, the command displays information about all interfaces.

If you specify an aggregate interface type but do not specify an interface number, the command displays information about all aggregate interfaces of the specified type.

Examples

Display detailed information about Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Switch> display interface bridge-aggregation 1
Bridge-Aggregation1
Current state: UP
IP packet frame type: Ethernet II, hardware address: 000f-e207-f2e0
Description: Bridge-Aggregation1 Interface
Bandwidth: 1000 kbps
2Gbps-speed mode, full-duplex mode
Link speed type is autonegotiation, link duplex type is autonegotiation
PVID: 1
Port link-type: Access
 Tagged VLANs:   None
 UnTagged VLANs: 1
Last clearing of counters: Never
Last 300 seconds input:  6900 packets/sec 885160 bytes/sec    0%
Last 300 seconds output:  3150 packets/sec 404430 bytes/sec    0%
Input (total):  5364747 packets, 686688416 bytes
         2682273 unicasts, 1341137 broadcasts, 1341337 multicasts, 0 pauses
Input (normal):  5364747 packets, 686688416 bytes
         2682273 unicasts, 1341137 broadcasts, 1341337 multicasts, 0 pauses
Input:  0 input errors, 0 runts, 0 giants, 0 throttles
         0 CRC, 0 frame, 0 overruns, - aborts
         - ignored, - parity errors
Output (total): 1042508 packets, 133441832 bytes
         1042306 unicasts, 0 broadcasts, 202 multicasts, - pauses
Output (normal): 1042508 packets, 133441832 bytes
         1042306 unicasts, 0 broadcasts, 202 multicasts, 0 pauses
Output: 0 output errors, - underruns, - buffer failures
         0 aborts, 0 deferred, 0 collisions, 0 late collisions
         - lost carrier, - no carrier
```

Display brief information about Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Switch> display interface bridge-aggregation 1 brief
Brief information on interfaces in bridge mode:
Link: ADM - administratively down; Stby - standby
Speed: (a) - auto
Duplex: (a)/A - auto; H - half; F - full
Type: A - access; T - trunk; H - hybrid
Interface            Link Speed   Duplex Type PVID Description
BAGG1                UP   auto    A      A    1
```

Table 6-1 Command output

Field	Description
Bridge-Aggregation1	Layer 2 aggregate interface name.
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
IP packet frame type	IPv4 packet framing format.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the bandwidth is 0 kbps.
Port priority	Port priority of the interface.
Output queue - Urgent queuing: Size/Length/Discards	Information about the urgent output queue: • **Size**—Number of packets in the queue. • **Length**—Maximum number of packets that the queue can contain. • **Discards**—Number of dropped packets.
Output queue - Protocol queuing: Size/Length/Discards	Information about the protocol output queue: • **Size**—Number of packets in the queue. • **Length**—Maximum number of packets that the queue can contain. • **Discards**—Number of dropped packets.
Output queue - FIFO queuing: Size/Length/Discards	Information about the FIFO output queue: • **Size**—Number of packets in the queue. • **Length**—Maximum number of packets that the queue can contain. • **Discards**—Number of dropped packets.
Unknown-speed mode, unknown-duplex mode	The interface speed and duplex mode are unknown.
Port link-type	Port link type: • Access. • Trunk. • Hybrid.
Tagged VLANs	VLAN whose packets are sent out of this interface with a

Field	Description
	tag.
Untagged VLANs	VLAN whose packets are sent out of this interface without a tag.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Last 300 seconds input/output rate	Average input or output rate over the last 300 seconds.
Input/Output (total)	Statistics of all packets received or sent on the interface.
Input/Output (normal)	Statistics of all normal packets received or sent on the interface.
Line protocol state	Data link layer state of the interface: • **UP**. • **DOWN**.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address	IP address of the interface. The **primary** attribute indicates that the address is the primary IP address.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Brief information on interfaces in bridge mode	Brief information about Layer 2 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Speed	Speed of the interface, in bps. This field displays the **(a)** flag next to the speed if the speed is automatically negotiated. This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex.

Field	Description
	• **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Cause	Cause for the physical link state of an interface to be **DOWN**.

6.1.3. display lacp system-id

Use **display lacp system-id** to display the local system ID.

Syntax

display lacp system-id

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

You can use the **lacp system-priority** command to change the LACP priority of the local system. The LACP priority value is specified in decimal format in the **lacp system-priority** command. However, it is displayed in hexadecimal format in the output from the **display lacp system-id** command.

Examples

Display the local system ID.

```
<Switch> display lacp system-id
Actor System ID: 0x8000, 0000-fc00-6504
```

Table 6-2 Command output

Field	Description
Actor System ID: 0x8000,	Local system ID, which contains the system LACP

Field	Description
0000-fc00-6504	priority (0x8000 in this sample output) and the system MAC address (0000-FC00-6504 in this sample output).

Related commands

lacp system-priority

6.1.4. display link-aggregation load-sharing mode

Use **display link-aggregation load-sharing mode** to display global or group-specific link-aggregation load sharing modes.

Syntax

display link-aggregation load-sharing mode

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the default global link-aggregation load sharing modes.

```
<Switch> display link-aggregation load-sharing mode
Link-aggregation load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the configured global link-aggregation load sharing mode.

```
<Switch> display link-aggregation load-sharing mode
Link-aggregation load-sharing mode:
destination-mac address, source-mac address
```

Table 6-3 Command output

Field	Description
Link-aggregation load-sharing mode	Global link-aggregation load sharing mode. By default, this field displays the link-aggregation load sharing modes for Layer 2 and Layer 3 traffic. If you have set the global link-aggregation load sharing mode, this field displays the set mode.
Route-Aggregation10 load-sharing mode	Link-aggregation load sharing mode of aggregation group 10. By default, this field displays the global link-aggregation load sharing modes. If you have set a link-aggregation load sharing mode for this aggregation group, this field displays the set mode.
Layer 2 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 2 traffic. In this sample output, Layer 2 traffic is load shared based on the packet type.

Field	Description
Layer 3 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 3 traffic. In this sample output, Layer 3 traffic is load shared based on the packet type.
destination-mac address, source-mac address	User-configured link-aggregation load sharing mode. In this sample output, traffic is load shared based on source and destination MAC addresses.

6.1.5. display link-aggregation member-port

Use **display link-aggregation member-port** to display detailed link aggregation information for the specified member ports.

Syntax

display link-aggregation member-port [*interface-list* | **auto**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-list: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number2* argument must be equal to or greater than the value for the *interface-number1* argument.

auto: Specifies all link aggregation member ports that are enabled with automatic assignment.

Usage guidelines

A member port in a static aggregation group cannot obtain information about the peer group. For such member ports, the command displays the port number, port priority, and operational key of only the local end.

Examples

Display detailed information about GigabitEthernet 1/0/1, which is a member port of a static aggregation group.

```
<Switch> display link-aggregation member-port gigabitethernet 1/0/1
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/1:
Aggregate Interface: Bridge-Aggregation1
Port Number: 1
Port Priority: 32768
Oper-Key: 1
```

Display detailed information about GigabitEthernet 1/0/2, which is a member port of a dynamic aggregation group.

```
<Switch> display link-aggregation member-port gigabitethernet 1/0/2
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/2:
Aggregate Interface: Bridge-Aggregation10
Local:
    Port Number: 2
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Remote:
    System ID: 0x8000, 000f-e267-6c6a
    Port Number: 26
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Received LACP Packets: 5 packet(s)
Illegal: 0 packet(s)
Sent LACP Packets: 7 packet(s)
```

Display detailed information about all link aggregation member ports that are enabled with automatic assignment.

```
<Switch> display link-aggregation member-port auto
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/3:
Preference Aggregation Interface: Bridge-Aggregation11
Aggregate Interface: Bridge-Aggregation11
Local:
    Port Number: 3
    Port Priority: 32768
    Oper-Key: 1
    Flag: {ACDEF}
Remote:
    System ID: 0x8000, a057-75a2-0100
    Port Number: 3
    Port Priority: 32768
    Oper-Key: 1
    Flag: {ACDEF}
Received LACP Packets: 3 packet(s)
Illegal: 0 packet(s)
Sent LACP Packets: 6 packet(s)
```

Table 6-4 Command output

Field	Description
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link has been aggregated. 1 indicates yes. 0 indicates no. • **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.
Aggregate Interface	Aggregate interface to which the member port belongs.
Preferred Aggregate Interface	Aggregate interface to which you prefer to assign the member port during automatic assignment.
Local	Information about the local end.
Oper-key	Operational key.
Flag	LACP protocol state flag.
Remote	Information about the peer end.
System ID	Peer system ID, containing the system LACP priority and the system MAC address.
Received LACP Packets	Total number of LACP packets received.
Illegal	Total number of illegal packets.
Sent LACP Packets	Total number of LACP packets sent.

6.1.6. display link-aggregation summary

Use **`display link-aggregation summary`** to display brief information about all aggregation groups.

Syntax

`display link-aggregation summary`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Static link aggregation groups cannot obtain information about the peer groups. As a result, the **Partner ID** field displays **None** for a static link aggregation group.

Examples

Display brief information about all aggregation groups.

```
<Switch> display link-aggregation summary
Aggregate Interface Type:
BAGG -- Bridge-Aggregation, BLAGG -- Blade-Aggregation, RAGG -- Route-Aggregation, SCH-B
- Schannel-Bundle
Aggregation Mode: S -- Static, D -- Dynamic
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Actor System ID: 0x8000, 000f-e267-6c6a

AGG          AGG   Partner ID              Selected  Unselected  Individual  Share
Interface    Mode                          Ports     Ports       Ports       Type
--------------------------------------------------------------------------------
RAGG10       S     None                    1         0           0           NonS
BAGG20       D     0x8000,f474-88ff-ff01   2         0           0           Shar
```

Table 6-5 Command output

Field	Description
Aggregate Interface Type	Aggregate interface type: • **BAGG**—Layer 2.
Aggregation Mode	Aggregation group type: • **S**—Static. • **D**—Dynamic.
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Actor System ID	Local system ID, which contains the local system LACP priority and the local system MAC address.
AGG Interface	Type and number of the aggregate interface.
AGG Mode	Aggregation group type.
Partner ID	System ID of the peer system, which contains the peer system LACP priority and the peer system MAC address.
Selected Ports	Total number of Selected ports.
Unselected Ports	Total number of Unselected ports.
Individual Ports	Total number of Individual ports.
Share Type	Load sharing type.

6.1.7. display link-aggregation verbose

Use **display link-aggregation verbose** to display detailed information about the aggregation groups that correspond to the specified aggregate interfaces.

Syntax

display link-aggregation verbose [**bridge-aggregation** [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface by its number.

Usage guidelines

If you do not specify an aggregate interface type, the command displays detailed information about all aggregation groups.

If you specify an aggregate interface type but do not specify an interface number, the command displays detailed information about all aggregation groups of the specified type.

The **bridge-aggregation** keyword is available only when the corresponding aggregate interfaces exist on the device.

This command does not display the interfaces that are enabled with automatic assignment if they have not joined an aggregation group.

Examples

Display detailed information about Layer 2 aggregation group 10, which is a dynamic aggregation group.

```
<Switch> display link-aggregation verbose bridge-aggregation 10
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port, M -- Management port, R -- Reference port
Flags:  A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregate Interface: Bridge-Aggregation10
Aggregation Mode: Dynamic
Loadsharing Type: Shar
Management VLANs: None
System ID: 0x8000, 000f-e267-6c6a
Local:
  Port                Status   Priority Index    Oper-Key               Flag
  GE1/0/1             S        32768    61       2                      {ACDEF}
  GE1/0/2             S        32768    62       2                      {ACDEF}
```

```
  GE1/0/3             S        32768    63       2                     {AG}

  GE1/0/3           S       32768    1
```

Table 6-6 Command output

Field	Description
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Port Status	Port state: • **Selected**. • **Unselected**. • **Individual**.
Port	Port type: • **Auto port**—The port is enabled with automatic assignment. • **Management port**—The port is a management port. This field is not supported in the current software version. • **Reference port**—The port is a reference port.
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link

Field	Description
	has been aggregated. 1 indicates yes. 0 indicates no. • **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.
Aggregate Interface	Name of the aggregate interface.
Aggregation Mode	Aggregation group type: • **S**—Static. • **D**—Dynamic.
Management VLANs	(This field is not supported in the current software version.) Management VLANs. If no management VLANs are specified, this field displays **None**.
System ID	Local system ID, containing the local system LACP priority and the local system MAC address.
Local	Information about the local end: • **Port**—Port type and number. • **Status**—Port state, which can be Selected, Unselected, or Individual. • **Priority**—Port priority. • **Index**—Port index. • **Oper-Key**—Operational key. • **Flag**—LACP state flag. **NOTE:** For static aggregation groups, the **Flag** field is not displayed.
Remote	Information about the peer end: • **Actor**—Type and number of the local port. This field displays the **(R)** flag next to the port if its peer port is the reference port. • **Priority**—Priority of the peer port. • **Index**—Index of the peer port. • **Oper-Key**—Operational key of the peer port. • **System ID**—System ID of the peer end. • **Flag**—LACP state flag of the peer end.

6.1.8. interface bridge-aggregation

Use **interface bridge-aggregation** to create a Layer 2 aggregate interface and enter its view, or enter the view of an existing Layer 2 aggregate interface.

Use **undo interface bridge-aggregation** to delete a Layer 2 aggregate interface.

Syntax

interface bridge-aggregation *interface-number*

undo interface bridge-aggregation *interface-number*

Default

No Layer 2 aggregate interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a Layer 2 aggregate interface number. The value range for the *interface-number* argument is 1 to 1024.

Usage guidelines

When you create a Layer 2 aggregate interface, the system automatically creates a Layer 2 aggregation group with the same number. The aggregation group operates in static aggregation mode by default.

Deleting a Layer 2 aggregate interface also deletes the Layer 2 aggregation group. At the same time, the member ports of the aggregation group, if any, leave the aggregation group.

Examples

Create Layer 2 aggregate interface Bridge-Aggregation 1, and enter its view.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1]
```

6.1.9. lacp period short

Use **lacp period short** to enable the short LACP timeout interval (3 seconds) on an interface.

Use **undo lacp period** to restore the default.

Syntax

lacp period short

undo lacp period

Default

The LACP timeout interval is the long timeout interval (90 seconds) on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

To avoid traffic interruption during an ISSU, do not enable the short LACP timeout interval before performing the ISSU. For more information about ISSU, see *Fundamentals Configuration Guide*.

Examples

Enable the short LACP timeout interval (3 seconds) on GigabitEthernet 1/0/1.

```
<Switch> system-view
```

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lacp period short
```

6.1.10. lacp system-priority

Use **lacp system-priority** to set the system LACP priority.

Use **undo lacp system-priority** to restore the default.

Syntax

lacp system-priority *priority*

undo lacp system-priority

Default

The system LACP priority is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

priority: Specifies the system LACP priority in the range of 0 to 65535. The smaller the value, the higher the system LACP priority.

Examples

Set the system LACP priority to 64.

```
<Switch> system-view
[Switch] lacp system-priority 64
```

Related commands

link-aggregation port-priority

6.1.11. link-aggregation global load-sharing mode

Use **link-aggregation global load-sharing mode** to set the global link-aggregation load sharing mode.

Use **undo link-aggregation global load-sharing mode** to restore the default.

Syntax

link-aggregation global load-sharing mode { **destination-ip** | **destination-mac** | **destination-port** | **ingress-port** | **source-ip** | **source-mac** | **source-port** } *

undo link-aggregation global load-sharing mode

Default

The system automatically chooses link-aggregation load sharing mode based on packet types.

Views

System view

Predefined user roles

network-admin

Parameters

destination-ip: Distributes traffic based on destination IP addresses.

destination-mac: Distributes traffic based on destination MAC addresses.

destination-port: Distributes traffic based on destination ports.

ingress-port: Distributes traffic based on ingress ports.

source-ip: Distributes traffic based on source IP addresses.

source-mac: Distributes traffic based on source MAC addresses.

source-port: Distributes traffic based on source ports.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If an unsupported load sharing mode is set, the device displays an error message.

The following are global load sharing modes supported on the device:

- Load sharing mode automatically determined based on the packet type.
- Source IP.
- Destination IP.
- Source MAC.
- Destination MAC.
- Source IP and destination IP.
- Source IP and source port.
- Destination IP and destination port.
- Source IP, source port, destination IP, and destination port.
- Ingress port.

Examples

Set the global load sharing mode to load share packets based on destination MAC addresses.

```
<Switch> system-view
[Switch] link-aggregation global load-sharing mode destination-mac
```

6.1.12. link-aggregation load-sharing mode local-first

Use **link-aggregation load-sharing mode local-first** to enable local-first load sharing for link aggregation.

Use **undo link-aggregation load-sharing mode local-first** to disable local-first load sharing for link aggregation.

Syntax

link-aggregation load-sharing mode local-first

undo link-aggregation load-sharing mode local-first

Default

Local-first load sharing is enabled for link aggregation.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Use local-first load sharing in a multidevice link aggregation scenario to distribute traffic preferentially across member ports on the ingress card or device. Local-first load sharing takes effect only on known unicast traffic.

If you disable local-first load sharing, packets of an aggregate interface are load shared among all Selected ports on IRF member devices.

Examples

Disable local-first load sharing for link aggregation.

```
<Switch> system-view
[Switch] undo link-aggregation load-sharing mode local-first
```

6.1.13. link-aggregation mode

Use **link-aggregation mode dynamic** to configure an aggregation group to operate in dynamic aggregation mode and enable LACP.

Use **undo link-aggregation mode** to restore the default.

Syntax

link-aggregation mode dynamic

undo link-aggregation mode

Default

An aggregation group operates in static aggregation mode.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

If a dynamic aggregation group contains member ports enabled with automatic assignment, changing the aggregation mode to static might cause Selected member ports to become Unselected. At the same time, automatic assignment is disabled automatically on the member ports. As a best practice, make sure a dynamic aggregation group does not contain such member ports before you change its aggregation mode.

Examples

Configure Layer 2 aggregation group 1 to operate in dynamic aggregation mode.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] link-aggregation mode dynamic
```

6.1.14. link-aggregation port-priority

Use **link-aggregation port-priority** to set the port priority of an interface.

Use **undo link-aggregation port-priority** to restore the default.

Syntax

link-aggregation port-priority *priority*

undo link-aggregation port-priority

Default

The port priority of an interface is 32768.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

priority: Specifies the port priority in the range of 0 to 65535. The smaller the value, the higher the port priority.

Examples

Set the port priority to 64 for Layer 2 Ethernet interface GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] link-aggregation port-priority 64
```

Set the port priority to 64 for Layer 3 Ethernet interface GigabitEthernet 1/0/2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] link-aggregation port-priority 64
```

Related commands

lacp system-priority

6.1.15. link-aggregation selected-port maximum

Use **link-aggregation selected-port maximum** to set the maximum number of Selected ports allowed in an aggregation group.

Use **undo link-aggregation selected-port maximum** to restore the default.

Syntax

link-aggregation selected-port maximum *max-number*

undo link-aggregation selected-port maximum

Default

The maximum number of Selected ports allowed in an aggregation group is 8.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of Selected ports allowed in an aggregation group. The value range for this argument is 1 to 8.

Usage guidelines

Executing this command might cause some of the Selected ports in an aggregation group to become Unselected ports.

The maximum number of Selected ports allowed in the aggregation groups must be the same for the local and peer ends.

The maximum number of Selected ports allowed in an aggregation group is limited by one of the following values, whichever value is smaller:

- Maximum number set by using the **link-aggregation selected-port maximum** command.
- Maximum number of Selected ports allowed by the link aggregation capability.

You can implement backup between two ports by performing the following tasks:

- Assigning two ports to an aggregation group.
- Setting the maximum number of Selected ports to 1 for the aggregation group.

Then, only one Selected port is allowed in the aggregation group at any point in time, while the Unselected port acts as a backup port.

Examples

Set the maximum number of Selected ports to 5 for Layer 2 aggregation group 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] link-aggregation selected-port maximum 5
```

Related commands

link-aggregation selected-port minimum

6.1.16. link-aggregation selected-port minimum

Use **link-aggregation selected-port minimum** to set the minimum number of Selected ports in an aggregation group.

Use **undo link-aggregation selected-port minimum** to restore the default.

Syntax

link-aggregation selected-port minimum *min-number*

undo link-aggregation selected-port minimum

Default

The minimum number of Selected ports in an aggregation group is not specified.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

min-number: Specifies the minimum number of Selected ports in an aggregation group required to bring up the aggregate interface. The value range for this argument is 1 to 8.

Usage guidelines

Executing this command might cause all member ports in the aggregation group to become Unselected ports.

The minimum number of Selected ports allowed in the aggregation groups must be the same for the local and peer ends.

Examples

Set the minimum number of Selected ports to 3 for Layer 2 aggregation group 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] link-aggregation selected-port minimum 3
```

Related commands

link-aggregation selected-port maximum

6.1.17. port link-aggregation group

Use **port link-aggregation group** to assign an interface to an aggregation group.

Use **undo port link-aggregation group** to remove an interface from the aggregation group to which it belongs.

Syntax

port link-aggregation group *group-id* [force]

undo port link-aggregation group

Memo:

The **force** option is practicable after V7.2.16.

Default

An interface does not belong to any aggregation group.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies an aggregation group by its aggregate interface number. The value range for the *number* argument is 1 to 1024.

force: Enables the current interface to synchronize attribute configurations from the aggregate interface. If you do not specify this keyword, the current interface does not synchronize attribute

configurations from the aggregate interface when it joins the aggregation group. This keyword is supported only on Layer 2 Ethernet interfaces.

Usage guidelines

A Layer 2 Ethernet interface can be assigned to a Layer 2 aggregation group only.

An interface can belong to only one aggregation group.

The device assigns the interface to the preferred aggregation group as long as the LACPDUs received on the interface match the peer information of the reference port in the group.

If you do not specify a preferred group or if the preferred group match fails, the device attempts to select a matching group from the existing dynamic aggregation groups. If no match is found, the device creates a dynamic aggregation group based on the LACPDUs and assigns the interface to that aggregation group.

Examples

Assign Layer 2 Ethernet interface GigabitEthernet 1/0/1 to Layer 2 aggregation group 1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-aggregation group 1
```

6.1.18. reset counters interface

Use **reset counters interface** to clear statistics for the specified aggregate interfaces.

Syntax

reset counters interface [**bridge-aggregation** | *interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

Usage guidelines

Use this command to clear history statistics before you collect traffic statistics for a time period.

If you do not specify an aggregate interface type, the command clears statistics for all interfaces in the system.

If you specify only an aggregate interface type, the command clears statistics for all aggregate interfaces of the specified type.

The **bridge-aggregation** keyword is available only when the corresponding aggregate interfaces exist on the device.

Examples

Clear statistics for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Switch> reset counters interface bridge-aggregation 1
```

6.1.19. reset lacp statistics

Use **reset lacp statistics** to clear LACP statistics for the specified link aggregation member ports.

Syntax

reset lacp statistics [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-list*: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number1* argument must be equal to or greater than the value for the *interface-number2* argument. If you do not specify any member ports, the command clears LACP statistics for all member ports.

Examples

Clear LACP statistics for all link aggregation member ports.

```
<Switch> reset lacp statistics
```

Related commands

display link-aggregation member-port

6.1.20. shutdown

Use **shutdown** to shut down an interface.

Use **undo shutdown** to bring up an interface.

Syntax

shutdown

undo shutdown

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Examples

Bring up Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] undo shutdown
```

7. Port isolation commands

7.1. Port isolation commands

7.1.1. display port-isolate group

Use **display port-isolate group** to display port isolation group information.

Syntax

display port-isolate group [*group-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

group-id: Specifies an isolation group by its ID. The value range is 1 to 8.

Examples

Display all isolation groups.

```
<Switch> display port-isolate group
 Port isolation group information:
 Group ID: 1
 Group members:
    GigabitEthernet1/0/1

 Group ID: 5
 Group members:
    GigabitEthernet1/0/2            GigabitEthernet1/0/4
```

Display information about isolation group 1.

```
<Switch> display port-isolate group 1
 Port isolation group information:
 Group ID: 1
 Group members:
    GigabitEthernet1/0/1
```

Table 7-1 Command output

Field	Description
Group ID	ID of the isolation group.
Group members	Isolated ports in the isolation group. **No ports** indicates that the isolation group does not contain isolated ports.

Related commands

port-isolate enable

7.1.2. port-isolate enable

Use **port-isolate enable** to assign a port to an isolation group.

Use **undo port-isolate enable** to remove a port from an isolation group.

Syntax

port-isolate enable group *group-id*

undo port-isolate enable

Default

The port is not assigned to an isolation group.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group *group-id*: Specifies an isolation group by its ID. The value range is 1 to 8.

Usage guidelines

The configuration in Layer 2 Ethernet interface view applies only to the interface.

The configuration in Layer 2 aggregate interface view applies to the Layer 2 aggregate interface and its aggregation member ports. If the device fails to apply the configuration to the aggregate interface, it does not assign any aggregation member port to the isolation group. If the failure occurs on an aggregation member port, the device skips the port and continues to assign other aggregation member ports to the isolation group.

To assign ports to an isolation group, make sure the isolation group already exists.

One port can be assigned to only one isolation group.

Examples

Assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to isolation group 1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port-isolate enable group 1
[Switch-GigabitEthernet1/0/1] quit
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] port-isolate enable group 1
```

Related commands

display port-isolate group

7.1.3. port-isolate group

Use **port-isolate group** to create an isolation group.

Use **undo port-isolate group** to delete isolation groups.

Syntax

port-isolate group *group-id*

undo port-isolate group { *group-id* | **all** }

Default

No isolation groups exist.

Views

System view

Predefined user roles

network-admin

Parameters

group-id: Specifies an isolation group by its ID. The value range is 1 to 8.

all: Deletes all isolation groups.

Examples

Create isolation group 1.

```
<Switch> system-view
[Switch] port-isolate group 1
```

8. Spanning tree commands

8.1. Spanning tree commands

8.1.1. active region-configuration

Use **active region-configuration** to activate your MST region configuration.

Syntax

active region-configuration

Views

MST region view

Predefined user roles

network-admin

Usage guidelines

When you configure MST region parameters, MSTP launches a new spanning tree calculation process that might cause network topology instability. This is most likely to occur when you configure the VLAN-to-instance mapping table. The launch occurs after you execute the **active region-configuration** command or the **stp global enable** command.

As a best practice, use the **check region-configuration** command to determine whether the MST region configurations to be activated are correct. Run this command only when they are correct.

Examples

Map VLAN 2 to MSTI 1 and activate the MST region configuration.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] instance 1 vlan 2
[Switch-mst-region] active region-configuration
```

Related commands

check region-configuration

instance

region-name

revision-level

stp global enable

vlan-mapping modulo

8.1.2. bpdu-drop any

Use **bpdu-drop any** to enable BPDU drop on a port.

Use **undo bpdu-drop any** to disable BPDU drop on a port.

Syntax

bpdu-drop any

undo bpdu-drop any

Default

BPDU drop is disabled on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

This feature allows the device to drop BPDUs of STP, RSTP, MSTP, PVST, LACP, Ethernet OAM, GVRP, and LLDP. Make sure you are fully aware of the impact of this feature when you use it on a live network.

Examples

Enable BPDU drop on port GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] bpdu-drop any
```

8.1.3. check region-configuration

Use **check region-configuration** to display MST region pre-configuration information.

Syntax

check region-configuration

Views

MST region view

Predefined user roles

network-admin

Usage guidelines

Spanning tree devices belong to the same MST region only when they are connected through a physical link and configured with the same details as follows:

- Format selector (0 by default and not configurable).
- MST region name.
- MST region revision level.
- VLAN-to-instance mapping entries in the MST region.

As a best practice, use this command to determine whether the MST region configurations to be activated are correct. Activate them only when they are correct.

Examples

Display MST region pre-configurations.

```
<Switch> system-view
[Switch] stp region-configuration
```

```
[Switch-mst-region] check region-configuration
 Admin Configuration
   Format selector      : 0
   Region name          : 001122334400
   Revision level       : 0
   Configuration digest : 0x3ab68794d602fdf43b21c0b37ac3bca8

   Instance  VLANs Mapped
   0         1, 3 to 4094
   15        2
```

Table 8-1 Command output

Field	Description
Format selector	Format selector of the MST region, which is 0 (not configurable).
Region name	MST region name.
Revision level	Revision level of the MST region.
Instance VLANs Mapped	VLAN-to-instance mappings in the MST region.

Related commands

active region-configuration

instance

region-name

revision-level

vlan-mapping modulo

8.1.4. display stp

Use **display stp** to display spanning tree status and statistics.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] [**interface** *interface-list* | **slot** *slot-number*] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*.

brief: Displays brief spanning tree status and statistics. If this keyword is not specified, the command displays detailed spanning tree status and statistics.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port list, this command applies to the specified ports.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN or port, this command applies to all ports in all VLANs.
- If you only specify a VLAN list but not a port, this command applies to all ports in the specified VLANs.
- If you only specify a port list but not a VLAN, this command applies to the specified ports in all VLANs.
- If you specify both a VLAN list and a port list, this command applies to the ports in the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify an MSTI list but not a port, this command applies to all ports in the specified MSTIs.
- If you specify a port list but not an MSTI, this command applies to all MSTIs on the specified ports.
- If you specify both an MSTI list and a port list, this command applies to the specified ports in the specified MSTIs.

Examples

In MSTP mode, display the brief spanning tree status and statistics for MSTI 0 on port GigabitEthernet 1/0/1.

```
<Switch> display stp instance 0 interface GigabitEthernet 1/0/1 brief
 MST ID      Port                        Role  STP State     Protection
 0           0           GigabitEthernet1/0/1         ALTE  DISCARDING    LOOP
```

In PVST mode, display the brief spanning tree status and statistics for VLAN 2 on port GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] stp mode pvst
[Switch] display stp vlan 2 interface gigabitethernet 1/0/1 brief
 VLAN ID     Port                        Role  STP State     Protection
 2           GigabitEthernet1/0/1        ALTE  DISCARDING    LOOP
```

Table 8-2 Command output

Field	Description
MST ID	MSTI ID in the MST region.
Port	Port name, corresponding to each MSTI or VLAN.
Role	Port role: • **ALTE**—The port is an alternate port. • **BACK**—The port is a backup port. • **ROOT**—The port is a root port. • **DESI**—The port is a designated port. • **MAST**—The port is a master port. • **DISA**—The port is disabled.
STP State	Spanning tree status on the port: • **FORWARDING**—The port can receive and send BPDUs and also forward user traffic. • **DISCARDING**—The port can receive and send BPDUs but cannot forward user traffic. • **LEARNING**—The port is in a transitional state. It can receive and send BPDUs but cannot forward user traffic.
Protection	Effective spanning tree protection feature on the port: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not triggered, this field displays **NONE**.

In MSTP mode, display the detailed spanning tree status and statistics for all MSTIs on all ports.

```

In PVST mode, display the spanning tree status and statistics when the spanning tree feature is disabled.

```
<Switch> display stp
 Protocol status    : Disabled
 Protocol Std.      : IEEE 802.1w (pvst)
 Version            : 2
 Bridge-Prio.       : 32768
 MAC address        : 3822-d69f-0800
 Max age(s)         : 20
 Forward delay(s)   : 15
 Hello time(s)      : 2
 TC Snooping        : Disabled
```

Table 8-3 Command output

Field	Description
Bridge ID	Bridge ID, which contains the device's priority and its MAC address. For example, in output 32768.000f-e200-2200, the value preceding the dot is the device's priority. The value following the dot is the device's MAC address.
Bridge times	Major parameters for the bridge: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MaxHops**—Maximum hops within the MST region.
Root ID/ERPC	CIST root ID and external path cost (the path cost from the device to the CIST root).
RegRoot ID/IRPC	CIST regional root ID and internal path cost (the path cost from the device to the CIST regional root).
VlanRoot ID/RPC	VLAN root ID and root path cost (the path cost from the device to the VLAN root bridge).
RootPort ID	Root port ID. The value **0.0** indicates that the device is the root and there is no root port.
BPDU-Protection	Global status of the BPDU guard feature.
Bridge Config-Digest-Snooping	Global status of Digest Snooping.
TC or TCN received	Number of TC/TCN BPDUs received in the MSTI or VLAN.
Time since last TC	Time since the latest topology change in the MSTI or VLAN.
[FORWARDING]	The port is in forwarding state.
[DISCARDING]	The port is in discarding state.
[LEARNING]	The port is in learning state.
Port protocol	Status of the spanning tree feature on the port.
Port role	Port role: • Alternate. • Backup. • Root. • Designated. • Master. • Disabled.
(Boundary)	The port is a regional boundary port.
Port cost(Legacy)	Path cost of the port. The field in parentheses indicates the standard (legacy, dot1d-1998, or dot1t) used for port path cost calculation. • **Config**—Configured value. • **Active**—Actual value.
Desg.bridge/port	Designated bridge ID and port ID of the port. The port ID displayed is insignificant for a port which does not support port priority.
Port edged	The port is an edge port or non-edge port.

Field	Description
	• **Config**—Configured value. • **Active**—Actual value.
Point-to-Point	The port is connected to a point-to-point link or not. • **Config**—Configured value. • **Active**—Actual value.
Transmit limit	Maximum number of BPDUs sent by a port within each hello time.
Protection type	Whether spanning tree protection is configured on the port: • **Config**—Configured spanning tree protection feature. • **Active**—Effective spanning tree protection feature. Spanning tree protection features are as follows: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. • **PVST BPDU**—PVST BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not triggered, this field displays **NONE**.
TC-Restriction	Status of TC transmission restriction on the port.
Role-Restriction	Status of port role restriction on the port.
MST BPDU format	Format of the MST BPDUs that the port can send: • **Config**—Configured value (legacy or 802.1s). • **Active**—Actual value (legacy or 802.1s). During MSTP operation, if fast convergence becomes disabled, it changes from "802.1 s compliant" to "legacy."
Port Config-Digest-Snooping	Status of Digest Snooping on the port.
Rapid transition	Indicates whether the port rapidly transits to the forwarding state in the MSTI or VLAN.
Num of VLANs mapped	Number of VLANs that are mapped to the MSTI.
Port times	Major parameters for the port: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MsgAge**—Message age timer. • **RemHops**—Remaining hops.
BPDU sent	Statistics on sent BPDUs.
BPDU received	Statistics on received BPDUs.
RegRoot ID/IRPC	MSTI regional root/internal path cost.
Root Type	MSTI root type: • **Primary root**. • **Secondary root**.
Master bridge	MSTI root bridge ID.
Cost to master	Path cost from the MSTI to the master bridge.
TC received	Number of received TC BPDUs.

Field	Description
Protocol status	Spanning tree protocol status.
Protocol Std.	Spanning tree protocol standard.
Version	Spanning tree protocol version.
Bridge-Prio.	In MSTP mode: Device's priority in the CIST. In PVST mode: Device's priority in VLAN 1.
Max age(s)	Aging timer for BPDUs (in seconds, which is the same as the aging timer for VLAN 1 in PVST mode).
Forward delay(s)	Port state transition delay (in seconds, which is the same as the port state transition delay for VLAN 1 in PVST mode).
Hello time(s)	Interval for the root bridge to send BPDUs (in seconds, which is the same as the interval for VLAN 1 in PVST mode).
Max hops	Maximum hops in the MSTI.
TC Snooping	Status of TC Snooping: **Enabled** or **Disabled**.

Related commands

reset stp

8.1.5. display stp abnormal-port

Use **display stp abnormal-port** to display history about ports that are blocked by spanning tree protection features.

Syntax

display stp abnormal-port

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

In an MSTI or VLAN, this command can display a maximum of three history records for a port that is blocked by spanning tree protection features.

Examples

In MSTP mode, display history about ports that are blocked by spanning tree protection features.

```
---[GigabitEthernet1/0/1]---
    MST ID   BlockReason                    Time
    0        Root-Protected                 14:39:04 04/15/2016
    0        Root-Protected                 14:39:02 04/15/2016
    0        Root-Protected                 14:39:00 04/15/2016
```

In PVST mode, display history about ports that are blocked by spanning tree protection features.

```
---[GigabitEthernet1/0/1]---
    VLAN ID  BlockReason                    Time
```

```
1         Root-Protected                  14:49:17 04/15/2016
1         Root-Protected                  14:49:15 04/15/2016
1         Root-Protected                  14:49:12 04/15/2016
```

Table 8-4 Command output

Field	Description
MST ID	MSTI of a blocked port.
VLAN ID	VLAN of a blocked port.
BlockReason	Reason that the port was blocked: • **Root-Protected**—Root guard feature. • **Loop-Protected**—Loop guard feature. • **Loopback-Protected**—Self-loop protection. A port in the MSTI receives a BPDU sent by itself. • **Disputed**—Dispute guard. A port receives a low-priority BPDU from a non-blocked designated port in forwarding or learning state. • **InconsistentPortType-Protected**—Inconsistent port type protection. • **InconsistentPvid-Protected**—Inconsistent PVID protection.
Time	Protection feature trigger time.

8.1.6. display stp bpdu-statistics

Use **display stp bpdu-statistics** to display the BPDU statistics for ports.

Syntax

display stp bpdu-statistics [**interface** *interface-type interface-number* [**instance** *instance-list*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

Usage guidelines

In MSTP mode, the command output is sorted by port name and by MSTI ID on each port.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify a port but not an MSTI, this command applies to all MSTIs on the port.
- If you specify both an MSTI ID and a port, this command applies to the specified MSTI on the port.

In STP, RSTP, or PVST mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port, this command applies to the port.

Examples

In MSTP mode, display the BPDU statistics for all MSTIs on GigabitEthernet 1/0/1.

```
<Switch> display stp bpdu-statistics interface gigabitethernet 1/0/1
 Port: GigabitEthernet1/0/1

 Instance-Independent:

 Type                        Count      Last Updated

PVID inconsistency BPDUs    0
```

Table 8-5 Command output

Field	Description
Port	Port name.
Instance-Independent	Statistics not related to a specific MSTI.
Type	Statistical item.
Looped-back BPDUs	Number of BPDUs sent and then received by the same port.
Max-aged BPDUs	Number of BPDUs whose max age was exceeded.
TCN sent	Number of sent TCN BPDUs.
TCN received	Number of received TCN BPDUs.
TCA sent	Number of sent TCA BPDUs.
TCA received	Number of received TCA BPDUs.
Config sent	Number of sent configuration BPDUs.
Config received	Number of received configuration BPDUs.
RST sent	Number of sent RSTP BPDUs.
RST received	Number of received RSTP BPDUs.
MST sent	Number of sent MSTP BPDUs.
MST received	Number of received MSTP BPDUs.
Instance	Statistics for a specific MSTI.
Timeout BPDUs	Number of expired BPDUs.
Max-hoped BPDUs	Number of BPDUs whose maximum hops were exceeded.
TC detected	Number of detected topology changes.
TC sent	Number of sent TC BPDUs.
TC received	Number of received TC BPDUs.
PVID inconsistency BPDUs	Number of received PVST BPDUs with a PVID inconsistent with the incoming port.

8.1.7. display stp down-port

Use **display stp down-port** to display information about ports that were shut down by spanning tree protection features.

Syntax

display stp down-port

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about ports that were shut down by spanning tree protection features.

```
<Switch> display stp down-port
 Down Port                      Reason
 GigabitEthernet1/0/1           BPDU protection
```

Table 8-6 Command output

Field	Description
Down Port	Name of a port that was shut down by the spanning tree protection features.
Reason	Reason that the port was shut down: • **BPDU protection**—Indicates the BPDU guard feature. • **PVST BPDU protection**—Indicates the PVST BPDU guard feature.

8.1.8. display stp history

Use **display stp history** to display port role calculation history.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **history** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port role calculation time.

In PVST mode, the command output is sorted by VLAN ID and by port role calculation time in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port role calculation time in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In MSTP mode, display the port role calculation history on the specified slot in MSTI 2.

```
<Switch> display stp instance 2 history slot 1
 -------------- STP slot 1 history trace ---------------

Table 8-7 Command output

Field	Description
Port	Port name.
Role change	Role change of the port (**Aged** means that the change was caused by expiration of the received configuration BPDU).
Time	Time of port role calculation.

8.1.9. display stp region-configuration

Use **display stp region-configuration** to display effective MST region configuration.

Syntax

display stp region-configuration

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

In MSTP mode, display effective MST region configuration.

```
<Switch> display stp region-configuration
 Oper Configuration
   Format selector      : 0
   Region name          : hello
   Revision level       : 0
   Configuration digest : 0x5f762d9a46311effb7a488a3267fca9f

   Instance   VLANs Mapped
   0          21 to 4094
   1          1 to 10
   2          11 to 20
```

Table 8-8 Command output

Field	Description
Format selector	Format selector that is defined by the spanning tree protocol. The default value is 0, and the selector cannot be configured.
Region name	MST region name.
Revision level	Revision level of the MST region. The default value is 0, and the level can be configured by using the **revision-level** command.
VLANs Mapped	VLANs mapped to the MSTI.

8.1.10. display stp root

Use **display stp root** to display the root bridge information of spanning trees.

Syntax

display stp root

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

In MSTP mode, display the root bridge information of all spanning trees.

```
<Switch> display stp root
 MST ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 0       0.f474-880e-6554      200200      0           GigabitEthernet1/0/1
```

In PVST mode, display the root bridge information of all spanning trees.

```
<Switch> display stp root
 VLAN ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 1        0.f474-880e-6554      200200      0           GigabitEthernet1/0/1
```

Table 8-9 Command output

Field	Description
ExtPathCost	External path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
IntPathCost	Internal path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
Root Port	Root port name (displayed only if a port of the device is the root port of the MSTI).

8.1.11. display stp tc

Use **display stp tc** to display the incoming and outgoing TC/TCN BPDU statistics for ports.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **tc** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In MSTP mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in MSTI 0.

```
<Switch> display stp instance 0 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 MST ID      Port                      Receive      Send
 0           GigabitEthernet1/0/1      6            4
 0           GigabitEthernet1/0/2      0            2
```

In PVST mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in VLAN 2.

```
<Switch> display stp vlan 2 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 VLAN ID     Port                      Receive      Send
 2           GigabitEthernet1/0/1      6            4
 2           GigabitEthernet1/0/2      0            2
```

Table 8-10 Command output

Field	Description
Port	Port name.

Field	Description
Receive	Number of TC/TCN BPDUs received on a port.
Send	Number of TC/TCN BPDUs sent by a port.

8.1.12. instance

Use **instance** to map a list of VLANs to an MSTI.

Use **undo instance** to remap the specified VLAN or all VLANs to the CIST (MSTI 0).

Syntax

instance *instance-id* **vlan** *vlan-id-list*

undo instance *instance-id* [**vlan** *vlan-id-list*]

Default

All VLANs are mapped to the CIST.

Views

MST region view

Predefined user roles

network-admin

Parameters

instance-id: Specifies an MSTI ID in the range of 0 to 4094. A value of 0 represents the CIST. The value range for the *instance-id* argument is 1 to 4094 for the **undo instance** command.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

CAUTION:
Use caution with global Digest Snooping in the following situations:

- When you modify the VLAN-to-instance mappings.
- When you restore the default MST region configuration.

If the local device has different VLAN-to-instance mappings than its neighboring devices, loops or traffic interruption will occur.

If you do not specify any VLANs in the **undo instance** command, all VLANs mapped to the specified MSTI are remapped to the CIST.

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

You can configure VLAN-to-instance mapping for up to 65 MSTIs.

After configuring this command, run the **active region-configuration** command to activate the VLAN-to-instance mapping.

Examples

Map VLAN 2 to MSTI 1.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] instance 1 vlan 2
```

Related commands

active region-configuration

check region-configuration

display stp region-configuration

8.1.13. region-name

Use **region-name** to configure the MST region name.

Use **undo region-name** to restore the default MST region name.

Syntax

region-name *name*

undo region-name

Default

The MST region name of the device is its MAC address.

Views

MST region view

Predefined user roles

network-admin

Parameters

name: Specifies the MST region name, a string of 1 to 32 characters.

Usage guidelines

The MST region name, the VLAN-to-instance mapping table, and the MSTP revision level of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region name.

Examples

Set the MST region name of the device to **hello**.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] region-name hello
```

Related commands

active region-configuration

check region-configuration

8.1.14. reset stp

Use **reset stp** to clear the spanning tree statistics.

Syntax

reset stp [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*. If you do not specify this option, this command clears the spanning tree statistics on all ports.

Examples

Clear the spanning tree statistics on ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3.

```
<Switch> reset stp interface gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Related commands

display stp

8.1.15. revision-level

Use **revision-level** to configure the MSTP revision level.

Use **undo revision-level** to restore the default MSTP revision level.

Syntax

revision-level *level*

undo revision-level

Default

The MSTP revision level is 0.

Views

MST region view

Predefined user roles

network-admin

Parameters

level: Specifies an MSTP revision level in the range of 0 to 65535.

Usage guidelines

The MSTP revision level, the MST region name, and the VLAN-to-instance mapping table of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region level.

Examples

Set the MSTP revision level of the MST region to 5.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] revision-level 5
```

Related commands

active region-configuration

vlan-mapping modulo

8.1.16. snmp-agent trap enable stp

Use **snmp-agent trap enable stp** to enable SNMP notifications for new-root election events or spanning tree topology changes.

Use **undo snmp-agent trap enable stp** to disable SNMP notifications for new-root election events or spanning tree topology changes.

Syntax

snmp-agent trap enable stp [**new-root** | **tc**]

undo snmp-agent trap enable stp [**new-root** | **tc**]

Default

SNMP notifications are disabled for new-root election events.

In MSTP mode, SNMP notifications are enabled in MSTI 0 and disabled in other MSTIs for spanning tree topology changes.

In PVST mode, SNMP notifications are disabled for spanning tree topology changes in all VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

new-root: Enables the device to send notifications if the device is elected as a new root bridge. This keyword applies only to STP, MSTP, and RSTP modes.

tc: Enables the device to send notifications if the device receives TCN BPDUs. This keyword applies only to PVST mode.

Usage guidelines

If no keyword is specified, the **snmp-agent trap enable stp** command applies to SNMP notifications for different events as follows:

- In STP, MSTP, and RSTP modes, the command applies to SNMP notifications for new-root election events.
- In PVST mode, the command applies to SNMP notifications for spanning tree topology changes.

Examples

Enable SNMP notifications for new-root election events.

```
<Switch> system-view
[Switch] snmp-agent trap enable stp new-root
```

8.1.17. stp bpdu-protection

Use **stp bpdu-protection** to enable BPDU guard globally.

Use **undo stp bpdu-protection** to disable BPDU guard globally.

Syntax

stp bpdu-protection

undo stp bpdu-protection

Default

BPDU guard is globally disabled.

Views

System view

Predefined user roles

network-admin

Examples

Enable BPDU guard globally.

```
<Switch> system-view
[Switch] stp bpdu-protection
```

Related commands

stp edged-port

stp port bpdu-protection

8.1.18. stp bridge-diameter

Use **stp bridge-diameter** to set the network diameter. The switched network diameter refers to the maximum number of devices on the path for an edge device to reach another through the root bridge.

Use **undo stp bridge-diameter** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **bridge-diameter** *diameter*

undo stp [**vlan** *vlan-id-list*] **bridge-diameter**

Default

The network diameter of the switched network is 7.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP switched network diameter, do not specify this option.

diameter: Specifies the switched network diameter in the range of 2 to 7.

Usage guidelines

An appropriate setting of hello time, forward delay, and max age can speed up network convergence. The values of these timers are related to the network size, and you can set the timers by setting the network diameter. With the network diameter set to 7 (the default), the three timers are also set to their defaults.

In STP, RSTP, or MSTP mode, each MST region is considered as a device. The configured network diameter of the switched network takes effect only on the CIST (or the common root bridge).

In PVST mode, the configured network diameter takes effect only on the root bridges of the specified VLANs.

Examples

In MSTP mode, set the network diameter of the switched network to 5.

```
<Switch> system-view
[Switch] stp bridge-diameter 5
```

In PVST mode, set the network diameter of VLAN 2 in the switched network to 5.

```
<Switch> system-view
[Switch] stp vlan 2 bridge-diameter 5
```

Related commands

stp timer forward-delay

stp timer hello

stp timer max-age

8.1.19. stp compliance

Use **stp compliance** to configure the mode a port uses to recognize and send MSTP BPDUs.

Use **undo stp compliance** to restore the default.

Syntax

stp compliance { **auto** | **dot1s** | **legacy** }

undo stp compliance

Default

A port automatically recognizes the formats of received MSTP packets and determines the formats of MSTP packets to be sent based on the recognized formats.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

auto: Configures the port to recognize the MSTP BPDU format automatically and determine the format of MSTP BPDUs to send.

dot1s: Configures the port to receive and send only standard-format (802.1s-compliant) MSTP BPDUs.

legacy: Configures the port to receive and send only compatible-format MSTP BPDUs.

Usage guidelines

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 to send only standard-format (802.1s) MSTP packets.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp compliance dot1s
```

8.1.20. stp config-digest-snooping

Use **stp config-digest-snooping** to enable Digest Snooping.

Use **undo stp config-digest-snooping** to disable Digest Snooping.

Syntax

stp config-digest-snooping

undo stp config-digest-snooping

Default

Digest Snooping is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

For Digest Snooping to take effect, you must enable Digest Snooping both globally and on associated ports. As a best practice, first enable Digest Snooping on ports connected to third-party

vendor devices and then enable the feature globally. Digest Snooping takes effect on the ports simultaneously, which reduces impact on the network.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable Digest Snooping on GigabitEthernet 1/0/1 and then globally.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp config-digest-snooping
[Switch-GigabitEthernet1/0/1] quit
[Switch] stp global config-digest-snooping
```

Related commands

display stp

stp global config-digest-snooping

8.1.21. stp cost

Use **stp cost** to set the path cost of a port.

Use **undo stp cost** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost** *cost-value*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost**

Default

The device automatically calculates the path costs of ports in each spanning tree based on the corresponding standard.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

cost-value: Specifies the path cost of the port, with an effective range that varies by path cost calculation standard that is used.

- When the IEEE 802.1d-1998 standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 65535.
- When the IEEE 802.1t standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000000.
- When the private standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000.

Usage guidelines

Path cost is an important factor in spanning tree calculation. Setting different path costs for a port in MSTIs allows VLAN traffic flows to be forwarded along different physical links. This results in VLAN-based load balancing.

The path cost setting of a port can affect the role selection of the port. When the path cost of a port is changed, the system calculates the role of the port and initiates a state transition.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, is takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command sets the path cost of a port in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the path cost to 200 for GigabitEthernet 1/0/1 in MSTI 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp instance 2 cost 200
```

In PVST mode, set the path cost to 200 for GigabitEthernet 1/0/1 in VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp vlan 2 cost 200
```

Related commands

display stp

stp pathcost-standard

8.1.22. stp dispute-protection

Use **stp dispute-protection** to enable dispute guard.

Use **undo stp dispute-protection** to disable dispute guard.

Syntax

stp dispute-protection

undo stp dispute-protection

Default

Dispute guard is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Dispute guard blocks a port to prevent loops when a unidirectional link is detected on the port by the spanning tree feature.

In some VLAN networks, an uplink port on a downstream device is configured to deny packets from the PVID. As a result, the downstream device cannot receive BPDUs of the PVID from the upstream device. However, the upstream device can receive BPDUs from the downstream device. In this case, dispute guard blocks the receiving port on the upstream device, which causes traffic interruption.

To ensure service continuity and prevent the link from being blocked, you can disable dispute guard by using the **undo stp dispute-protection** command.

Examples

Disable dispute guard.

```
<Switch> system-view
[Switch] undo stp dispute-protection
```

8.1.23. stp edged-port

Use **stp edged-port** to configure a port as an edge port.

Use **undo stp edged-port** to restore the default.

Syntax

stp edged-port

undo stp edged-port

Default

All ports are non-edge ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

A port directly connecting to a user terminal rather than another device or a shared LAN segment can be configured as an edge port. In case the network topology changes, an edge port does not cause a temporary loop. You can enable the port to transit to the forwarding state rapidly by configuring it as an edge port. As a best practice, configure ports that directly connect to user terminals as edge ports.

Typically, configuration BPDUs from other devices cannot reach an edge port, because the edge port does not connect to any other device. When BPDU guard is disabled on a port configured as an edge port, the port acts as a non-edge port if it receives configuration BPDUs.

On a port, the loop guard feature and the edge port setting are mutually exclusive.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 as an edge port.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp edged-port
```

Related commands

8.1.24. stp enable

Use **stp enable** to enable the spanning tree feature.

Use **undo stp enable** to disable the spanning tree feature.

Syntax

stp enable

undo stp enable

Default

The spanning tree feature is enabled on all ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When you enable the spanning tree feature, the device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

When you enable the spanning tree feature, the device dynamically maintains the spanning tree status of VLANs, based on received configuration BPDUs. When you disable the spanning tree feature, the device stops maintaining the spanning tree status.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

In MSTP mode, disable the spanning tree feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo stp enable
```

Usage guidelines

For Digest Snooping to take effect, you must enable Digest Snooping both globally and on associated ports. As a best practice, first enable Digest Snooping on ports connected to third-party vendor devices and then enable the feature globally. Digest Snooping takes effect on the ports simultaneously, which reduces impact on the network.

Examples

Enable Digest Snooping on GigabitEthernet 1/0/1 and then globally.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp config-digest-snooping
[Switch-GigabitEthernet1/0/1] quit
[Switch] stp global config-digest-snooping
```

Related commands

display stp

stp config-digest-snooping

8.1.26. stp global enable

Use **stp global enable** to enable the spanning tree feature globally.

Use **undo stp global enable** to disable the spanning tree feature globally.

Syntax

stp global enable

undo stp global enable

Default

The spanning tree feature is globally disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When you enable the spanning tree feature, the device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

When the spanning tree feature is enabled, the device dynamically maintains the spanning tree status of VLANs based on received configuration BPDUs. When the spanning tree feature is disabled, the device stops maintaining the spanning tree status.

Examples

Enable the spanning tree feature globally.

```
<Switch> system-view
[Switch] stp global enable
```

Related commands

stp enable

stp mode

8.1.27. stp global mcheck

Use **stp global mcheck** to perform mCheck globally.

Syntax

stp global mcheck

Views

System view

Predefined user roles

network-admin

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform a mCheck operation to forcibly transit the port to operate in the original mode.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp global mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

Examples

Perform mCheck globally.

```
<Switch> system-view
[Switch] stp global mcheck
```

Related commands

stp mcheck

stp mode

8.1.28. stp log enable tc

Use **stp log enable tc** to enable the device to log events of detecting or receiving TC BPDUs.

Use **undo stp log enable tc** to restore the default.

Syntax

stp log enable tc

undo stp log enable tc

Default

In PVST mode, the device does not generate logs when it detects or receives TC BPDUs.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command applies only to PVST mode.

Examples

In PVST mode, enable the device to log events of detecting or receiving TC BPDUs.

```
<Switch> system-view
[Switch] stp log enable tc
```

8.1.29. stp loop-protection

Use **stp loop-protection** to enable loop guard on a port.

Use **undo stp loop-protection** to disable loop guard on a port.

Syntax

stp loop-protection

undo stp loop-protection

Default

Loop guard is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

On a port, the loop guard feature is mutually exclusive with the root guard feature or the edge port setting.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable loop guard on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp loop-protection
```

8.1.30. stp max-hops

Use **stp max-hops** to set the maximum number of hops for an MST region.

Use **undo stp max-hops** to restore the default.

Syntax

stp max-hops *hops*

undo stp max-hops

Default

The maximum number of hops for an MST region is 20.

Views

System view

Predefined user roles

network-admin

Parameters

hops: Specifies the maximum hops in the range of 1 to 40.

Examples

Set the maximum hops of the MST region to 35.

```
<Switch> system-view
[Switch] stp max-hops 35
```

Related commands

display stp

8.1.31. stp mcheck

Use **stp mcheck** to perform mCheck on a port.

Syntax

stp mcheck

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform a mCheck operation to forcibly transit the port to operation in the original mode.

For example, Device A, Device B, and Device C are connected in sequence. Device A runs STP, Device B does not run any spanning tree protocol, and Device C runs RSTP, MSTP, or PVST. When Device C receives an STP BPDU transparently transmitted by Device B, the receiving port transits to the STP mode. If you configure Device B to run RSTP, MSTP, or PVST with Device C, perform mCheck operations on the ports that connect Device B and Device C.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Perform mCheck on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] stp mcheck
```

Related commands

stp global mcheck

stp mode

8.1.32. stp mode

Use **stp mode** to configure the spanning tree operating mode.

Use **undo stp mode** to restore the default.

Syntax

stp mode { **mstp** | **pvst** | **rstp** | **stp** }

undo stp mode

Default

A spanning tree device operates in MSTP mode.

Views

System view

Predefined user roles

network-admin

Parameters

mstp: Configures the spanning tree device to operate in MSTP mode.

pvst: Configures the spanning tree device to operate in PVST mode.

rstp: Configures the spanning tree device to operate in RSTP mode.

stp: Configures the spanning tree device to operate in STP mode.

Usage guidelines

The MSTP mode is compatible with the RSTP mode, and the RSTP mode is compatible with the STP mode.

The PVST mode's compatibility with other modes is as follows:

- **Access port**—The PVST mode is compatible with other modes in any VLAN.
- **Trunk or hybrid port**—The PVST mode is compatible with other modes only in the default VLAN.

Examples

Configure the spanning tree device to operate in STP mode.

```
<Switch> system-view
[Switch] stp mode stp
```

Use **stp no-agreement-check** to enable No Agreement Check on a port.

Use **undo stp no-agreement-check** to disable No Agreement Check on a port.

Syntax

stp no-agreement-check

undo stp no-agreement-check

Default

No Agreement Check is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only after you enable it on the root port.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable No Agreement Check on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp no-agreement-check
```

8.1.34. stp pathcost-standard

Use **stp pathcost-standard** to specify a standard for the device to use when calculating the default path costs for ports.

Use **undo stp pathcost-standard** to restore the default.

Syntax

stp pathcost-standard { **dot1d-1998** | **dot1t** | **legacy** }

undo stp pathcost-standard

Default

The default standard used by the device is **legacy**.

Views

System view

Predefined user roles

network-admin

Parameters

dot1d-1998: Configures the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

dot1t: Configures the device to calculate the default path cost for ports based on IEEE 802.1t.

legacy: Configures the device to calculate the default path cost for ports based on a private standard.

Usage guidelines

If you change the standard that the device uses in calculating the default path costs, you restore the path costs to the default.

Examples

Configure the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

```
<Switch> system-view
[Switch] stp pathcost-standard dot1d-1998
```

Related commands

display stp

stp cost

8.1.35. stp point-to-point

Use **stp point-to-point** to configure the link type of a port.

Use **undo stp point-to-point** to restore the default.

Syntax

stp point-to-point { **auto** | **force-false** | **force-true** }

undo stp point-to-point

Default

The default setting is **auto,** and the spanning tree device automatically detects whether a port connects to a point-to-point link.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

auto: Specifies automatic detection of the link type.

force-false: Specifies the non-point-to-point link type.

force-true: Specifies the point-to-point link type.

Usage guidelines

When connecting to a non-point-to-point link, a port is incapable of rapid state transition.

You can configure the link type as point-to-point for a Layer 2 aggregate interface or a port that operates in full duplex mode. As a best practice, use the default setting to let the device automatically detect the port link type.

In MSTP or PVST mode, the **stp point-to-point force-false** or **stp point-to-point force-true** command configured on a port takes effect on all MSTIs or VLANs.

Before you set the link type of a port to point-to-point, make sure the port is connected to a point-to-point link. Otherwise, a temporary loop might occur.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure the link type of GigabitEthernet 1/0/1 as point-to-point.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp point-to-point force-true
```

Related commands

display stp

8.1.36. stp port bpdu-protection

Use **stp port bpdu-protection** to configure BPDU guard on an interface.

Use **undo stp port bpdu-protection** to restore the default.

Syntax

stp port bpdu-protection { **enable** | **disable** }

undo stp port bpdu-protection

Default

BPDU guard is not configured on a per-edge port basis. The status of BPDU guard on an interface is the same as the global BPDU guard status.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

enable: Enables BPDU guard.

disable: Disables BPDU guard.

Usage guidelines

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable BPDU guard on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp port bpdu-protection enable
```

Related commands

stp bpdu-protection

stp edged-port

8.1.37. stp port priority

Use **stp port priority** to set the priority of a port. The port priority affects the role of a port in a spanning tree.

Use **undo stp port priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority**

Default

The port priority is 128.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the port priority in the range of 0 to 240 in increments of 16 (as in 0, 16, 32).

Usage guidelines

The smaller the value, the higher the port priority. If all ports on your device use the same priority value, the port priority depends on the port index. The smaller the index, the higher the priority.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command configures the priority of the ports in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the port priority of GigabitEthernet 1/0/1 to 16 in MSTI 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp instance 2 port priority 16
```

In PVST mode, set the port priority of GigabitEthernet 1/0/1 to 16 in VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp vlan 2 port priority 16
```

Related commands

display stp

8.1.38. stp port shutdown permanent

Use **stp port shutdown permanent** to disable the device from reactivating edge ports shut down by BPDU guard.

Use **undo stp port shutdown permanent** to restore the default.

Syntax

stp port shutdown permanent

undo stp port shutdown permanent

Default

The device reactivates an edge port shut down by BPDU guard after the port status detection timer expires.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on edge ports shut down by BPDU guard after this command is configured. The device does not bring up the shutdown ports if you execute the **undo stp port shutdown permanent** command. To bring up these ports, you must use the **undo shutdown** command.

For more information about the port status detection timer, see device management configuration in *Fundamentals Configuration Guide*.

Examples

Disable the device from reactivating edge ports shut down by BPDU guard.

```
<Switch> system-view
[Switch] stp port shutdown permanent
```

8.1.39. stp port-log

Use **stp port-log** to enable outputting port state transition information.

Use **undo stp port-log** to disable outputting port state transition information.

Syntax

stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

undo stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

Default

Outputting port state transition information is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

all: Specifies all MSTIs or VLANs.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Examples

In MSTP mode, enable outputting port state transition information for MSTI 2.

```
<Switch> system-view
[Switch] stp port-log instance 2
%Aug 16 00:49:41:856 2011 Switch STP/3/STP_DISCARDING: Instance 2's port
GigabitEthernet1/0/1 has been set to discarding state.
%Aug 16 00:49:41:856 2011 Switch STP/3/STP_FORWARDING: Instance 2's port
GigabitEthernet1/0/2 has been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in MSTI 2 transited to the discarding state and GigabitEthernet 1/0/2 in MSTI 2 transited to the forwarding state.

In PVST mode, enable outputting port state transition information for VLAN 1 through VLAN 4094.

```
<Switch> system-view
[Switch] stp port-log vlan 1 to 4094
%Aug 16 00:49:41:856 2006 Switch STP/3/STP_DISCARDING: VLAN 2's GigabitEthernet1/0/1 has
been set to discarding state.
%Aug 16 00:49:41:856 2006 Switch STP/3/STP_FORWARDING: VLAN 2's GigabitEthernet1/0/2 has
been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in VLAN 2 transited to the discarding state and GigabitEthernet 1/0/2 in VLAN 2 transited to the forwarding state.

8.1.40. stp priority

Use **stp priority** to set the priority of the device.

Use **undo stp priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority**

Default

The device priority is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the device priority in the range of 0 to 61440 in increments of 4096 (as in 0, 4096, 8192). You can set up to 16 priority values on the device. The smaller the value, the higher the device priority.

Usage guidelines

If you do not specify an MSTI or VLAN, this command configures the priority of the device in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the device priority to 4096 in MSTI 1.

```
<Switch> system-view
[Switch] stp instance 1 priority 4096
```

In PVST mode, set the device priority to 4096 in VLAN 1.

```
<Switch> system-view
[Switch] stp vlan 1 priority 4096
```

8.1.41. stp pvst-bpdu-protection

Use **stp pvst-bpdu-protection** to enable PVST BPDU guard.

Use **undo stp pvst-bpdu-protection** to disable PVST BPDU guard.

Syntax

stp pvst-bpdu-protection

undo stp pvst-bpdu-protection

Default

PVST BPDU guard is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

PVST BPDU guard enables an MSTP-enabled device to shut down a port if the port receives PVST BPDUs. The shutdown port is brought up after a detection timer expires. To set the detection timer, use the **shutdown-interval** command.

Examples

In MSTP mode, enable PVST BPDU guard.

```
<Switch> system-view
[Switch] stp pvst-bpdu-protection
```

Related commands

shutdown-interval (For more information, see *Fundamentals Command Reference*.)

8.1.42. stp region-configuration

Use **stp region-configuration** to enter MST region view.

Use **undo stp region-configuration** to restore the default MST region configurations.

Syntax

stp region-configuration

undo stp region-configuration

Default

The default settings for an MST region are as follows:

- The MST region name of the device is its MAC address.
- All VLANs are mapped to the CIST.
- The MSTP revision level is 0.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enter MST region view, you can configure MST region parameters, including the region name, VLAN-to-instance mappings, and revision level.

Examples

Enter MST region view.

```
<Switch> system-view
```

```
[Switch] stp region-configuration
[Switch-mst-region]
```

8.1.43. stp role-restriction

Use **stp role-restriction** to enable port role restriction.

Use **undo stp role-restriction** to disable port role restriction.

Syntax

stp role-restriction

undo stp role-restriction

Default

Port role restriction is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

When port role restriction is enabled on a port, the port cannot become a root port.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable port role restriction on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp role-restriction
```

8.1.44. stp root primary

Use **stp root primary** to configure the device as the root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root primary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a root bridge.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as the root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures the device as the root bridge of the MSTP CIST or of the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as the root bridge of MSTI 1.

```
<Switch> system-view
[Switch] stp instance 1 root primary
```

In PVST mode, specify the device as the root bridge of VLAN 1.

```
<Switch> system-view
[Switch] stp vlan 1 root primary
```

Related commands

stp priority

stp root secondary

8.1.45. stp root secondary

Use **stp root secondary** to configure the device as a secondary root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root secondary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a secondary root bridge.

Views

System view

Predefined user roles

network-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as a secondary root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures a secondary root bridge for the MSTP CIST or the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as a secondary root bridge in MSTI 1.

```
<Switch> system-view
[Switch] stp instance 1 root secondary
```

In PVST mode, specify the device as a secondary root bridge in VLAN 1.

```
<Switch> system-view
[Switch] stp vlan 1 root secondary
```

Related commands

stp priority

stp root primary

8.1.46. stp root-protection

Use **stp root-protection** to enable root guard on a port.

Use **undo stp root-protection** to disable root guard on a port.

Syntax

stp root-protection

undo stp root-protection

Default

Root guard is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

[Switch-GigabitEthernet1/0/1] stp root-protection
```

Related commands

stp edged-port

stp loop-protection

8.1.47. stp tc-protection

Use **stp tc-protection** to enable TC-BPDU attack guard for the device.

Use **undo stp tc-protection** to disable TC-BPDU attack guard for the device.

Syntax

stp tc-protection

undo stp tc-protection

Default

TC-BPDU attack guard is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

With TC-BPDU guard, you can set the maximum number of immediate forwarding address entry flushes that the device can perform every 10 seconds. For TC-BPDUs received that exceed the limit, the device performs a forwarding address entry flush when the interval elapses. This prevents frequent flushing of forwarding address entries.

Examples

Disable TC-BPDU attack guard for the device.

```
<Switch> system-view
[Switch] undo stp tc-protection
```

Related commands

stp tc-protection threshold

8.1.48. stp tc-protection threshold

Use **stp tc-protection threshold** to set the maximum number of forwarding address entry flushes that the device can perform every 10 seconds.

Use **undo stp tc-protection threshold** to restore the default.

Syntax

stp tc-protection threshold *number*

undo stp tc-protection threshold

Default

By default, the device can perform a maximum of 6 forwarding address entry flushes every 10 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of immediate forwarding address entry flushes that the device can perform every 10 seconds. The value is in the range of 1 to 255.

Examples

Configure the device to perform up to 10 forwarding address entry flushes every 10 seconds.

```
<Switch> system-view
[Switch] stp tc-protection threshold 10
```

Related commands

stp tc-protection

8.1.49. stp tc-snooping

Use **stp tc-snooping** to enable TC Snooping.

Use **undo stp tc-snooping** to disable TC Snooping.

Syntax

stp tc-snooping

undo stp tc-snooping

Default

TC Snooping is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

TC Snooping and the spanning tree feature are mutually exclusive. You must globally disable the spanning tree feature before enabling TC Snooping.

Examples

Globally disable the spanning tree feature and enable TC Snooping.

```
<Switch> system-view
```

```
[Switch] undo stp global enable
[Switch] stp tc-snooping
```

Related commands

stp global enable

8.1.50. stp timer forward-delay

Use **stp timer forward-delay** to set the forward delay timer.

Use **undo stp timer forward-delay** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer forward-delay** *time*

undo stp [**vlan** *vlan-id-list*] **timer forward-delay**

Default

The forward delay timer is 1500 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP forward delay, do not specify this option.

time: Specifies the forward delay in centiseconds, in the range of 400 to 3000 in increments of 100 (as in 400, 500, 600).

Usage guidelines

The forward delay timer determines the time interval of state transition. To prevent temporary loops, a spanning tree port goes through the learning (intermediate) state before it transits from the discarding state to the forwarding state. To stay synchronized with the remote device, the port has a wait period that is determined by the forward delay timer between transition states.

As a best practice, do not set the forward delay with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the forward delay timer. If the network diameter uses the default value, the forward delay timer also uses the default value.

Examples

In MSTP mode, set the forward delay timer to 2000 centiseconds.

```
<Switch> system-view
[Switch] stp timer forward-delay 2000
```

In PVST mode, set the forward delay timer for VLAN 2 to 2000 centiseconds.

```
<Switch> system-view
[Switch] stp vlan 2 timer forward-delay 2000
```

Related commands

stp bridge-diameter

stp timer hello

stp timer max-age

8.1.51. stp timer hello

Use **stp timer hello** to set the hello time.

Use **undo stp timer hello** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer hello** *time*

undo stp [**vlan** *vlan-id-list*] **timer hello**

Default

The hello time is 200 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP hello time, do not specify this option.

time: Specifies the hello time in centiseconds, in the range of 100 to 1000 in increments of 100 (as in 100, 200, 300).

Usage guidelines

Hello time is the interval at which spanning tree devices send configuration BPDUs to maintain the spanning tree. If a device fails to receive configuration BPDUs within the set period of time, a new spanning tree calculation process is triggered.

As a best practice, do not set the hello time with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the hello timer. If the network diameter uses the default value, the hello timer also uses the default value.

Examples

In MSTP mode, set the hello time to 400 centiseconds.

```
<Switch> system-view
[Switch] stp timer hello 400
```

In PVST mode, set the hello time for VLAN 2 to 400 centiseconds.

```
<Switch> system-view
[Switch] stp vlan 2 timer hello 400
```

stp timer max-age

8.1.52. stp timer max-age

Use **stp timer max-age** to set the max age timer.

Use **undo stp timer max-age** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer max-age** *time*

undo stp [**vlan** *vlan-id-list*] **timer max-age**

Default

The max age is 2000 centiseconds.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP max age, do not specify this option.

time: Specifies the max age in centiseconds, in the range of 600 to 4000 in increments of 100 (as in 600, 700, 800).

Usage guidelines

In the CIST of an MSTP network, the device determines whether a configuration BPDU received on a port has expired based on the max age timer. If the configuration BPDU has expired, a new spanning tree calculation process starts. The max age timer takes effect only on the CIST (or MSTI 0).

As a best practice, do not set the max age timer with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the max age timer. If the network diameter uses the default value, the max age timer also uses the default value.

Examples

In MSTP mode, set the max age timer to 1000 centiseconds.

```
<Switch> system-view
[Switch] stp timer max-age 1000
```

In PVST mode, set the max age timer for VLAN 2 to 1000 centiseconds.

```
<Switch> system-view
[Switch] stp vlan 2 timer max-age 1000
```

Related commands

stp bridge-diameter

stp timer forward-delay

stp timer hello

8.1.53. stp timer-factor

Use **stp timer-factor** to configure the timeout period by setting the timeout factor.

Timeout period = timeout factor × 3 × hello time.

Use **undo stp timer-factor** to restore the default.

Syntax

stp timer-factor *factor*

undo stp timer-factor

Default

The timeout factor of the device is set to 3.

Views

System view

Predefined user roles

network-admin

Parameters

factor: Specifies the timeout factor in the range of 1 to 20.

Usage guidelines

In a stable network, each non-root-bridge forwards configuration BPDUs to surrounding devices at the interval of hello time to determine whether any link fails. If a device does not receive a BPDU from the upstream device within nine times of the hello time, it assumes that the upstream device has failed. Then it will start a new spanning tree calculation process.

As a best practice, set the timeout factor to 5, 6, or 7 in the following situations:

- To prevent undesired spanning tree calculations. An upstream device might be too busy to forward configuration BPDUs in time, for example, many Layer 2 interfaces are configured on the upstream device. In this case, the downstream device fails to receive a BPDU within the timeout period and then starts an undesired spanning tree calculation.
- To save network resources on a stable network.

Examples

Set the timeout factor of the device to 7.

```
<Switch> system-view
[Switch] stp timer-factor 7
```

Related commands

stp timer hello

8.1.54. stp transmit-limit

Use **stp transmit-limit** to set the BPDU transmission rate of a port.

Use **undo stp transmit-limit** to restore the default.

Syntax

stp transmit-limit *limit*

undo stp transmit-limit

Default

The BPDU transmission rate of all ports is 10.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

limit: Specifies the BPDU transmission rate in the range of 1 to 255.

Usage guidelines

The maximum number of BPDUs a port can send within each hello time equals the BPDU transmission rate plus the hello timer value.

A larger BPDU transmission rate value requires more system resources. An appropriate BPDU transmission rate setting can prevent spanning tree protocols from using excessive bandwidth resources during network topology changes. As a best practice, use the default value.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Set the BPDU transmission rate of GigabitEthernet 1/0/1 to 5.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] stp transmit-limit 5
```

8.1.55. stp vlan enable

Use **stp vlan enable** to enable the spanning tree feature for VLANs.

Use **undo stp enable** to disable the spanning tree feature for VLANs.

Syntax

stp vlan *vlan-id-list* **enable**

undo stp vlan *vlan-id-list* **enable**

Default

The spanning tree feature is enabled in VLANs.

Views

System view

Predefined user roles

network-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

When you enable the spanning tree feature, the device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

When you enable the spanning tree feature, the device dynamically maintains the spanning tree status of VLANs, based on received configuration BPDUs. When you disable the spanning tree feature, the device stops maintaining the spanning tree status.

Examples

In PVST mode, globally enable the spanning tree feature and then enable the spanning tree feature for VLAN 2.

```
<Switch> system-view
[Switch] stp mode pvst
[Switch] stp global enable
[Switch] stp vlan 2 enable
```

Related commands

stp enable

stp global enable

stp mode

8.1.56. vlan-mapping modulo

Use **vlan-mapping modulo** to map VLANs in an MST region to MSTIs according to the specified modulo value and quickly create a VLAN-to-instance mapping table.

Syntax

vlan-mapping modulo *modulo*

Default

All VLANs are mapped to the CIST (MSTI 0).

Views

MST region view

Predefined user roles

network-admin

Parameters

modulo: Specifies the modulo value. The value range for this argument is 1 to 64.

Usage guidelines

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

This command maps each VLAN to the MSTI with ID (VLAN ID – 1) % *modulo* + 1. (VLAN ID – 1) % *modulo* is the modulo operation for (VLAN ID – 1). If the modulo value is 15, then VLAN 1 is mapped to MSTI 1, VLAN 2 to MSTI 2, …, VLAN 15 to MSTI 15, VLAN 16 to MSTI 16, and so on.

Examples

Map VLANs to MSTIs as per modulo 8.

```
<Switch> system-view
[Switch] stp region-configuration
[Switch-mst-region] vlan-mapping modulo 8
```

9. Loop detection commands

9.1. Loop detection commands

9.1.1. display loopback-detection

Use **display loopback-detection** to display the loop detection configuration and status.

Syntax

display loopback-detection

Views

Any view

Predefined user roles

network-admin

network-operator

Example

Display the loop detection configuration and status.

```
<Switch> display loopback-detection
Loopback detection is enabled.
Loopback detection interval is 30 second(s).
Loopback is detected on following interfaces:
 Interface                Action mode     VLANs
 GigabitEthernet1/0/1     Shutdown        10
```

Table 9-1 Command output

Field	Description
Action mode	Loop protection action: • **Block**—When a loop is detected on a port, the device performs the following operations: ○ Generates a log. ○ Disables the port from learning MAC addresses. ○ Blocks the port. • **None**—When a loop is detected on a port, the device generates a log but performs no action on the port. • **No-learning**—When a loop is detected on a port, the device generates a log and disables the port from learning MAC addresses. • **Shutdown**—When a loop is detected on a port, the device performs the following operations: ○ Generates a log. ○ Shuts down the port to disable the port from receiving or sending frames. The device automatically sets the port to the forwarding state after a time interval. Set the time interval by using the **shutdown-interval** command (see *Fundamentals Command Reference*).
VLANs	VLANs to which the interface belongs and where loops are detected.

9.1.2. loopback-detection action

Use **loopback-detection action** to set the loop protection action on a per-port basis.

Use **undo loopback-detection action** to restore the default.

Syntax

In Layer 2 Ethernet interface view:

loopback-detection action { **block** | **no-learning** | **shutdown** }

undo loopback-detection action

In Layer 2 aggregate interface view:

loopback-detection action shutdown

undo loopback-detection action

Default

When the device detects a loop on a port, it generates a log but performs no action on the port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

block: Enables the block mode. If a loop is detected, the device performs the following operations:

- Generates a log.
- Disables MAC address learning.
- Blocks the port.

Layer 2 aggregate interfaces do not support this keyword.

no-learning: Enables the no-learning mode. If a loop is detected, the device generates a log and disables MAC address learning on the port. Layer 2 aggregate interfaces do not support this keyword.

shutdown: Enables the shutdown mode. If a loop is detected, the device generates a log and shuts down the port. The device automatically sets the port to the forwarding state after the time interval set by using the **shutdown-interval** command (see *Fundamentals Command Reference*).

Usage guidelines

To set the loop protection action globally, use the **loopback-detection global action** command.

The global configuration applies to all ports. The per-port configuration applies to the individual ports. The per-port configuration takes precedence over the global configuration.

Example

Set the loop protection action to **shutdown** on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] loopback-detection action shutdown
```

Related commands

display loopback-detection

loopback-detection global action

9.1.3. loopback-detection enable

Use **loopback-detection enable** to enable loop detection on a per-port basis.

Use **undo loopback-detection enable** to disable loop detection on a port.

Syntax

loopback-detection enable vlan { *vlan-id-list* | **all** }

undo loopback-detection enable vlan { *vlan-id-list* | **all** }

Default

Loop detection is disabled on ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The ID for *vlan-id2* must be no less than the ID for *vlan-id1*.

all: Specifies all existing VLANs.

Usage guidelines

You can enable loop detection globally or on a per-port basis. When a port receives a detection frame in any VLAN, the loop protection action is triggered on that port, regardless of whether loop detection is enabled on it.

Example

Enable loop detection on GigabitEthernet 1/0/1 for VLAN 10 through VLAN 20.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] loopback-detection enable vlan 10 to 20
```

Related commands

display loopback-detection

loopback-detection global enable

9.1.4. loopback-detection global action

Use **loopback-detection global action** to set the global loop protection action.

Use **undo loopback-detection global action** to restore the default.

Syntax

loopback-detection global action shutdown

undo loopback-detection global action

Default

When the device detects a loop on a port, it generates a log but performs no action on the port.

Views

System view

Predefined user roles

network-admin

Parameters

shutdown: Enables the shutdown mode. If a loop is detected, the device generates a log and shuts down the port. The device automatically sets the port to the forwarding state after you set the time interval by using the **shutdown-interval** command (see *Fundamentals Command Reference*).

Usage guidelines

To set the loop protection action on a per-port basis, use the **loopback-detection action** command in interface view.

The global configuration applies to all ports. The per-port configuration applies to the individual ports. The per-port configuration takes precedence over the global configuration.

Example

Set the global loop protection action to **shutdown**.

```
<Switch> system-view
[Switch] loopback-detection global action shutdown
```

Related commands

display loopback-detection

loopback-detection action

9.1.5. loopback-detection global enable

Use **loopback-detection global enable** to enable loop detection globally.

Use **undo loopback-detection global enable** to disable loop detection globally.

Syntax

loopback-detection global enable vlan { *vlan-id-list* | **all** }

undo loopback-detection global enable vlan { *vlan-id-list* | **all** }

Default

Loop detection is globally enabled.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The ID for *vlan-id2* must be equal to or greater than the ID for *vlan-id1*.

all: Specifies all existing VLANs.

Usage guidelines

You can enable loop detection globally or on a per-port basis. When a port receives a detection frame in any VLAN, the loop protection action is triggered on that port, regardless of whether loop detection is enabled on it.

Example

Globally enable loop detection for VLAN 10 through VLAN 20.

```
<Switch> system-view
[Switch] loopback-detection global enable vlan 10 to 20
```

Related commands

display loopback-detection

loopback-detection enable

9.1.6. loopback-detection interval-time

Use **loopback-detection interval-time** to set the loop detection interval.

Use **undo loopback-detection interval-time** to restore the default.

Syntax

loopback-detection interval-time *interval*

undo loopback-detection interval-time

Default

The loop detection interval is 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the loop detection interval in the range of 1 to 300 seconds.

Usage guidelines

With loop detection enabled, the device sends loop detection frames at the specified interval. A shorter interval offers more sensitive detection but consumes more resources. Consider the system performance and loop detection speed when you set the loop detection interval.

Using **undo loopback-detection interval-time** cannot restore the default. You must use the **loopback-detection interval-time 5** command to reconfigure the interval-time.

Example

Set the loop detection interval to 10 seconds.

```
<Switch> system-view
```

```
[Switch] loopback-detection interval-time 10
```

Related commands

display loopback-detection

10. VLAN commands

10.1. Basic VLAN commands

10.1.1. description

Use **description** to configure the description of a VLAN or VLAN interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

For a VLAN, the description is **VLAN** *vlan-id*. The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the default description of VLAN 100 is **VLAN 0100**.

For a VLAN interface, the description is the name of the interface. For example, **Vlan-interface1 Interface**.

Views

VLAN view

VLAN interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

To manage VLANs and VLAN interfaces efficiently, configure descriptions for them based on their functions or connections.

Examples

Configure the description of VLAN 2 as **sales-private**.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] description sales-private
```

Configure the description of VLAN-interface 2 as **linktoPC56**.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] quit
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] description linktoPC56
```

Related commands

display vlan

10.1.2. display interface vlan-interface

Use **display interface vlan-interface** to display VLAN interface information.

Syntax

display interface vlan-interface [*interface-number*] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface number. If you do not specify this argument, the command displays information about all VLAN interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays VLAN interfaces in down state and their down causes. If you do not specify this keyword, the command displays information about VLAN interfaces in all states.

Examples

Display information about VLAN-interface 10.

```
<Switch> display interface vlan-interface 10
Vlan-interface10
Current state: UP
Line protocol state: UP
Description: Vlan-interface10 Interface
Bandwidth: 100000 kbps
Maximum transmission unit: 1500
Internet Address is 192.168.1.54/24 Primary
IP packet frame type: Ethernet II, hardware address: 0023-89b6-d613
IPv6 packet frame type: Ethernet II, hardware address: 0023-89b6-d613
Last clearing of counters: Never
```

Display brief information about VLAN-interface 2.

```
<Switch> display interface vlan-interface 2 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
Vlan2                DOWN DOWN     --
```

Table 10-1 Command output

Field	Description
Vlan-interface2	VLAN interface name.
Current state	Physical link state of the VLAN interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down. The VLAN of this VLAN interface does not contain any physical ports in up state. The ports might not be connected correctly or the links might have failed. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the VLAN interface: • **DOWN**—The link layer protocol state of the interface is down. • **UP**—The link layer protocol state of the interface is up.
Description	Description of the VLAN interface.
Bandwidth	Expected bandwidth of the VLAN interface.
Maximum transmission unit	MTU of the VLAN interface.
Internet protocol processing : Disabled	The VLAN interface is not assigned an IP address and cannot process IP packets.
Internet Address	IP address of the VLAN interface. The **primary** attribute indicates that the address is the primary IP address.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address of the VLAN interface.
IPv6 packet frame type	IPv6 packet framing format.
Last clearing of counters	The most recent time that the **reset counters interface vlan-interface** command was executed. This field displays **Never** if you have never executed this command.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol state of the

Field	Description
	interface is up. • **DOWN**—The data link layer protocol state of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag.
Primary IP	Primary IP address of the interface.

Related commands

reset counters interface vlan-interface

10.1.3. display vlan

Use **display vlan** to display VLAN information.

Syntax

display vlan [*vlan-id1* [**to** *vlan-id2*] | **all** | **dynamic** | **reserved** | **static**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id1: Specifies a VLAN by its ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies a VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs except the reserved VLANs.

dynamic: Specifies dynamic VLANs. If you specify this keyword, the command displays the total number of dynamic VLANs and each dynamic VLAN ID. Dynamic VLANs are generated through MVRP or assigned by a RADIUS server.

reserved: Specifies reserved VLANs. Protocol modules determine which VLANs are reserved according to function implementation. The reserved VLANs provide services for protocol modules. You cannot configure reserved VLANs.

static: Specifies static VLANs. If you specify this keyword, the command displays the total number of static VLANs and each static VLAN ID. Static VLANs are manually created.

Examples

Display information about VLAN 2.

```
<Switch> display vlan 2
 VLAN ID: 2
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0002
 Name: VLAN 0002
```

```
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/1  GigabitEthernet1/0/2  GigabitEthernet1/0/3
```

Display information about VLAN 3.

```
<Switch> display vlan 3
 VLAN ID: 3
 VLAN type: static
 Route interface: Configured
 IPv4 address: 1.1.1.1
 IPv4 subnet mask: 255.255.255.0
 Description: VLAN 0003
 Name: VLAN 0003
 Tagged ports:   None
 Untagged ports: None
```

Table 10-2 Command output

Field	Description
VLAN type	VLAN type, static or dynamic.
Route interface	Whether the VLAN interface is configured for the VLAN. • Not configured. • Configured.
Description	Description of the VLAN.
Name	VLAN name.
IP address	Primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface. When the VLAN interface is also configured with secondary IPv4 addresses, you can view them by using one of the following commands: • **display interface vlan-interface**. • **display this** (VLAN interface view).
Subnet mask	Subnet mask of the primary IP address. This field is available only when an IP address is configured for the VLAN interface.
Tagged ports	Tagged members of the VLAN.
Untagged ports	Untagged members of the VLAN.

Related commands

vlan

10.1.4. display vlan brief

Use **display vlan brief** to display brief VLAN information.

Syntax

display vlan brief

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display brief VLAN information.

```
<Switch> display vlan brief
Brief information about all VLANs:
Supported Minimum VLAN ID: 1
Supported Maximum VLAN ID: 4094
Default VLAN ID: 1
VLAN ID   Name                                Port
1         VLAN 0001                           GE1/0/1  GE1/0/2  GE1/0/3  GE1/0/4
                                              GE1/0/5  GE1/0/6  GE1/0/7  GE1/0/8
                                              GE1/0/9  GE1/0/10  GE1/0/11
                                              GE1/0/12  GE1/0/13  GE1/0/14
                                              GE1/0/15  GE1/0/16  GE1/0/17
                                              GE1/0/18  GE1/0/19  GE1/0/20
                                              GE1/0/21  GE1/0/22  GE1/0/23
                                              GE1/0/24  GE1/0/25  GE1/0/26
                                              GE1/0/27  GE1/0/28  GE1/0/29
                                              GE1/0/30  GE1/0/31  GE1/0/32
                                              GE1/0/33  GE1/0/34  GE1/0/35
                                              GE1/0/36  GE1/0/37  GE1/0/38
                                              GE1/0/39  GE1/0/40  GE1/0/41
                                              GE1/0/42  GE1/0/43  GE1/0/44
                                              GE1/0/45  GE1/0/46  GE1/0/47
                                              GE1/0/48
2         VLAN 0002
3         VLAN 0003
```

Table 10-3 Command output

Field	Description
Default VLAN ID	System default VLAN ID.
Name	VLAN name.
Port	Ports that allow packets from the VLAN to pass through.

10.1.5. interface vlan-interface

Use **interface vlan-interface** to create a VLAN interface and enter its view, or enter the view of an existing VLAN interface.

Use **undo interface vlan-interface** to delete a VLAN interface.

Syntax

interface vlan-interface *interface-number*

undo interface vlan-interface *interface-number*

Default

No VLAN interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

interface-number: Specifies a VLAN interface number in the range of 1 to 4094.

Usage guidelines

Create the VLAN before you create the VLAN interface for a VLAN.

You cannot create VLAN interfaces for sub-VLANs.

You cannot create VLAN interfaces for secondary VLANs that meet the following requirements:

- Associated with the same primary VLAN.
- Enabled with Layer 3 communication in VLAN interface view of the primary VLAN interface.

Examples

Create VLAN-interface 2, and enter its view.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] quit
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2]
```

Related commands

display interface vlan-interface

10.1.6. mac-address

Use **mac-address** to assign a MAC address to a VLAN interface.

Use **undo mac-address** to restore the default.

Syntax

mac-address *mac-address*

undo mac-address

Default

No MAC address is configured for a VLAN interface.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in the format of H-H-H.

Examples

Assign MAC address 0001-0001-0001 to VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] mac-address 1-1-1
```

10.1.7. name

Use **name** to assign a name to a VLAN.

Use **undo name** to restore the default.

Syntax

name *text*

undo name

Default

The name of a VLAN is **VLAN** *vlan-id*. The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the name of VLAN 100 is **VLAN 0100**.

Views

VLAN view

Predefined user roles

network-admin

Parameters

text: Specifies a VLAN name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For 802.1X or MAC authentication, you can specify authorization VLANs by their names or IDs. If a large number of VLANs are configured, use VLAN names to identify them.

Examples

Assign the name **test vlan** to VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] name test vlan
```

Related commands

display vlan

10.1.8. reset counters interface vlan-interface

Use **reset counters interface vlan-interface** to clear statistics on a VLAN interface.

Syntax

reset counters interface vlan-interface [*interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface by its number. If you do not specify the *interface-number* argument, this command clears statistics on all VLAN interfaces.

Usage guidelines

Use this command to clear the history statistics before you collect statistics within a time period.

Examples

Clear statistics on VLAN-interface 2.

```
<Switch> reset counters interface vlan-interface 2
```

Related commands

display interface vlan-interface

10.1.9. shutdown

Use **shutdown** to shut down a VLAN interface.

Use **undo shutdown** to bring up a VLAN interface.

Syntax

shutdown

undo shutdown

Default

A VLAN interface is not manually shut down, and the following guidelines apply to the interface state:

- The VLAN interface is down if all ports in the VLAN are down.
- The VLAN interface is up if one or more ports in the VLAN are up.

Views

VLAN interface view

Predefined user roles

network-admin

Usage guidelines

When you use this command to shut down a VLAN interface, the VLAN interface remains in DOWN (Administratively) state. In this case, the VLAN interface state is not affected by the state of the ports in the VLAN.

Before you configure parameters for a VLAN interface, use this command to shut it down to prevent the configuration from affecting the network. After you complete the VLAN interface configuration, use the **undo shutdown** command to make the settings take effect.

To troubleshoot a failed VLAN interface, you can use the **shutdown** command and then the **undo shutdown** command on the interface to see whether it recovers.

In a VLAN, the state of each Ethernet port is independent of the state of the VLAN interface.

Examples

Shut down VLAN-interface 2, and then bring it up.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] shutdown
[Switch-Vlan-interface2] undo shutdown
```

10.1.10. vlan

Use **vlan** *vlan-id-list* to create VLANs in batches, except reserved VLANs.

Use **vlan all** to create VLANs 1 through 4094.

Use **undo vlan** to delete the specified VLANs.

Syntax

vlan { *vlan-id-list* | **all** }

undo vlan { *vlan-id-list* | **all** }

Default

VLAN 1 (system default VLAN) exists.

Views

System view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

all: Specifies all VLANs except reserved VLANs. The keyword is not supported when the maximum number of VLANs that can be created on a device is less than 4094.

Usage guidelines

You cannot create or delete the system default VLAN (VLAN 1) or reserved VLANs.

Before you delete a dynamic VLAN or a VLAN locked by an application, you must first remove the configuration from the VLAN.

Examples

Create VLAN 2 and enter its view.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2]
```

Create VLAN 2 and VLANs 4 through 100.

```
<Switch> system-view
```

```
[Switch] vlan 2 4 to 100
```

Related commands

display vlan

10.2. Port-based VLAN commands

10.2.1. display port

Use **display port** to display information about hybrid or trunk ports.

Syntax

display port { **hybrid** | **trunk** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

hybrid: Specifies hybrid ports.

trunk: Specifies trunk ports.

Examples

Display information about hybrid ports.

```
<Switch> display port hybrid
Interface            PVID  VLAN Passing
GE1/0/1              100   Tagged:  1000, 1002, 1500, 1600-1611, 2000,
                                    2555-2558, 3000, 4000
                           Untagged:1, 10, 15, 18, 20-30, 44, 55, 67, 100,
                                    150-160, 200, 255, 286, 300-302
```

Display information about trunk ports.

```
<Switch> display port trunk
Interface            PVID  VLAN Passing
GE1/0/2              2     1-4, 6-100, 145, 177, 189-200, 244, 289, 400,
                           555, 600-611, 1000, 2006-2008
```

Table 10-4 Command output

Field	Description
Interface	Interface name.
PVID	Port VLAN ID.
VLAN Passing	Existing VLANs allowed on the port.
Tagged	VLANs from which the port sends packets without removing VLAN tags.
Untagged	VLANs from which the port sends packets after removing VLAN tags.

10.2.2. port

Use **port** to assign the specified access ports to a VLAN.

Use **undo port** to remove the specified access ports from a VLAN.

Syntax

port *interface-list*

undo port *interface-list*

Default

All ports are in VLAN 1.

Views

VLAN view

Predefined user roles

network-admin

Parameters

interface-list: Specifies a space-separated list of up to 10 Ethernet interface items. Each item specifies an Ethernet interface or a range of Ethernet interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. The value for the *interface-number2* argument must be equal to or greater than the value for the *interface-number1* argument.

Usage guidelines

This command is applicable only to access ports.

By default, all ports are access ports. You can manually configure the port link type. For more information, see "port link-type."

Examples

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Related commands

display vlan

10.2.3. port access vlan

Use **port access vlan** to assign an access port to the specified VLAN.

Use **undo port access vlan** to restore the default.

Syntax

port access vlan *vlan-id*

undo port access vlan

Default

All access ports belong to VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

Before assigning an access port to a VLAN, make sure the VLAN has been created.

Examples

Assign GigabitEthernet 1/0/1 to VLAN 3.

```
<Switch> system-view
[Switch] vlan 3
[Switch-vlan3] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port access vlan 3
```

10.2.4. port hybrid pvid

Use **port hybrid pvid** to set the PVID of a hybrid port.

Use **undo port hybrid pvid** to set the PVID of a hybrid port to 1.

Syntax

port hybrid pvid vlan *vlan-id*

undo port hybrid pvid

Default

The PVID of a hybrid port is the ID of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID of a hybrid port. When you delete the PVID of a hybrid port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local hybrid port and its peer.

To enable a hybrid port to transmit packets from its PVID, you must assign the hybrid port to the PVID by using the **port hybrid vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, set its PVID to VLAN 100, and assign it to VLAN 100 as an untagged member.

```
<Switch> system-view
[Switch] vlan 100
[Switch-vlan100] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type hybrid
[Switch-GigabitEthernet1/0/1] port hybrid pvid vlan 100
[Switch-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Related commands

port hybrid vlan

port link-type

10.2.5. port hybrid vlan

Use **port hybrid vlan** to assign a hybrid port to the specified VLANs.

Use **undo port hybrid vlan** to remove a hybrid port from the specified VLANs.

Syntax

port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

undo port hybrid vlan *vlan-id-list*

Default

A hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. The specified VLANs must already exist on the device.

tagged: Configures the port as a tagged member of the specified VLANs. A tagged member of a VLAN sends packets from the VLAN without removing VLAN tags.

untagged: Configures the port as an untagged member of the specified VLANs. An untagged member of a VLAN sends packets from the VLAN after removing VLAN tags.

Usage guidelines

A hybrid port can allow multiple VLANs. If you execute this command multiple times on a hybrid port, the hybrid port allows all the specified VLANs.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100 as a tagged member.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type hybrid
[Switch-GigabitEthernet1/0/1] port hybrid vlan 2 4 50 to 100 tagged
```

Related commands

port link-type

10.2.6. port link-type

Use **port link-type** to set the link type of a port.

Use **undo port link-type** to restore the default link type of a port.

Syntax

port link-type { **access** | **hybrid** | **trunk** }

undo port link-type

Default

Each port is an access port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

access: Sets the port link type to access.

hybrid: Sets the port link type to hybrid.

trunk: Sets the port link type to trunk.

Usage guidelines

To change the link type of a port from trunk to hybrid or vice versa, first set the link type to access.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type trunk
```

10.2.7. port trunk permit vlan

Use **port trunk permit vlan** to assign a trunk port to the specified VLANs.

Use **undo port trunk permit vlan** to remove a trunk port from the specified VLANs.

Syntax

port trunk permit vlan { *vlan-id-list* | **all** }

undo port trunk permit vlan { *vlan-id-list* | **all** }

Default

A trunk port allows packets only from VLAN 1 to pass through.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 32 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs. To prevent unauthorized VLAN users from accessing restricted resources through the port, use the **port trunk permit vlan all** command with caution.

Usage guidelines

A trunk port can allow multiple VLANs. If you execute this command multiple times on a trunk port, the trunk port allows all the specified VLANs.

On a trunk port, packets only from the PVID can pass through untagged.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type trunk
[Switch-GigabitEthernet1/0/1] port trunk permit vlan 2 4 50 to 100
```

Related commands

port link-type

10.2.8. port trunk pvid

Use **port trunk pvid** to set the PVID for a trunk port.

Use **undo port trunk pvid** to restore the default.

Syntax

port trunk pvid vlan *vlan-id*

undo port trunk pvid

Default

The PVID of a trunk port is VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID for a trunk port. When you delete the PVID of a trunk port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local trunk port and its peer.

To enable a trunk port to transmit packets from its PVID, you must assign the trunk port to the PVID by using the **port trunk permit vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a trunk, set its PVID to VLAN 100, and assign it to VLAN 100.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type trunk
[Switch-GigabitEthernet1/0/1] port trunk pvid vlan 100
[Switch-GigabitEthernet1/0/1] port trunk permit vlan 100
```

Related commands

10.3. MAC-based VLAN commands

IMPORTANT:
Do not configure MAC-based VLANs together with mapping an Ethernet service instance to a VSI on a Layer 2 Ethernet interface or Layer 2 aggregate interface. Do not configure MAC-based VLANs on a Layer 2 Ethernet interface or Layer 2 aggregate interface that acts as the source interface of a VXLAN tunnel. For information about VXLAN and VSIs, see *VXLAN Configuration Guide*.

10.3.1. display mac-vlan

Use **display mac-vlan** to display MAC-to-VLAN entries.

Syntax

display mac-vlan { **all** | **dynamic** | **mac-address** *mac-address* [**mask** *mac-mask*] | **static** | **vlan** *vlan-id* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Specifies all MAC-to-VLAN entries.

dynamic: Specifies dynamically configured MAC-to-VLAN entries.

mac-address *mac-address*: Specifies the MAC address in the MAC-to-VLAN entry. The format of the *mac-address* argument is H-H-H.

mask *mac-mask*: Specifies the mask for matching MAC addresses in MAC-to-VLAN entries. For the *mac-mask* argument, the high-order bits must be consecutive 1s in binary notation or consecutive Fs in hexadecimal notation. The default value is ffff-ffff-ffff.

static: Specifies statically configured MAC-to-VLAN entries.

vlan *vlan-id*: Specifies the VLAN in MAC-to-VLAN entries. The value range for the *vlan-id* argument is 1 to 4094.

Examples

Display all MAC-to-VLAN entries.

```
<Switch> display mac-vlan all
The following MAC VLAN entries exist:
State: S - Static, D - Dynamic

MAC address         Mask                VLAN ID   Dot1q      State
0008-0001-0000      ffff-ff00-0000      5         3          S
0002-0001-0000      ffff-ffff-ffff      5         3          S&D

Total MAC VLAN entries count: 2
```

Table 10-5 Command output

Field	Description
S - Static	Statically configured MAC-to-VLAN entries.
D - Dynamic	Dynamically configured MAC-to-VLAN entries.
MAC address	MAC address of the MAC-to-VLAN entry.
Mask	MAC address mask of the MAC-to-VLAN entry.
VLAN ID	VLAN ID of the MAC-to-VLAN entry.
Dot1q	802.1p priority of the VLAN in the MAC-to-VLAN entry.
State	State of a MAC-to-VLAN entry: • **S**—The MAC-to-VLAN entry is configured statically. • **D**—The MAC-to-VLAN entry is dynamically issued by the authentication server. • **S&D**—The MAC-to-VLAN entry is configured both statically and dynamically.

10.3.2. display mac-vlan interface

Use **display mac-vlan interface** to display all ports that are enabled with the MAC-based VLAN feature.

Syntax

display mac-vlan interface

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display all ports that are enabled with the MAC-based VLAN feature.

```
<Switch> display mac-vlan interface
MAC VLAN is enabled on following ports:
GigabitEthernet1/0/1  GigabitEthernet1/0/2  GigabitEthernet1/0/3
```

Related commands

mac-vlan enable

10.3.3. mac-vlan enable

Use **mac-vlan enable** to enable the MAC-based VLAN feature on a port.

Use **undo mac-vlan enable** to disable the MAC-based VLAN feature on a port.

Syntax

mac-vlan enable

undo mac-vlan enable

Default

The MAC-based VLAN feature is disabled on a port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable the MAC-based VLAN feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-vlan enable
```

Related commands

display mac-vlan interface

10.3.4. mac-vlan mac-address

Use **mac-vlan mac-address** to configure a MAC-to-VLAN entry.

Use **undo mac-vlan** to delete the specified MAC-to-VLAN entries.

Syntax

mac-vlan mac-address *mac-address* [**mask** *mac-mask*] **vlan** *vlan-id* [**dot1q** *priority*]

undo mac-vlan { **all** | **mac-address** *mac-address* [**mask** *mac-mask*] | **vlan** *vlan-id* }

Default

No MAC-to-VLAN entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address *mac-address*: Specifies a MAC address in the format of H-H-H. The MAC address cannot be a multicast MAC address or all 0s. When you configure a MAC address, leading zeros in each H section can be omitted. For example, to configure a MAC address 000f-00e2-0001, you can enter only **f-e2-1**.

mask *mac-mask*: Specifies the MAC address mask. For the *mac-mask* argument, the high-order bits must be consecutive 1s in binary notation or consecutive Fs in hexadecimal notation. The default value is ffff-ffff-ffff.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094.

dot1q *priority*: Specifies the 802.1p priority of the VLAN specific to the MAC-to-VLAN entry. The value range for the *priority* argument is 0 to 7, and the default value is 0. The higher the value, the higher the 802.1p priority.

all: Specifies all static MAC-to-VLAN entries.

Usage guidelines

For successful dynamic MAC-based VLAN assignment, use static VLANs when you create MAC-to-VLAN entries.

Different types of MAC-to-VLAN entries are created depending on whether you specify the **mask** keyword.

- When you specify this keyword, the created MAC-to-VLAN entry describes the relationship among a group of MAC addresses, a VLAN, and the 802.1p priority for the VLAN.
- When you do not specify this keyword, the created MAC-to-VLAN entry describes the relationship among a MAC address, a VLAN, and the 802.1p priority for the VLAN.

These different types of MAC-to-VLAN entries are stored separately in two tables. The system updates the two tables according to the configuration.

Examples

Associate the MAC address 0000-0001-0001 with VLAN 100, and set the 802.1p priority to 7 for VLAN 100 in this entry.

```
<Switch> system-view
```

```
[Switch] mac-vlan mac-address 0-1-1 vlan 100 dot1q 7
```

Associate VLAN 100 with MAC addresses whose six high-order bits are 121122, and set the 802.1p priority to 4 for VLAN 100 in this entry.

```
<Switch> system-view
[Switch] mac-vlan mac-address 1211-2222-3333 mask ffff-ff00-0000 vlan 100 dot1q 4
```

Related commands

display mac-vlan

10.3.5. mac-vlan trigger enable

Use **mac-vlan trigger enable** to enable dynamic MAC-based VLAN assignment on a port.

Use **undo mac-vlan trigger enable** to disable dynamic MAC-based VLAN assignment on a port.

Syntax

mac-vlan trigger enable

undo mac-vlan trigger enable

Default

Dynamic MAC-based VLAN assignment is disabled on a port.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

VLAN assignment for a port is triggered only when the source MAC address of its received packet exactly matches the MAC address in a MAC-to-VLAN entry.

Examples

Enable dynamic MAC-based VLAN assignment on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] mac-vlan trigger enable
```

Related commands

mac-vlan mac-address

port pvid forbidden

10.3.6. port pvid forbidden

Use **port pvid forbidden** to disable a port from forwarding packets that fail the exact MAC address match in its PVID.

Use **undo port pvid forbidden** to restore the default.

Syntax

port pvid forbidden

undo port pvid forbidden

Default

When a port receives packets whose source MAC addresses fail the exact MAC address match, the port forwards them in its PVID.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

Use this feature only with dynamic MAC-based VLAN assignment.

Examples

Disable GigabitEthernet 1/0/1 from forwarding packets that fail the exact MAC address match in its PVID.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port pvid forbidden
```

Related commands

mac-vlan trigger enable

10.3.7. vlan precedence

Use **vlan precedence** to set the VLAN matching order.

Use **undo vlan precedence** to restore the default.

Syntax

vlan precedence { **mac-vlan** | **ip-subnet-vlan** }

undo vlan precedence

Default

A port matches VLANs based on MAC addresses preferentially.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

mac-vlan: Matches VLANs based on MAC addresses preferentially.

ip-subnet-vlan: Matches VLANs based on IP subnets preferentially.

Usage guidelines

This command takes effect only on MAC-based VLANs and IP subnet-based VLANs.

When you enable dynamic MAC-based VLAN assignment, configure the **vlan precedence mac-vlan** command as a best practice to ensure the priority of MAC-based VLAN matching. If you execute the **vlan precedence ip-subnet-vlan** command, the command does not take effect.

Examples

Configure GigabitEthernet 1/0/1 to match VLANs based on MAC addresses preferentially.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] vlan precedence mac-vlan
```

Related commands

mac-vlan trigger enable

10.4. IP subnet-based VLAN commands

10.4.1. display ip-subnet-vlan interface

Use **display ip-subnet-vlan interface** to display IP subnet-based VLANs that are associated with the specified ports.

Syntax

display ip-subnet-vlan interface { *interface-type interface-number1* [**to** *interface-type interface-number2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number1 **to** *interface-type interface-number2*: Specifies an interface range. Both the *interface-type interface-number1* argument and the *interface-type interface-number2* argument represent the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument.

all: Specifies all ports.

Examples

Display IP subnet-based VLANs on GigabitEthernet 1/0/1.

```
<Switch> display ip-subnet-vlan interface gigabitethernet 1/0/1
 Interface: GigabitEthernet1/0/1
  VLAN ID   Subnet index    IP address       Subnet mask       Status
  3         0               192.168.1.0      255.255.255.0     Active
  4         N/A             N/A              N/A               Inactive
  4094      65535           172.16.1.1       255.255.0.0       Inactive
```

Table 10-6 Command output

Field	Description
VLAN ID	ID of the IP subnet-based VLAN.
Subnet index	Index of the IP subnet. This field displays **N/A** if no IP subnet-based VLAN is configured.
IP address	IP address of the subnet. It can be an IP address or a subnet address. This field displays **N/A** if no IP subnet address is configured for the VLAN.
Subnet mask	Mask of the IP subnet. This field displays **N/A** if no subnet mask is configured for the VLAN.
Status	Whether the IP subnet-based VLAN has taken effect on the port: • **Active**—The IP subnet-based VLAN has taken effect. • **Inactive**—The IP subnet-based VLAN has not taken effect. For example, this field displays **Inactive** in one of the following conditions: o The configuration of the IP subnet-based VLAN is not complete. o The port does not allow the IP subnet-based VLAN.

Related commands

display ip-subnet-vlan vlan

ip-subnet-vlan

port hybrid ip-subnet-vlan

10.4.2. display ip-subnet-vlan vlan

Use **display ip-subnet-vlan vlan** to display information about IP subnet-based VLANs.

Syntax

display ip-subnet-vlan vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id1: Specifies an IP subnet-based VLAN by its VLAN ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies an IP subnet-based VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all IP subnet-based VLANs.

Examples

Display information about all IP subnet-based VLANs.

```
<Switch> display ip-subnet-vlan vlan all
```

```
VLAN ID: 3
 Subnet index       IP address       Subnet mask
 0                  192.168.1.0      255.255.255.0
```

Table 10-7 Command output

Field	Description
VLAN ID	ID of the IP subnet-based VLAN.
Subnet index	Index of the IP subnet.
IP address	IP address of the subnet. It can be an IP address or a subnet address.
Subnet mask	Mask of the IP subnet.

Related commands

display ip-subnet-vlan interface

ip-subnet-vlan

port hybrid ip-subnet-vlan

10.4.3. ip-subnet-vlan

Use **ip-subnet-vlan** to associate a VLAN with the specified IP subnet or IP address.

Use **undo ip-subnet-vlan** to disassociate a VLAN from the specified IP subnet or IP address.

Syntax

ip-subnet-vlan [*ip-subnet-index*] **ip** *ip-address* [*mask*]

undo ip-subnet-vlan { *ip-subnet-index* [**to** *ip-subnet-end*] | **all** }

Default

A VLAN is not associated with an IP subnet or IP address.

Views

VLAN view

Predefined user roles

network-admin

Parameters

ip-subnet-index: Specifies a beginning IP subnet index in the range of 0 to 65535. The value can be configured by users. It can also be automatically numbered by the system based on the order in which the IP subnets or IP addresses are associated with the VLAN.

ip *ip-address* [*mask*]: Specifies the source IP address or network address that is associated with the VLAN. The *ip-address* argument specifies the source IP address or network address in dotted decimal notation. The *mask* argument is the subnet mask of the source IP address or network address, in dotted decimal notation with a default value of 255.255.255.0.

to *ip-subnet-end*: Specifies an end IP subnet index of an IP subnet index range, in the range of 0 to 65535. The value for the *ip-subnet-end* argument must be greater than or equal to the beginning IP subnet index.

all: Specifies all IP subnets or IP addresses that are associated with the VLAN.

Usage guidelines

The IP subnet or IP address cannot be a multicast network segment or a multicast address.

Examples

Configure VLAN 3 as an IP subnet-based VLAN and associate it with the subnet 192.168.1.0/24.

```
<Switch> system-view
[Switch] vlan 3
[Switch-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0
```

Related commands

10.4.4. port hybrid ip-subnet-vlan

Use **port hybrid ip-subnet-vlan** to associate a port with the specified IP subnet-based VLAN.

Use **undo port hybrid ip-subnet-vlan** to disassociate a port from the specified IP subnet-based VLAN.

Syntax

port hybrid ip-subnet-vlan vlan *vlan-id*

undo port hybrid ip-subnet-vlan { **vlan** *vlan-id* | **all** }

Default

A port is not associated with an IP subnet-based VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

all: Specifies all VLANs.

Usage guidelines

For this command to take effect, perform the following tasks:

1. Create a VLAN and associate it with the specified IP subnet or IP address.
2. Set the port link type to hybrid.
3. Configure the port to allow the IP subnet-based VLAN to pass through.

Examples

Associate GigabitEthernet 1/0/1 with IP subnet-based VLAN 3.

```
<Switch> system-view
[Switch] vlan 3
[Switch-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0
```

```
[Switch-vlan3] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type hybrid
[Switch-GigabitEthernet1/0/1] port hybrid vlan 3 untagged
[Switch-GigabitEthernet1/0/1] port hybrid ip-subnet-vlan vlan 3
```

Associate Layer 2 aggregate interface Bridge-Aggregation 1 with IP subnet-based VLAN 3.

```
<Switch> system-view
[Switch] vlan 3
[Switch-vlan3] ip-subnet-vlan ip 192.168.1.0 255.255.255.0
[Switch-vlan3] quit
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] port link-type hybrid
[Switch-Bridge-Aggregation1] port hybrid vlan 3 untagged
[Switch-Bridge-Aggregation1] port hybrid ip-subnet-vlan vlan 3
```

10.5. Protocol-based VLAN commands

10.5.1. display protocol-vlan interface

Use **display protocol-vlan interface** to display protocol-based VLANs that are associated with the specified ports.

Syntax

display protocol-vlan interface { *interface-type interface-number1* [**to** *interface-type interface-number2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number1 **to** *interface-type interface-number2*: Specifies an interface range. Both the *interface-type interface-number1* argument and the *interface-type interface-number2* argument represent the interface type and interface number. The value for the *interface-number2* argument must be greater than or equal to the value for the *interface-number1* argument.

all: Specifies all ports.

Examples

Display protocol-based VLAN information on GigabitEthernet 1/0/1.

```
<Switch> display protocol-vlan interface gigabitethernet 1/0/1
```

```
Interface: GigabitEthernet1/0/1
 VLAN ID  Protocol index  Protocol type            Status
 2        0              IPv6                    Active
 2        1              N/A                     Inactive
 4094     65535          IPv4                    Inactive
```

Table 10-8 Command output

Field	Description
VLAN ID	ID of the protocol-based VLAN.
Protocol index	Protocol template index.
Protocol type	Protocol type specified by the protocol template. This field displays **N/A** if the protocol type is not specified.
Status	Whether the protocol-based VLAN has taken effect: • **Active**—The protocol-based VLAN has taken effect. • **Inactive**—The protocol-based VLAN has not taken effect.

Related commands

display protocol-vlan vlan

port hybrid protocol-vlan

protocol-vlan

10.5.2. display protocol-vlan vlan

Use **display protocol-vlan vlan** to display information about protocol-based VLANs.

Syntax

display protocol-vlan vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan-id1: Specifies a protocol-based VLAN ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies a protocol-based VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all protocol-based VLANs.

Examples

Displays information about all protocol-based VLANs.

```
<Switch> display protocol-vlan vlan all
 VLAN ID: 2
  Protocol index  Protocol type
```

```
 0               IPv4
 65535           IPv6

VLAN ID: 3
 Protocol index  Protocol type
 0               IPv4
 65535           LLC DSAP 0x11 SSAP 0x22
```

Table 10-9 Command output

Field	Description
VLAN ID	ID of the protocol-based VLAN.
Protocol index	Protocol template index.
Protocol type	Protocol type or encapsulation format specified by the protocol template.

Related commands

display protocol-vlan interface

port hybrid protocol-vlan

protocol-vlan

10.5.3. port hybrid protocol-vlan

Use **port hybrid protocol-vlan** to associate a port with the specified protocol-based VLAN.

Use **undo port hybrid protocol-vlan** to disassociate a port from the specified protocol-based VLAN.

Syntax

port hybrid protocol-vlan vlan *vlan-id* { *protocol-index* [**to** *protocol-end*] | **all** }

undo hybrid protocol-vlan { **vlan** *vlan-id* { *protocol-index* [**to** *protocol-end*] | **all** } | **all** }

Default

A port is not associated with a protocol-based VLAN.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

protocol-index: Specifies a beginning protocol template index in the range of 0 to 65535.

to *protocol-end*: Specifies an end protocol template index of a protocol template range, in the range of 0 to 65535. The value for this argument must be greater than or equal to the beginning protocol template index.

all: Specifies all protocol templates.

Usage guidelines

For this command to take effect, perform the following tasks:

1. Create a VLAN and associate it with the specified protocol templates.
2. Set the port link type to hybrid.
3. Configure the port to allow the protocol-based VLAN to pass through.

When you execute the **undo port hybrid protocol-vlan** command on a port, follow these guidelines:

- If you specify both the *vlan-id* argument and the **all** keyword, this command disassociates the port from all protocol templates of the specified VLAN.
- If you specify only the **all** keyword, this command disassociates the port from all protocol templates of all VLANs.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, assign it to VLAN 2 as an untagged member, and associated it with protocol template 1 in VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] protocol-vlan 1 ipv4
[Switch-vlan2] quit
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port link-type hybrid
[Switch-GigabitEthernet1/0/1] port hybrid vlan 2 untagged
[Switch-GigabitEthernet1/0/1] port hybrid protocol-vlan vlan 2 1
```

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as a hybrid port, assign it to VLAN 2 as an untagged member, and associated it with protocol template 1 in VLAN 2.

```
<Switch> system-view
[Switch] vlan 2
[Switch-vlan2] protocol-vlan 1 ipv4
[Switch-vlan2] quit
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] port link-type hybrid
[Switch-Bridge-Aggregation1] port hybrid vlan 2 untagged
[Switch-Bridge-Aggregation1] port hybrid protocol-vlan vlan 2 1
```

10.5.4. protocol-vlan

Use **protocol-vlan** to associate a VLAN with the specified protocol template.

Use **undo protocol-vlan** to disassociate a VLAN from the specified protocol template.

Syntax

protocol-vlan [*protocol-index*] { **at** | **ipv4** | **ipv6** | **ipx** { **ethernetii** | **llc** | **raw** | **snap** } | **mode** { **ethernetii etype** *etype-id* | **llc** { **dsap** *dsap-id* [**ssap** *ssap-id*] | **ssap** *ssap-id* } | **snap etype** *etype-id* } }

undo protocol-vlan { *protocol-index* [**to** *protocol-end*] | **all** }

Default

A VLAN is not associated with a protocol template.

Views

VLAN view

Predefined user roles

network-admin

Parameters

at: Specifies the AppleTalk-based VLAN.

ipv4: Specifies the IPv4-based VLAN.

ipv6: Specifies the IPv6-based VLAN.

ipx: Specifies the IPX-based VLAN. The keywords **ethernetii**, **llc**, **raw**, and **snap** specify IPX encapsulation formats.

mode: Configures a user-defined protocol template for the VLAN. The keywords **ethernetii**, **llc**, and **snap** specify the available encapsulation formats.

ethernetii etype *etype-id*: Matches the Ethernet II encapsulation format and the specified protocol type ID. The *etype-id* argument specifies the protocol type ID of inbound packets, in the range of 600 to ffff in hexadecimal notation, excluding 800, 86dd, 809b, and 8137.

llc: Matches the LLC encapsulation format.

dsap *dsap-id*: Specifies the destination service access point in hexadecimal notation, in the range of 0 to ff.

ssap *ssap-id*: Specifies the source service access point in hexadecimal notation, in the range of 0 to ff.

snap etype *etype-id*: Matches the SNAP encapsulation format and the specified protocol type value. The *etype-id* argument specifies the Ethernet type of inbound packets, in the range of 600 to ffff in hexadecimal notation, excluding 8137.

protocol-index: Specifies a protocol template index that is associated with the VLAN. The value range for this argument is 0 to 65535. The system will automatically assign an index if you do not specify this argument.

to *protocol-end*: Specifies an end protocol template index of a protocol template range, in the range of 0 to 65535. The value for the *protocol-end* argument must be greater than or equal to the value for the *protocol-index* argument.

all: Specifies all protocols associated with the VLAN.

Usage guidelines

CAUTION:
IP uses ARP for address resolution in Ethernet. To prevent communication failures, configure the IP and ARP templates in the same VLAN and associate them with the same port.

When you use the **mode** keyword to configure a protocol template, follow these restrictions and guidelines:

- Do not set the *etype-id* argument in the **ethernetii etype** *etype-id* option to the following hexadecimal values:
  - **800**—Specifies the IPv4 protocol in Ethernet II encapsulation.
  - **809b**—Specifies the AppleTalk protocol in Ethernet II encapsulation.

- **8137**—Specifies the IPX protocol in Ethernet II encapsulation.
- **86dd**—Specifies the IPv6 protocol in Ethernet II encapsulation.

- Do not set both the *dsap-id* and *ssap-id* arguments to any of the following hexadecimal values:
  - **e0**—Specifies the 802.2 LLC encapsulation format for IPX packets.
  - **ff**—Specifies the 802.3 raw encapsulation format for IPX packets.
  - **aa**—Specifies the 802.2 SNAP encapsulation format.

  When either of the *dsap-id* and *ssap-id* arguments is configured, the system assigns the hexadecimal value **aa** to the other argument.
- Do not set the *etype-id* argument in the **snap etype** *etype-id* option to the hexadecimal value 8137. Otherwise, the template format will be the same as that of the IPX protocol. You can set the *etype-id* argument to the hexadecimal value 800, 809b, or 86dd. The hexadecimal values 800, 809b, and 86dd correspond to IPv4, AppleTalk, and IPv6, respectively.

Examples

Assign ARP packets in Ethernet II encapsulation and IPv4 packets to VLAN 3 for transmission. (The protocol type ID for ARP is 0806 in hexadecimal notation.)

```
<Switch> system-view
[Switch] vlan 3
[Switch-vlan3] protocol-vlan 1 ipv4
[Switch-vlan3] protocol-vlan 2 mode ethernetii etype 0806
```

11. Private VLAN commands

11.1. Private VLAN commands

11.1.1. display private-vlan

Use **display private-vlan** to display information about primary VLANs and their associated secondary VLANs.

Syntax

display private-vlan [*primary-vlan-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

primary-vlan-id: Specifies a primary VLAN ID in the range of 1 to 4094. If you do not specify a primary VLAN ID, this command displays information about all primary VLANs and their associated secondary VLANs.

Examples

Display information about primary VLANs and their associated secondary VLANs.

```
<Switch> display private-vlan
 Primary VLAN ID: 2
 Secondary VLAN ID: 3-4

 VLAN ID: 2
 VLAN type: Static
 Private VLAN type: Primary
 Route interface: Configured
 IPv4 address: 1.1.1.1
 IPv4 subnet mask: 255.255.255.0
 IPv6 global unicast addresses:
   2001::1, subnet is 2001::/64 [TENTATIVE]
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/2
    GigabitEthernet1/0/3
    GigabitEthernet1/0/4

 VLAN ID: 3
```

```
VLAN type: Static
Private VLAN type: Secondary
Route interface: Not configured
Description: VLAN 0003
Name: VLAN 0003
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/2
   GigabitEthernet1/0/3

VLAN ID: 4
VLAN type: Static
Private VLAN type: Secondary
Route interface: Not configured
Description: VLAN 0004
Name: VLAN 0004
Tagged ports:   None
Untagged ports:
   GigabitEthernet1/0/2
   GigabitEthernet1/0/4
```

Table 11-1 Command output

Field	Description
VLAN type	VLAN type, dynamic or static.
Private VLAN type	Private VLAN type: • **Primary**—Primary VLAN. • **Secondary**—Secondary VLAN. • **Isolated secondary**—Secondary VLAN configured with port isolation at Layer 2.
Route interface	Whether a VLAN interface is created for the VLAN: • Configured. • Not configured.
IPv4 address	Primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface. When the VLAN interface is also configured with secondary IPv4 addresses, you can view them by using one of the following commands: • **`display interface vlan-interface`**. • **`display this`** (VLAN interface view).
IPv4 subnet mask	Subnet mask for the primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface.
IPv6 global unicast addresses	Global unicast IPv6 address of the VLAN interface. This field is not displayed when no IPv6 address is configured for the VLAN interface. The IPv6 address states are as follows: • **TENTATIVE**—Initial state. DAD is being performed or is to be performed on the address. An address in this state

Field	Description
	cannot be used as the source address or destination address of packets. • **DUPLICATE**—DAD has been completed for the address. The address is not unique on the link and cannot be used. • **PREFERRED**—The address is preferred and can be used as the source or destination address of a packet. If an address is in this state, the command does not display the address state. • **DEPRECATED**—The address is beyond the preferred lifetime but within the valid lifetime. It is valid, but it cannot be used as the source address for a new connection. Packets destined to the address are processed correctly.
Description	VLAN description.
Name	VLAN name.
Tagged ports	Tagged members of the VLAN.
Untagged ports	Untagged members of the VLAN.

Related commands

`private-vlan` (VLAN view)

`private-vlan primary`

11.1.2. port private-vlan host

Use **`port private-vlan host`** to configure a port as a host port.

Use **`undo port private-vlan`** to restore the default.

Syntax

`port private-vlan host`

`undo port private-vlan`

Default

A port is not a host port.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

If the port has been assigned to a secondary VLAN, the command assigns the port to the primary VLAN associated with the secondary VLAN. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid.
  - Configures the secondary VLAN as the PVID.

  - Assigns the port to the primary VLAN as an untagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of the primary VLAN, this member attribute remains in the primary VLAN.
  - If the hybrid port does not allow the primary VLAN, the device assigns the port to the primary VLAN as an untagged member.

You can assign the port to a secondary VLAN before or after you execute this command.

The **undo port private-vlan** command does not change the VLAN attributes (allowed VLANs, port link type, and PVID) of the port.

The **port private-vlan host** command is mutually exclusive with the **port private-vlan trunk promiscuous** and **port private-vlan trunk secondary** commands.

Examples

In this example, VLAN 20 is a secondary VLAN and is associated with primary VLAN 2.

Configure GigabitEthernet 1/0/1 as a host port, and then verify the configuration.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port private-vlan host
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port private-vlan host
#
return
```

The output show that GigabitEthernet 1/0/1 is operating in bridge mode and is a host port.

Assign GigabitEthernet 1/0/1 to VLAN 20, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] port access vlan 20
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port private-vlan host
 port link-type hybrid
 undo port hybrid vlan 1
 port hybrid vlan 2 20 untagged
 port hybrid pvid vlan 20
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is an untagged member of secondary VLAN 20 and primary VLAN 2.
- The port link type of GigabitEthernet 1/0/1 is hybrid and its PVID is VLAN 20.

Related commands

port private-vlan promiscuous

port private-vlan trunk promiscuous

port private-vlan trunk secondary

private-vlan (VLAN view)

private-vlan primary

11.1.3. port private-vlan promiscuous

Use **port private-vlan promiscuous** to configure a port as a promiscuous port of the specified VLAN and assign the port to the VLAN.

Use **undo port private-vlan** to restore the default.

Syntax

port private-vlan *vlan-id* **promiscuous**

undo port private-vlan

Default

A port is not a promiscuous port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN ID in the range of 1 to 4094. Though VLAN 1 is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLAN is a primary VLAN that has been associated with secondary VLANs, the command assigns the port to the associated secondary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid.
  - Configures the primary VLAN as the PVID.
  - Assigns the port to the primary VLAN and its associated secondary VLANs as an untagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of the primary VLAN and part of its associated secondary VLANs, this member attribute remains in these VLANs. The device assigns the hybrid port to the rest of the associated secondary VLANs as an untagged member.
  - If the hybrid port does not allow any of the primary VLAN and its associated secondary VLANs, the command assigns the port to these VLANs as an untagged member.

If you execute this command on a promiscuous port multiple times, the most recent configuration takes effect.

The **undo port private-vlan** command does not change the VLAN attributes (allowed secondary VLANs, link type, and PVID) of the port. When you execute the **undo port**

private-vlan command on a promiscuous port of a VLAN, the command removes the port from the VLAN.

You can configure the VLAN as a primary VLAN before or after you execute the **port private-vlan promiscuous** command.

This command is mutually exclusive with the **port private-vlan trunk promiscuous** and **port private-vlan trunk secondary** commands.

Examples

In this example, VLAN 2 is a primary VLAN, and it is associated with secondary VLAN 20.

Display information about GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

Configure GigabitEthernet 1/0/1 as a promiscuous port of VLAN 2, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] port private-vlan 2 promiscuous
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port private-vlan 2 promiscuous
 undo port hybrid vlan 1
 port hybrid vlan 2 20 untagged
 port hybrid pvid vlan 2
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a promiscuous port of VLAN 2.
- GigabitEthernet 1/0/1 is an untagged member of primary VLAN 2 and secondary VLAN 20.
- The port link type of GigabitEthernet 1/0/1 is hybrid and its PVID is VLAN 2.

Execute the **undo port private-vlan** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] undo port private-vlan
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 undo port hybrid vlan 1
 port hybrid vlan 20 untagged
 port hybrid pvid vlan 2
```

```
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from primary VLAN 2.
- GigabitEthernet 1/0/1 is an untagged member of VLAN 20.
- The link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan trunk promiscuous

port private-vlan trunk secondary

private-vlan (VLAN view)

private-vlan primary

11.1.4. port private-vlan trunk promiscuous

Use **port private-vlan trunk promiscuous** to configure a port as a trunk promiscuous port of the specified VLANs and assign the port to these VLANs.

Use **undo port private-vlan trunk promiscuous** to cancel the trunk promiscuous attribute of a port in the specified VLANs.

Syntax

port private-vlan *vlan-id-list* **trunk promiscuous**

undo port private-vlan *vlan-id-list* **trunk promiscuous**

Default

A port is not a trunk promiscuous port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 primary VLAN items. Each item specifies a primary VLAN ID or a range of primary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for primary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLANs are primary VLANs that have been associated with secondary VLANs, the command assigns the port to the associated secondary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid. The PVID of the port does not change.
  - Assigns the port to the primary VLANs and the associated secondary VLANs as a tagged member.

- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the hybrid port has been a tagged or untagged member of part of the primary VLANs and their associated secondary VLANs, this member attribute remains in these VLANs. The device assigns the hybrid port to the rest of the primary VLANs and their associated secondary VLANs as a tagged member.
  - If the hybrid port does not allow any of the primary VLANs and their associated secondary VLANs, the device assigns the port to these VLANs as a tagged member.

The **undo** form of this command does not change the VLAN attributes (allowed secondary VLANs, port link type, and PVID) of the port.

If you execute the **undo** form of this command on a trunk promiscuous port, the command removes the port from the VLANs specified by the *vlan-id-list* argument.

You can configure the specified VLANs as primary VLANs before or after you execute this command.

This command is mutually exclusive with the **port private-vlan host**, **port private-vlan promiscuous** and **port private-vlan trunk secondary** commands.

For an uplink port to permit multiple primary VLANs, use the **port private-vlan trunk promiscuous** command to assign the port to these VLANs. The port can then transmit packets from these primary VLANs with VLAN tags. For an uplink port to permit only one primary VLAN, use the **port private-vlan promiscuous** command to assign the port to the VLAN. The port can then transmit packets from the primary VLAN without VLAN tags.

Examples

In this example, VLANs 2 and 3 are primary VLANs. VLAN 2 is associated with secondary VLAN 20. VLAN 3 is associated with secondary VLAN 30.

Display information about GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

Configure GigabitEthernet 1/0/1 as a trunk promiscuous port of VLANs 2 and 3, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] port private-vlan 2 3 trunk promiscuous
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port private-vlan 2 3 trunk promiscuous
 port hybrid vlan 2 3 20 30 tagged
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a trunk promiscuous port of VLANs 2 and 3.
- GigabitEthernet1/0/1 is a tagged member of VLANs 2, 3, 20, and 30.
- The port link type of GigabitEthernet 1/0/1 is hybrid.

Execute the **undo port private-vlan trunk promiscuous** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] undo port private-vlan 2 3 trunk promiscuous
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 20 30 tagged
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from VLANs 2 and 3.
- GigabitEthernet 1/0/1 is a tagged member of VLANs 20 and 30.
- The port link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan promiscuous

private-vlan (VLAN view)

private-vlan primary

11.1.5. port private-vlan trunk secondary

Use **port private-vlan trunk secondary** to configure a port as a trunk secondary port of the specified VLANs and assign the port to these VLANs.

Use **undo port private-vlan trunk secondary** to cancel the trunk secondary attribute of a port in the specified VLANs.

Syntax

port private-vlan *vlan-id-list* **trunk secondary**

undo port private-vlan *vlan-id-list* **trunk secondary**

Default

A port is not a trunk secondary port of any VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

If the specified VLANs are secondary VLANs that have been associated with primary VLANs, the command also assigns the port to the associated primary VLANs. Also, the following events occur:

- For an access port, the device performs the following operations:
  - Changes the port link type to hybrid. The PVID of the port does not change.
  - Assigns the port to the secondary VLANs and the associated primary VLANs as a tagged member.
- For a trunk port, the device does not change the port link type or PVID.
- For a hybrid port, the device does not change the port link type or PVID.
  - If the port has been an untagged or tagged member of part of the secondary VLANs and their associated primary VLANs, this member attribute remains in these VLANs. The device assigns the port to the rest of the secondary VLANs and their associated primary VLANs as a tagged member.
  - If the hybrid port does not allow any of the secondary VLANs and their associated primary VLANs, the device assigns the port to these VLANs as a tagged member.

A trunk secondary port can join only one secondary VLAN among all secondary VLANs associated with a primary VLAN. However, it can join multiple secondary VLANs that are associated with different primary VLANs.

The **undo** form of this command does not change the VLAN attributes (allowed primary VLANs, port link type, and PVID) of the port.

When you execute the **undo** form of this command on a trunk secondary port of the VLANs specified by the *vlan-id-list* argument, one of the following events occurs:

- If the port is an access port, the device does not change the VLAN configuration of the port.
- If the port is a trunk or hybrid port, the device removes the port from the specified VLANs.

You can associate the specified VLANs with their respective primary VLANs before or after you execute this command.

This command does not take effect on the specified VLAN if any of the following conditions applies:

- The specified VLAN does not exist.
- The specified VLAN is not a secondary VLAN and is used for other purposes.
- The specified VLAN shares the same primary VLAN with other secondary VLANs, and the current port has been configured as a trunk secondary port in one of the other secondary VLANs.

This command is mutually exclusive with the **port private-vlan host**, **port private-vlan promiscuous** and **port private-vlan trunk promiscuous** commands.

For a downlink port to permit multiple secondary VLANs associated with different primary VLANs, use the **port private-vlan trunk secondary** command to assign the port to these secondary VLANs. The port can then transmit packets from these secondary VLANs with VLAN tags. For a downlink port to permit only one secondary VLAN, use the **port private-vlan host** command to assign the port to the secondary VLAN. The port can then transmit packets from the secondary VLAN without VLAN tags.

Examples

- In this example, VLANs 2 and 3 are primary VLANs. VLAN 2 is associated with secondary VLAN 20. VLAN 3 is associated with secondary VLAN 30.

  # Display information about GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

  # Configure GigabitEthernet 1/0/1 as a trunk secondary port of VLANs 20 and 30, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] port private-vlan 20 30 trunk secondary
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 2 3 20 30 tagged
 port hybrid vlan 1 untagged
 port private-vlan 20 30 trunk secondary
#
return
```

  The output shows that:

  - GigabitEthernet 1/0/1 is a trunk secondary port of VLANs 20 and 30.
  - GigabitEthernet 1/0/1 is a tagged member of VLANs 2, 3, 20, and 30.
  - The port link type of GigabitEthernet 1/0/1 is hybrid.

  # Execute the **undo port private-vlan trunk secondary** command on GigabitEthernet 1/0/1, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] undo port private-vlan 20 30 trunk secondary
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 2 3 tagged
 port hybrid vlan 1 untagged
#
return
```

  The output shows that:

  - GigabitEthernet 1/0/1 is removed from VLANs 20 and 30.
  - GigabitEthernet 1/0/1 is a tagged member of VLANs 2 and 3.
  - The port link type and PVID of GigabitEthernet 1/0/1 do not change.

- In this example, VLAN 10 is not a secondary VLAN.

Display information about GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
#
return
```

Configure GigabitEthernet 1/0/1 as a trunk secondary port of VLAN 10, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] port private-vlan 10 trunk secondary
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 10 tagged
 port hybrid vlan 1 untagged
 port private-vlan 10 trunk secondary
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is a trunk secondary port of VLAN 10.
- GigabitEthernet 1/0/1 is a tagged member of VLAN 10.
- The port link type of GigabitEthernet 1/0/1 is hybrid.

Execute the **undo port private-vlan trunk secondary** command on GigabitEthernet1/0/1, and then verify the configuration.

```
[Switch-GigabitEthernet1/0/1] undo port private-vlan 10 trunk secondary
[Switch-GigabitEthernet1/0/1] display this
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port link-type hybrid
 port hybrid vlan 1 untagged
#
return
```

The output shows that:

- GigabitEthernet 1/0/1 is removed from VLAN 10.
- The port link type and PVID of GigabitEthernet 1/0/1 do not change.

Related commands

port private-vlan host

port private-vlan promiscuous

port private-vlan trunk promiscuous

private-vlan (VLAN view)

private-vlan isolated

private-vlan primary

11.1.6. private-vlan (VLAN interface view)

Use **private-vlan secondary** to enable Layer 3 communication between secondary VLANs that are associated with a primary VLAN.

Use **undo private-vlan** to cancel the Layer 3 communication configuration for secondary VLANs that are associated with a primary VLAN.

Syntax

private-vlan secondary *vlan-id-list*

undo private-vlan [**secondary** *vlan-id-list*]

Default

Secondary VLANs are isolated at Layer 3.

Views

VLAN interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

Usage guidelines

This command takes effect only when the following conditions exist:

- This command is executed in VLAN interface view of the primary VLAN interface.
- Secondary VLANs are associated with the primary VLAN.
- No VLAN interfaces are created for secondary VLANs.
- An IP address is assigned to the primary VLAN interface.
- Local proxy ARP is enabled on the primary VLAN interface.

You can create VLAN interfaces for secondary VLANs that are not enabled with Layer 3 communication. If secondary VLANs are enabled with Layer 3 communication, do not create VLAN interfaces for them.

When you execute this command in the same primary VLAN interface view multiple times, all the specified secondary VLANs are interoperable at Layer 3.

When you execute the **undo private-vlan** command, follow these guidelines:

- If you specify the **secondary** *vlan-id-list* option, this command cancels the Layer 3 communication configuration only for the specified secondary VLANs.
- If you do not specify the **secondary** *vlan-id-list* option, this command cancels the Layer 3 communication configuration for all secondary VLANs of the primary VLAN.

Examples

This example shows how to meet the following requirements:

- VLAN 4 is a secondary VLAN, and it is associated with primary VLAN 2.
- The uplink port (GigabitEthernet 1/0/2) is a promiscuous port of VLAN 2.
- Downlink ports GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are host ports of VLANs 3 and 4, respectively.
- Secondary VLANs 3 and 4 can communicate at Layer 3.

Configure VLAN 2 as a primary VLAN and associate it with secondary VLANs 3 and 4.

```
<Switch> system-view
[Switch] vlan 3 to 4
[Switch] vlan 2
[Switch-vlan2] private-vlan primary
[Switch-vlan2] private-vlan secondary 3 to 4
[Switch-vlan2] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a promiscuous port of VLAN 2.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] port private-vlan 2 promiscuous
[Switch-GigabitEthernet1/0/2] quit
```

Assign downlink port GigabitEthernet 1/0/3 to VLAN 3 and configure the port as a host port.

```
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] port access vlan 3
[Switch-GigabitEthernet1/0/3] port private-vlan host
[Switch-GigabitEthernet1/0/3] quit
```

Assign downlink port GigabitEthernet 1/0/4 to VLAN 4 and configure the port as a host port.

```
[Switch] interface gigabitethernet 1/0/4
[Switch-GigabitEthernet1/0/4] port access vlan 4
[Switch-GigabitEthernet1/0/4] port private-vlan host
[Switch-GigabitEthernet1/0/4] quit
```

Create VLAN-interface 2 and enable Layer 3 communication between secondary VLANs 3 and 4.

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] private-vlan secondary 3 to 4
```

Assign an IP address to VLAN-interface 2.

```
[Switch-Vlan-interface2] ip address 192.168.1.1 255.255.255.0
```

Enable local proxy ARP on VLAN-interface 2.

```
[Switch-Vlan-interface2] local-proxy-arp enable
```

Related commands

private-vlan (VLAN view)

private-vlan primary

11.1.7. private-vlan (VLAN view)

Use **private-vlan** to associate a primary VLAN with the specified secondary VLANs.

Use **undo private-vlan** to dissociate a primary VLAN from the specified secondary VLANs.

Syntax

private-vlan secondary *vlan-id-list*

undo private-vlan [**secondary** *vlan-id-list*]

Default

A primary VLAN is not associated with any secondary VLANs.

Views

VLAN view

Predefined user roles

network-admin

Parameters

secondary *vlan-id-list*: Specifies a space-separated list of up to 10 secondary VLAN items. Each item specifies a secondary VLAN ID or a range of secondary VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for secondary VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. Though the system default VLAN (VLAN 1) is in the valid value range, it cannot be configured in the command.

Usage guidelines

A primary VLAN can be associated with multiple secondary VLANs. When you execute this command in the same VLAN view multiple times, all the specified secondary VLANs are associated with the primary VLAN.

The configuration synchronization is triggered based on the interface configuration when the following conditions exist:

- This command is configured for a primary VLAN.
- Ports on the device are promiscuous, trunk promiscuous, or host ports.

When you execute the **undo private-vlan** command, follow these guidelines:

- If you specify the **secondary** *vlan-id-list* option, this command dissociates the primary VLAN from the specified secondary VLANs.
- If you do not specify the **secondary** *vlan-id-list* option, this command dissociates the primary VLAN from all secondary VLANs.

Examples

Associate primary VLAN 2 with secondary VLANs 3 and 4.

```
<Switch> system-view
[Switch] vlan 3 to 4
[Switch] vlan 2
[Switch-vlan2] private-vlan primary
[Switch-vlan2] private-vlan secondary 3 to 4
```

Related commands

port private-vlan host

port private-vlan promiscuous

port private-vlan trunk promiscuous

port private-vlan trunk secondary

primary-vlan primary

11.1.8. private-vlan isolated

Use **private-vlan isolated** to isolate ports in a secondary VLAN at Layer 2.

Use **undo private-vlan isolated** to restore the default.

Syntax

private-vlan isolated

undo private-vlan isolated

Default

Ports in the same secondary VLAN can communicate with each other at Layer 2.

Views

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command takes effect when the following conditions exist:

- The secondary VLAN is associated with a primary VLAN.
- The ports are configured as host ports or trunk secondary ports of the secondary VLAN.

This command is mutually exclusive with the primary VLAN, and sub-VLAN configuration commands.

Examples

This example shows how to meet the following requirements:

- VLAN 4 is a secondary VLAN, and it is associated with primary VLAN 2.
- GigabitEthernet 1/0/1 is a promiscuous port of VLAN 2.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 are host ports.
- GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 are isolated at Layer 2 in secondary VLAN 4.

Configure VLAN 2 as a primary VLAN and associate it with secondary VLAN 4.

```
<Switch> system-view
[Switch] vlan 4
[Switch-vlan4] quit
[Switch] vlan 2
[Switch-vlan2] private-vlan primary
[Switch-vlan2] private-vlan secondary 4
[Switch-vlan2] quit
```

Configure GigabitEthernet 1/0/1 as a promiscuous port of VLAN 2.

```
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] port private-vlan 2 promiscuous
[Switch-GigabitEthernet1/0/1] quit
```

Assign GigabitEthernet 1/0/2 to VLAN 4 and configure the port as a host port.

```
[Switch] interface gigabitethernet 1/0/2
[Switch-GigabitEthernet1/0/2] port access vlan 4
[Switch-GigabitEthernet1/0/2] quit
[Switch-GigabitEthernet1/0/2] port private-vlan host
```

Assign GigabitEthernet 1/0/3 to VLAN 4 and configure the port as a host port.

```
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] port access vlan 4
[Switch-GigabitEthernet1/0/3] port private-vlan host
```

Configure port isolation at Layer 2 in secondary VLAN 4.

```
[Switch] vlan 4
[Switch-vlan4] private-vlan isolated
```

Related commands

private-vlan (VLAN view)

private-vlan primary

11.1.9. private-vlan primary

Use **private-vlan primary** to configure a VLAN as a primary VLAN.

Use **undo private-vlan primary** to restore the default.

Syntax

private-vlan primary

undo private-vlan primary

Default

A VLAN is not a primary VLAN.

Views

VLAN view

Predefined user roles

network-admin

Usage guidelines

The configuration synchronization is triggered based on the interface configuration when the following conditions exist:

- This command is configured for a VLAN that has been associated with secondary VLANs.
- Ports on the device are promiscuous, trunk promiscuous, host, or trunk secondary ports.

Examples

Configure VLAN 5 as a primary VLAN.

```
<Switch> system-view
[Switch] vlan 5
[Switch-vlan5] private-vlan primary
```

Related commands

port private-vlan host

port private-vlan promiscuous

port private-vlan trunk promiscuous

port private-vlan trunk secondary

00e0-bb00-0000  ffff-ff00-0000  3Com phone
```

Table 12-1 Command output

Field	Description
OUI Address	OUI address allowed on the device.
Mask	Mask of the OUI address.
Description	Description of the OUI address.

Related commands

voice-vlan mac-address

12.1.2. display voice-vlan state

Use **display voice-vlan state** to display voice VLAN information.

Syntax

display voice-vlan state

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display voice VLAN information.

```
<Switch> display voice-vlan state
 Current voice VLANs: 1
 Voice VLAN security mode: Security
 Voice VLAN aging time: 1440 minutes
 Voice VLAN enabled ports and their modes:
 Port                        VLAN        Mode        CoS         DSCP
 GE1/0/1                     111         Auto        6           46
```

Table 12-2 Command output

Field	Description
Current Voice VLANs	Number of existing voice VLANs.
Voice VLAN security mode	Voice VLAN mode: • Security. • Normal.
Voice VLAN aging time	Voice VLAN aging timer. **No aging** indicates that the voice VLAN does not age out.
Voice VLAN enabled ports and their modes	Voice VLAN-enabled ports and their voice VLAN assignment modes.
Port	Name of the voice VLAN-enabled port.
VLAN	ID of the voice VLAN enabled on the port.
Mode	Voice VLAN assignment mode of the port: • Manual. • Automatic.

Related commands

voice-vlan aging

voice-vlan enable

voice-vlan mode auto

voice-vlan security enable

12.1.3. voice-vlan aging

Use **voice-vlan aging** to set the voice VLAN aging timer.

Use **undo voice-vlan aging** to restore the default.

Syntax

voice-vlan aging *minutes*

undo voice-vlan aging

Default

The voice VLAN aging timer is 1440 minutes (24 hours).

Views

System view

Predefined user roles

network-admin

Parameters

minutes: Sets the voice VLAN aging timer to 0 minutes or a value in the range of 5 to 43200 minutes. If you set the voice VLAN aging timer to 0 minutes, the voice VLAN does not age out.

Usage guidelines

In automatic voice VLAN assignment mode, the device starts an aging timer for a voice VLAN when assigning a port to the voice VLAN. If no voice packets are received on the port before the timer expires, the device removes the port from the voice VLAN.

Set the voice VLAN aging timer only when the voice VLAN assignment mode is automatic.

Examples

Set the voice VLAN aging timer to 100 minutes.

```
<Switch> system-view
[Switch] voice-vlan aging 100
```

Related commands

display voice-vlan state

12.1.4. voice-vlan enable

Use **voice-vlan enable** to enable the voice VLAN feature on a port.

Use **undo voice-vlan enable** to disable the voice VLAN feature on a port.

Syntax

voice-vlan *vlan-id* **enable**

undo voice-vlan [*vlan-id*] **enable**

Default

The voice VLAN feature is disabled on ports.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a voice VLAN ID in the range of 2 to 4094.

Usage guidelines

Use this command only on a hybrid or trunk port operating in automatic voice VLAN assignment mode.

Before you execute this command, make sure the specified VLAN already exists.

Examples

Enable the voice VLAN feature on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] voice-vlan 2 enable
```

Related commands

display voice-vlan state

voice-vlan mode auto

12.1.5. voice-vlan mac-address

Use **voice-vlan mac-address** to configure the OUI address information for voice packet identification.

Use **undo voice-vlan mac-address** to delete an OUI address.

Syntax

voice-vlan mac-address *mac-address* **mask** *oui-mask* [**description** *text*]

undo voice-vlan mac-address *oui*

Default

System default OUI addresses exist.

Table 12-3 System default OUI addresses

Number	OUI address	Vendor
1	0001-e300-0000	Siemens phone
2	0003-6b00-0000	Cisco phone
3	0004-0d00-0000	Avaya phone
4	000f-e200-0000	Aolynk phone
5	0060-b900-0000	Philips/NEC phone
6	00d0-1e00-0000	Pingtel phone
7	00e0-7500-0000	Polycom phone
8	00e0-bb00-0000	3Com phone

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a source MAC address of voice traffic, in the format of H-H-H. For example, 1234-1234-1234.

mask *oui-mask*: Specifies the valid length of the OUI address by using a mask in the format of H-H-H. The mask contains consecutive 1s and 0s. For example, ffff-0000-0000. To match the voice devices of a vendor, set the mask to ffff-ff00-0000.

description *text*: Specifies the OUI address description, a case-sensitive string of 1 to 30 characters.

oui: Specifies an OUI address to delete, in the format of H-H-H. For example, 1234-1200-0000. An OUI address is the logical AND result of the *mac-address* and *oui-mask* arguments. It cannot be a broadcast address, a multicast address, or an all-zero address.

Usage guidelines

You can manually delete or add the system default OUI addresses.

The device supports a maximum of 128 OUI addresses.

Examples

Add OUI address **1234-1200-0000** by specifying the MAC address as 1234-1234-1234 and the mask as fff-ff00-0000. Configure the OUI address description as **PhoneA**.

```
<Switch> system-view
[Switch] voice-vlan mac-address 1234-1234-1234 mask ffff-ff00-0000 description PhoneA
```

Related commands

display voice-vlan mac-address

12.1.6. voice-vlan mode auto

Use **voice-vlan mode auto** to configure a port to operate in automatic voice VLAN assignment mode.

Use **undo voice-vlan mode auto** to configure a port to operate in manual voice VLAN assignment mode.

Syntax

voice-vlan mode auto

undo voice-vlan mode auto

Default

A port operates in automatic voice VLAN assignment mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

To make a voice VLAN take effect on a port operating in manual mode, you must manually assign the port to the voice VLAN.

Examples

Configure GigabitEthernet 1/0/1 to operate in manual voice VLAN assignment mode.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo voice-vlan mode auto
```

Related commands

display voice-vlan state

12.1.7. voice-vlan qos

Use **voice-vlan qos** to configure a port to modify the CoS and DSCP values for incoming voice VLAN packets.

Use **undo voice-vlan qos** to restore the default.

Syntax

voice-vlan qos *cos-value dscp-value*

undo voice-vlan qos

Default

A port modifies the CoS and DSCP values for incoming voice VLAN packets to 6 and 46, respectively.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Parameters

cos-value: Specifies a CoS value in the range of 0 to 7. A bigger CoS value represents a higher priority.

dscp-value: Specifies a DSCP value in the range of 0 to 63. A bigger DSCP value represents a higher priority.

Usage guidelines

If you execute both the **voice-vlan qos** and **voice-vlan qos trust** commands multiple times, the most recent configuration takes effect.

Examples

Configure GigabitEthernet 1/0/1 to modify the CoS and DSCP values for voice VLAN packets to 5 and 45, respectively.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] voice-vlan qos 5 45
```

Related commands

voice-vlan qos trust

12.1.8. voice-vlan qos trust

Use **voice-vlan qos trust** to configure a port to trust the priority settings in incoming voice VLAN packets.

Use **undo voice-vlan qos** to restore the default.

Syntax

voice-vlan qos trust

undo voice-vlan qos

Default

A port modifies the CoS and DSCP values for incoming voice VLAN packets to 6 and 46, respectively.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

Usage guidelines

When a port trusts the QoS priority settings in incoming voice VLAN packets, the port does not modify their CoS and DSCP values.

By default, a port does not trust the 802.1p priority of incoming packets. To configure the port to trust the priority settings in incoming voice VLAN packets, you must also use the **qos trust dot1p** command to set the priority trust mode to 802.1p priority on the port. For information about setting the priority trust mode, see *ACL and QoS Configuration Guide*.

If you execute both the **voice-vlan qos** and **voice-vlan qos trust** commands multiple times, the most recent configuration takes effect.

Examples

Configure GigabitEthernet 1/0/1 to trust the priority settings in incoming voice VLAN traffic.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] voice-vlan qos trust
```

Related commands

voice-vlan qos

12.1.9. voice-vlan security enable

Use **voice-vlan security enable** to enable the voice VLAN security mode.

Use **undo voice-vlan security enable** to disable the voice VLAN security mode.

Syntax

voice-vlan security enable

undo voice-vlan security enable

Default

The voice VLAN security mode is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

In security mode, a voice VLAN transmits only voice packets whose source MAC addresses match the OUI addresses of the device.

In normal mode, a voice VLAN transmits voice packets and non-voice packets.

Examples

Disable the voice VLAN security mode.

```
<Switch> system-view
[Switch] undo voice-vlan security enable
```

Related commands

display voice-vlan state

13.1.5. qinq transparent-vlan 13-5

13. QinQ commands

13.1. QinQ commands

Do not configure QinQ and Ethernet service instance-to-VSI binding on the same Layer 2 Ethernet interface or Layer 2 aggregate interface. Do not configure QinQ on a Layer 2 Ethernet interface or Layer 2 aggregate interface that acts as the source interface of a VXLAN tunnel. Otherwise, these features might not take effect. For more information about VXLAN and VSI, see *VXLAN Configuration Guide*.

This document uses the following terms:

- **CVLAN**—Customer network VLANs, also called inner VLANs, refer to VLANs that a customer uses on the private network.
- **SVLAN**—Service provider network VLANs, also called outer VLANs, refer to VLANs that a service provider uses to transmit VLAN tagged traffic for customers.

13.1.1. display qinq

Use **display qinq** to display QinQ-enabled interfaces.

Syntax

display qinq [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays all QinQ-enabled interfaces.

Usage guidelines

If QinQ is not enabled on any interfaces, this command does not provide any output.

Examples

Enable QinQ on GigabitEthernet 1/0/1. Then, verify that QinQ is enabled on the interface.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qinq enable
[Switch-GigabitEthernet1/0/1] display qinq interface gigabitethernet 1/0/1
Interface
 GigabitEthernet1/0/1
```

Enable QinQ on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/3. Then, verify that QinQ is enabled on the interfaces.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] qinq enable
[Switch-GigabitEthernet1/0/1] quit
[Switch] interface gigabitethernet 1/0/3
[Switch-GigabitEthernet1/0/3] qinq enable
[Switch-GigabitEthernet1/0/3] display qinq
Interface
 GigabitEthernet1/0/1
 GigabitEthernet1/0/3
```

Related commands

qinq enable

13.1.2. qinq enable

Use **qinq enable** to enable QinQ on an interface.

Use **undo qinq enable** to disable QinQ on an interface.

Syntax

qinq enable

undo qinq enable

Default

QinQ is disabled on interfaces.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Examples

Enable QinQ on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qinq enable
```

Related commands

display qinq

13.1.3. qinq ethernet-type (interface view)

Use **qinq ethernet-type** to set the TPID value in SVLAN tags on an interface.

Use **undo qinq ethernet-type** to restore the default TPID value in SVLAN tags on an interface.

Syntax

qinq ethernet-type service-tag *hex-value*

undo qinq ethernet-type service-tag

Default

The TPID value in SVLAN tags is 8100 in hexadecimal notation.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

service-tag: Sets the TPID value in the SVLAN tag.

hex-value: Sets a hexadecimal TPID value in the range of 1 to ffff, excluding the reserved EtherType values listed in Table 13-1 .

Table 13-1 Reserved EtherType values

Protocol type	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86dd
PPPoE	0x8863/0x8864
MPLS	0x8847/0x8848
IPX/SPX	0x8137
IS-IS	0x8000
LACP	0x8809
LLDP	0x88cc
802.1X	0x888e
802.1ag	0x8902
Cluster	0x88a7
Reserved	0xfffd/0xfffe/0xffff

Usage guidelines

A port without QinQ enabled uses the SVLAN TPID to match incoming tagged frames. The port modifies the TPID in the SVLAN tag of outgoing frames as the configured value.

Examples

Set the TPID value in SVLAN tags to 9100 (hexadecimal) on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] qinq ethernet-type service-tag 9100
```

Related commands

qinq ethernet-type (system view)

13.1.4. qinq ethernet-type (system view)

Use **qinq ethernet-type** to set the TPID value in CVLAN tags.

Use **undo qinq ethernet-type** to restore the default TPID value in CVLAN tags.

Syntax

qinq ethernet-type customer-tag *hex-value*

undo qinq ethernet-type customer-tag

Default

The TPID value in CVLAN tags is 8100 in hexadecimal notation.

Views

System view

Predefined user roles

network-admin

Parameters

customer-tag: Sets the TPID value in the CVLAN tag.

hex-value: Sets a hexadecimal TPID value in the range of 1 to ffff, excluding the reserved EtherType values listed in Table 13-2 .

Table 13-2 Reserved EtherType values

Protocol type	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86dd
PPPoE	0x8863/0x8864

LLDP	0x88cc
802.1X	0x888e
802.1ag	0x8902
Cluster	0x88a7
Reserved	0xfffd/0xfffe/0xffff

Examples

Set the TPID value in CVLAN tags to 8200 (hexadecimal).

```
<Switch> system-view
```

```
[Switch] qinq ethernet-type customer-tag 8200
```

Related commands

qinq ethernet-type (interface view)

13.1.5. qinq transparent-vlan

Use **qinq transparent-vlan** to enable transparent transmission for a list of VLANs on a port.

Use **undo qinq transparent-vlan** to disable transparent transmission for a list of VLANs on a port.

Syntax

qinq transparent-vlan *vlan-id-list*

undo qinq transparent-vlan { *vlan-id-list* | **all** }

Default

Transparent transmission is disabled for all VLANs.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a single VLAN ID or a VLAN ID range in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The end VLAN ID must be equal to or greater than the start VLAN ID.

all: Specifies all VLANs.

Usage guidelines

By default, QinQ tags all incoming frames with the PVID on a port. This command disables QinQ to tag incoming traffic from a list of VLANs. These VLANs are called transparent VLANs.

You can repeat this command to add VLANs to the list of transparent VLANs.

To ensure successful transmission for a transparent VLAN, follow these configuration guidelines:

- Set the link type of the port to trunk or hybrid, and assign the port to the transparent VLAN.
- Do not configure any other VLAN manipulation actions for the transparent VLAN on the port.
- Make sure all ports on the traffic path permit the transparent VLAN to pass through.
- If you use both transparent VLANs and VLAN mappings on an interface, the transparent VLANs cannot be the following VLANs:
  - Original or translated VLANs of one-to-one or one-to-two VLAN mappings.
  - Original or translated outer VLANs of two-to-two VLAN mappings.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port, and assign the port to VLAN 2, VLAN 3, and VLANs 50 through 100. Enable QinQ on GigabitEthernet 1/0/1, and configure the port to transparently transmit frames from VLAN 2.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
```

```
[Switch-GigabitEthernet1/0/1] port link-type trunk
[Switch-GigabitEthernet1/0/1] port trunk permit vlan 2 3 50 to 100
[Switch-GigabitEthernet1/0/1] qinq enable
[Switch-GigabitEthernet1/0/1] qinq transparent-vlan 2
```

14. VLAN mapping commands

14.1. VLAN mapping commands

Do not configure VLAN mapping and Ethernet service instance-to-VSI binding on the same Layer 2 Ethernet interface or Layer 2 aggregate interface. Do not configure VLAN mapping on a Layer 2 Ethernet interface or Layer 2 aggregate interface that acts as the source interface of a VXLAN tunnel. Otherwise, these features might not take effect. For more information about VXLAN and VSI, see *VXLAN Configuration Guide*.

14.1.1. display vlan mapping

Use **display vlan mapping** to display VLAN mapping information.

Syntax

display vlan mapping [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays VLAN mapping information on all interfaces.

Examples

Display VLAN mapping information on all interfaces.

```
<Switch> display vlan mapping

Interface GigabitEthernet1/0/1:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  10            N/A           120                      N/A
  Outer VLAN    Inner VLAN    Nested VLAN
  200           100           300

Interface GigabitEthernet1/0/3:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  12            N/A           110                      12

Interface GigabitEthernet1/0/4:
  Outer VLAN    Inner VLAN    Translated Outer VLAN    Translated Inner VLAN
  11            30            130                      40
```

Table 14-1 Command output

Field	Description
Outer VLAN	Original outer VLAN. This field indicates the original VLAN for one-to-one VLAN mapping and one-to-two VLAN mapping.
Inner VLAN	Original inner VLAN. This field displays **N/A** for one-to-one VLAN mapping and one-to-two VLAN mapping.
Translated Outer VLAN	Translated outer VLAN. This field indicates the translated VLAN for one-to-one VLAN mapping.
Translated Inner VLAN	Translated inner VLAN. This field displays **N/A** for one-to-one VLAN mapping.

Related commands

vlan mapping

14.1.2. vlan mapping

Use **vlan mapping** to configure VLAN mapping on an interface.

Use **undo vlan mapping** to cancel the VLAN mapping configuration.

Syntax

vlan mapping { *vlan-id* **translated-vlan** *vlan-id* | **nest** { **range** *vlan-range-list* | **single** *vlan-id-list* } **nested-vlan** *vlan-id* | **tunnel** *outer-vlan-id inner-vlan-id* **translated-vlan** *outer-vlan-id inner-vlan-id* }

undo vlan mapping { *vlan-id* **translated-vlan** *vlan-id* | **all** | **nest** { **range** *vlan-range-list* | **single** *vlan-id-list* } **nested-vlan** *vlan-id* | **tunnel** *outer-vlan-id inner-vlan-id* **translated-vlan** *outer-vlan-id inner-vlan-id* }

Default

No VLAN mapping is configured on an interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan-id **translated-vlan** *vlan-id*: Specifies the original VLAN and translated VLAN for a one-to-one VLAN mapping. The value range for the *vlan-id* argument is 1 to 4094. The original VLAN and the translated VLAN cannot be the same.

nest range *vlan-range-list* **nested-vlan** *vlan-id*: Specifies the CVLAN ranges and the SVLAN for a one-to-two VLAN mapping. The *vlan-range-list* argument specifies a space-separated list of up to 10 CVLAN items. Each item specifies a CVLAN ID or a range of CVLAN

IDs in the format of *vlan-id1* **to** *vlan-id2*. The value range for CVLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be greater than the value for the *vlan-id1* argument. Different CVLAN ranges cannot overlap. The *vlan-id* argument specifies the SVLAN ID in the range of 1 to 4094.

nest single *vlan-id-list* **nested-vlan** *vlan-id*: Specifies the CVLANs and the SVLAN for a one-to-two VLAN mapping. The *vlan-id-list* argument specifies a space-separated list of up to 10 CVLAN IDs, each of which is in the range of 1 to 4094. The *vlan-id* argument specifies the SVLAN ID in the range of 1 to 4094.

tunnel *outer-vlan-id inner-vlan-id* **translated-vlan** *outer-vlan-id inner-vlan-id*: Specifies the original outer VLAN ID, original inner VLAN ID, translated outer VLAN ID, and translated inner VLAN ID for a two-to-two VLAN mapping. The value ranges for the *outer-vlan-id* argument and the *inner-vlan-id* argument are both 1 to 4094.

all: Deletes all VLAN mapping configurations from the interface.

Usage guidelines

VLAN mapping takes effect only on VLAN-tagged packets received on an interface.

The original and translated VLANs in VLAN mappings on an interface must meet the following requirements:

- Different types of VLAN mapping entries cannot include the same original VLANs or translated VLANs.
- Different one-to-one or two-to-two VLAN mapping entries cannot include the same translated VLANs. If you configure multiple one-to-one or two-to-two VLAN mapping entries for the same original VLANs, the most recent configuration takes effect.

The configuration restrictions between QinQ and VLAN mappings are as follows:

- Before you enable or disable QinQ on a port, you must remove all VLAN mappings on the port.
- You cannot configure two-to-two VLAN mappings on a QinQ-enabled port.

If you use both transparent VLANs and VLAN mappings on an interface, the transparent VLANs cannot be the following VLANs:

- Original or translated VLANs of one-to-one and one-to-two VLAN mappings.
- Original or translated outer VLANs of two-to-two VLAN mappings.

The MTU of an interface is 1500 bytes by default. After a VLAN tag is added to a packet, the packet length is added by 4 bytes. As a best practice, set the MTU to a minimum of 1504 bytes for ports on the forwarding path of the packet on the service provider network.

VLAN mapping is supported only for Layer 2 switching and is not supported for Layer 3 routing.

If you create a VLAN interface for the original VLAN and set an IP address, do not configure VLAN mapping on the interface that sends and receives the Layer 3 routing traffic.

Examples

Configure a one-to-one VLAN mapping on GigabitEthernet 1/0/1 to map VLAN 1 to VLAN 101.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] vlan mapping 1 translated-vlan 101
```

Configure one-to-two VLAN mappings on GigabitEthernet 1/0/4 to add SVLAN tag 101 to packets carrying VLAN tags 1 through 10 and VLAN tag 80.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/4
[Switch-GigabitEthernet1/0/4] vlan mapping nest range 1 to 10 nested-vlan 101
[Switch-GigabitEthernet1/0/4] vlan mapping nest single 80 nested-vlan 101
```

Configure a two-to-two VLAN mapping on GigabitEthernet 1/0/5 to map SVLAN 101 and CVLAN 1 to SVLAN 201 and CVLAN 10.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/5
[Switch-GigabitEthernet1/0/5] vlan mapping tunnel 101 1 translated-vlan 201 10
```

15. LLDP commands

15.1. LLDP commands

15.1.1. display lldp local-information

Use **display lldp local-information** to display local LLDP information.

Syntax

display lldp local-information [**global** | **interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global local LLDP information.

interface *interface-type interface-number*: Specifies a port by its type and number.

Usage guidelines

If you do not specify any keywords or arguments, the command displays all local LLDP information, which includes the following:

- The global LLDP information.
- The LLDP information about the LLDP-enabled ports in up state.

Examples

Display all local LLDP information.

```
<Switch> display lldp local-information

	also act as a normal terminal device or media terminal device.
MED inventory information of master board	MED inventory information about the .
HardwareRev	Hardware version.
FirmwareRev	Firmware version.
SoftwareRev	Software version.
SerialNum	Serial number.
Manufacturer name	Device manufacturer.
Model name	Device model.
Port ID type	Port ID type: • MAC address. • Interface name.
Port ID	Port ID, the value of which depends on the port ID type.
Management address interface type	Numbering type of the interface identified by the management address.
Management address interface ID	Index of the interface identified by the management address.
Management address OID	Management address object ID.
Port VLAN ID(PVID)	Port VLAN ID.
Port and protocol VLAN ID(PPVID)	Port protocol VLAN ID.
Port and protocol VLAN supported	Indicates whether protocol VLAN is supported on the port.
Port and protocol VLAN enabled	Indicates whether protocol VLAN is enabled on the port.
Link aggregation supported	Indicates whether link aggregation is supported on the port.
Link aggregation enabled	Indicates whether link aggregation is enabled on the port.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.
OperMau	Speed and duplex state of the port.
Power port class	PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.

Field	Description
Port power classification	Power class of the PD: • Class 0. • Class 1. • Class 2. • Class 3. • Class 4.
Power type	Power supply type: • Type 1 PD. • Type 2 PD. • Type 1 PSE. • Type 2 PSE.
Power source	Power source: • When the power supply type is PSE, options are: ○ **Unknown**—Unknown power supply. ○ **Primary**—Primary power supply. ○ **Backup**—Backup power supply. ○ **Reserved**. • When the power supply type is PD, options are: ○ **Unknown**—Unknown power supply. ○ **PSE**—PSE power supply. ○ **Local**—Local power supply. ○ **PSE and local**—PSE and local power supplies.
Power priority	• Unknown. • Critical. • High. • Low.
PD requested power value	PD requested power in watts.
PSE allocated power value	PSE allocated power value.
PoE PSE power source	PSE power source type: • **Unknown**—Unknown power supply. • **Primary**—Primary power supply. • **Backup**—Backup power supply.
PoE PD power source	PD power source type: • **Unknown**—Unknown power supply. • **PSE**—PSE power supply. • **Local**—Local power supply. • **PSE and local**—PSE and local power supplies.
Port PSE priority	PoE power supply priority of PSE ports: • Unknown. • Critical. • High. • Low.
Port PD priority	PoE power receiving priority of PD ports: • Unknown. • Critical. • High.

Field	Description
	• Low.
Port available power value	Available PoE power on PSE ports, or power needed on PD ports, in watts.
Transmit Tw	Sleep time of the local client, in μs.
Receive Tw	Sleep time of the peer client expected by the local client, in μs.
Fallback Tw	Candidate sleep time of the peer client expected by the local client, in μs.
Echo Transmit Tw	Sleep time of the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the sleep time of the peer client. • The sleep time of the peer client is 0 μs.
Echo Receive Tw	Sleep time of the local client expected by the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the expected sleep time from the peer client. • The sleep time of the local client expected by the peer client is 0 μs.

15.1.2. display lldp neighbor-information

Use **display lldp neighbor-information** to display the LLDP information received from the neighboring devices.

Syntax

display lldp neighbor-information [[[**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** }] [**verbose**]] | **list** [**system-name** *system-name*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the LLDP information that all ports receive from the neighboring devices.

agent: Specifies an agent type. If you do not specify an agent type, the command displays the LLDP information that all LLDP agents receive from the neighboring devices.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

verbose: Displays the detailed LLDP information that the local device receives from the neighboring devices. If you do not specify this keyword, the command displays the brief LLDP information that the local device receives from the neighboring devices.

list: Displays the LLDP information that the local device receives from the neighboring devices in the form of a list.

system-name *system-name*: Displays the LLDP information that the local device receives from a neighboring device specified by its system name. The *system-name* argument is a string of 1 to 255 characters. If you do not specify this option, the command displays the LLDP information that the local device receives from all neighboring devices in a list.

Examples

Display detailed LLDP information that the nearest bridge agents on all ports received from the neighboring devices.

```
<Switch> display lldp neighbor-information agent nearest-bridge verbose

Table 15-2 Command output

Field	Description
LLDP neighbor-information of port 1	LLDP information received through port 1.
Update time	Time when LLDP information about a neighboring device was last updated.
LLDP mac type	Type of the neighbor MAC address: • Nearest bridge. • Nearest customer bridge. • Nearest non-TPMR bridge.
Chassis type	Chassis ID type: • **Chassis component**. • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Locally assigned**—Locally-defined chassis type other than those listed above.
Nbr chassis ID	ID that identifies the LLDP sending device, which can be a MAC address, a network address, an interface, or some other value, depending on the chassis ID type of the neighboring device.
Port ID type	Port ID type: • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Agent circuit ID**. • **Locally assigned**—Locally-defined port ID type other than those listed above.
Nbr port ID	Value of the type of the port ID.
Nbr system name	System name of the neighboring device.
System description	System description of the neighboring device.
System capabilities supported	Capabilities supported on the neighboring device: • **Repeater**—Signal repeating is supported. • **Bridge**—Switching is supported. • **Router**—Routing is supported. • **Telephone**—The neighboring device can act as a telephone. • **DocsisCableDevice**—The neighboring device can act as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device can act as a station only. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled.

Field	Description
	• **TPMR**—The TPMR feature is enabled. • **Other**—Features other than those listed above are supported.
System capabilities enabled	Capabilities enabled on the neighboring device: • **Repeater**—Signal repeating is enabled. • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Telephone**—The neighboring device is acting as a telephone. • **DocsisCableDevice**—The neighboring device is acting as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device is acting as a station only. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled. • **TPMR**—The TPMR feature is enabled. • **Other**—Features other than those listed above are supported.
Management address OID	Management address object ID.
Port and protocol VLAN ID(PPVID)	Port and protocol VLAN ID.
Port and protocol VLAN supported	Indicates whether protocol VLAN is supported on the port.
Port and protocol VLAN enabled	Indicates whether protocol VLAN is enabled on the port.
VLAN name of VLAN 12	Name of VLAN 12.
Link aggregation supported	Indicates whether link aggregation is supported.
Link aggregation enabled	Indicates whether link aggregation is enabled.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.
OperMau	Speed and duplex state on the port.
Power port class	PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.

Field	Description
Port power classification	Power class of the PD: • Class 0. • Class 1. • Class 2. • Class 3. • Class 4.
Power type	Power supply type: • Type 1 PD. • Type 2 PD. • Type 1 PSE. • Type 2 PSE.
Power source	Power source: • When the power supply type is PSE, options are: o **Unknown**—Unknown power supply. o **Primary**—Primary power supply. o **Backup**—Backup power supply. o **Reserved**. • When the power supply type is PD, options are:: o **Unknown**—Unknown power supply. o **PSE**—PSE power supply. o **Local**—Local power supply. o **PSE and local**—PSE and local power supplies.
Power priority	• Unknown. • Critical. • High. • Low.
PD requested power value	PD requested power in watts.
PSE allocated power value	PSE allocated power in watts.
PoE PSE power source	PSE power source type: • **Unknown**—Unknown power supply. • **Primary**—Primary power supply. • **Backup**—Backup power supply.
PoE PD power source	PD power source type: • **Unknown**—Unknown power supply. • **PSE**—PSE power supply. • **Local**—Local power supply. • **PSE and local**—PSE and local power supplies.
Port PSE priority	PoE power supply priority of PSE ports: • Unknown. • Critical. • High. • Low.
Port PD priority	PoE power receiving priority of PD ports: • Unknown. • Critical. • High.

Field	Description
	• Low.
Port available power value	Available PoE power on PSE ports, or power needed on PD ports, in watts.
TLV type	Unknown basic TLV type.
TLV information	Information contained in the unknown basic TLV type.
Unknown organizationally-defined TLV	Unknown organizationally specific TLV.
TLV OUI	OUI of the unknown organizationally specific TLV.
TLV subtype	Unknown organizationally specific TLV subtype.
Index	Unknown organization index.
Capabilities	Capabilities enabled on the neighboring device: • **Repeater**—Signal repeating is enabled. • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Telephone**—The neighboring device is acting as a telephone. • **DocsisCableDevice**—The neighboring device is acting as a DOCSIS-compliant cable device. • **StationOnly**—The neighboring device is acting as a station only. • **Other**—Features other than those listed above are supported. • **None**—The neighboring device does not advertise this TLV.
LocalIf	Local interface on which the LLDP frame was received.
Chassis ID : * -- -- Nearest nontpmr bridge neighbor #-- -- Nearest customer bridge neighbor	Chassis ID flag: • An asterisk (*) indicates the nearest non-TPMR bridge neighbor. • A pound sign (#) indicates the nearest customer bridge neighbor.

15.1.3. display lldp statistics

Use **display lldp statistics** to display the global LLDP statistics or the LLDP statistics of a port.

Syntax

display lldp statistics [**global** | [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** }]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

global: Displays the global LLDP statistics.

interface *interface-type interface-number*: Specifies a port by its type and number.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the statistics for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Usage guidelines

If you do not specify any keywords or arguments, the command displays the global LLDP statistics and the LLDP statistics of all ports.

Examples

Display the global LLDP statistics and the LLDP statistics of all ports.

```
<Switch> display lldp statistics
LLDP statistics global information:
LLDP neighbor information last change time:0 days, 0 hours, 4 minutes, 40 seconds
The number of LLDP neighbor information inserted : 1
The number of LLDP neighbor information deleted  : 1
The number of LLDP neighbor information dropped  : 0
The number of LLDP neighbor information aged out : 1

LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0

LLDP agent nearest-nontpmr:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
```

```
The number of CDP error frames                  : 0

LLDP agent nearest-customer:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Display the LLDP statistics for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Switch> display lldp statistics interface GigabitEthernet1/0/1 agent nearest-customer
LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-customer:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Table 15-3 Command output

Field	Description
LLDP statistics global information	Global LLDP statistics.
LLDP neighbor information last change time	Time when the neighbor information was last updated.
The number of LLDP neighbor information inserted	Number of times neighbor information was added.
The number of LLDP neighbor information deleted	Number of times neighbor information was removed.
The number of LLDP neighbor information dropped	Number of times neighbor information was dropped due to lack of available memory space.

15.1.4. display lldp status

Use **display lldp status** to display LLDP status.

Syntax

display lldp status [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the global LLDP status and the LLDP status of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the status information for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Examples

Display the global LLDP status and the LLDP status of each port.

```
<Switch> display lldp status
Global status of LLDP: Enable
Bridge mode of LLDP: customer-bridge
The current number of LLDP neighbors: 5
The current number of CDP neighbors: 0
LLDP neighbor information last changed time: 0 days, 0 hours, 4 minutes, 40 seconds
Transmit interval              : 30s
Fast transmit interval         : 1s
Transmit max credit            : 5
Hold multiplier                : 4
Reinit delay                   : 2s
Trap interval                  : 5s
Fast start times               : 3

LLDP status information of port 1 [GigabitEthernet1/0/1]:
LLDP agent  nearest-bridge:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5
```

```
LLDP agent nearest-nontpmr:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5

LLDP agent nearest-customer:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5
```

Table 15-4 Command output

Field	Description
Bridge mode of LLDP	LLDP bridge mode: service-bridge or customer-bridge.
Global status of LLDP	Indicates whether LLDP is globally enabled.
LLDP neighbor information last changed time	Time when the neighbor information was last updated.
Transmit interval	LLDP frame transmission interval.
Hold multiplier	TTL multiplier.
Reinit delay	LLDP reinitialization delay.
Transmit max credit	Token bucket size for sending LLDP frames.
Trap interval	Trap transmission interval.
Fast start times	Number of LLDP frames sent each time fast LLDP frame transmission is triggered.
Port 1	LLDP status of port 1.
Port status of LLDP	Indicates whether LLDP is enabled on the port.
Admin status	LLDP operating mode of the port: • **TX_RX**—The port can send and receive LLDP frames. • **Rx_Only**—The port can only receive LLDP frames. • **Tx_Only**—The port can only send LLDP frames. • **Disable**—The port cannot send or receive LLDP

Field	Description
	frames.
Trap Flag	Indicates whether trapping is enabled.
Polling interval	LLDP polling interval, which is 0 when LLDP polling is disabled.
Number of neighbors	Number of LLDP neighbors connecting to the port.
Number of MED neighbors	Number of MED neighbors connecting to the port.
Number of CDP neighbors	Number of CDP neighbors connecting to the port.
Number of sent optional TLV	Number of optional TLVs contained in an LLDP frame sent through the port.
Number of received unknown TLV	Number of unknown TLVs contained in a received LLDP frame.

15.1.5. display lldp tlv-config

Use **display lldp tlv-config** to display the types of advertisable optional LLDP TLVs of a port.

Syntax

display lldp tlv-config [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the types of advertisable optional TLVs of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the types of advertisable optional LLDP TLVs for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Examples

Display the types of advertisable optional LLDP TLVs of GigabitEthernet 1/0/1.

```
<Switch> display lldp tlv-config interface gigabitethernet 1/0/1
LLDP tlv-config of port 1[GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
NAME                              STATUS    DEFAULT
Basic optional TLV:

Table 15-5 Command output

Field	Description
LLDP tlv-config of port 1	Advertisable optional TLVs of port 1.
NAME	TLV type.
STATUS	Indicates whether the type of TLV is sent through a port.
DEFAULT	Indicates whether the type of TLV is sent through a port by default.
Basic optional TLV	Basic optional TLVs: • Port Description TLV. • System Name TLV. • System Description TLV. • System Capabilities TLV. • Management Address TLV. • Congestion notification TLV. The device does not support congestion notification TLVs in the current software version.

Field	Description
IEEE 802.1 extended TLV	IEEE 802.1 organizationally specific TLVs: • Port VLAN ID TLV. • Port and protocol VLAN ID TLV. • VLAN name TLV. • DCBX TLV. The device does not support DCBX TLVs in the current software version. • EVB TLV. • Management VID TLV.
IEEE 802.3 extended TLV	IEEE 802.3 organizationally specific TLVs: • MAC-Physic TLV. • Power via MDI TLV. • Link aggregation TLV. • Maximum frame size TLV.
LLDP-MED extend TLV	LLDP-MED TLVs: • Capabilities TLV. • Network Policy TLV. • Extended Power-via-MDI TLV. • Location Identification TLV. • Inventory TLV.
Inventory TLV	Inventory TLVs: • Hardware Revision TLV. • Firmware Revision TLV. • Software Revision TLV. • Serial Number TLV. • Manufacturer Name TLV. • Model name TLV. • Asset ID TLV.

15.1.6. lldp admin-status

Use **lldp admin-status** to set the LLDP operating mode.

Use **undo lldp admin-status** to restore the default.

Syntax

In Layer 2/Layer 3 Ethernet interface view or management Ethernet interface view:

lldp [**agent nearest-customer**] **admin-status** { **disable** | **rx** | **tx** | **txrx** }

undo lldp [**agent nearest-customer** }] **admin-status**

In Layer 2 aggregate interface view:

lldp agent nearest-customer admin-status { **disable** | **rx** | **tx** | **txrx** }

undo lldp agent nearest-customer admin-status

In IRF physical interface view:

lldp admin-status { **disable** | **rx** | **tx** | **txrx** }

undo lldp admin-status

Default

The nearest bridge agent operates in **TxRx** mode, and the nearest customer bridge agent operate in **Disable** mode.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

IRF physical interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the operating mode for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

disable: Specifies the **Disable** mode. A port in this mode cannot send or receive LLDP frames.

rx: Specifies the **Rx** mode. A port in this mode can only receive LLDP frames.

tx: Specifies the **Tx** mode. A port in this mode can only send LLDP frames.

txrx: Specifies the **TxRx** mode. A port in this mode can send and receive LLDP frames.

Usage guidelines

In IRF physical interface view, only nearest bridge agents are supported.

Examples

Set the LLDP operating mode to **Rx** for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp agent nearest-customer admin-status rx
```

15.1.7. lldp check-change-interval

Use **lldp check-change-interval** to enable LLDP polling and set the polling interval.

Use **undo lldp check-change-interval** to disable LLDP polling.

Syntax

In Layer 2/Layer 3 Ethernet interface view or management Ethernet interface view:

lldp [**agent nearest-customer**] **check-change-interval** *interval*

undo lldp [**agent nearest-customer**] **check-change-interval**

In Layer 2 aggregate interface view:

lldp agent nearest-customer check-change-interval *interval*

undo lldp agent nearest-customer check-change-interval

In IRF physical interface view:

lldp check-change-interval *interval*

undo lldp check-change-interval

Default

LLDP polling is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

IRF physical interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command enables LLDP polling and sets the polling interval for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

interval: Sets the LLDP polling interval in the range of 1 to 30 seconds.

Examples

Enable LLDP polling and set the polling interval to 30 seconds for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp agent nearest-customer check-change-interval 30
```

15.1.8. lldp compliance admin-status cdp

Use **lldp compliance admin-status cdp** to set the operating mode of CDP-compatible LLDP.

Use **undo lldp compliance admin-status cdp** to restore the default.

Syntax

lldp compliance admin-status cdp { **disable** | **txrx** }

undo lldp compliance admin-status cdp

Default

CDP-compatible LLDP operates in **Disable** mode.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Predefined user roles

network-admin

Parameters

disable: Specifies the **Disable** mode. CDP-compatible LLDP in this mode cannot receive or transmit CDP packets.

txrx: Specifies the **TxRx** mode. CDP-compatible LLDP in this mode can send and receive CDP packets.

Usage guidelines

For your device to work with Cisco IP phones, you must perform the following tasks:

- Enable CDP-compatible LLDP globally.
- Configure CDP-compatible LLDP to operate in TxRx mode on the specified ports.

Examples

Enable CDP-compatible LLDP globally and configure CDP-compatible LLDP to operate in **TxRx** mode on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] lldp compliance cdp
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp compliance admin-status cdp txrx
```

Related commands

lldp compliance cdp

15.1.9. lldp compliance cdp

Use **lldp compliance cdp** to enable CDP compatibility.

Use **undo lldp compliance cdp** to disable CDP compatibility.

Syntax

lldp compliance cdp

undo lldp compliance cdp

Default

CDP compatibility is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The maximum TTL that CDP allows is 255 seconds. To make CDP-compatible LLDP work correctly with Cisco IP phones, set the LLDP frame transmission interval to be no more than 1/3 of the TTL value.

Examples

Enable CDP compatibility.

```
<Switch> system-view
```

```
[Switch] lldp compliance cdp
```

Related commands

lldp hold-multiplier

lldp timer tx-interval

15.1.10. lldp enable

Use **lldp enable** to enable LLDP on a port.

Use **undo lldp enable** to disable LLDP on a port.

Syntax

lldp enable

undo lldp enable

Default

LLDP is enabled on a port.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

IRF physical interface view

Predefined user roles

network-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo lldp enable
```

Related commands

lldp global enable

15.1.11. lldp encapsulation snap

Use **lldp encapsulation snap** to set the encapsulation format for LLDP frames to SNAP.

Use **undo lldp encapsulation** to restore the default.

Syntax

In Layer 2/Layer 3 Ethernet interface view or management Ethernet interface view:

lldp [**agent nearest-customer**] **encapsulation snap**

undo lldp [**agent nearest-customer**] **encapsulation**

In Layer 2 aggregate interface view:

lldp agent nearest-customer encapsulation snap

undo lldp agent nearest-customer encapsulation

In IRF physical interface view:

lldp encapsulation snap

undo lldp encapsulation

Default

The encapsulation format for LLDP frames is Ethernet II.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

IRF physical interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the LLDP frame encapsulation format for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Usage guidelines

LLDP-CDP packets use only SNAP encapsulation.

Examples

Set the encapsulation format for LLDP frames to SNAP on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp encapsulation snap
```

15.1.12. lldp fast-count

Use **lldp fast-count** to set the number of LLDP frames sent each time fast LLDP frame transmission is triggered.

Use **undo lldp fast-count** to restore the default.

Syntax

lldp fast-count *count*

undo lldp fast-count

Default

Four LLDP frames are sent each time fast LLDP frame transmission is triggered.

Views

System view

Predefined user roles

network-admin

Parameters

count: Sets the number of LLDP frames sent each time fast LLDP frame transmission is triggered. The value range is 1 to 8.

Examples

Configure the device to send five LLDP frames each time fast LLDP frame transmission is triggered.

```
<Switch> system-view
[Switch] lldp fast-count 5
```

15.1.13. lldp global enable

Use **lldp global enable** to enable LLDP globally.

Use **undo lldp global enable** to disable LLDP globally.

Syntax

lldp global enable

undo lldp global enable

Default

LLDP is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP globally.

```
<Switch> system-view
[Switch] undo lldp global enable
```

Related commands

lldp enable

15.1.14. lldp hold-multiplier

Use **lldp hold-multiplier** to set the TTL multiplier.

Use **undo lldp hold-multiplier to** restore the default.

Syntax

lldp hold-multiplier *value*

undo lldp hold-multiplier

Default

The TTL multiplier is 4.

Views

System view

Predefined user roles

network-admin

Parameters

value: Sets the TTL multiplier in the range of 2 to 10.

Usage guidelines

The TTL TLV carried in an LLDPDU determines how long the device information carried in the LLDPDU can be saved on a recipient device.

By setting the TTL multiplier, you can set the TTL of locally sent LLDP frames. The TTL is expressed by using the following formula:

TTL = Min (65535, (TTL multiplier × LLDP frame transmission interval + 1))

As the expression shows, the TTL can be up to 65535 seconds.

Examples

Set the TTL multiplier to 6.

```
<Switch> system-view
[Switch] lldp hold-multiplier 6
```

Related commands

lldp timer tx-interval

15.1.15. lldp management-address

Use **lldp management-address** to enable the device to generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Use **undo lldp management-address** to restore the default.

Syntax

lldp management-address { **arp-learning** | **nd-learning** } [**vlan** *vlan-id*]

undo lldp management-address { **arp-learning** | **nd-learning** }

Default

The device does not generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Views

Layer 3 Ethernet interface view

Default command level

network-admin

Parameters

arp-learning: Generates an ARP entry if the received management address TLV contains an IPv4 address.

nd-learning: Generates an ND entry if the received management address TLV contains an IPv6 address.

vlan *vlan-id*: Specifies a VLAN ID in the range of 1 to 4094. Include this option in the command to generate the ARP or ND entry for the Layer 3 Ethernet subinterface identified by *interface-number.subnumber,* where *subnumber* is the specified VLAN ID. If the Layer 3 Ethernet subinterface does not exist or if this option is not specified, the device generates the entry for the Layer 3 Ethernet interface.

Usage guidelines

You can enable the device to generate both ARP entries and ND entries.

Examples

Configure GigabitEthernet 1/0/1 to generate an ARP entry after receiving an LLDP frame carrying an IPv4 management address TLV.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp management-address arp-learning
```

NOTE:

`nd-learning` option is not supported in the current software version.

15.1.16. lldp management-address-format string

Use **lldp management-address-format string** to set the encoding format of the management address to string.

Use **undo lldp management-address-format** to restore the default.

Syntax

In Layer 2/Layer 3 Ethernet interface view/management Ethernet interface view:

lldp [**agent nearest-customer**] **management-address-format string**

undo lldp [**agent nearest-customer**] **management-address-format**

In Layer 2 aggregate interface view:

lldp agent nearest-customer management-address-format string

undo lldp agent nearest-customer management-address-format

Default

The encoding format of the management address is numeric.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command sets the encoding format of the management address for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Usage guidelines

LLDP neighbors must use the same encoding format for the management address.

The device supports only the numeric encoding format for IPv6 management addresses.

Examples

Set the encoding format of the management address to string for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp agent nearest-customer management-address-format
string
```

15.1.17. lldp notification remote-change enable

Use **lldp notification remote-change enable** to enable LLDP trapping.

Use **undo lldp notification remote-change enable** to disable LLDP trapping.

Syntax

In Layer 2/Layer 3 Ethernet interface view/management Ethernet interface view:

lldp [**agent nearest-customer**] **notification remote-change enable**

undo lldp [**agent nearest-customer**] **notification remote-change enable**

In Layer 2 aggregate interface view:

lldp agent nearest-customer notification remote-change enable

undo lldp agent nearest-customer notification remote-change enable

In IRF physical interface view:

lldp notification remote-change enable

undo lldp notification remote-change enable

Default

LLDP trapping is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Layer 2 aggregate interface view

IRF physical interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command enables LLDP trapping for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

Examples

Enable LLDP trapping for the nearest customer bridge agent on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface GigabitEthernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp agent nearest-customer notification remote-change
enable
```

15.1.18. lldp timer notification-interval

Use **lldp timer notification-interval** to set the LLDP trap and LLDP-MED trap transmission interval.

Use **undo lldp timer notification-interval** to restore the default.

Syntax

lldp timer notification-interval *interval*

undo lldp timer notification-interval

Default

The LLDP trap and LLDP-MED trap transmission interval is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the LLDP trap and LLDP-MED trap transmission interval in the range of 5 to 3600 seconds.

Examples

Set both the LLDP trap and LLDP-MED trap transmission interval to 8 seconds.

```
<Switch> system-view
[Switch] lldp timer notification-interval 8
```

15.1.19. lldp timer reinit-delay

Use **lldp timer reinit-delay** to set the LLDP reinitialization delay.

Use **undo lldp timer reinit-delay** to restore the default.

Syntax

lldp timer reinit-delay *delay*

undo lldp timer reinit-delay

Default

The LLDP reinitialization delay is 2 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

delay: Sets the LLDP reinitialization delay in the range of 1 to 10 seconds.

Examples

Set the LLDP reinitialization delay to 4 seconds.

```
<Switch> system-view
[Switch] lldp timer reinit-delay 4
```

15.1.20. lldp timer tx-interval

Use **lldp timer tx-interval** to set the LLDP frame transmission interval.

Use **undo lldp timer tx-interval** to restore the default.

Syntax

lldp timer tx-interval *interval*

undo lldp timer tx-interval

Default

The LLDP frame transmission interval is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Sets the LLDP frame transmission interval in the range of 1 to 32768 seconds.

Examples

Set the LLDP frame transmission interval to 20 seconds.

```
<Switch> system-view
[Switch] lldp timer tx-interval 20
```

15.1.21. lldp tlv-enable

Use **lldp tlv-enable** to configure the types of advertisable TLVs on a port.

Use **undo lldp tlv-enable** to disable the advertising of the specified types of TLVs on a port.

Syntax

In Layer 2 Ethernet interface view:

- For nearest bridge agents:

  lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** | **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*] } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **network-policy** [*vlan-id*] | **power-over-ethernet** | **location-id** { **civic-address** *device-type country-code* { *ca-type ca-value* }&<1-10> | **elin-address** *tel-number* } } }

  undo lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** | **protocol-vlan-id** | **vlan-name** | **management-vid** } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **network-policy** [*vlan-id*] | **power-over-ethernet** | **location-id** } }

- For nearest customer bridge agents:

  lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** } }

  undo lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **port-vlan-id** | **link-aggregation** } }

In Layer 3 Ethernet interface view:

lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **power-over-ethernet** | **location-id** { **civic-address** *device-type country-code* { *ca-type ca-value* }&<1-10> | **elin-address** *tel-number* } } }

lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } }

undo lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **power-over-ethernet** | **location-id** } }

undo lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } }

In management Ethernet interface view:

lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** |

power-over-ethernet | **location-id** { **civic-address** *device-type country-code* { *ca-type ca-value* }&<1-10> | **elin-address** *tel-number* } } }

lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } }

undo lldp tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } | **dot3-tlv** { **all** | **mac-physic** | **max-frame-size** | **power** } | **med-tlv** { **all** | **capability** | **inventory** | **power-over-ethernet** | **location-id** } }

undo lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **port-description** | **system-capability** | **system-description** | **system-name** | **management-address-tlv** [*ip-address*] } | **dot1-tlv** { **all** | **link-aggregation** } }

In Layer 2 aggregate interface view:

lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **management-address-tlv** [*ip-address*] | **port-description** | **system-capability** | **system-description** | **system-name** } | **dot1-tlv** { **all** | **port-vlan-id** } }

lldp tlv-enable dot1-tlv { **protocol-vlan-id** [*vlan-id*] | **vlan-name** [*vlan-id*] | **management-vid** [*mvlan-id*] }

undo lldp agent nearest-customer tlv-enable { **basic-tlv** { **all** | **management-address-tlv** [*ip-address*] | **port-description** | **system-capability** | **system-description** | **system-name** } | **dot1-tlv** { **all** | **port-vlan-id** } }

undo lldp tlv-enable dot1-tlv { **protocol-vlan-id** | **vlan-name** | **management-vid** }

In IRF physical interface view:

lldp tlv-enable basic-tlv { **port-description** | **system-capability** | **system-description** | **system-name** }

undo lldp tlv-enable basic-tlv { **port-description** | **system-capability** | **system-description** | **system-name** }

Default

On Layer 2 Ethernet interfaces:

- Nearest bridge agents can advertise all types of LLDP TLVs except the following types:
  - Location identification TLVs.
  - Port and protocol VLAN ID TLVs.
  - VLAN name TLVs.
  - Management VLAN ID TLVs.
- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs.

On Layer 3 Ethernet interfaces or management Ethernet interfaces:

- Nearest bridge agents can advertise all types of LLDP TLVs except network policy TLVs. Among all the 802.1 organizationally specific TLVs, only the link aggregation TLV is supported.

- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs (only link aggregation TLV is supported).

On management Ethernet interfaces:

- Nearest bridge agents can advertise all types of LLDP TLVs except network policy TLVs. Among all the 802.1 organizationally specific TLVs, only the link aggregation TLV is supported.
- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs (only link aggregation TLV is supported).

On Layer 2 aggregate interfaces:

- Nearest customer bridge agents can advertise basic TLVs and IEEE 802.1 organizationally specific TLVs. Among the IEEE 802.1 organizationally specific TLVs, only port and protocol VLAN ID TLVs, VLAN name TLVs, and management VLAN ID TLVs are supported.

IRF physical interfaces support all available types of TLVs.

IRF physical interface view

Predefined user roles

network-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet or management Ethernet interface view, the command configures the types of advertisable TLVs for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

all: Advertises all TLVs of the specified type. This keyword enables the interface to advertise following TLVs:

- All basic LLDP TLVs if the **all** keyword is specified for **basic-tlv**.
- All IEEE 802.1 organizationally specific LLDP TLVs if the **all** keyword is specified for **dot1-tlv**.
- All IEEE 802.3 organizationally specific LLDP TLVs if the **all** keyword is specified for **dot3-tlv**.
- All LLDP-MED TLVs except location identification TLVs if the **all** keyword is specified for **med-tlv**.

basic-tlv: Advertises basic LLDP TLVs.

management-address-tlv [*ip-address*]: Advertises management address TLVs. The *ip-address* argument specifies the management address to be advertised. By default, the following rules apply:

- When you execute the **lldp tlv-enable** command:
  - For a Layer 2 Ethernet or aggregate interface, the management address is the IPv4 address of the VLAN interface that meets the following requirements:
    - In up state.
    - The corresponding VLAN ID is the lowest among the VLANs permitted on the port.

If none of the VLAN interfaces of the permitted VLANs is assigned an IPv4 address or all VLAN interfaces are down, the MAC address of the port will be advertised.

- For a Layer 3 Ethernet interface, the IPv4 address of the port will be advertised when the following conditions exist:
  - The *ip-address* argument is not configured.
  - The specified loopback interface does not have an IPv4 address, or the specified loopback interface does not exist.

  If the port does not have an IPv4 address, the MAC address of the port will be advertised.

- When you execute the **undo lldp tlv-enable** command for a Layer 2/Layer 3 Ethernet interface, management Ethernet interface, or Layer 2 aggregate interface:
  - If you do not specify *ip-address*, the port does not advertise any management address TLVs.
  - If you specify *ip-address*, the port advertises the default management address TLVs.

port-description: Advertises port description TLVs.

system-capability: Advertises system capabilities TLVs.

system-description: Advertises system description TLVs.

system-name: Advertises system name TLVs.

dot1-tlv: Advertises IEEE 802.1 organizationally specific LLDP TLVs.

port-vlan-id: Advertises port VLAN ID TLVs.

protocol-vlan-id [*vlan-id*]: Advertises port and protocol VLAN ID TLVs. The *vlan-id* argument specifies a VLAN ID in the TLVs to be advertised. The VLAN ID is in the range of 1 to 4094, and the default is the lowest VLAN ID on the port.

vlan-name [*vlan-id*]: Advertises VLAN name TLVs. The *vlan-id* argument specifies a VLAN ID in the TLVs to be advertised. The VLAN ID is in the range of 1 to 4094, and the default is the lowest VLAN ID on the port. If you do not specify a VLAN ID and the port is not assigned to any VLAN, the PVID of the port is advertised.

management-vid [*mvlan-id*]: Advertises management VLAN ID TLVs. The *mvlan-id* argument specifies a management VLAN ID in the TLVs to be advertised. The management VLAN ID is in the range of 1 to 4094. If you do not specify this option, the value 0 is advertised, which means that the LLDP agent is not configured with a management VLAN ID.

dot3-tlv: Advertises IEEE 802.3 organizationally specific LLDP TLVs.

link-aggregation: Advertises link aggregation TLVs.

mac-physic: Advertises MAC/PHY configuration/status TLVs.

max-frame-size: Advertises maximum frame size TLVs.

power: Advertises power in MDI TLVs and power stateful control TLVs.

med-tlv: Advertises LLDP-MED TLVs.

capability: Advertises LLDP-MED capabilities TLVs.

inventory: Advertises the following TLVs: hardware revision, firmware revision, software revision, serial number, manufacturer name, model name, and asset ID.

location-id: Advertises location identification TLVs.

civic-address: Inserts the typical address information about the network device in location identification TLVs .

device-type: Sets a device type value in the range of 0 to 2:

- Value 0 specifies a DHCP server.
- Value 1 specifies a network device.
- Value 2 specifies an LLDP-MED endpoint.

country-code: Sets a country code defined in ISO 3166.

{ *ca-type ca-value* }&<1-10>: Configures address information. *ca-type* represents the address information type in the range of 0 to 255. *ca-value* represents address information, a string of 1 to 250 characters. &<1-10> indicates that you can specify up to 10 *ca-type ca-value* pairs.

elin-address: Inserts telephone numbers for emergencies in location identification TLVs.

tel-number: Sets the telephone number for emergencies, a string of 10 to 25 characters.

network-policy [*vlan-id*]: Advertises network policy TLVs. The *vlan-id* argument specifies the voice VLAN ID to be advertised, in the range of 1 to 4094.

power-over-ethernet: Advertises extended power-via-MDI TLVs.

Usage guidelines

Nearest bridge agents are not supported on aggregate interfaces.

You can enable the device to advertise multiple types of TLVs by using this command without the **all** keyword specified.

If the MAC/PHY configuration/status TLV is not advertisable, none of the LLDP-MED TLVs will be advertised whether or not they are advertisable. If the LLDP-MED capabilities TLV is not advertisable, the other LLDP-MED TLVs will not be advertised regardless of whether or not they are advertisable.

The port and protocol VLAN ID, VLAN name, and management VLAN ID TLVs in IEEE 802.1 organizationally specific LLDP TLVs can be configured only for nearest bridge agents. The configuration can be inherited by nearest customer bridge agents and nearest non-TPMR bridge agents.

Examples

Enable the nearest customer bridge agents on GigabitEthernet 1/0/1 to advertise link aggregation TLVs of the IEEE 802.1 organizationally specific TLVs.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] lldp agent nearest-customer tlv-enable dot1-tlv
link-aggregation
```

Use **display l2protocol statistics** to display Layer 2 Protocol Tunneling (L2PT) statistics.

Syntax

display l2protocol statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet or aggregate interface by its type and number. If you do not specify this option, the command displays L2PT statistics for all Layer 2 Ethernet and aggregate interfaces.

Examples

Display L2PT statistics for all Layer 2 Ethernet and aggregate interfaces.

```
<Switch> display l2protocol statistics
L2PT statistics information on interface Bridge-Aggregation1:
Protocol  Encapsulated      Decapsulated      Forwarded         Dropped
CDP       0                 0                 0                 0
DLDP      0                 3                 0                 0
EOAM      0                 2                 0                 0
GVRP      8                 4                 9                 2
LACP      0                 0                 0                 0
LLDP      0                 3                 0                 0
MVRP      0                 0                 0                 0
PAGP      0                 1                 0                 0
PVST      0                 0                 0                 0

VTP       0                 6                 0                 0
UDLD      0                 0                 0                 0

L2PT statistics information on interface GigabitEthernet1/0/1:
Protocol  Encapsulated      Decapsulated      Forwarded         Dropped
CDP       0                 0                 0                 0
DLDP      2                 3                 3                 0
```

```
EOAM        5                 2                 9                 0
GVRP        8                 4                 9                 2
LACP        0                 0                 0                 0
LLDP        3                 3                 3                 3
MVRP        0                 0                 0                 0
PAGP        5                 1                 7                 3
PVST        0                 0                 0                 0
STP         5                 5                 5                 0
Tunnel      N/A               N/A               100               10
VTP         0                 6                 0                 0
UDLD        0                 0                 0                 0
```

Table 16-1 Command output

Field	Description
Encapsulated	Number of encapsulated packets. The number increases by 1 when the interface receives and encapsulates a protocol packet from a customer network. For protocol **Tunnel**, which represents tunneled packets, this field displays **N/A**.
Decapsulated	Number of decapsulated packets. The number increases by 1 when the interface receives and decapsulates a tunneled packet from the service provider network. For protocol **Tunnel**, which represents tunneled packets, this field displays **N/A**.
Forwarded	Number of forwarded packets. The number increases by 1 when the interface receives a protocol packet and forwards it. The number increases by 1 for protocol **Tunnel** when the interface receives a tunneled packet and forwards it. If no interface of the PE is connected to customer networks, the number does not increase.
Dropped	Number of dropped packets. The number increases by 1 when the interface receives a protocol packet and drops it. Protocol packets dropped by hardware are not counted. The number increases by 1 for protocol **Tunnel** when the interface receives a tunneled packet and drops it.

16.1.2. l2protocol tunnel dot1q

Use **l2protocol tunnel dot1q** to enable L2PT for a protocol.

Use **undo l2protocol tunnel dot1q** to disable L2PT for a protocol.

Syntax

In Layer 2 Ethernet interface view:

l2protocol { **cdp** | **dldp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

undo l2protocol { **cdp** | **dldp** | **eoam** | **gvrp** | **lacp** | **lldp** | **mvrp** | **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

In Layer 2 aggregate interface view:

MEMO:

cdp , **lacp** , **lldp** , **pagp** , **udld** option is supported from later software, including Version 7.2.23. Version 7.3.21 does not support the above options.

l2protocol { **cdp** | **lacp** | **lldp** | **gvrp** | **mvrp**| **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

undo l2protocol { **cdp** | **lacp** | **lldp** | **gvrp** | **mvrp**| **pagp** | **pvst** | **stp** | **udld** | **vtp** } **tunnel dot1q**

Default

L2PT is disabled for all protocols.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

cdp: Specifies CDP.

dldp: Specifies DLDP.

eoam: Specifies EOAM.

gvrp: Specifies GVRP.

lacp: Specifies LACP.

lldp: Specifies LLDP. L2PT for LLDP supports LLDP packets from only nearest bridge agents.

mvrp: Specifies MVRP.

pagp: Specifies PAgP.

pvst: Specifies PVST.

stp: Specifies STP.

udld: Specifies UDLD.

vtp: Specifies VTP.

Usage guidelines

Before you enable L2PT for a protocol on a port, perform the following tasks:

- Enable the protocol on the CE, and disable the protocol on the port.
- Enable L2PT only on customer-facing PE ports. If you enable L2PT on ports connected to the service provider network, L2PT determines that the ports are connected to a customer network.

Do not enable L2PT on a port that is going to join a service loopback group. All configuration is removed after the port joins the group.

You can enable L2PT on member ports of a Layer 2 aggregation group, but the configuration does not take effect.

The **l2protocol tunnel dot1q** command and the **l2protocol drop** command overwrite each other.

Examples

Disable STP and enable L2PT for STP on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] undo stp enable
[Switch-GigabitEthernet1/0/1] l2protocol stp tunnel dot1q
```

Disable STP and enable L2PT for STP on Bridge-Aggregation 1.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] undo stp enable
[Switch-Bridge-Aggregation1] l2protocol stp tunnel dot1q
```

Related commands

l2protocol drop

16.1.3. l2protocol tunnel-dmac

Use **l2protocol tunnel-dmac** to set the destination multicast MAC address for tunneled packets.

Use **undo l2protocol tunnel-dmac** to restore the default.

Syntax

l2protocol tunnel-dmac *mac-address*

undo l2protocol tunnel-dmac

Default

The tunneled packets use 010f-e200-0003 as the destination multicast MAC address.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a destination multicast MAC address. The available addresses are 0100-0ccd-cdd0, 0100-0ccd-cdd1, 0100-0ccd-cdd2, and 010f-e200-0003.

Examples

Set the destination multicast MAC address to 0100-0ccd-cdd0 for tunneled packets.

```
<Switch> system-view
[Switch] l2protocol tunnel-dmac 0100-0ccd-cdd0
```

16.1.4. reset l2protocol statistics

Use **reset l2protocol statistics** to clear L2PT statistics.

Syntax

reset l2protocol statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet or aggregate interface by its type and number. If you do not specify this option, the command clears L2PT statistics on all Layer 2 Ethernet and aggregate interfaces.

Examples

Clear L2PT statistics on all Layer 2 Ethernet and aggregate interfaces.

```
<Switch> reset l2protocol statistics
```

NOTE:

This function is supported on Ver7.4.37 and later.

When used in combination with UNIVERGE Network Operation Engine Overlay Network Extension, this function is supported on Ver7.4.30 and later.

17.1. M-LAG commands

17.1.1. display m-lag consistency-check status

Use **display m-lag consistency-check status** to display the configuration consistency check status.

Syntax

display m-lag consistency-check status

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the configuration consistency check status.

```
<Sysname> display m-lag consistency-check status
              Global Consistency Check Configuration
Local status     : Enabled          Peer status     : Enabled
Local check mode : Strict           Peer check mode : Strict

              Consistency Check on Modules
Module          Type1          Type2
LAGG            Check          Check
VLAN            Check          Check
STP             Check          Check
MAC             Not Check      Check
L2VPN           Not Check      Check

              Type1 Consistency Check Result
Global consistency check result: SUCCESS
Inconsistent global modules: -

M-LAG interface    M-LAG group ID    Check Result     Inconsistency modules
BAGG4              4                 SUCCESS          -
```

Table 17-1 Command output

Field	Description
Local status	Status of configuration consistency check at the local end: • **Enabled**. • **Disabled**.
Peer status	Status of configuration consistency check at the peer end: • **Enabled**. • **Disabled**.
Local check mode	Configuration consistency check mode at the local end: • **Loose**. • **Strict**.
Peer check mode	Configuration consistency check mode at the peer end: • **Loose**. • **Strict**.
Module	Feature module name.
Type1	Whether M-LAG checks the module for a type 1 configuration inconsistency: • **Check**. • **Not Check**.
Type2	Whether M-LAG checks the module for a type 2 configuration inconsistency: • **Check**. • **Not Check**.
Global consistency check result	Result of global configuration consistency check: • **FAILURE**. • **SUCCESS**.
Inconsistent global modules	Modules that failed global configuration consistency check. If the check succeeded, this field displays a hyphen (**-**).
M-LAG interface	Abbreviated name of the M-LAG interface.
Inconsistency modules	Modules that failed interface configuration consistency check. If the check succeeded, this field displays a hyphen (**-**).

17.1.2. display m-lag drcp statistics

Use **display m-lag drcp statistics** to display DRCPDU statistics.

Syntax

display m-lag drcp statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 aggregate interface or VXLAN tunnel interface by its type and number. If you do not specify this option, the command displays the DRCPDU statistics about the M-LAG peer-link interface and all M-LAG interfaces.

Examples

Display DRCPDU statistics.

```
<Sysname> display m-lag drcp statistics
 * indicates the port is the M-LAG peer-link interface .
Interface type:
BAGG -- Bridge-Aggregation, Tun -- Tunnel
Interface     State     Sent     Received(Normal/Error/Unknown)
*BAGG3        UP        30       26/0/0
 BAGG4        UP        29       26/0/0
```

Display DRCPDU statistics about Bridge-Aggregation 4.

```
<Sysname> display m-lag drcp statistics interface bridge-aggregation 4
* indicates the port is the M-LAG peer-link interface .
Interface type:
BAGG -- Bridge-Aggregation, Tun -- Tunnel
Interface  : BAGG4
State      : UP
Sent       : 31
Received (Normal/Error/Unknown): 28/0/0
Last received packet information:
  Source MAC address: 3cd4-437d-0300
  Time: 2019/09/11 09:19:58
  Action: Accept
```

Table 17-2 Command output

Field	Description
Interface	Abbreviated interface name. The name of the M-LAG peer-link interface is prefixed with an asterisk (*).
State	Physical state of the interface: • **UP**. • **DOWN**.
Sent	Number of sent DRCPDUs.
Received (Normal/Error/Unknown)	Numbers of received normal, error, and unrecognized DRCPDUs.
Last received packet information	Information about the most recently received DRCPDU.

Field	Description
Time	Date and time when the DRCPDU was received, in the YYYY/MM/DD hh:mm:ss format.
Action	Action taken on the DRCPDU: • **Accept**. • **Drop**. If the DRCPDU was dropped, this field also displays the reason for dropping the DRCPDU.

Related commands

reset m-lag drcp statistics

17.1.3. display m-lag keepalive

Use **display m-lag keepalive** to display M-LAG keepalive packet statistics.

Syntax

display m-lag keepalive

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display M-LAG keepalive packet statistics.

```
<Sysname> display m-lag keepalive
Neighbor keepalive link status (cause): Up
Neighbor is alive for: 135642 s 501 ms
Keepalive packet transmission status:
  Sent: Successful
  Received: Successful
Last received keepalive packet information:
  Source IP address: 1.1.1.1
  Time: 2019/09/11 09:21:51
  Action: Accept

Distributed relay keepalive parameters:
Destination IP address: 10.0.0.2
Source IP address: 10.0.0.1
Keepalive UDP port : 6400
Keepalive VPN name : vpn1
Keepalive interval : 1000 ms
Keepalive timeout  : 5 sec
Keepalive hold time: 3 sec
```

Table 17-3 Command output

Field	Description
Neighbor keepalive link status (cause)	State of the M-LAG peer: • **Unknown**—No M-LAG peer is detected because the destination IP address of keepalive packets is not specified. • **Up**—The M-LAG peer is up. • **Down**—The M-LAG peer is down. Cause of the keepalive link down event: • **M-LAG system init**—M-LAG system initialization. • **Local IP not configured**—The local end does not have source and destination IP address settings for the keepalive link. • **Local Tx failed**—Packet transmission failed on the local end. • **Local Rx timeou**t—Packet reception timed out on the local end. • **Peer Rx timeout**—Packet reception timed out on the peer end.
Neighbor is alive for	Time period for which the M-LAG peer has been up.
Last received keepalive packet information	Information about the most recently received keepalive packet.
Time	Date and time when the keepalive packet was received, in the YYYY/MM/DD hh:mm:ss format. If the device has not received any keepalive packets, this field displays **N/A**.
Action	Action taken on the keepalive packet: • **Accept**. • **Drop**. If the keepalive packet was dropped, this field also displays the reason for dropping the packet.
Destination IP address	Destination IP address of keepalive packets sent by the device.
Source IP address	Source IP address of keepalive packets sent by the device.
Keepalive UDP port	Destination UDP port of keepalive packets.
Keepalive VPN name	VPN instance for keepalive packets. If no VPN instance is configured for keepalive packets, this field displays **N/A**.
Keepalive interval	Interval at which the device sends keepalive packets.
Keepalive timeout	Keepalive timeout timer.
Keepalive hold time	Keepalive hold timer setting. The keepalive hold timer specifies the amount of time that the device uses to identify the cause of an

Field	Description
	M-LAG peer-link down event.

Related commands

m-lag keepalive { **ip** | **ipv6** }

m-lag keepalive hold-time

m-lag keepalive interval

17.1.4. display m-lag mad verbose

Use **display m-lag mad verbose** to display detailed M-LAG MAD information.

Syntax

display m-lag mad verbose

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display detailed M-LAG MAD information.

```
<Sysname> display m-lag mad verbose
M-LAG MAD DOWN state    : No
Restore delay         : 30 s
Remaining restore delay: -
M-LAG MAD default action: DOWN
M-LAG MAD DOWN persistence: Disabled
Excluding logical interfaces: Disabled
Port configuration for M-LAG MAD DOWN action:
 Included ports(user-configured):
   Bridge-Aggregation1
   GigabitEthernet1/0/5(ineffective)
 Included ports(system-configured):
   Member interfaces of M-LAG Bridge-Aggregation3:
     GigabitEthernet 1/0/3
 Excluded ports(user-configured):
   Bridge-Aggregation2
   GigabitEthernet1/0/4
 Excluded ports(system-configured):
   Management interfaces:
     M-GigabitEthernet0/0/0
   M-LAG interfaces:
     Bridge-Aggregation4
   M-LAG peer-link interface :
     Bridge-Aggregation3
```

```
Member interfaces of M-LAG peer-link interface  Bridge-Aggregation3:
  GigabitEthernet1/0/1
  GigabitEthernet1/0/2
```

Table 17-4 Command output

Field	Description
M-LAG MAD DOWN state	Whether the network interfaces on the device are in M-LAG MAD DOWN state: • **Yes**—The device has network interfaces placed in M-LAG MAD DOWN state. • **No**—No network interfaces are in M-LAG MAD DOWN state. If this field displays **Yes**, check the M-LAG peer-link for the link down issue to remove multi-active collision.
Restore delay	Data restoration interval, in seconds.
Remaining restore delay	The remaining time (in seconds) before the data restoration interval expires. If the data restoration interval has not started, this field displays a hyphen (**-**).
M-LAG MAD default action	Default action to take on network interfaces when the M-LAG system splits: • **DOWN**—Shut down interfaces and place them in M-LAG MAD DOWN state. • **NONE**—M-LAG MAD does not take action on interfaces.
M-LAG MAD DOWN persistence	M-LAG MAD DOWN state persistence: • **Enabled**—The M-LAG member device does not bring up the network interfaces in M-LAG MAD DOWN state when its role changes from secondary to primary. • **Disabled**—The M-LAG member device brings up the network interfaces in M-LAG MAD DOWN state when its role changes from secondary to primary.
Excluding logical interfaces	Whether all logical interfaces are excluded from the shutdown action by M-LAG MAD: • **Enabled**. • **Disabled**.
Included ports(user-configured)	Network interfaces manually configured to be shut down by M-LAG MAD when the M-LAG system splits. An interface entry will be marked as ineffective if the system does not allow the specified interface to be shut down by M-LAG MAD. M-LAG MAD will not shut down interfaces in ineffective entries when the M-LAG system splits. The following are interfaces not allowed to be shut down by M-LAG MAD: • Interfaces automatically excluded from being shut down by M-LAG MAD. • Interfaces manually or automatically excluded from being shut down by IRF MAD.

Field	Description
	• Interfaces used for special purposes.
Included ports(system-configured)	Network interfaces automatically set by the system to shut down by M-LAG MAD when the M-LAG system splits. Aggregation member ports of M-LAG interfaces are in this category of interfaces.
Excluded ports(user-configured)	Network interfaces manually configured to not be shut down by M-LAG MAD. An interface entry will be marked as ineffective if the specified interface is in the list of ports excluded by the system from the M-LAG MAD shutdown action. In this situation, the manual configuration does not take effect.
Excluded ports(system-configured)	Network interfaces set by the system to not shut down by M-LAG MAD, including: • **Management interfaces**. • **M-LAG interfaces.** • **M-LAG peer-link interface** . • Aggregation member interfaces if a Layer 2 aggregate interface is used as the M-LAG peer-link interface .

17.1.5. display m-lag role

Use **display m-lag role** to display M-LAG role information.

Syntax

display m-lag role

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display M-LAG role information.

```
<Sysname> display m-lag role
                 Effective role information
Factors              Local                Peer
Effective role        Primary              Secondary
```

```
Initial role           None                 None
MAD DOWN state         Yes                  Yes
Health level           0                    0
Role priority          32768                32768
Bridge MAC             3cd4-3ce1-0200       3cd4-437d-0300
Effective role trigger: M-LAG peer-link calculation
Effective role reason: Bridge MAC

                Configured role information
Factors              Local                Peer
Configured role      Primary              Secondary
Role priority        32768                32768
Bridge MAC           3cd4-3ce1-0200       3cd4-437d-0300
```

Table 17-5 Command output

Field	Description
Factors	Factors used in role calculation.
Local	Local configuration.
Peer	Peer configuration.
Effective role	Effective device role: • **None**. • **Primary**. • **Secondary**.
Initial role	Device role before role calculation: • **None**. • **Primary**. • **Secondary**.
MAD DOWN state	Whether there were interfaces in M-LAG MAD DOWN state during role calculation: • **Yes**. • **No**. This field displays **N/A** if no peer exists.
Health level	Health level of the device during role calculation. The member device with a lower value is healthier. This field displays **N/A** if no peer exists.
Effective role trigger	Why effective role calculation was triggered: • **M-LAG system init**—M-LAG system initialization. • **M-LAG peer-link down and all local M-LAG interfaces down**—The M-LAG peer-link and all local M-LAG interfaces went down. • **M-LAG peer-link down and all peer M-LAG interfaces down**—The M-LAG peer-link and all peer M-LAG interfaces went down. • **M-LAG peer-link and keepalive link down**—Both the M-LAG peer-link and

Field	Description
	keepalive link went down. • **M-LAG peer-link calculation**—The local device role was calculated over the M-LAG peer-link. • **M-LAG peer-link down and role calculation based on keepalive link**—The M-LAG peer-link went down, and the local device role was calculated over the keepalive link.
Effective role reason	Factor that determined the effective device role: • No peer existed. In this situation, a hyphen (-) is displayed. • Single None role. One M-LAG member device had the None role, and the other M-LAG member device had the Primary role. • MAD status. • Health level. • Role priority. • Bridge MAC.
Configured role	Manually assigned device role: • **None**. • **Primary**. • **Secondary**.

Related commands

17.1.6. display m-lag summary

Use **display m-lag summary** to display summary information about the M-LAG peer-link interface and M-LAG interfaces.

Syntax

display m-lag summary

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display summary information about the M-LAG peer-link interface and M-LAG interfaces. In this example, global configuration consistency check was successful.

```
<Sysname> display m-lag summary
Flags: A -- Aggregate interface down, B -- No peer M-LAG interface configured
       C -- Configuration consistency check failed
```

```
M-LAG peer-link interface : BAGG3
M-LAG peer-link interface  state (cause): UP
Keepalive link state (cause): UP

                  M-LAG interface information
M-LAG interface  M-LAG group  Local state (cause)  Peer state  Remaining down time(s)
BAGG4        4        UP                UP         -
```

Table 17-6 Command output

Field	Description
M-LAG peer-link interface	Abbreviated name of the M-LAG peer-link interface .
M-LAG peer-link interface state (cause)	State of the M-LAG peer-link interface : • **UP**. • **DOWN**. If the M-LAG peer-link interface is down, this field also displays the cause of the down state.
Keepalive link state (cause)	State of the keepalive link: • **UP**. • **DOWN**. Cause of the keepalive link down event: • **M-LAG system init**—M-LAG system initialization. • **Local IP not configured**—The local end does not have source and destination IP address settings for the keepalive link. • **Local Tx failed**—Packet transmission failed on the local end. • **Local Rx timeou**t—Packet reception timed out on the local end. • **Peer Rx timeout**—Packet reception timed out on the peer end.
M-LAG interface	Name of the M-LAG interface.
Local state (cause)	State of the M-LAG interface: • **UP**. • **DOWN**. If the M-LAG interface is down, this field also displays the cause of the down state: • **A**—The aggregate interface went down. • **B**—The peer M-LAG interface did not exist. • **C**—Configuration consistency check failed.
Peer state	State of the peer M-LAG interface: • **UP**. • **DOWN**—No peer M-LAG interface exists or the peer M-LAG interface is down.

Field	Description
	• **UNKNOWN**—The state of the peer M-LAG interface is unknown when the M-LAG peer-link is down.
Remaining down time (s)	Remaining time (in seconds) during which the M-LAG interface will stay in M-LAG MAD DOWN state. If the M-LAG interface is not in M-LAG MAD DOWN state, this field displays a hyphen (-).

17.1.7. display m-lag system

Use **display m-lag system** to display the M-LAG system settings.

Syntax

display m-lag system

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the M-LAG system settings.

```
<Sysname> display m-lag system
                  System information
Local system number: 1                  Peer system number: 2
Local system MAC: 0001-0001-0001          Peer system MAC: 0001-0001-0001
Local system priority: 123               Peer system priority: 123
Local bridge MAC: 3cd4-3ce1-0200          Peer bridge MAC: 3cd4-437d-0300
Local effective role: Primary             Peer effective role: Secondary
Health level: 0
Standalone mode on split: Enabled
In standalone mode: Yes

                  System timer information
Timer                   State      Value (s)    Remaining time (s)
Auto recovery            Disabled    -            -
Restore delay            Disabled    30           -
Consistency-check delay    Disabled    15           -
Standalone delay          Disabled    -            -
Role to None delay        Disabled    60           -
```

Table 17-7 Command output

Field	Description
Local system number	Local M-LAG system number. If the parameter is not configured, this field

Field	Description
	displays **N/A**.
Peer system number	Peer M-LAG system number. If the parameter is not configured or the peer does not exist, this field displays **N/A**.
Local system MAC	Local M-LAG system MAC address. If the parameter is not configured, this field displays **N/A**.
Peer system MAC	Peer M-LAG system MAC address. If the parameter is not configured or the peer does not exist, this field displays **N/A**.
Local system priority	Local M-LAG system priority. If the parameter is not configured, this field displays **N/A**.
Peer system priority	Peer M-LAG system priority. If the parameter is not configured or the peer does not exist, this field displays **N/A**.
Local bridge MAC	Local bridge MAC address.
Peer bridge MAC	Peer bridge MAC address. If the peer does not exist, this field displays **N/A**.
Local effective role	Effective role of the local device: • **None**. • **Primary**. • **Secondary**.
Peer effective role	Effective role of the peer device: • **None**. • **Primary**. • **Secondary**.
Health level	Health level of the device. The member device with a lower value is healthier.
Standalone mode on split	Whether M-LAG standalone mode is enabled: • **Enabled**. • **Disabled**.
In standalone state	Whether the device is in M-LAG standalone mode: • **Yes**. • **No**.
Timer	Timer type: • **Auto recovery**—Reload delay timer. • **Restore delay**—Data restoration interval. • **Consistency check delay**—Configuration consistency check delay timer. • **Standalone delay**—Delay that the device must wait before changing to M-LAG standalone mode. • **Role to None delay**—Delay that the device must wait before setting its role

Field	Description
	to None.
State	State of the timer: • **Enabled**. • **Disabled**.
Value (s)	Value of the timer, in seconds.
Remaining time (s)	Remaining time of the timer, in seconds. If the timer has not started, this field displays a hyphen (**-**).

17.1.8. display m-lag troubleshooting

Use **display m-lag troubleshooting** to display M-LAG troubleshooting information.

Syntax

display m-lag troubleshooting [**m-lag** | **peer-link** | **keepalive**] [**history**] [*count*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

m-lag: Displays M-LAG interface troubleshooting information.

peer-link: Displays M-LAG peer-link interface troubleshooting information.

keepalive: Displays keepalive link troubleshooting information.

history: Displays troubleshooting records. If you do not specify this keyword, the command displays current troubleshooting information.

count: Specifies the number of events to display, in the range of 1 to 200. If you do not specify this argument, the command displays the most recent 20 events.

Usage guidelines

If you do not specify the **m-lag-interface**, **peer-link**, or **keepalive** keywords, this command displays troubleshooting information about M-LAG interfaces, the M-LAG peer-link interface , and the keepalive link.

Examples

Display M-LAG troubleshooting records.

```
<Sysname> display m-lag troubleshooting history
Total: 3

Time                    Event description
2019-09-10 14:13:53.103  M-LAG peer-link interface  BAGG10 went down because the M-LAG
peer-link interface  role of the
                        interface was removed. Please reconfigure an interface
```

```
                    as the M-LAG peer-link interface .
2019-09-10 14:23:53.102  Keepalive link went down because the peer keepalive
                    timeout timer expired. Please check the keepalive
                    packet transmission and reception status at the two
                    ends.
2019-09-10 14:53:53.103  Local M-LAG interface state of BAGG1024 in M-LAG group 1024
                    changed to down because the aggregate interface went
                    down. Please check the aggregate link status.
```

Related commands

reset m-lag troubleshooting history

17.1.9. display m-lag verbose

Use **display m-lag verbose** to display detailed information about the M-LAG peer-link interface and M-LAG interfaces.

Syntax

display m-lag verbose [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies a M-LAG interface or the M-LAG peer-link interface by its number. The interface number must already exist. If you do not specify an interface, the command displays detailed information about the M-LAG peer-link interface and all M-LAG interfaces.

Usage guidelines

If the specified interface is not the M-LAG peer-link interface or a M-LAG interface, no information is displayed.

Examples

Display detailed information about M-LAG interface Bridge-Aggregation 1.

```
<Sysname> display m-lag verbose interface bridge-aggregation 1
Flags: A -- Home_Gateway, B -- Neighbor_Gateway, C -- Other_Gateway,
      D -- M-LAG peer-link interface _Activity, E -- DRCP_Timeout, F -- Gateway_Sync,
      G -- Port_Sync, H -- Expired

M-LAG interface/M-LAG group ID: BAGG1/1
Local M-LAG interface state: UP
Peer M-LAG interface state: UP
M-LAG group state: UP
Local M-LAG interface down cause: -
Remaining M-LAG DOWN time: -
Local M-LAG interface LACP MAC: Config=0001-0001-0001, Effective=0001-0001-0001
```

```
Peer M-LAG interface LACP MAC: Config=0001-0001-0001, Effective=0001-0001-0001
Local M-LAG interface LACP priority: Config=200, Effective=200
Peer M-LAG interface LACP priority: Config=200, Effective=200
Local DRCP flags/Peer DRCP flags: ABDFG/ABDFG
Local Selected ports (index): GE1/0/1 (260), GE1/0/2 (261)
Peer Selected ports indexes: 260, 261
```

Display detailed information about M-LAG peer-link interface Bridge-Aggregation 2.

```
<Sysname> display m-lag verbose interface bridge-aggregation 2
Flags: A -- Home_Gateway, B -- Neighbor_Gateway, C -- Other_Gateway,
      D -- M-LAG peer-link interface _Activity, E -- DRCP_Timeout, F -- Gateway_Sync,
      G -- Port_Sync, H -- Expired

M-LAG peer-link interface /M-LAG peer-link interface  ID: BAGG2/1
State: UP
Cause: -
Local DRCP flags/Peer DRCP flags: ABDFG/ABDFG
Local Selected ports (index): GE1/0/1 (258), GE1/0/2 (259)
Peer Selected ports indexes: 258, 259
```

Table 17-8 Command output

Field	Description
Flags	DRCP state flags. The flag field is one byte long, represented by ABCDEFGH from the lowest bit to the highest bit. A letter is displayed when its bit is 1 and is not displayed when its bit is 0. • **A**—Indicates whether DRCP is enabled on the local device. 1 indicates enabled. 0 indicates disabled. • **B**—Indicates whether DRCP is enabled on the M-LAG peer. 1 indicates enabled. 0 indicates disabled. • **C**—Indicates whether DRCP is enabled on a third M-LAG member device. 1 indicates enabled. 0 indicates disabled. • **D**—Indicates whether the local M-LAG peer-link interface has determined that DRCP is enabled on the M-LAG peer. 1 indicates yes. 0 indicates no. • **E**—Indicates the DRCP timeout timer. 1 indicates the short timeout timer. 0 indicates the long timeout timer. • **F**—Indicates whether the local M-LAG peer-link interface permits the packets that contain the negotiated gateway conversation IDs. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the local M-LAG peer-link interface permits the packets that contain the negotiated port conversation IDs. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the local DRCPDU receive machine is in default

Field	Description
	or expired state. 1 indicates yes. 0 indicates no.
M-LAG peer-link interface	Abbreviated name of the M-LAG peer-link interface .
M-LAG interface	Abbreviated name of the M-LAG interface.
Local M-LAG interface state	State of the local M-LAG interface: • **UP**—The M-LAG interface is up if it has Selected ports in its aggregation group. • **DOWN**—The M-LAG interface is down if it does not have Selected ports in its aggregation group.
Peer M-LAG interface state	State of the peer M-LAG interface: • **UP**—The M-LAG interface is up if it has Selected ports in its aggregation group. • **DOWN**—The M-LAG interface is down if it does not have Selected ports in its aggregation group. • **UNKNOWN**—The state of the peer M-LAG interface is unknown when the M-LAG peer-link is down.
M-LAG group state	State of the M-LAG group: • **UP**—The M-LAG group is up if it contains a minimum of one member M-LAG interface in UP state. • **DOWN**—The M-LAG group is down if it all its member M-LAG interfaces are in DOWN state.
Local M-LAG interface down cause	Cause of the down state of the local M-LAG interface. If the local M-LAG interface is up, this field displays a hyphen (**-**).
Remaining M-LAG DOWN time	Remaining time (in seconds) during which the M-LAG interface will stay in M-LAG MAD DOWN state. If the M-LAG interface is not in M-LAG MAD DOWN state, this field displays a hyphen (**-**).
State	State of the M-LAG peer-link interface : • **UP**. • **DOWN**.
Cause	Cause of the down state of the M-LAG peer-link interface . If the M-LAG peer-link interface is up, this field displays a hyphen (**-**).
Config	Configured value.
Effective	Effective value.
Local DRCP flags	Local DRCP state flags. If all bits are set to 0, this field displays **Unknown**.
Peer DRCP flags	Peer DRCP state flags. If all bits are set to 0 or no peer exists, this field displays **Unknown**.
Local Selected ports (index)	Abbreviated name of the Selected ports in

Field	Description
	the local aggregation group and their port indexes.
Peer Selected ports indexes	Port indexes of the Selected ports in the peer aggregation group.

17.1.10. m-lag auto-recovery reload-delay

Use **m-lag auto-recovery reload-delay** to enable M-LAG system auto-recovery and set the reload delay timer.

Use **undo m-lag auto-recovery reload-delay** to restore the default.

Syntax

m-lag auto-recovery reload-delay *delay-value*

undo m-lag auto-recovery reload-delay

Default

M-LAG system auto-recovery is disabled and the reload delay timer is not set.

Views

System view

Predefined user roles

network-admin

Parameters

delay-value: Specifies a reload delay in the range of 240 to 3600 seconds.

Usage guidelines

If only one M-LAG member device recovers after the entire M-LAG system reboots, auto-recovery enables that member device to remove its M-LAG interfaces from the M-LAG DOWN interface list.

- If that member device has up M-LAG interfaces, it takes over the primary role when the reload delay timer expires and forwards traffic.
- If that member device does not have up M-LAG interfaces, it is stuck in the None role and does not forward traffic.

If auto-recovery is disabled, that M-LAG member device will be stuck in the None role with all its M-LAG interfaces being M-LAG DOWN after it recovers.

If both M-LAG member devices recover and have up M-LAG interfaces after the entire M-LAG system reboots, active-active situation might occur if both M-LAG peer link and keepalive links were down when the reload delay timer expires. If this rare situation occurs, examine the M-LAG peer link and keepalive links and restore them.

To avoid incorrect role preemption, make sure the reload delay timer is longer than the amount of time required for the device to restart.

Examples

Enable M-LAG system auto-recovery and set the reload delay timer to 245 seconds.

```
<Sysname> system-view
[Sysname] m-lag auto-recovery reload-delay 245
```

Related commands

display m-lag role

17.1.11. m-lag drcp period short

Use **m-lag drcp period short** to enable the short DRCP timeout timer (3 seconds) on the M-LAG peer-link interface or a M-LAG interface.

Use **undo m-lag drcp period** to restore the default.

Syntax

m-lag drcp period short

undo m-lag drcp period

Default

An aggregate interface uses the long DRCP timeout timer (90 seconds).

Views

Layer 2 aggregate interface view

VXLAN tunnel interface view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on the M-LAG peer-link interface or a M-LAG interface.

DRCP uses a timeout mechanism to specify the amount of time that an M-LAG peer-link interface or M-LAG interface must wait to receive DRCPDUs before it determines that the peer interface is down. This timeout mechanism provides the following timer options:

- Short DRCP timeout timer, which is fixed at 3 seconds. If this timer is used, the peer interface sends one DRCPDU every second.
- Long DRCP timeout timer, which is fixed at 90 seconds. If this timer is used, the peer interface sends one DRCPDU every 30 seconds.

Short DRCP timeout timer enables the M-LAG member devices to detect a peer interface down event more quickly than the long DRCP timeout timer. However, this benefit is at the expense of bandwidth and system resources.

To avoid traffic interruption during an ISSU or M-LAG process restart, disable the short DRCP timeout timer before you perform an ISSU or M-LAG process restart. For more information about ISSU, see *Fundamentals Configuration Guide*.

Examples

Enable the short DRCP timeout timer on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] m-lag drcp period short
```

17.1.12. m-lag keepalive { ip | ipv6 }

Use **m-lag keepalive** { **ip** | **ipv6** } to configure M-LAG keepalive packet parameters.

Use **undo m-lag keepalive** { **ip** | **ipv6** } to restore the default.

Syntax

m-lag keepalive { **ip** | **ipv6** } **destination** { *ipv4-address* | *ipv6-address* } [**source** { *ipv4-address* | *ipv6-address* } | **udp-port** *udp-number* | **vpn-instance** *vpn-instance-name*] *

undo m-lag keepalive { **ip** | **ipv6** }

Default

No keepalive packet parameters are configured.

Views

System view

Predefined user roles

network-admin

Parameters

ip: Specifies IPv4 addresses.

ipv6: Specifies IPv6 addresses.

destination: Specifies an IP address of the M-LAG peer as the destination IP address of keepalive packets.

source: Specifies a local IP address as the source IP address of keepalive packets. If you do not specify a source IP address, the IP address of the outgoing interface is used.

ipv4-address: Specifies an IPv4 address.

ipv6-address: Specifies an IPv6 address.

udp-port *udp-number*: Specifies the destination UDP port of keepalive packets. The value range for the *udp-number* argument is 1 to 65535. If you do not specify a UDP port number, 6400 is used.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the keepalive packets belong to the public network, do not specify a VPN instance.

Usage guidelines

The device accepts only keepalive packets that are sourced from the specified destination IP address. The keepalive link goes down if the device receives keepalive packets sourced from any other IP addresses.

Make sure the M-LAG member devices in a M-LAG system use the same keepalive destination UDP port.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the destination and source IP addresses of keepalive packets as 192.168.68.125 and 192.168.68.100, respectively.

```
<Sysname> system-view
[Sysname] m-lag keepalive ip destination 192.168.68.125 source 192.168.68.100
```

Related commands

display m-lag keepalive

17.1.13. m-lag keepalive interval

Use **m-lag keepalive interval** to set the M-LAG keepalive interval and timeout timer.

Use **undo m-lag keepalive interval** to restore the default.

Syntax

m-lag keepalive interval *interval* [**timeout** *timeout*]

undo m-lag keepalive interval

Default

The M-LAG keepalive interval is 1000 milliseconds, and the M-LAG keepalive timeout timer is 5 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the keepalive interval, in the range of 100 to 10000 milliseconds.

timeout *timeout*: Specifies the keepalive timeout timer, in the range of 3 to 20 seconds. The local keepalive timeout timer must be two times the keepalive interval of the peer at minimum.

Usage guidelines

The device sends keepalive packets at the specified interval to its M-LAG peer. If the device has not received a keepalive packet from the M-LAG peer before the keepalive timeout timer expires, the device determines that the keepalive link is down.

You must configure the same M-LAG keepalive interval on the M-LAG member devices in a M-LAG system.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the M-LAG keepalive interval and timeout timer to 2000 milliseconds and 6 seconds, respectively.

```
<Sysname> system-view
[Sysname] m-lag keepalive interval 2000 timeout 6
Changing the keepalive interval might cause system setup failure. Continue? [Y/N]:y
```

Related commands

display m-lag keepalive

17.1.14. m-lag mad default-action

Use **m-lag mad default-action** to configure the default M-LAG MAD action to take on network interfaces on the secondary M-LAG member device when the M-LAG system splits.

Use **undo m-lag mad default-action** to restore the default.

Syntax

m-lag mad default-action { **down** | **none** }

undo m-lag mad default-action

Default

M-LAG MAD shuts down network interfaces on the secondary M-LAG member device.

Views

System view

Predefined user roles

network-admin

Parameters

down: Sets the action to M-LAG MAD DOWN. M-LAG MAD will shut down all network interfaces on the secondary M-LAG member device when the M-LAG system splits, except the interfaces excluded manually or by the system.

none: Sets the M-LAG MAD action to NONE. M-LAG MAD will not shut down any network interfaces when the M-LAG system splits, except the interfaces configured manually or by the system to be shut down by M-LAG MAD.

Usage guidelines

In most network environments, use the M-LAG MAD DOWN action in conjunction with the **m-lag mad exclude interface** command.

- The M-LAG MAD DOWN action helps avoid network issues caused by multi-active collision, which occurs if the M-LAG peer-link goes down while the keepalive link is up.
- The **m-lag mad exclude interface** command enables you to exclude special-purpose interfaces, for example, interfaces used in M-LAG for M-LAG keepalive detection.

This configuration method is inefficient if a large number of interfaces on the secondary M-LAG member must be retained in up state after the M-LAG system splits. For example, if you use a VXLAN tunnel as the M-LAG peer-link in an EVPN environment, you must retain a large number of logical interfaces (for example, tunnel and loopback interfaces) in up state.

In these situations, use the following method to configure M-LAG MAD:

- Set the default M-LAG MAD action to NONE.
- Execute the **m-lag mad include interface** command to specify interfaces that must be shut down by M-LAG MAD in addition to those already automatically specified by the system.

The M-LAG MAD DOWN action will not take effect on the following interfaces:

- Interfaces automatically or manually excluded from being shut down by M-LAG MAD. To identify these interfaces, execute the **display m-lag mad verbose** command.
- Interfaces automatically or manually excluded from being shut down by IRF MAD. To identify these interfaces, execute the **display mad verbose** command.
- Interfaces used for special purposes, including:
  - Interfaces placed in a loopback test by using the **loopback** command.
  - Interfaces in a mirroring group.
  - Interfaces forced to stay up by using the **port-up mode** command.

Examples

Configure M-LAG MAD to shut down all network interfaces except excluded interfaces when the M-LAG system splits.

```
<Sysname> system-view
[Sysname] m-lag mad default-action down
```

Related commands

display m-lag mad verbose

display mad (*Virtual Technologies Command Reference*)

m-lag mad exclude logical-interfaces

m-lag mad exclude interface

m-lag mad include interface

loopback (*Interface Command Reference*)

port up-mode (*Interface Command Reference*)

17.1.15. m-lag mad exclude interface

Use **m-lag mad exclude interface** to add an interface to the user-configured list of excluded ports, which will not be shut down by M-LAG MAD when the M-LAG system splits.

Use **undo m-lag mad exclude interface** to remove an interface from the user-configured list of excluded ports.

Syntax

m-lag mad exclude interface *interface-type interface-number*

undo m-lag mad exclude interface *interface-type interface-number*

Default

M-LAG MAD shuts down all network interfaces when detecting a multi-active collision, except for the network interfaces set by the system to not shut down.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

This command is typically used when the default M-LAG MAD action is set to M-LAG MAD DOWN. In this situation, when M-LAG MAD detects a multi-active collision, M-LAG sets all network interfaces on the secondary M-LAG member device to M-LAG MAD DOWN state, except for the following interfaces:

- Network interfaces excluded from the shutdown action by IRF MAD.
- Network interfaces manually configured to not shut down by M-LAG MAD.
- Network interfaces set by the system to not shut down by M-LAG MAD, including:
  - Peer-Link.
  - Aggregation member interfaces if a Layer 2 aggregate interface is used as the Peer-Link.
  - M-LAG interfaces.
  - Management interfaces.

You must exclude the following interfaces from the shutdown action by M-LAG MAD:

- For correct keepalive detection, you must exclude the interfaces used for keepalive detection from the shutdown action.
- For M-LAG member devices to synchronize ARP entries, you must exclude the VLAN interfaces of the VLANs to which the M-LAG interfaces and Peer-Link belong from the shutdown action.
- If the Peer-Link is a tunnel interface, you must exclude the traffic outgoing interface for the tunnel from the shutdown action. To view the traffic outgoing interface for a tunnel, use the **display fib** *ip-address* or **display ip routing-table** *ip-address* command. To view the destination address of a tunnel, use the **display interface tunnel** command.

Examples

Exclude GigabitEthernet 1/0/1 from the shutdown action by M-LAG MAD.

```
<Sysname> system-view
[Sysname] m-lag mad exclude interface gigabitethernet 1/0/1
```

Related commands

display m-lag mad verbose

display fib (*Layer 3—IP Services Command Reference*)

display ip routing-table (*Layer 3—IP Routing Command Reference*)

m-lag mad default-action

m-lag mad exclude logical-interfaces

m-lag mad include interface

17.1.16. m-lag mad exclude logical-interfaces

Use **m-lag mad exclude logical-interfaces** to exclude all logical interfaces from the shutdown action by M-LAG MAD.

Use **undo m-lag mad exclude logical-interfaces** to restore the default.

Syntax

m-lag mad exclude logical-interfaces

undo m-lag mad exclude logical-interfaces

Default

By default, M-LAG MAD shuts down all network interfaces when it detects a multi-active collision, except for the network interfaces set by the system to not shut down.

Views

System view

Predefined user roles

network-admin

Usage guidelines

When a VXLAN tunnel is used as the M-LAG peer link on an EVPN M-LAG system, you must retain a large number of logical interfaces (for example, tunnel and loopback interfaces) in up state. To

simplify configuration, you can exclude all logical interfaces from the shutdown action by M-LAG MAD.

The **m-lag mad exclude interface** and **m-lag mad include interface** commands take precedence over the **m-lag mad exclude logical-interfaces** command.

Examples

Exclude all logical interfaces from the shutdown action by M-LAG MAD.

```
<Sysname> system-view
[Sysname] m-lag mad exclude logical-interfaces
```

Related commands

display m-lag mad verbose

m-lag mad default-action

m-lag mad exclude interface

m-lag mad include interface

17.1.17. m-lag mad include interface

Use **m-lag mad include interface** to add an interface to the user-configured list of included ports, which will be shut down by M-LAG MAD when the M-LAG system splits.

Use **undo m-lag mad include interface** to remove a network interface from the user-configured list of included ports.

Syntax

m-lag mad include interface *interface-type interface-number*

undo m-lag mad include interface *interface-type interface-number*

Default

The user-configured included port list does not contain any ports.

Views

System view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

This command is typically used when the default M-LAG MAD action is set to NONE. In this situation, M-LAG MAD does not shut down the network interfaces on the secondary M-LAG member device when the M-LAG system splits. To avoid network issues caused by multi-active collision, add network interfaces to the user-configured include port list if they are not in the system-configured included port list. M-LAG MAD on the secondary M-LAG member device will shut down the interfaces in the system-configured and user-configured included port lists when the M-LAG system splits.

For example, if you use a VXLAN tunnel as the M-LAG peer-link in an EVPN environment, you must retain a large number of logical interfaces (for example, tunnel and loopback interfaces) in up state. To improve configuration efficiency, you can set the default M-LAG MAD action to NONE and add interfaces to the user-configured include port list.

The M-LAG MAD DOWN action will not take effect on the following interfaces:

- Network interfaces automatically or manually excluded from being shut down by M-LAG MAD. To identify these interfaces, execute the **display m-lag mad verbose** command.
- Network interfaces automatically or manually excluded from being shut down by IRF MAD. To identify these interfaces, execute the **display mad verbose** command.
- Network interfaces used for special purposes, including:
  - Interfaces placed in a loopback test by using the **loopback** command.
  - Interfaces in a mirroring group.
  - Interfaces forced to stay up by using the **port-up mode** command.

Examples

Configure M-LAG MAD to shut down Bridge-Aggregation 1 on the secondary M-LAG member device when the M-LAG system splits.

```
<Sysname> system-view
[Sysname] m-lag mad include interface bridge-aggregation 1
```

Related commands

17.1.18. m-lag mad persistent

Use **m-lag mad persistent** to enable M-LAG MAD DOWN state persistence.

Use **undo m-lag mad persistent** to disable M-LAG MAD DOWN state persistence.

Syntax

m-lag mad persistent

undo m-lag mad persistent

Default

The secondary M-LAG member device brings up interfaces in M-LAG MAD DOWN state when its role changes to primary.

Views

System view

Predefined user roles

network-admin

Usage guidelines

M-LAG MAD DOWN state persistence prevents the secondary M-LAG member device from bringing up the network interfaces in M-LAG MAD DOWN state when its role change to primary. This feature

helps avoid the forwarding issues that might occur in the multi-active situation that occurs because the keepalive link goes down while the M-LAG peer link is down.

Examples

Enable M-LAG MAD DOWN state persistence.

```
<Sysname> system-view
[Sysname] m-lag mad persistent
```

Related commands

display m-lag mad verbose

m-lag mad restore

17.1.19. m-lag mad restore

NOTE:

It is not supported for use with the UNIVERGE Network Operation Engine Overlay Network Extension.

Use **m-lag mad restore** to bring up the interfaces in M-LAG MAD DOWN state.

Syntax

m-lag mad restore

Views

System view

Predefined user roles

network-admin

Usage guidelines

Execute this command only when both the peer link and the keepalive link are down.

You can bring up the interfaces in M-LAG MAD DOWN state on the secondary M-LAG member device for it to forward traffic if the following conditions exist:

- The primary M-LAG member device fails while the peer link is down.
- M-LAG MAD DOWN state persists on the secondary M-LAG member device.

Examples

Bring up the interfaces in M-LAG MAD DOWN state.

<Sysname> system-view

[Sysname] m-lag mad restore

```
To avoid network issues, make sure the primary device has failed and cannot forward
traffic. Continue? [Y/N]:y
```

Related commands

display m-lag mad verbose

m-lag mad persistent

17.1.20. m-lag restore-delay

Use **m-lag restore-delay** to set the data restoration interval.

Use **undo m-lag restore-delay** to restore the default.

Syntax

m-lag restore-delay *value*

undo m-lag restore-delay

Default

The data restoration interval is 30 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the data restoration interval, in the range of 1 to 3600 seconds.

Usage guidelines

The data restoration interval specifies the maximum amount of time for the secondary M-LAG member device to synchronize data with the primary M-LAG member device during M-LAG system setup. Within the data restoration interval, the secondary M-LAG member device sets all network interfaces to M-LAG MAD DOWN state, except for the following interfaces:

- M-LAG peer-link interface .
- Management Ethernet interface.
- Interfaces excluded from the MAD shutdown action.

When the data restoration interval expires, the secondary M-LAG member device brings up all network interfaces.

To avoid packet loss and forwarding failure, increase the data restoration interval if the amount of data is large or if an ISSU is to be performed between the M-LAG member devices.

Examples

Set the data restoration interval to 50 seconds.

```
<Sysname> system-view
[Sysname] m-lag restore-delay 50
```

17.1.21. m-lag role priority

Use **m-lag role priority** to set the M-LAG role priority of the device.

Use **undo m-lag role priority** to restore the default.

Syntax

m-lag role priority *priority-value*

undo m-lag role priority

Default

The M-LAG role priority of the device is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

priority-value: Specifies the M-LAG role priority, in the range of 0 to 65535. The lower the value, the higher the priority.

Usage guidelines

For features that require centralized traffic processing, a M-LAG member device is assigned the primary or secondary role based on its M-LAG role priority. The secondary M-LAG member device forwards the traffic of those features to the primary M-LAG member device for processing. If the M-LAG member devices use the same M-LAG role priority, the member device with a lower bridge MAC address is assigned the primary role.

As a best practice to avoid network flapping, do not modify the M-LAG role priority of M-LAG member devices after the M-LAG system is established.

Examples

Set the M-LAG role priority of the device to 66.

```
<Sysname> system-view
[Sysname] m-lag role priority 66
```

Related commands

display m-lag role

17.1.22. m-lag standalone enable

NOTE:

It is not supported for use with the UNIVERGE Network Operation Engine Overlay Network Extension.

Use **m-lag standalone enable** to enable M-LAG standalone mode.

Use **undo m-lag standalone enable** to disable M-LAG standalone mode.

Syntax

m-lag standalone enable [delay *delay-time* **]**

undo m-lag standalone enable [delay]

Default

M-LAG standalone mode is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

delay *delay-time*: Sets the delay that the device must wait before changing to M-LAG standalone mode. The value range for this delay is 0 to 3600 seconds. If you do not set this parameter, the

device changes to M-LAG standalone mode without delay when both the peer link and the keepalive link go down.

Usage guidelines

Enable M-LAG standalone mode to avoid forwarding issues in the multi-active situation that might occur after both the peer link and the keepalive link are down.

M-LAG standalone mode helps avoid traffic forwarding issues in this multi-active situation by allowing only the member ports in the M-LAG interfaces on one member device to forward traffic.

An M-LAG member device does not enter M-LAG standalone mode if the M-LAG peer reboots.

If you execute this command multiple times, the most recent configuration takes effect.

As a best practice, enable M-LAG standalone mode on both primary and secondary M-LAG member devices.

To prevent member ports of M-LAG interfaces from flapping, set the M-LAG standalone mode delay to be longer than the time required for a device reboot.

In a single-level M-LAG network, before you enable M-LAG standalone mode on an M-LAG member device, make sure its LACP system priority is higher than that of the remote aggregation system. This restriction ensures that the reference port is on the remote aggregation system and prevents the interfaces attached to the M-LAG system from flapping.

An M-LAG member device changes to M-LAG standalone mode only when it detects that both the peer link and the keepalive link are down. It does not change to M-LAG standalone mode when the peer M-LAG member device reboots. As a best practice, set the delay that the device must wait before changing to M-LAG standalone mode based on the cause of simultaneous failure of the peer link and keepalive link:

Examples

Enable M-LAG standalone mode.

<Sysname> system-view

[Sysname] m-lag standalone enable

17.1.23. m-lag system-mac

Use **m-lag system-mac** to configure the M-LAG system MAC address.

Use **undo m-lag system-mac** to restore the default.

Syntax

m-lag system-mac *mac-address*

undo m-lag system-mac

Default

The M-LAG system MAC address is not configured.

Views

System view

Predefined user roles

network-admin

Parameters

mac-address: Specifies a MAC address in the H-H-H format. The MAC address cannot be a multicast MAC address, all-zero MAC address, or all-F MAC address.

Usage guidelines

CAUTION:
Changing the M-LAG system MAC address causes M-LAG system split. When you perform this task on a live network, make sure you are fully aware of its impact.

The M-LAG system MAC address uniquely identifies the M-LAG system on the network. For the M-LAG member devices to be identified as one M-LAG system, you must configure the same M-LAG system MAC address on them. As a best practice to avoid MAC address collision, use the bridge MAC address of one M-LAG member device as the M-LAG system MAC address.

Examples

Configure the M-LAG system MAC address as 0001-0001-0001.

```
<Sysname> system-view
[Sysname] m-lag system-mac 1-1-1
Changing the system MAC address might flap the intra-portal link and cause M-LAG
system setup failure. Continue? [Y/N]:y
[Sysname]
```

17.1.24. m-lag system-number

Use **m-lag system-number** to set the M-LAG system number.

Use **undo m-lag system-number** to restore the default.

Syntax

m-lag system-number *system-number*

undo m-lag system-number

Default

The M-LAG system number is not set.

Views

System view

Predefined user roles

network-admin

Parameters

system-number: Specifies the M-LAG system number. Available values are 1 and 2.

Usage guidelines

CAUTION:
Changing the M-LAG system number causes M-LAG system split. When you perform this task on a live network, make sure you are fully aware of its impact.

You must assign different M-LAG system numbers to the M-LAG member devices in a M-LAG system.

Examples

Set the M-LAG system number to 1.

```
<Sysname> system-view
```

```
[Sysname] m-lag system-number 1
Changing the system number might flap the intra-portal link and cause M-LAG system
setup failure. Continue? [Y/N]:y
[Sysname]
```

Related commands

display m-lag system

17.1.25. m-lag system-priority

Use **m-lag system-priority** to set the M-LAG system priority.

Use **undo m-lag system-priority** to restore the default.

Syntax

m-lag system-priority *priority*

undo m-lag system-priority

Default

The M-LAG system priority is 32768.

Views

System view

Predefined user roles

network-admin

Parameters

priority: Specifies a priority value in the range of 0 to 65535. The lower the value, the higher the priority.

Usage guidelines

CAUTION:

Changing the M-LAG system priority causes M-LAG system split. When you perform this task on a live network, make sure you are fully aware of its impact.

A M-LAG system uses its M-LAG system priority as the system LACP priority to communicate with the remote aggregation system.

You must configure the same M-LAG system priority for the M-LAG member devices in a M-LAG system.

Examples

Set the M-LAG system priority to 64.

```
<Sysname> system-view
[Sysname] m-lag system-priority 64
Changing the system priority might flap the intra-portal link and cause M-LAG system
setup failure. Continue? [Y/N]:y
[Sysname]
```

Related commands

display m-lag system

17.1.26. port m-lag group

Use **port m-lag group** to assign an aggregate interface to a M-LAG group.

Use **undo port m-lag group** to restore the default.

Syntax

port m-lag group *group-id*

undo port m-lag group

Default

An aggregate interface does not belong to a M-LAG group.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

group-id: Specifies a M-LAG group number in the range of 1 to 1024.

Usage guidelines

To use a Layer 2 aggregate interface as a M-LAG interface, you must assign it to a M-LAG group.

The device can have multiple M-LAG interfaces. However, you can assign a Layer 2 aggregate interface to only one M-LAG group.

A Layer 2 aggregate interface cannot operate as both M-LAG peer-link interface and M-LAG interface.

Examples

Assign Bridge-Aggregation 1 to M-LAG group 100.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] port m-lag group 100
```

Related commands

display m-lag summary

display m-lag verbose

17.1.27. port m-lag peer-link

Use **port m-lag peer-link** to specify an aggregate interface or VXLAN tunnel interface as the M-LAG peer-link interface .

Use **undo port m-lag peer-link** to restore the default.

Syntax

port m-lag peer-link *port-id*

undo port m-lag peer-link

Default

No interface is the M-LAG peer-link interface .

Views

Layer 2 aggregate interface view

VXLAN tunnel interface view

Predefined user roles

network-admin

Parameters

port-id: Specifies the M-LAG peer-link interface ID, which is fixed at 1.

Usage guidelines

A M-LAG member device can have only one M-LAG peer-link interface .

A Layer 2 aggregate interface cannot operate as both M-LAG peer-link interface and M-LAG interface.

As a best practice to reduce the impact of interface flapping on upper-layer services, execute the **link-delay** command on the M-LAG peer-link interface .

By default, MAC address learning is enabled on the M-LAG peer-link interface . This feature is not configurable on the M-LAG peer-link interface .

For M-LAG to operate correctly, you must disable the static source check feature for the MAC address table after you configure the M-LAG peer-link interface .

- With software versions earlier than Release 6510, execute the **undo mac-address static source-check enable** command on the M-LAG peer-link interface .
- With Release 6510 and later, execute the **undo mac-address static source-check enable** command in system view.

Examples

Specify Bridge-Aggregation 2 as the M-LAG peer-link interface .

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 2
[Sysname-Bridge-Aggregation2] port m-lag peer-link 1
```

Related commands

link-delay
mac-address mac-learning enable
mac-address static source-check enable

17.1.28. port m-lag virtual-ip

Use **port m-lag virtual-ip** to assign an M-LAG virtual IPv4 address to an interface.

Use **undo port m-lag virtual-ip** to restore the default.

Syntax

VLAN interface view:

port m-lag virtual-ip *ipv4-address* { *mask-length* | *mask* } [**active** | **standby**] [**virtual-mac** *mac-address*]

undo port m-lag virtual-ip [*ipv4-address*]

Loopback interface view:

port m-lag virtual-ip *ipv4-address* { *mask-length* | *mask* } [**active** | **standby**]

undo port m-lag virtual-ip [*ipv4-address*]

VSI interface view:

port m-lag virtual-ip *ipv4-address* { *mask-length* | *mask* } [**active** | **standby**]

undo port m-lag virtual-ip [*ipv4-address*]

Default

No M-LAG virtual IPv4 addresses are assigned to interfaces.

Views

CAUTION:
This command is only supported when setting up VLAN Interface view and VSI Interface view.

VLAN interface view

Loopback interface view

VSI interface view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies a virtual IPv4 address.

mask-length: Specifies the subnet mask length in the range of 0 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

active: Sets the virtual IPv4 address to be active on the local device.

standby: Sets the virtual IPv4 address to be standby on the local device.

virtual-mac *mac-address*: Specifies a MAC address in the H-H-H format. The MAC address cannot be a multicast MAC address, all-zero MAC address, or all-F MAC address.

Usage guidelines

To ensure correct traffic forwarding, assign M-LAG virtual IPv4 addresses to the following interfaces on the M-LAG system:

- VLAN interfaces that act as dual-active gateways for the same VLAN.
- Loopback interfaces that offer AAA and 802.1X authentication services.
- VSI interfaces that act as distributed EVPN gateways.

If you do not specify the **active** or **standby** keyword for a virtual IPv4 address, the address is active only on the primary M-LAG member device.

If you execute the **undo port m-lag ipv4 virtual-ip** command without specifying the ipv4-address argument, the command deletes all M-LAG virtual IPv4 addresses on the interface.

When the peer-link interface fails, the standby virtual IPv4 address becomes active on the primary M-LAG member device. If no virtual MAC address is associated with the standby virtual IPv4 address, the MAC address of the interface that owns the standby virtual IPv4 address is used as the virtual MAC address. In this scenario, the devices attached to the primary M-LAG member device will refresh their ARP entries.

When you assign multiple M-LAG virtual IPv4 addresses to an interface, follow these restrictions and guidelines:

- You can assign a maximum of two virtual IPv4 addresses to an interface.
- If you configure different virtual MAC addresses for a virtual IPv4 address, the most recent configuration takes effect.
- You cannot configure the same virtual MAC address for multiple virtual IPv4 addresses.
- When you assign a virtual IPv4 address to VLAN interfaces, you must configure the same virtual MAC address for the virtual IPv4 address on both M-LAG member devices.

If you assign both virtual IPv4 and IPv6 addresses to VLAN interfaces, make sure the virtual IPv4 and IPv6 addresses that use the same virtual MAC address are in the same state on the M-LAG member devices.

When both M-LAG member devices act as gateways for dualhomed user-side devices, the gateway interfaces (VLAN or VSI interfaces) on the M-LAG member devices use the same IP address and MAC address. In this scenario, the M-LAG member devices cannot set up neighbor relationships with the user-side devices. To resolve this issue, assign virtual IPv4 addresses to the gateway interfaces and configure routing protocols such as BGP and OSPF to use the virtual IPv4 addresses for neighbor relationship setup.

For the M-LAG member devices to set up BGP peer relationships with other devices, perform the following tasks:

- Execute the **port m-lag virtual-ip** *ipv4-address* { *mask-length* | *mask* } [**active** | **standby**] [**virtual-mac** *mac-address*] command.
- Execute the **peer source-address** command to specify the virtual IPv4 address as the source IPv4 address for establishing TCP connections to peers.

For the M-LAG member devices to set up OSPF neighbor relationships with other devices, perform the following tasks:

- Execute the **port m-lag virtual-ip** *ipv4-address* { *mask-length* | *mask* } [**active** | **standby**] [**virtual-mac** *mac-address*] command.
- Execute the ospf **peer sub-address enable** command to specify the virtual IPv4 address as the secondary IPv4 address for establishing OSPF neighbor relationships.

When dual-active gateways exist on the M-LAG system, you must assign unique virtual IPv4 addresses to the gateway interfaces on the M-LAG member devices and configure both virtual IPv4 addresses to be active. When you assign a virtual MAC address to a VLAN interface, make sure the virtual MAC address is identical to the MAC address assigned to the VLAN interface by using the mac-address command.

Examples

Assign M-LAG virtual IPv4 address **10.10.10.10/24** to VLAN-interface 2 and set the state of the address to **active**.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] port m-lag virtual-ip 10.10.10.10 24 active virtual-mac 1-1-1
```

1. ARP commands

1.1. ARP commands

1.1.1. arp check enable

Use **arp check enable** to enable dynamic ARP entry check.

Use **undo arp check enable** to disable dynamic ARP entry check.

Syntax

arp check enable

undo arp check enable

Default

Dynamic ARP entry check is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Dynamic ARP entry check disables a device from supporting dynamic ARP entries with multicast MAC addresses. The device cannot learn dynamic ARP entries containing multicast MAC addresses. You cannot manually add static ARP entries that contain multicast MAC addresses.

When dynamic ARP entry check is disabled, ARP entries containing multicast MAC addresses are supported. The device can learn dynamic ARP entries containing multicast MAC addresses obtained from the ARP packets sourced from a unicast MAC address. You can also manually add static ARP entries containing multicast MAC addresses.

Examples

Enable dynamic ARP entry check.

```
<Switch> system-view
[Switch] arp check enable
```

1.1.2. arp check log enable

Use **arp check log enable** to enable the ARP logging feature.

Use **undo arp check log enable** to disable the ARP logging feature.

Syntax

arp check log enable

undo arp check log enable

Default

ARP logging is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This feature enables a device to log ARP events when ARP cannot resolve IP addresses correctly. The log information helps administrators locate and solve problems. The device can log the following ARP events:

- On a proxy ARP-disabled interface, the target IP address of a received ARP packet is not one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.
- The sender IP address of a received ARP reply conflicts with one of the following IP addresses:
  - The IP address of the receiving interface.
  - The virtual IP address of the VRRP group.

The device sends ARP log messages to the information center. You can use the **info-center source** command to specify the log output rules for the information center. For more information about information center, see *Network Management and Monitoring Configuration Guide*.

The device can generate a large number of ARP logs. To conserve system resources, enable ARP logging only when you are auditing or troubleshooting ARP events.

Examples

Enable ARP logging.

```
<Switch> system-view
[Switch] arp check log enable
```

1.1.3. arp mac-interface-consistency check enable

Use **arp mac-interface-consistency check enable** to enable interface consistency check for ARP and MAC address entries.

Use **undo arp mac-interface-consistency check enable** to disable this feature.

Syntax

arp mac-interface-consistency check enable

undo arp mac-interface-consistency check enable

Default

Enabling interface consistency check for ARP and MAC address entries is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

In an instable network, the receiving interface for packets from a user might change. The interface in the MAC address entry can be updated immediately while the interface in the ARP entry cannot. In

this case, the packets matching the ARP entry will be sent out of an incorrect interface. To solve this problem, you can use this feature to periodically check the interface consistency for the ARP and MAC address entry of a user. If the interfaces are not the same, ARP sends ARP requests in the VLAN of the ARP entry and updates the entry with the ARP reply receiving interface.

Use **display mac-address** to display MAC address entries.

Examples

Enable interface consistency check for ARP and MAC address entries.

```
<Switch> system-view
[Switch] arp mac-interface-consistency check enable
```

Related commands

display mac-address

1.1.4. arp max-learning-num

Use **arp max-learning-num** to set the dynamic ARP learning limit for an interface.

Use **undo arp max-learning-num** to restore the default.

Syntax

arp max-learning-num *max-number*

undo arp max-learning-num

Default

An interface can learn a maximum of 16384 dynamic ARP entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 Ethernet interface view

VXLAN VSI interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of dynamic ARP entries for an interface. The value range for this argument is 0 to 16384.

Usage guidelines

An interface can dynamically learn ARP entries. To prevent an interface from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the interface can learn. When the maximum number is reached, the interface stops learning ARP entries.

When the *number* argument is set to 0, the interface is disabled from learning dynamic ARP entries.

Examples

Specify VLAN-interface 40 to learn a maximum of 10 dynamic ARP entries.

```
<Switch> system-view
[Switch] interface vlan-interface 40
```

```
[Switch-Vlan-interface40] arp max-learning-num 10
```

Specify GigabitEthernet 1/0/1 to learn a maximum of 10 dynamic ARP entries.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] arp max-learning-num 10
```

Specify Layer 2 aggregate interface Bridge-Aggregation 1 to learn a maximum of 10 dynamic ARP entries.

```
<Switch> system-view
[Switch] interface bridge-aggregation 1
[Switch-Bridge-Aggregation1] arp max-learning-num 10
```

1.1.5. arp max-learning-number

Use **arp max-learning-number** to set the dynamic ARP learning limit for a device.

Use **undo arp max-learning-number** to restore the default.

Syntax

arp max-learning-number *max-number* **slot** *slot-number*

undo arp max-learning-number slot *slot-number*

Default

A device can learn a maximum of 16384 dynamic ARP entries.

Views

System view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of dynamic ARP entries for a device. The value range for this argument is 0 to 16384.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

A device can dynamically learn ARP entries. To prevent a device from holding too many ARP entries, you can set the maximum number of dynamic ARP entries that the device can learn. When the maximum number is reached, the device stops learning ARP entries.

When the *number* argument is set to 0, the device is disabled from learning dynamic ARP entries.

Examples

Set the dynamic ARP learning limit to 64 for slot 1.

```
<Switch> system-view
[Switch] arp max-learning-number 64 slot 1
```

1.1.6. arp mode uni

Use **arp mode uni** to configure a port as a customer-side port.

Use **undo arp mode** to restore the default.

Syntax

arp mode uni

undo arp mode

Default

A port operates as a network-side port.

Views

VLAN interface view

VXLAN VSI interface view

Predefined user roles

network-admin

Usage guidelines

By default, the device associates an ARP entry with routing information when the device learns an ARP entry. The ARP entry provides the next hop information for routing. To save hardware resources, you can use this command to specify a port that connects to a user terminal as a customer-side port. The device will not associate the routing information with the learned ARP entries.

Examples

Configure VLAN-interface 2 as a customer-side port.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] arp mode uni
```

1.1.7. arp multiport

Use **arp multiport** to configure a multiport ARP entry.

Use **undo arp** to delete an ARP entry.

Syntax

arp multiport *ip-address mac-address vlan-id* [**vpn-instance** *vpn-instance-name*]

undo arp *ip-address* [*vpn-instance-name*]

Default

No multiport ARP entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address for the multiport ARP entry.

mac-address: Specifies a MAC address for the multiport ARP entry, in the format of H-H-H.

vlan-id: Specifies a VLAN for the multiport ARP entry, in the range of 1 to 4094. The specified VLAN must already exist.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the multiport ARP entry belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist. To specify a multiport ARP entry on the public network, do not specify this option.

Usage guidelines

If the VLAN or the corresponding VLAN interface is deleted, the multiport ARP entry is also deleted.

To make the multiport ARP entry effective for packet forwarding, you must configure a multicast or multiport unicast MAC address entry to specify multiple output interfaces. The MAC address entry must have the same MAC address and VLAN ID as the multiport ARP entry. In addition, the IP address in the multiport ARP entry must reside on the same subnet as the VLAN interface of the specified VLAN.

Examples

Configure a multiport ARP entry that contains IP address 202.38.10.2 and MAC address f474-8801-0000 in VLAN 10.

```
<Switch> system-view
[Switch] arp multiport 202.38.10.2 f474-8801-0000 10
```

Related commands

display arp multiport

reset arp multiport

1.1.8. arp static

Use **arp static** to configure a static ARP entry.

Use **undo arp** to delete an ARP entry.

Syntax

arp static *ip-address mac-address* [*vlan-id interface-type interface-number* | **vsi-interface** *vsi-interface-id* **tunnel** *number* **vsi** *vsi-name* | **vsi-interface** *vsi-interface-id interface-type interface-number* **service-instance** *instance-id* **vsi** *vsi-name*] [**vpn-instance** *vpn-instance-name*]

undo arp *ip-address* [*vpn-instance-name*]

Default

No static ARP entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies an IP address for the static ARP entry.

mac-address: Specifies a MAC address for the static ARP entry, in the format of H-H-H.

vlan-id: Specifies the ID of a VLAN to which the static ARP entry belongs. The value range is 1 to 4094.

interface-type interface-number: Specifies an interface by its type and number.

vsi-interface *vsi-interface-id*: Specifies a VSI interface by its number. The VSI interface must already exist.

tunnel *number*: Specifies a tunnel interface by its number. The tunnel interface must already exist.

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the static ARP entry belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. The VPN instance must already exist. To specify a static ARP entry on the public network, do not specify this option.

Usage guidelines

A static ARP entry is manually configured and maintained. It does not age out and cannot be overwritten by any dynamic ARP entry.

Static ARP entries can be short or long.

A resolved short static ARP entry becomes unresolved upon certain events, for example, when the resolved output interface goes down, or the corresponding VLAN or VLAN interface is deleted.

Long static ARP entries are effective or ineffective. Ineffective long static ARP entries cannot be used for packet forwarding. A long static ARP entry is ineffective when any of the following conditions exists:

- The corresponding VLAN interface or output interface is down.
- The IP address in the entry conflicts with a local IP address.
- No local interface has an IP address in the same subnet as the IP address in the ARP entry.

If you specify the *vlan-id interface-type interface-number* argument, follow these restrictions and guidelines:

- The interface can be an Ethernet interface or an aggregate interface.
- The VLAN and VLAN interface must already exist. The specified Ethernet interface must belong to the specified VLAN.
- The IP address of the VLAN interface and the IP address specified by the *ip-address* argument must be on the same network.
- A long static ARP entry in a VLAN is deleted if the VLAN or VLAN interface is deleted.

On a VXLAN IP gateway that forwards traffic among VXLANs through VXLAN tunnels, a VSI interface can act as the gateway for multiple VXLANs. The VSI interface (input interface) might be connected to multiple VXLAN tunnel interfaces (output interfaces). In this case, you must specify the **vsi-interface** *vsi-interface-id* **tunnel** *number* **vsi** *vsi-name* parameters to identify a VSI interface-VSI-VXLAN tunnel interface binding. For more information about VSI interfaces, VSI, and VXLAN tunnel interfaces, see *VXLAN Configuration Guide*.

Examples

Configure a long static ARP entry that contains IP address 202.38.10.2, MAC address f474-8801-0000, and output interface GigabitEthernet 1/0/1 in VLAN 10.

```
<Switch> system-view
[Switch] arp static 202.38.10.2 f474-8801-0000 10 gigabitethernet 1/0/1
```

Configure a long static ARP entry that contains IP address 1.1.1.1, MAC address f474-8801-0000, input interface VSI-interface 1, output interface Tunnel 1, and the VSI **a**.

```
<Switch> system-view
[Switch] arp static 1.1.1.1 f474-8801-0000 vsi-interface 1 tunnel 1 vsi a
```

Related commands

display arp

reset arp

1.1.9. arp timer aging

Use **arp timer aging** to set the aging timer for dynamic ARP entries.

Use **undo arp timer aging** to restore the default.

Syntax

arp timer aging *aging-minutes*

undo arp timer aging

Default

The aging timer for dynamic ARP entries is 20 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

aging-minutes: Specifies the aging timer in minutes. The value range for this argument is 1 to 1440.

Usage guidelines

Each dynamic ARP entry in the ARP table has a limited lifetime, called an aging timer. The aging timer of a dynamic ARP entry is reset each time the dynamic ARP entry is updated. Dynamic ARP entries that are not updated before their aging timers expire are deleted from the ARP table.

Set the aging timer for dynamic ARP entries as needed. For example, when you configure proxy ARP, set a short aging time so that invalid dynamic ARP entries can be deleted in a timely manner.

Examples

Set the aging timer for dynamic ARP entries to 10 minutes.

```
<Switch> system-view
[Switch] arp timer aging 10
```

Related commands

display arp timer aging

1.1.10. display arp

Use **display arp** to display ARP entries.

Syntax

display arp [[**all** | **dynamic** | **multiport** | **static**] [**slot** *slot-number*] | **vlan** *vlan-id* | **interface** *interface-type interface-number*] [**count** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays all ARP entries.

dynamic: Displays dynamic ARP entries.

multiport: Displays multiport ARP entries.

static: Displays static ARP entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ARP entries for the master device.

vlan *vlan-id*: Specifies a VLAN by its VLAN ID. The VLAN ID is in the range of 1 to 4094.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays ARP entries for all interfaces.

count: Displays the number of ARP entries.

verbose: Displays detailed information about ARP entries.

Usage guidelines

This command displays information about ARP entries, including the IP address, MAC address, VLAN ID, output interface, entry type, and aging timer.

Examples

Display all ARP entries.

```
<Switch> display arp all
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP Address       MAC Address     VID     Interface/Link ID      Aging Type
1.1.1.1          02e0-f102-0023  1       GE1/0/1                N/A   S
1.1.1.2          f474-8800-0001  12      GE1/0/2                960   D
1.1.1.3          00e0-fe50-6503  12      Tunnel1                960   D
1.1.1.4          000d-88f7-9f7d  12      0x1                    960   D
```

Display detailed information about all ARP entries.

```
<Switch> display arp all verbose
IP address          : 1.1.1.1                 MAC address    : 02e0-f102-0023

```

Display the number of all ARP entries.

```
<Switch> display arp all count
 Total number of entries : 4
```

Table 1-1 Command output

Field	Description
IP Address	IP address in an ARP entry.
MAC Address	MAC address in an ARP entry.
VID	This field is not supported in the current software version. ID of the VLAN or index of the VSI to which the ARP entry belongs. This field displays **N/A** in either of the following situations: • The ARP entry is an unresolved short static ARP entry. • The output interface of the ARP entry does not belong to the VLAN or VSI.
Interface	Output interface in an ARP entry. This field displays **N/A** in either of the following situations: • The ARP entry is an unresolved short static ARP entry. • The ARP entry is a multiport ARP entry and has no output interface information. To obtain the output interface information of the multiport ARP entry, look up the MAC address table according to the MAC address in the ARP entry.
Link ID	This field is not supported in the current software version. Link ID in an ARP entry. This field displays hyphens (**--**) if the ARP entry does not belong to any VSI.
Aging	Aging time for an ARP entry in seconds. For a static ARP entry, this field always displays **N/A**. The static ARP entry never ages out unless you delete it manually. For a dynamic ARP entry, this field displays **N/A** if the aging time is unknown.
Type	ARP entry type: • **D**—Dynamic. • **S**—Static. • **O**—OpenFlow. • **R**—Rule. • **M**—Multiport. • **I**—Invalid.
Nickname	This field is not supported in the current software version. Nickname of the ARP entry. The nickname is a string of four hexadecimal numbers, for example, 012a.
VPN Instance	This field is not supported in the current software version. Name of VPN instance. If no VPN instance is configured for the ARP entry, this field displays **[No Vrf]**.

Field	Description
VXLAN ID	This field is not supported in the current software version. ID of the VXLAN to which the ARP entry belongs. VXLAN ID is also called VNI. If the ARP entry does not belong to any VXLAN, this field displays **N/A**.
VSI Name	This field is not supported in the current software version. Name of the VSI to which the ARP entry belongs. If the ARP entry does not belong to any VSI, this field displays **N/A**.
VSI Interface	This field is not supported in the current software version. Name of the gateway interface of the VSI. If no gateway interface is specified for the VSI, this field displays **N/A**.
Total number of entries	Number of ARP entries.

Related commands

reset arp

1.1.11. display arp *ip-address*

Use **display arp** *ip-address* to display the ARP entry for an IP address.

Syntax

display arp *ip-address* [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip-address: Displays the ARP entry for the specified IP address.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for the master device.

verbose: Displays the detailed information about the specified ARP entry.

Usage guidelines

The ARP entry information includes the IP address, MAC address, VLAN ID, output interface, entry type, and aging timer.

Examples

Display the ARP entry for the IP address 20.1.1.1.

```
<Switch> display arp 20.1.1.1
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP Address       MAC Address     VID     Interface/Link ID      Aging Type
20.1.1.1         f474-8800-0001  N/A     N/A                    N/A   S
```

Predefined user roles

network-admin

network-operator

Usage guidelines

This command always displays the aging time in seconds no matter which unit you set in the **arp timer aging** command.

Examples

Display the aging timer of dynamic ARP entries.

```
<Switch> display arp timer aging
Current ARP aging time is 1200 seconds
```

Related commands

arp timer aging

1.1.13. display arp vpn-instance

Use **display arp vpn-instance** to display the ARP entries for a VPN instance.

Syntax

display arp vpn-instance *vpn-instance-name* [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. The VPN instance name cannot contain any spaces.

count: Displays the number of ARP entries.

Usage guidelines

This command displays information about ARP entries for a VPN instance, including the IP address, MAC address, VLAN ID, output interface, entry type, and aging timer.

Examples

Display ARP entries for VPN instance **test**.

```
<Switch> display arp vpn-instance test
  Type: S-Static   D-Dynamic   O-Openflow   R-Rule   M-Multiport  I-Invalid
IP Address       MAC Address     VID     Interface/Link ID      Aging Type
20.1.1.1         f474-8800-0001  N/A     N/A                    N/A   S
```

Related commands

arp static

reset arp

1.1.14. reset arp

Use **reset arp** to clear ARP entries from the ARP table.

Syntax

reset arp { **all** | **dynamic** | **interface** *interface-type interface-number* | **multiport** | **slot** *slot-number* | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all ARP entries.

dynamic: Clears all dynamic ARP entries.

multiport: Clears all multiport ARP entries.

static: Clears all static ARP entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears ARP entries for the master device.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears ARP entries for all interfaces.

Examples

Clear all static ARP entries.

```
<Switch> reset arp static
```

2.1. Gratuitous ARP commands

2.1.1. arp ip-conflict log prompt

Use **arp ip-conflict log prompt** to enable IP conflict notification.

Use **undo arp ip-conflict log prompt** to restore the default.

Syntax

arp ip-conflict log prompt

undo arp ip-conflict log prompt

Default

IP conflict notification is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

By default, the device performs the following operations if it is using the sender IP address of a received ARP packet:

- Sends a gratuitous ARP request.
- Displays an error message after the device receives an ARP reply about the conflict.

You can use this command to enable the device to display error messages before sending a gratuitous ARP reply or request for conflict confirmation.

Examples

Enable IP conflict notification on the device.

```
<Switch> system-view
[Switch] arp ip-conflict log prompt
```

2.1.2. arp send-gratuitous-arp

Use **arp send-gratuitous-arp** to enable periodic sending of gratuitous ARP packets on an interface.

Use **undo arp send-gratuitous-arp** to disable the interface from periodically sending gratuitous ARP packets.

Syntax

arp send-gratuitous-arp [**interval** *interval*]

undo arp send-gratuitous-arp

Default

Periodic sending of gratuitous ARP packets is disabled.

Views

Layer 3 Ethernet interface view

VXLAN VSI interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the sending interval in the range of 200 to 200000 milliseconds. The default value is 2000 milliseconds.

Usage guidelines

This feature takes effect on an interface only when the interface has an IP address and the data link layer state of the interface is up.

This feature can send gratuitous ARP requests only for a VRRP virtual IP address, or the sending interface's primary IP address or manually configured secondary IP address. The primary IP address can be configured manually or automatically, whereas the secondary IP address must be configured manually.

If you change the sending interval for gratuitous ARP packets, the configuration takes effect at the next sending interval.

The sending interval for gratuitous ARP packets might be much longer than the set interval when any of the following conditions exist:

- This feature is enabled on multiple interfaces.
- Each interface is configured with multiple secondary IP addresses.
- A small sending interval is configured in the preceding cases.

Examples

Enable VLAN-interface 2 to send gratuitous ARP packets every 300 milliseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] arp send-gratuitous-arp interval 300
```

2.1.3. gratuitous-arp mac-change retransmit

Use **gratuitous-arp mac-change retransmit** to set the times and the interval for retransmitting a gratuitous ARP packet for the device MAC address change.

Use **undo gratuitous-arp mac-change retransmit** to restore the default.

Syntax

gratuitous-arp mac-change retransmit *times* **interval** *seconds*

undo gratuitous-arp mac-change retransmit

Default

The device sends a gratuitous packet for its MAC address change once only.

Views

System view

Predefined user roles

network-admin

Parameters

times: Specifies the times of retransmitting a gratuitous packet, in the range of 1 to 10.

interval *seconds*: Specifies the interval for retransmitting a gratuitous packet, in the range of 1 to 10 seconds.

Usage guidelines

The device sends a gratuitous ARP packet to inform other devices of its MAC address change. However, the other devices might fail to receive the packet because the device sends the gratuitous ARP packet once only by default. Use this command to configure gratuitous ARP retransmission parameters to ensure that the other devices can receive the packet.

After you execute this command, the device will retransmit a gratuitous ARP packet for its MAC address change at the specified interval for the specified times.

Examples

Set the times to 3 and the interval to 5 for retransmitting a gratuitous ARP packet for the device MAC address change.

```
<Sysname> system-view
[Sysname] gratuitous-arp mac-change retransmit 3 interval 5
```

2.1.4. gratuitous-arp-learning enable

Use **gratuitous-arp-learning enable** to enable learning of gratuitous ARP packets.

Use **undo gratuitous-arp-learning enable** to disable learning of gratuitous ARP packets.

Syntax

gratuitous-arp-learning enable

undo gratuitous-arp-learning enable

Default

Learning of gratuitous ARP packets is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

The learning of gratuitous ARP packets feature allows a device to maintain its ARP table by creating or updating ARP entries based on received gratuitous ARP packets.

When this feature is disabled, the device uses received gratuitous ARP packets to update existing ARP entries only. ARP entries are not created based on the received gratuitous ARP packets, which saves ARP table space.

Examples

Enable learning of gratuitous ARP packets.

```
<Switch> system-view
[Switch] gratuitous-arp-learning enable
```

2.1.5. gratuitous-arp-sending enable

Use **gratuitous-arp-sending enable** to enable sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

Use **undo gratuitous-arp-sending enable** to disable sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

Syntax

gratuitous-arp-sending enable

undo gratuitous-arp-sending enable

Default

A device does not send gratuitous ARP packets when it receives ARP requests whose sender IP address is on a different subnet.

Views

System view

Predefined user roles

network-admin

Examples

Disable a device from sending gratuitous ARP packets upon receiving ARP requests whose sender IP address is on a different subnet.

```
<Switch> system-view
[Switch] undo gratuitous-arp-sending enable
```

proxy-arp enable

3.1.3. local-proxy-arp enable

Use **local-proxy-arp enable** to enable local proxy ARP.

Use **undo local-proxy-arp enable** to disable local proxy ARP.

Syntax

local-proxy-arp enable [**ip-range** *start-ip-address* **to** *end-ip-address*]

undo local-proxy-arp enable

Default

Local proxy ARP is disabled.

Views

Layer 3 Ethernet interface view

VXLAN VSI interface view

VLAN interface view

Predefined user roles

network-admin

Parameters

ip-range *start-ip-address* **to** *end-ip-address*: Specifies the IP address range for which local proxy ARP is enabled. The start IP address must be lower than or equal to the end IP address.

Usage guidelines

Proxy ARP enables a device on a network to answer ARP requests for an IP address not on that network. With proxy ARP, hosts in different broadcast domains can communicate with each other as they do on the same network.

Proxy ARP includes common proxy ARP and local proxy ARP.

Common proxy ARP allows communication between hosts that connect to different Layer 3 interfaces and reside in different broadcast domains.

Local proxy ARP allows communication between hosts that connect to the same Layer 3 interface and reside in different broadcast domains.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable local proxy ARP on VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] local-proxy-arp enable
```

Enable local proxy ARP on VLAN-interface 2 for an IP address range.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] local-proxy-arp enable ip-range 1.1.1.1 to 1.1.1.20
```

Related commands

display arp snooping ip *ip-address* [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vlan *vlan-id*: Displays ARP snooping entries for a VLAN. The *vlan-id* argument is in the range of 1 to 4094.

count: Displays the number of the ARP snooping entries.

ip *ip-address*: Displays the ARP snooping entry for the specified IP address.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ARP snooping entries for the master device.

Examples

Display ARP snooping entries for VLAN 2.

```
<Switch> display arp snooping vlan 2
IP Address    MAC Address    VLAN ID Interface  Aging       Status
3.3.3.3       0003-0003-0003 2       GE1/0/1    20          Valid
3.3.3.4       0004-0004-0004 2       GE1/0/2    5           Invalid
```

Display the number of the ARP snooping entries.

```
<Switch> display arp snooping count
Total entries: 2
```

Table 4-1 Command output

Field	Description
IP Address	IP address in an ARP snooping entry.
MAC Address	MAC address in an ARP snooping entry.
VLAN ID	ID of the VLAN to which the ARP snooping entry belongs.
Interface	Input interface in an ARP snooping entry.
Aging	Aging time for an ARP snooping entry in minutes. If the card learns an ARP snooping entry from another card, the card cannot learn the aging time of the entry, and this field displays **N/A**.
Status	Status of an ARP snooping entry: **Valid**, **Invalid**, **Collision**.
Total entries	Number of ARP snooping entries.

Related commands

reset arp snooping

4.1.3. reset arp snooping

Use **reset arp snooping** to delete ARP snooping entries.

Syntax

reset arp snooping [**ip** *ip-address* | **vlan** *vlan-id*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Deletes the ARP snooping entry for the specified IP address.

vlan *vlan-id*: Deletes ARP snooping entries for the specified VLAN. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

If you do not specify any option, the command deletes all ARP snooping entries.

Examples

Delete ARP snooping entries for VLAN 2.

```
<Switch> reset arp snooping vlan 2
```

Related commands

display arp snooping

5.1.1. display ip interface

Use **display ip interface** to display IP configuration and statistics for Layer 3 interfaces.

Syntax

display ip interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays IP configuration and statistics for all Layer 3 interfaces.

Usage guidelines

Use the **display ip interface** command to display IP configuration and statistics for the specified Layer 3 interface. The statistics include the following information:

- The number of unicast packets, bytes, and multicast packets the interface has sent and received.
- The number of TTL-invalid packets and ICMP packets the interface has received.

The packet statistics helps you locate a possible attack on the network.

Examples

Display IP configuration and statistics for VLAN-interface 10.

```
<Switch> display ip interface vlan-interface 10
Vlan-interface10 current state : DOWN
Line protocol current state : DOWN
Internet Address is 1.1.1.1/8 Primary
Broadcast address : 1.255.255.255
The Maximum Transmit Unit : 1500 bytes
input packets : 0, bytes : 0, multicasts : 0
output packets : 0, bytes : 0, multicasts : 0
TTL invalid packet number:         0
ICMP packet input number:          0
  Echo reply:                      0
  Unreachable:                     0
  Source quench:                   0
  Routing redirect:                0
```

```
Echo request:                   0
Router advert:                  0
Router solicit:                 0
Time exceed:                    0
IP header bad:                  0
Timestamp request:              0
Timestamp reply:                0
Information request:            0
Information reply:              0
Netmask request:                0
Netmask reply:                  0
Unknown type:                   0
```

Table 5-1 Command output

Field	Description
current state	Physical link state of the interface: • **Administrative DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
Line protocol current state	Data link layer state of the interface. • **DOWN**—The data link layer protocol is down. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist.
Internet Address	IP address of an interface followed by: • **Primary**—A primary IP address. • **Sub**—A secondary IP address. • **DHCP-Allocated**—An IP address obtained through DHCP. • **BOOTP-Allocated**—An IP address obtained through BOOTP. • **Mad**—A MAD IP address. • **IRF-Member**—IP address of the management Ethernet port of an IRF member device.
Broadcast address	Broadcast address of the subnet attached to an interface.
The Maximum Transmit Unit	MTU of the interface, in bytes.
input packets, bytes, multicasts output packets, bytes, multicasts	All received and sent packets and bytes, and received and sent multicast packets on an interface (statistics start at the device startup).
TTL invalid packet number	Number of TTL-invalid packets received on the interface (statistics start at the device startup).
ICMP packet input number: Echo reply:	Total number of ICMP packets received on the interface (statistics start at the device startup): • Echo reply packets.

Field	Description
Unreachable: Source quench: Routing redirect: Echo request: Router advert: Router solicit: Time exceed: IP header bad: Timestamp request: Timestamp reply: Information request: Information reply: Netmask request: Netmask reply: Unknown type:	• Unreachable packets. • Source quench packets. • Routing redirect packets. • Echo request packets. • Router advertisement packets. • Router solicitation packets. • Time exceeded packets. • IP header bad packets. • Timestamp request packets. • Timestamp reply packets. • Information request packets. • Information reply packets. • Netmask request packets. • Netmask reply packets. • Unknown type packets.

Related commands

display ip interface brief

ip address

5.1.2. display ip interface brief

Use **display ip interface brief** to display brief IP configuration for Layer 3 interfaces.

Syntax

display ip interface [*interface-type* [*interface-number*]] **brief** [**description**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface type. If you do not specify an interface type, this command displays brief IP configuration for all Layer 3 interfaces.

interface-number: Specifies an interface number. If you do not specify an interface number, this command displays brief IP configuration for all Layer 3 interfaces of the specified type.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays a maximum of 13 characters for each interface description. If the description is longer than 13 characters, the first 10 characters are displayed, followed by an ellipsis (...).

Usage guidelines

Information displayed by the command includes the state of the physical and link layer protocols, IP address, and interface descriptions.

Examples

Display brief IP configuration for VLAN interfaces.

```
<Switch> display ip interface vlan-interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface            Physical  Protocol  IP address      VPN instance  Description
Vlan10               down      down      6.6.6.1         --            Link to Co...
Vlan2                down      down      7.7.7.1         vpn-first...  --
<Switch> display ip interface vlan-interface brief description
*down: administratively down
(s): spoofing  (l): loopback
Interface            Physical  Protocol  IP address      VPN instance  Description
Vlan10               down      down      6.6.6.1         --            Link to CoreR
                                                                       Outer
Vlan2                down      down      7.7.7.1         vpn-first-in  --
                                                         stance
```

Table 5-2 Command output

Field	Description
*down: administratively down	The interface is administratively shut down by using the **shutdown** command.
(s) : spoofing	Spoofing attribute of the interface. The link protocol state of the interface is up, but the link is temporarily established on demand or does not exist.
Interface	Interface name.
Physical	Physical state of the interface: • ***down**—The interface is administratively shut down by using the **shutdown** command. • **down**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **up**—Both the administrative and physical states of the interface are up.
Protocol	Link layer protocol state of the interface: • **down**—The protocol state of the interface is down. • **down(l)**—The protocol state of the interface is down (loopback). • **up**—The protocol state of the interface is up. • **up(l)**—The protocol state of the interface is up (loopback). • **up(s)**—The protocol state of the interface is up (spoofing).
IP address	IP address of the interface. If no IP address is configured, this field displays hyphens (**--**).
VPN instance	Name of the VPN instance to which the interface belongs. This field displays a maximum of 12 characters. If the VPN instance name is longer than 12 characters, the first 9 characters are displayed, followed by an ellipsis (...). If the interface does not belong to any VPN instance, this field displays hyphens (**--**).
Description	Description of the interface. This field displays a maximum of 13 characters. If the description is longer than 13 characters, the first 10 characters are displayed, followed by an ellipsis (...). If no

Field	Description
	description is configured, this field displays hyphens (**--**).

Related commands

display ip interface

ip address

5.1.3. ip address

Use **ip address** to assign an IP address to the interface.

Use **undo ip address** to remove the IP address from the interface.

Syntax

ip address *ip-address* { *mask-length* | *mask* } [**sub**]

undo ip address *ip-address* { *mask-length* | *mask* } [**sub**]

Default

No IP address is assigned to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of the interface, in dotted decimal notation.

mask-length: Specifies the subnet mask length in the range of 1 to 31. For a loopback interface, the value range is 1 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

sub: Assigns a secondary IP address to the interface.

Usage guidelines

Use the command to assign a primary or secondary IP address to an interface.

An interface can have only one primary IP address. A newly configured primary IP address overwrites the previous address. If the interface connects to multiple subnets, configure primary and secondary IP addresses on the interface so the subnets can communicate with each other through the interface.

You cannot assign secondary IP addresses to an interface that obtains an IP address through BOOTP, PPP address negotiation, IP unnumbered, or DHCP.

If you do not specify any parameters, the **undo ip address** command removes all IP addresses from the interface. The **undo ip address** *ip-address* { *mask* | *mask-length* } command removes the primary IP address. The **undo ip address** *ip-address* { *mask* | *mask-length* } **sub** command removes a secondary IP address.

The primary and secondary IP addresses assigned to the interface can be located on the same network segment. Different interfaces on your device must reside on different network segments.

Examples

Assign VLAN-interface 10 a primary IP address 129.12.0.1 and a secondary IP address 202.38.160.1, with subnet masks both 255.255.255.0.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ip address 129.12.0.1 255.255.255.0
[Switch-Vlan-interface10] ip address 202.38.160.1 255.255.255.0 sub
```

Related commands

display ip interface

display ip interface brief

5.1.4. ip address unnumbered

Use **ip address unnumbered** to configure the current interface as IP unnumbered to borrow an IP address from the specified interface.

Use **undo ip address unnumbered** to restore the default.

Syntax

ip address unnumbered interface *interface-type interface-number*

undo ip address unnumbered

Default

The interface does not borrow IP addresses from other interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface from which the current interface can borrow an IP address.

Usage guidelines

Typically, you assign an IP address to an interface either manually or through DHCP. If the IP addresses are not enough, or the interface is used only occasionally, you can configure an interface to borrow an IP address from other interfaces. This is called IP unnumbered, and the interface borrowing the IP address is called IP unnumbered interface.

Loopback interfaces cannot borrow IP addresses of other interfaces, but other interfaces can borrow IP addresses of loopback interfaces.

Multiple interfaces can use the same unnumbered IP address. If an interface has multiple manually configured IP addresses, only the primary IP address manually configured can be borrowed.

You cannot enable a dynamic routing protocol on the interface that has no IP address configured. To enable the interface to communicate with other devices, you must configure a static route to the peer device on the interface.

Examples

Configure Ten-GigabitEthernet1/0/49 to borrow the IP address of LoopBack1.

```
<Sysname> system-view
[Sysname] interface Ten-GigabitEthernet1/0/49
[Switch-Ten-GigabitEthernet1/0/49] ip address unnumbered interface LoopBack1
```

Display interface configuration for Ten-GigabitEthernet1/0/49. It shows the borrowed IP address.

```
<Sysname> display interface Ten-GigabitEthernet 1/0/49
  <...snip...>
  Internet address: 172.16.1.1/32 (unnumbered)
  <...snip...>
```

6. DHCP commands

6.1. Common DHCP commands

6.1.1. dhcp dscp

Use **dhcp dscp** to set the DSCP value for DHCP packets sent by the DHCP server or the DHCP relay agent.

Use **undo dhcp dscp** to restore the default.

Syntax

dhcp dscp *dscp-value*

undo dhcp dscp

Default

The DSCP value is 56 in DHCP packets sent by the DHCP server or the DHCP relay agent.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value for DHCP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCP packets sent by the DHCP server or the DHCP relay agent.

```
<Switch> system-view
[Switch] dhcp dscp 30
```

6.1.2. dhcp enable

Use **dhcp enable** to enable DHCP.

Use **undo dhcp enable** to disable DHCP.

Syntax

dhcp enable

undo dhcp enable

Default

DHCP is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DHCP related configuration takes effect only after you enable DHCP.

Enable DHCP before you configure the DHCP server or relay agent.

Examples

Enable DHCP.

```
<Switch> system-view
[Switch] dhcp enable
```

6.1.3. dhcp select

Use **dhcp select** to enable the DHCP server or DHCP relay agent on an interface.

Use **undo dhcp select** to disable the DHCP server or DHCP relay agent on an interface. The interface will discard incoming DHCP packets.

Syntax

dhcp select { **relay** | **server** }

undo dhcp select { **relay** | **server** }

Default

The interface operates in the DHCP server mode and responds to DHCP requests with configuration parameters.

Views

Interface view

Predefined user roles

network-admin

Parameters

relay: Enables the DHCP relay agent on the interface.

server: Enables the DHCP server on the interface.

Usage guidelines

Before enabling a DHCP server to operate as a DHCP relay agent, use the **reset dhcp server ip-in-use** command to clear address bindings and authorized ARP entries. These authorized ARP entries might conflict with ARP entries that are created after the DHCP relay agent is enabled.

When DHCP server proxy is enabled on the DHCP relay agent, the proxy forwards packets between the DHCP clients and DHCP server.

- When receiving DHCP requests from DHCP clients, the proxy forwards them to the DHCP server.
- When receiving DHCP responses from the DHCP server, the proxy modifies the DHCP server's IP address in these responses as its own IP address.

Examples

Enable the DHCP relay agent on VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
```

```
[Switch-Vlan-interface2] dhcp select relay
```

Related commands

dhcp relay server-address

reset dhcp server ip-in-use

6.2. DHCP server commands

6.2.1. address range

Use **address range** to configure an IP address range in a DHCP address pool for dynamic allocation.

Use **undo address range** to restore the default.

Syntax

address range *start-ip-address end-ip-address*

undo address range

Default

No IP address range exists.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address.

end-ip-address: Specifies the end IP address.

Usage guidelines

If no IP address range is specified, all IP addresses in the subnet specified by the **network** command in address pool view are assignable. If an IP address range is specified, only the IP addresses in the IP address range are assignable.

After you use the **address range** command, you cannot use the **network secondary** command to specify a secondary subnet in the address pool.

If you execute this command multiple times, the most recent configuration takes effect.

The address range specified by the **address range** command must be within the subnet specified by the **network** command. The addresses outside of the subnet cannot be assigned.

Examples

Specify an address range of 192.168.8.1 through 192.168.8.150 in address pool 1.

```
<Switch> system-view
[Switch] dhcp server ip-pool 1
[Switch-dhcp-pool-1] address range 192.168.8.1 192.168.8.150
```

Related commands

display dhcp server pool

network

6.2.2. bims-server

Use **bims-server** to specify the IP address, port number, and shared key of the BIMS server in a DHCP address pool.

Use **undo bims-server** to restore the default.

Syntax

bims-server ip *ip-address* [**port** *port-number*] **sharekey** { **cipher** | **simple** } *string*

undo bims-server

Default

No BIMS server information is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Specifies the IP address of the BIMS server.

port *port-number*: Specifies the port number of the BIMS server, in the range of 1 to 65534.

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key string. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 1 to 53 characters. The DHCP client uses the shared key to encrypt packets sent to the BIMS server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify BIMS server IP address 1.1.1.1, port number 80, and shared key **aabbcc** in address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] bims-server ip 1.1.1.1 port 80 sharekey simple aabbcc
```

Related commands

display dhcp server pool

6.2.3. bootfile-name

Use **bootfile-name** to specify a configuration file name or URL.

Use **undo bootfile-name** to restore the default.

Syntax

bootfile-name *bootfile-name*

undo bootfile-name

Default

No configuration file name is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

bootfile-name: Specifies the configuration file name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

To specify a configuration file on a TFTP server, use the *bootfile-name* argument.

Examples

Specify configuration file name **boot.cfg** in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] bootfile-name boot.cfg
```

Related commands

display dhcp server pool

next-server

tftp-server domain-name

tftp-server ip-address

6.2.4. dhcp relay mac-forward enable

Use **dhcp relay mac-forward enable** to configure the DHCP relay agent to perform a MAC address table lookup for a DHCP reply if it does not have the request forwarding information for the reply.

Use **undo dhcp relay mac-forward enable** to restore the default.

Syntax

dhcp relay mac-forward enable [**broadcast**]

undo dhcp relay mac-forward enable

Default

The DHCP relay agent discards a DHCP reply if the agent does not have the request forwarding information for the reply.

Views

System view

Predefined user roles

network-admin

Parameters

broadcast: Enables the DHCP relay agent to broadcast DHCP replies. If you do not specify this keyword, the DHCP relay agent unicasts DHCP replies.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the DHCP relay agent to perform a MAC address table lookup for a DHCP reply if it does not have the request forwarding information for the reply.

```
<Sysname> system-view
[Sysname] dhcp relay mac-forward enable
```

6.2.5. dhcp server apply ip-pool

Use **dhcp server apply ip-pool** to apply an address pool to an interface.

Use **undo dhcp server apply ip-pool** to restore the default.

Syntax

dhcp server apply ip-pool *pool-name*

undo dhcp server apply ip-pool

Default

No address pool is applied to an interface

Views

Interface view

Predefined user roles

network-admin

Parameters

pool-name: Specifies the name of a DHCP address pool, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Upon receiving a DHCP request from the interface, the DHCP server searches for a static binding for the client from all address pools. If no static binding is found, the server assigns configuration parameters from the address pool applied on the interface to the client. If the address pool has no assignable IP address or does not exist, the DHCP client cannot obtain an IP address.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Apply DHCP address pool 0 to VLAN-interface 2.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] dhcp server apply ip-pool 0
```

Related commands

dhcp server ip-pool

6.2.6. dhcp server forbidden-ip

Use **dhcp server forbidden-ip** to exclude IP addresses from dynamic allocation globally.

Use **undo dhcp server forbidden-ip** to remove the configuration.

Syntax

dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

undo dhcp server forbidden-ip *start-ip-address* [*end-ip-address*]

Default

No IP addresses are excluded from dynamic allocation globally.

Views

System view

Predefined user roles

network-admin

Parameters

start-ip-address: Specifies the start IP address.

end-ip-address: Specifies the end IP address, which cannot be lower than the *start-ip-address*. If you do not specify this argument, only the *start-ip-address* is excluded from dynamic allocation.

Usage guidelines

The IP addresses of some devices such as the gateway and FTP server cannot be assigned to clients. Use this command to exclude such addresses from dynamic allocation.

If the excluded IP address is in a static DHCP binding, the address can still be assigned to the client.

The address or address range specified in the **undo dhcp server forbidden-ip** command must be the same as that specified in the **dhcp server forbidden-ip** command. To remove an IP address from the specified address range, you must remove the entire address range.

You can execute this command multiple times to exclude multiple IP address ranges from dynamic allocation.

Examples

Exclude the IP addresses of 10.110.1.1 through 10.110.1.63 from dynamic allocation globally.

```
<Switch> system-view
[Switch] dhcp server forbidden-ip 10.110.1.1 10.110.1.63
```

Related commands

forbidden-ip

static-bind

6.2.7. dhcp server ip-pool

Use **dhcp server ip-pool** to create a DHCP address pool and enter its view, or enter the view of an existing DHCP address pool.

Use **undo dhcp server ip-pool** to delete the specified DHCP address pool.

Syntax

dhcp server ip-pool *pool-name*

undo dhcp server ip-pool *pool-name*

Default

No DHCP address pools exist.

Views

System view

Predefined user roles

network-admin

Parameters

pool-name: Specifies a DHCP address pool name, a case-insensitive string of 1 to 63 characters. The pool name uniquely identifies an address pool.

Usage guidelines

A DHCP address pool is used to store the configuration parameters to be assigned to DHCP clients.

Examples

Create a DHCP address pool named **pool1**.

```
<Switch> system-view
[Switch] dhcp server ip-pool pool1
[Switch-dhcp-pool-pool1]
```

Related commands

dhcp server apply ip-pool

display dhcp server pool

6.2.8. dhcp server ping packets

Use **dhcp server ping packets** to set the maximum number of ping packets.

Use **undo dhcp server ping packets** to restore the default.

Syntax

dhcp server ping packets *number*

undo dhcp server ping packets

Default

The maximum number of ping packets is 1.

Views

System view

Predefined user roles

network-admin

Parameters

number: Sets the maximum number of ping packets, in the range of 0 to 10. To disable the address conflict detection, set the value to 0.

Usage guidelines

To avoid IP address conflicts, the DHCP server pings an IP address before assigning it to a DHCP client.

If a ping attempt succeeds, the server determines that the IP address is in use and picks a new IP address. If all the ping attempts fail, the server assigns the IP address to the requesting DHCP client.

Examples

Set the maximum number of ping packets to 10.

```
<Switch> system-view
[Switch] dhcp server ping packets 10
```

Related commands

dhcp server ping timeout

display dhcp server conflict

reset dhcp server conflict

6.2.9. dhcp server ping timeout

Use **dhcp server ping timeout** to set the ping response timeout time on the DHCP server.

Use **undo dhcp server ping timeout** to restore the default.

Syntax

dhcp server ping timeout *milliseconds*

undo dhcp server ping timeout

Default

The ping response timeout time is 500 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

milliseconds: Specifies the timeout time in the range of 0 to 10000 milliseconds. To disable the ping operation for address conflict detection, set the value to 0 milliseconds.

Usage guidelines

To avoid IP address conflicts, the DHCP server pings an IP address before assigning it to a DHCP client.

If a ping attempt succeeds, the server determines that the IP address is in use and picks a new IP address. If all the ping attempts fail, the server assigns the IP address to the requesting DHCP client.

Examples

Set the response timeout time to 1000 milliseconds.

```
<Switch> system-view
[Switch] dhcp server ping timeout 1000
```

Related commands

dhcp server ping packets

display dhcp server conflict

reset dhcp server conflict

6.2.10. dhcp server relay information enable

Use **dhcp server relay information enable** to enable the DHCP server to handle Option 82.

Use **undo dhcp server relay information enable** to configure the DHCP server to ignore Option 82.

Syntax

dhcp server relay information enable

undo dhcp server relay information enable

Default

The DHCP server handles Option 82.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Upon receiving a DHCP request that contains Option 82, the server copies the original Option 82 into the response. If the server is configured to ignore Option 82, the response will not contain Option 82.

Examples

Configure the DHCP server to ignore Option 82.

```
<Switch> system-view
[Switch] undo dhcp server relay information enable
```

6.2.11. display dhcp server conflict

Use **display dhcp server conflict** to display information about IP address conflicts.

Syntax

display dhcp server conflict [**ip** *ip-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays conflict information about the specified IP address. If you do not specify this option, this command displays information about all IP address conflicts.

Usage guidelines

The DHCP server generates IP address conflict information in the following situations:

- Before assigning an IP address to a DHCP client, the DHCP server pings the IP address and discovers that another host is using the address.
- The DHCP client sends a DECLINE packet to the DHCP server to inform the server of an IP address conflict.
- The DHCP server discovers that the only assignable address in the address pool is its own IP address.

Examples

Display information about all IP address conflicts.

```
<Switch> display dhcp server conflict
IP address          Detect time
4.4.4.1             Apr 25 16:57:20 2007
4.4.4.2             Apr 25 17:00:10 2007
```

Table 6-1 Command output

Field	Description
IP address	Conflicted IP address.
Detect time	Time when the conflict was discovered.

Related commands

reset dhcp server conflict

6.2.12. display dhcp server expired

Use **display dhcp server expired** to display the lease expiration information.

Syntax

display dhcp server expired [**ip** *ip-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays lease expiration information about the specified IP address. If you do not specify an IP address, this command displays lease expiration information about all IP addresses.

pool *pool-name*: Displays lease expiration information about the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays lease expiration information about all address pools.

Usage guidelines

DHCP assigns these expired IP addresses to DHCP clients when all available addresses have been assigned.

Examples

Display all lease expiration information.

```
<Switch> display dhcp server expired
IP address       Client-identifier/Hardware address    Lease expiration
4.4.4.6          3030-3066-2e65-3230-302e-3130-3234    Apr 25 17:10:47 2007
                 -2d45-7468-6572-6e65-7430-2f31
```

Table 6-2 Command output

Field	Description
IP address	Expired IP address.
Client-identifier/Hardware address	Client ID or MAC address.
Lease expiration	Time when the lease expired.

Related commands

reset dhcp server expired

6.2.13. display dhcp server free-ip

Use **display dhcp server free-ip** to display information about assignable IP addresses.

Syntax

display dhcp server free-ip [**pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Displays assignable IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays all assignable IP addresses for all address pools.

Examples

Display assignable IP addresses in all address pools.

```
<Switch> display dhcp server free-ip
Pool name: 1
  Network: 10.0.0.0 mask 255.0.0.0
    IP ranges from 10.0.0.10 to 10.0.0.100
    IP ranges from 10.0.0.105 to 10.0.0.255
  Secondary networks:
    10.1.0.0 mask 255.255.0.0
      IP ranges from 10.1.0.0 to 10.1.0.255
```

```
    10.2.0.0 mask 255.255.0.0
      IP Ranges from 10.2.0.0 to 10.2.0.255

Pool name: 2
  Network: 20.1.1.0 mask 255.255.255.0
    IP ranges from 20.1.1.0 to 20.1.1.255
```

Table 6-3 Command output

Field	Description
Pool name	Name of the address pool.
Network	Assignable network.
IP ranges	Assignable IP address range.
Secondary networks	Assignable secondary networks.

Related commands

dhcp server ip-pool

network

6.2.14. display dhcp server ip-in-use

Use **display dhcp server ip-in-use** to display binding information about assigned IP addresses.

Syntax

display dhcp server ip-in-use [**ip** *ip-address* | **pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays binding information about the specified assigned IP address. If you do not specify an IP address, this command displays binding information about all assigned IP addresses.

pool *pool-name*: Displays binding information about assigned IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command displays binding information about assigned IP addresses in all address pools.

Usage guidelines

The binding information can be used by other security modules only when the DHCP server is configured on the gateway of DHCP clients.

If the lease deadline exceeds the year 2100, the lease expiration time is displayed as **After 2100**.

Examples

Display binding information about all assigned DHCP addresses.

```
<Switch> display dhcp server ip-in-use
IP address       Client identifier/    Lease expiration      Type
                 Hardware address
10.1.1.1         4444-4444-4444        Not used              Static(F)
10.1.1.2         3030-3030-2e30-3030-  May 1 14:02:49 2015   Auto(C)
                 662e-3030-3033-2d45-
                 7468-6572-6e65-74
10.1.1.3         1111-1111-1111        After 2100            Static(C)
```

Table 6-4 Command output

Field	Description
IP address	IP address assigned.
Client identifier/Hardware address	Client ID or hardware address.
Lease expiration	Lease expiration time: • **Exact time (May 1 14:02:49 2015 in this example)**—Time when the lease will expire. • **Not used**—The IP address of the static binding has not been assigned to the specific client. • **Unlimited**—Infinite lease expiration time. • **After 2100**—The lease will expire after 2100.
Type	Binding types: • **Static(F)**—A free static binding whose IP address has not been assigned. • **Static(O)**—An offered static binding whose IP address has been selected and sent by the DHCP server in a DHCP-OFFER packet to the client. **Static(C)**—A committed static binding whose IP address has been assigned to the DHCP client. • **Auto(O)**—An offered dynamic binding whose IP address has been dynamically selected by the DHCP server and sent in a DHCP-OFFER packet to the DHCP client. • **Auto(C)**—A committed dynamic binding whose IP address has been dynamically assigned to the DHCP client.

Related commands

reset dhcp server ip-in-use

6.2.15. display dhcp server pool

Use **display dhcp server pool** to display information about a DHCP address pool.

Syntax

display dhcp server pool [*pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool-name: Displays information about the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify the *pool-name* argument, this command displays information about all address pools.

Examples

Display information about all DHCP address pools.

```
<Switch> display dhcp server pool
Pool name: 0
  Network 20.1.1.0 mask 255.255.255.0
  class a range 20.1.1.50 20.1.1.60

  expired unlimited
```

Table 6-5 Command output

Field	Description
Pool name	Name of an address pool.
Network	Assignable network.
secondary networks	Assignable secondary networks.
address range	Assignable address range.
class *class-name* range	DHCP user class and its address range.
static bindings	Static IP-to-MAC/client ID bindings.
option	Customized DHCP option.
expired	Lease duration: 1 2 3 4 in this example refers to 1 day 2 hours 3 minutes 4 seconds.
bootfile-name	Boot file name
dns-list	DNS server IP address.
domain-name	Domain name suffix.
bims-server	BIMS server information.
forbidden-ip	IP addresses excluded from dynamic allocation.
gateway-list	Gateway addresses.
nbns-list	WINS server addresses.
netbios-type	NetBIOS node type.
next-server	Next server IP address.
tftp-server domain-name	TFTP server name.
tftp-server ip-address	TFTP server address.
voice-config ncp-ip	Primary network calling processor address.
voice-config as-ip	Backup network calling processor address.
voice-config voice-vlan	Voice VLAN.
voice-config fail-over	Failover route.

6.2.16. display dhcp server statistics

Use **display dhcp server statistics** to display the DHCP server statistics.

Syntax

display dhcp server statistics [**pool** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pool *pool-name*: Specifies an address pool by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, this command displays information about all address pools.

Examples

Display the DHCP server statistics.

```
<Switch> display dhcp server statistics
    Pool number:                    1
    Pool utilization:               0.39%
    Bindings:
      Automatic:                    1
      Manual:                       0
      Expired:                      0
    Conflict:                       1
    Messages received:              10
      DHCPDISCOVER:                 5
      DHCPREQUEST:                  3
      DHCPDECLINE:                  0
      DHCPRELEASE:                  2
      DHCPINFORM:                   0
      BOOTPREQUEST:                 0
    Messages sent:                  6
      DHCPOFFER:                    3
      DHCPACK:                      3
      DHCPNAK:                      0
      BOOTPREPLY:                   0
    Bad Messages:                   0
```

Table 6-6 Command output

Field	Description
Pool number	Total number of address pools. This field is not displayed when you display statistics for a specific address pool.
Pool utilization	Pool usage rate: • If you display statistics for all address pools, this field displays the usage rate of all address pools. • If you display statistics for an address pool, this field displays the pool usage rate of the specified address pool.

Field	Description
Bindings	Bindings include the following types: • **Automatic**—Number of dynamic bindings. • **Manual**—Number of static bindings. • **Expired**—Number of expired bindings.
Conflict	Total number of conflict addresses. This field is not displayed if you display statistics for a specific address pool.
Messages received	DHCP packets received from clients: • DHCPDISCOVER. • DHCPREQUEST. • DHCPDECLINE. • DHCPRELEASE. • DHCPINFORM. • BOOTPREQUEST. This field is not displayed if you display statistics for a specific address pool.
Messages sent	DHCP packets sent to clients: • DHCPOFFER. • DHCPACK. • DHCPNAK. • BOOTPREPLY. This field is not displayed if statistics about a specific address pool are displayed.
Bad Messages	Number of bad messages. This field is not displayed if you display statistics for a specific address pool.

Related commands

reset dhcp server statistics

6.2.17. dns-list

Use **dns-list** to specify DNS server addresses in a DHCP address pool.

Use **undo dns-list** to remove DNS server addresses from a DHCP address pool.

Syntax

dns-list *ip-address*&<1-8>

undo dns-list [*ip-address*&<1-8>]

Default

No DNS server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight DNS servers.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify any parameters, the **undo dns-list** command deletes all DNS server addresses in the DHCP address pool.

Examples

Specify DNS server address 10.1.1.254 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] dns-list 10.1.1.254
```

Related commands

display dhcp server pool

6.2.18. domain-name

Use **domain-name** to specify a domain name in a DHCP address pool.

Use **undo domain-name** to restore the default.

Syntax

domain-name *domain-name*

undo domain-name

Default

No domain name is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the domain name, a case-sensitive string of 1 to 50 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify domain name **company.com** in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] domain-name company.com
```

Related commands

display dhcp server pool

6.2.19. expired

Use **expired** to set the lease duration in a DHCP address pool.

Use **undo expired** to restore the default lease duration for a DHCP address pool.

Syntax

expired { **day** *day* [**hour** *hour* [**minute** *minute* [**second** *second*]]] | **unlimited** }

undo expired

Default

The lease duration of a dynamic DHCP address pool is one day.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

day *day*: Specifies the number of days, in the range of 0 to 365.

hour *hour*: Specifies the number of hours, in the range of 0 to 23. The default is 0.

minute *minute*: Specifies the number of minutes, in the range of 0 to 59. The default is 0.

second *second*: Specifies the number of seconds, in the range of 0 to 59. The default is 0.

unlimited: Specifies the unlimited lease duration, which is actually 136 years.

Usage guidelines

The DHCP server assigns an IP address together with the lease duration to the DHCP client. Before the lease expires, the DHCP client must extend the lease duration.

- If the lease extension operation succeeds, the DHCP client can continue to use the IP address.
- If the lease extension operation does not succeed, both of the following events occur:
  - The DHCP client cannot use the IP address after the lease duration expires.
  - The DHCP server will label the IP address as an expired address.

Examples

Set the lease duration to 1 day, 2 hours, 3 minutes, and 4 seconds in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] expired day 1 hour 2 minute 3 second 4
```

Related commands

display dhcp server expired

display dhcp server pool

reset dhcp server expired

6.2.20. forbidden-ip

Use **forbidden-ip** to exclude IP addresses from dynamic allocation in an address pool.

Use **undo forbidden-ip** to remove the configuration.

Syntax

forbidden-ip *ip-address*&<1-8>

undo forbidden-ip [*ip-address*&<1-8>]

Default

No IP addresses are excluded from dynamic allocation in an address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight excluded IP addresses.

Usage guidelines

The excluded IP addresses in an address pool are still assignable in other address pools.

You can exclude a maximum of 4096 IP addresses in an address pool by executing this command multiple times.

If you do not specify any parameters, the **undo forbidden-ip** command removes all excluded IP addresses.

Examples

Exclude IP addresses 192.168.1.3 and 192.168.1.10 from dynamic allocation in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] forbidden-ip 192.168.1.3 192.168.1.10
```

Related commands

dhcp server forbidden-ip

display dhcp server pool

6.2.21. gateway-list

Use **gateway-list** to specify gateway addresses in a DHCP address pool or a DHCP secondary subnet.

Use **undo gateway-list** to remove the specified gateway addresses from a DHCP address pool or a DHCP secondary subnet.

Syntax

gateway-list *ip-address*&<1-64>

undo gateway-list [*ip-address*&<1-64>]

Default

No gateway address is configured in a DHCP address pool or a DHCP secondary subnet.

Views

DHCP address pool view

DHCP secondary subnet view

Predefined user roles

network-admin

Parameters

ip-address&<1-64>: Specifies a space-separated list of up to 64 gateway addresses. Gateway addresses must reside on the same subnet as the assignable IP addresses.

Usage guidelines

The DHCP server assigns gateway addresses to clients on a secondary subnet in the following ways:

- If gateways are specified in both address pool view and secondary subnet view, DHCP assigns those specified in the secondary subnet view.
- If gateways are specified in address pool view but not in secondary subnet view, DHCP assigns those specified in address pool view.

If you do not specify any parameters, the **undo gateway-list** command deletes all gateway addresses.

Examples

Specify gateway address 10.1.1.1 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] gateway-list 10.1.1.1
```

Related commands

display dhcp server pool

6.2.22. nbns-list

Use **nbns-list** to specify WINS server addresses in a DHCP address pool.

Use **undo nbns-list** to remove the specified WINS server addresses.

Syntax

nbns-list *ip-address*&<1-8>

undo nbns-list [*ip-address*&<1-8>]

Default

No WINS server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight WINS server IP addresses.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify any parameters, the **undo nbns-list** command deletes all WINS server addresses.

Examples

Specify WINS server address 10.1.1.1 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] nbns-list 10.1.1.1
```

Related commands

display dhcp server pool

netbios-type

6.2.23. netbios-type

Use **netbios-type** to specify the NetBIOS node type in a DHCP address pool.

Use **undo netbios-type** to restore the default.

Syntax

netbios-type { **b-node** | **h-node** | **m-node** | **p-node** }

undo netbios-type

Default

No NetBIOS node type is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

b-node: Specifies the broadcast node. A b-node client sends the destination name in a broadcast message to get the name-to-IP mapping from a server.

h-node: Specifies the hybrid node. An h-node client unicasts the destination name to a WINS server. If it does not receive a response, the h-node client broadcasts the destination name to get the mapping from a server.

m-node: Specifies the mixed node. An m-node client broadcasts the destination name. If it does not receive a response, the m-node client unicasts the destination name to the WINS server to get the mapping.

p-node: Specifies the peer-to-peer node. A p-node client sends the destination name in a unicast message to get the mapping from the WINS server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the NetBIOS node type as p-node in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] netbios-type p-node
```

Related commands

display dhcp server pool

nbns-list

6.2.24. network

Use **network** to specify the subnet for dynamic allocation in a DHCP address pool.

Use **undo network** to remove the specified subnet.

Syntax

network *network-address* [*mask-length* | **mask** *mask*] [**secondary**]

undo network *network-address* [*mask-length* | **mask** *mask*] [**secondary**]

Default

No subnet is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

network-address: Specifies the subnet for dynamic allocation. If no mask length or mask is specified, the natural mask will be used.

mask-length: Specifies the mask length in the range of 1 to 30.

mask *mask*: Specifies the mask in dotted decimal format.

secondary: Specifies the subnet as a secondary subnet. If you do not specify this keyword, this command specifies the primary subnet. If the addresses in the primary subnet are used up, the DHCP server can select addresses from a secondary subnet for clients.

Usage guidelines

You can use the **secondary** keyword to specify a secondary subnet and enter its view. In secondary subnet view, you can specify gateways by using the **gateway-list** command for DHCP clients in the secondary subnet.

You can specify only one primary subnet for a DHCP address pool. If you execute the **network** command multiple times, the most recent configuration takes effect.

You can specify up to 32 secondary subnets for a DHCP address pool.

The primary subnet and secondary subnets in a DHCP address pool must not have the same network address and mask.

If you have used the **address range** or **class** command in an address pool, you cannot specify a secondary subnet in the same address pool.

Modifying or removing the **network** configuration deletes the assigned addresses from the current address pool.

Examples

Specify primary subnet 192.168.8.0/24 and secondary subnet 192.168.10.0/24 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] network 192.168.8.0 mask 255.255.255.0
[Switch-dhcp-pool-0] network 192.168.10.0 mask 255.255.255.0 secondary
[Switch-dhcp-pool-0-secondary]
```

Related commands

display dhcp server pool

gateway-list

6.2.25. next-server

Use **next-server** to specify the IP address of a server in a DHCP address pool.

Use **undo next-server** to restore the default.

Syntax

next-server *ip-address*

undo next-server

Default

No server's IP address is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a server.

Usage guidelines

Upon startup, the DHCP client obtains an IP address and the specified server IP address. Then it contacts the specified server, such as a TFTP server, to get other boot information.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify a server's IP address 10.1.1.254 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] next-server 10.1.1.254
```

Related commands

display dhcp server pool

6.2.26. option

Use **option** to customize a DHCP option.

Use **undo option** to remove a customized DHCP option.

Syntax

option *code* { **ascii** *ascii-string* | **hex** *hex-string* | **ip-address** *ip-address*&<1-8> }

undo option *code*

Default

No DHCP option is customized.

Views

DHCP address pool view

DHCP option group view

Predefined user roles

network-admin

Parameters

code: Specifies the number of the customized option, in the range of 2 to 254, excluding 50 through 54, 56, 58, 59, 61, and 82.

ascii *ascii-string*: Specifies a case-sensitive ASCII string of 1 to 255 characters as the option content.

hex *hex-string*: Specifies a hexadecimal number as the option content. The length of the hexadecimal number must be an even number in the range of 2 to 256.

ip-address *ip-address*&<1-8>: Specifies a space-separated list of up to eight IP addresses as the option content.

Usage guidelines

The DHCP server fills the customized option with the specified ASCII string, hexadecimal number, or IP addresses, and sends it in a response to the client.

You can customize options for the following purposes:

- Add newly released options.
- Add options for which the vendor defines the contents, for example, Option 43.
- Add options for which the CLI does not provide a dedicated configuration command. For example, you can use the **option 4 ip-address 1.1.1.1** command to define the time server address 1.1.1.1 for DHCP clients.
- Add all option values if the actual requirement exceeds the limit for a dedicated option configuration command. For example, the **dns-list** command can specify up to eight DNS servers. To specify more than eight DNS server, you must use the **option 6** command to define all DNS servers.

DHCP options specified by dedicated commands take precedence over those specified by the **option** commands. For example, if a DNS server address is specified by both the **dns-list** command and the **option 6** command, the server uses the address specified by the **dns-list** command.

DHCP options specified in DHCP option groups take precedence over those specified in DHCP address pools.

If you execute this command multiple times with the same *code* specified, the most recent configuration takes effect.

Examples

Configure Option 7 to specify log server address 2.2.2.2 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] option 7 ip-address 2.2.2.2
```

Related commands

display dhcp server pool

6.2.27. reset dhcp server conflict

Use **reset dhcp server conflict** to clear IP address conflict information.

Syntax

reset dhcp server conflict [**ip** *ip-address*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears conflict information about the specified IP address. If you do not specify this option, this command clears all address conflict information.

Usage guidelines

Address conflicts occur when dynamically assigned IP addresses have been statically configured for other hosts. After you modify the address pool configuration, the conflicted addresses might become assignable. To assign these addresses, use the **reset dhcp server conflict** command to clear the conflict information first.

Examples

Clear all IP address conflict information.

```
<Switch> reset dhcp server conflict
```

Related commands

display dhcp server conflict

6.2.28. reset dhcp server expired

Use **reset dhcp server expired** to clear binding information about expired IP addresses.

Syntax

reset dhcp server expired [**ip** *ip-address* | **pool** *pool-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears binding information about the specified expired IP address. If you do not specify an IP address, this command clears binding information about all expired IP addresses.

pool *pool-name*: Clears binding information about the expired IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information about expired IP addresses in all address pools.

Examples

Clear binding information about all expired IP addresses.

```
<Switch> reset dhcp server expired
```

Related commands

display dhcp server expired

6.2.29. reset dhcp server ip-in-use

Use **reset dhcp server ip-in-use** to clear binding information about assigned IP addresses.

Syntax

reset dhcp server ip-in-use [**ip** *ip-address* | **pool** *pool-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ip *ip-address*: Clears binding information about the specified assigned IP address. If you do not specify an IP address, this command clears binding information about all assigned IP addresses.

pool *pool-name*: Clears binding information about assigned IP addresses in the specified address pool. The pool name is a case-insensitive string of 1 to 63 characters. If you do not specify an address pool, this command clears binding information about assigned IP addresses in all address pools.

Usage guidelines

If you use this command to clear information about an assigned static binding, the static binding becomes a free static binding.

Examples

Clear binding information about IP address 10.110.1.1.

```
<Switch> reset dhcp server ip-in-use ip 10.110.1.1
```

Related commands

display dhcp server ip-in-use

6.2.30. reset dhcp server statistics

Use **reset dhcp server statistics** to clear DHCP server statistics.

Syntax

reset dhcp server statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear DHCP server statistics.

```
<Switch> reset dhcp server statistics
```

Related commands

display dhcp server statistics

6.2.31. static-bind

Use **static-bind** to statically bind a client ID or MAC address to an IP address.

Use **undo static-bind** to remove a static binding.

Syntax

static-bind ip-address *ip-address* [*mask-length* | **mask** *mask*] { **client-identifier** *client-identifier* | **hardware-address** *hardware-address* [**ethernet** | **token-ring**] }

undo static-bind ip-address *ip-address*

Default

No static binding is specified in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address *ip-address*: Specifies the IP address of the static binding. The natural mask is used if no mask length or mask is specified.

mask-length: Specifies the mask length in the range of 1 to 30.

mask *mask*: Specifies the mask, in dotted decimal format.

client-identifier *client-identifier*: Specifies the client ID of the static binding, a string of 4 to 254 characters. The string can contain only hexadecimal numbers and hyphen (-), in the format of H-H-H…. The last H can be a two-digit or four-digit hexadecimal number while the other Hs must be all four-digit hexadecimal numbers. For example, aabb-cccc-dd is correct, and aabb-c-dddd and aabb-cc-dddd are not correct.

hardware-address *hardware-address*: Specifies the client hardware address of the static binding, a string of 4 to 39 characters. The string can contain only hexadecimal numbers and hyphen (-), in the format of H-H-H…. The last H can be a two-digit or four-digit hexadecimal number while the other Hs must be all four-digit hexadecimal numbers. For example, aabb-cccc-dd is correct, and aabb-c-dddd and aabb-cc-dddd are not correct.

ethernet: Specifies the client hardware address type as Ethernet. The default type is Ethernet.

token-ring: Specifies the client hardware address type as token ring.

Usage guidelines

The IP address of a static binding must not be an interface address of the DHCP server. Otherwise, an IP address conflict occurs, and the bound client cannot obtain the IP address.

You can specify multiple static bindings in an address pool. The total number of static bindings in all address pools cannot exceed 8192.

An IP address can be bound to only one DHCP client. To modify the binding for a DHCP client, first execute the **undo** form of the command to delete the existing binding and then create a new binding.

Examples

Bind IP address 10.1.1.1/24 to client ID **00aa-aabb** in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] static-bind ip-address 10.1.1.1 mask 255.255.255.0
client-identifier 00aa-aabb
```

Related commands

display dhcp server pool

6.2.32. tftp-server domain-name

Use **tftp-server domain-name** to specify a TFTP server name in a DHCP address pool.

Use **undo tftp-server domain-name** to restore the default.

Syntax

tftp-server domain-name *domain-name*

undo tftp-server domain-name

Default

No TFTP server name is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

domain-name: Specifies the TFTP server name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify TFTP server name **aaa** in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] tftp-server domain-name aaa
```

Related commands

display dhcp server pool

tftp-server ip-address

6.2.33. tftp-server ip-address

Use **tftp-server ip-address** to specify a TFTP server address in a DHCP address pool.

Use **undo tftp-server ip-address** to restore the default.

Syntax

tftp-server ip-address *ip-address*

undo tftp-server ip-address

Default

No TFTP server address is specified.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a TFTP server.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify TFTP server address 10.1.1.1 in DHCP address pool 0.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] tftp-server ip-address 10.1.1.1
```

Related commands

display dhcp server pool

tftp-server domain-name

6.2.34. voice-config

Use **voice-config** to configure the content for Option 184 in a DHCP address pool.

Use **undo voice-config** to remove the Option 184 content from a DHCP address pool.

Syntax

voice-config { **as-ip** *ip-address* | **fail-over** *ip-address dialer-string* | **ncp-ip** *ip-address* | **voice-vlan** *vlan-id* { **disable** | **enable** } }

undo voice-config [**as-ip** | **fail-over** | **ncp-ip** | **voice-vlan**]

Default

No Option 184 content is configured in a DHCP address pool.

Views

DHCP address pool view

Predefined user roles

network-admin

Parameters

as-ip *ip-address*: Specifies the IP address of the backup network calling processor.

fail-over *ip-address dialer-string*: Specifies the failover IP address and dialer string. The *dialer-string* is a string of 1 to 39 characters. Valid characters are digits and asterisk (*).

ncp-ip *ip-address*: Specifies the IP address of the primary network calling processor.

voice-vlan *vlan-id*: Specifies the voice VLAN ID in the range of 2 to 4094.

- **disable**: Disables the specified VLAN. DHCP clients will not take this VLAN as their voice VLAN.
- **enable**: Enables the specified VLAN. DHCP clients will take this VLAN as their voice VLAN.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure Option 184 in DHCP address pool 0. The primary and backup network calling processors are at 10.1.1.1 and 10.2.2.2, respectively. The voice VLAN 3 is enabled. The failover IP address is 10.3.3.3. The dialer string is 99*.

```
<Switch> system-view
[Switch] dhcp server ip-pool 0
[Switch-dhcp-pool-0] voice-config ncp-ip 10.1.1.1
[Switch-dhcp-pool-0] voice-config as-ip 10.2.2.2
[Switch-dhcp-pool-0] voice-config voice-vlan 3 enable
[Switch-dhcp-pool-0] voice-config fail-over 10.3.3.3 99*
```

Related commands

display dhcp server pool

6.3. DHCP relay agent commands

6.3.1. dhcp relay client-information record

Use **dhcp relay client-information record** to enable recording client information in relay entries.

Use **undo dhcp relay client-information record** to disable the feature.

Syntax

dhcp relay client-information record

undo dhcp relay client-information record

Default

The DHCP relay agent does not record client information in relay entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

Client information is recorded only when the DHCP relay agent is configured on the gateway of DHCP clients. A relay entry contains information about a client such as the client's IP and MAC addresses.

Disabling the recording of client information deletes all recorded relay entries.

Examples

Enable the recording of relay entries on the relay agent.

```
<Switch> system-view
[Switch] dhcp relay client-information record
```

Related commands

dhcp relay client-information refresh enable

6.3.2. dhcp relay client-information refresh enable

Use **dhcp relay client-information refresh enable** to enable the DHCP relay agent to periodically refresh dynamic relay entries.

Use **undo dhcp relay client-information refresh enable** to disable the DHCP relay agent to periodically refresh dynamic relay entries.

Syntax

dhcp relay client-information refresh enable

undo dhcp relay client-information refresh enable

Default

The DHCP relay agent periodically refreshes relay entries.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A DHCP client unicasts a DHCP-RELEASE message to the DHCP server to release its IP address. The DHCP relay agent conveys the message to the DHCP server and does not remove the IP-to-MAC entry of the client.

With this feature, the DHCP relay agent uses a client's IP address to periodically send a DHCP-REQUEST message to the DHCP server.

- If the server returns a DHCP-ACK message or does not return any message within an interval, the DHCP relay agent performs the following operations:
  - Removes the relay entry.
  - Sends a DHCP-RELEASE message to the DHCP server to release the IP address.
- If the server returns a DHCP-NAK message, the relay agent keeps the entry.

With this feature disabled, the DHCP relay agent does not remove relay entries automatically. After a DHCP client releases its IP address, you must use the **reset dhcp relay client-information** on the relay agent to remove the corresponding relay entry.

Examples

Disable periodic refresh of relay entries.

```
<Switch> system-view
[Switch] undo dhcp relay client-information refresh enable
```

Related commands

dhcp relay client-information record

dhcp relay client-information refresh

reset dhcp relay client-information

6.3.3. dhcp relay information circuit-id

Use **dhcp relay information circuit-id** to configure the padding mode and padding format for the Circuit ID sub-option of Option 82.

Use **undo dhcp relay information circuit-id** to restore the default.

Syntax

dhcp relay information circuit-id { **bas** | **string** *circuit-id* | **vxlan-port** | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] [**interface**] } [**format** { **ascii** | **hex** }] }

undo dhcp relay information circuit-id

Default

The padding mode is **normal** and the padding format is **hex**.

Views

Interface view

Predefined user roles

network-admin

Parameters

bas: Specifies the bas mode that uses the interface and VLAN information to pad the Circuit ID sub-option.

string *circuit-id*: Specifies the string mode that uses a case-sensitive string of 3 to 63 characters as the content of the Circuit ID sub-option.

vxlan-port: Specifies the mode that uses the VXLAN ID and port number to pad the Circuit ID sub-option.

normal: Specifies the normal mode, in which the padding content consists of the VLAN ID and port number.

verbose: Specifies the verbose mode. The padding content includes the node identifier, interface information, and VLAN ID. The default node identifier is the MAC address of the access node. The default interface information consists of the Ethernet type (fixed to **eth**), chassis number, slot number, sub-slot number, and interface number.

node-identifier { **mac** | **sysname** | **user-defined** *node-identifier* }: Specifies the access node identifier.

- **mac**: Uses the MAC address of the access node as the node identifier.
- **sysname**: Uses the device name as the node identifier. You can set the device name by using the **sysname** command in system view. The padding format for the device name is always ASCII regardless of the specified padding format.

NOTE:

If **sysname** is specified as the node identifier, do not include any spaces when you set the device name. Otherwise, the DHCP relay agent fails to add or replace Option 82.

- **user-defined** *node-identifier:* Uses a case-sensitive string of 1 to 50 characters as the node identifier. The padding format for the specified character string is always ASCII regardless of the specified padding format.

interface: Uses the interface name as the interface information. The padding format for the interface name is always ASCII regardless of the specified padding format.

format: Specifies the padding format for the Circuit ID sub-option.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The padding format for the string mode, the normal mode, or the verbose mode varies by command configuration. Table 6-7 shows how the padding format is determined for different modes.

Table 6-7 Padding format for different modes

Keyword (mode)	If no padding format is set	If the padding format is ascii	If the padding format is hex
string *circuit-id*	The padding format is ASCII, and is not configurable.	N/A	N/A
normal	Hex.	ASCII.	Hex.
verbose	Hex for the VLAN ID. ASCII for the node identifier, Ethernet type, chassis number, slot number, sub-slot number, and interface number.	ASCII.	ASCII for the node identifier and Ethernet type. Hex for the chassis number, slot number, sub-slot number, interface number, and VLAN ID.

Examples

Specify the content mode as verbose, node identifier as the device name, and the padding format as ASCII for the Circuit ID sub-option.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] dhcp relay information enable
[Switch-Vlan-interface10] dhcp relay information strategy replace
[Switch-Vlan-interface10] dhcp relay information circuit-id verbose node-identifier
sysname format ascii
```

Related commands

dhcp relay information enable

dhcp relay information strategy

display dhcp relay information

6.3.4. dhcp relay information enable

Use **dhcp relay information enable** to enable the DHCP relay agent to support Option 82.

Use **undo dhcp relay information enable** to disable Option 82 support.

Syntax

dhcp relay information enable

undo dhcp relay information enable

Default

The DHCP relay agent does not support Option 82.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

This command enables the DHCP relay agent to add Option 82 to DHCP requests that do not contain Option 82 before forwarding the requests to the DHCP server. The content of Option 82 is determined by the **dhcp relay information circuit-id** and **dhcp relay information remote-id** commands. If the DHCP requests contain Option 82, the relay agent handles the requests according to the strategy configured with the **dhcp relay information strategy** command.

If this feature is disabled, the relay agent forwards requests that contain or do not contain Option 82 to the DHCP server.

Examples

Enable Option 82 support on the relay agent.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] dhcp relay information enable
```

Related commands

dhcp relay information circuit-id

dhcp relay information strategy

display dhcp relay information

6.3.5. dhcp relay information remote-id

Use **dhcp relay information remote-id** to configure the padding mode and padding format for the Remote ID sub-option of Option 82.

Use **undo dhcp relay information remote-id** to restore the default.

Syntax

dhcp relay information remote-id { **normal** [**format** { **ascii** | **hex** }] | **string** *remote-id* | **sysname** }

undo dhcp relay information remote-id

Default

The padding mode is **normal** and the padding format is **hex**.

Views

Interface view

Predefined user roles

network-admin

Parameters

normal: Specifies the normal mode in which the padding content is the MAC address of the receiving interface.

format: Specifies the padding format for the Remote ID sub-option. The default padding format is hex.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

string *remote-id*: Specifies the string mode that uses a case-sensitive string of 1 to 63 characters as the content of the Remote ID sub-option.

sysname: Specifies the sysname mode that uses the device name as the content of the Remote ID sub-option. You can set the device name by using the **sysname** command.

Usage guidelines

The padding format for the specified character string (**string**) or the device name (**sysname**) is always ASCII. The padding format for the **normal** mode is determined by the command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the padding content for the Remote ID sub-option of Option 82 as **device001**.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] dhcp relay information enable
[Switch-Vlan-interface10] dhcp relay information strategy replace
[Switch-Vlan-interface10] dhcp relay information remote-id string device001
```

Related commands

dhcp relay information enable

dhcp relay information strategy

display dhcp relay information

6.3.6. dhcp relay information strategy

Use **dhcp relay information strategy** to configure the strategy for the DHCP relay agent to handle messages containing Option 82.

Use **undo dhcp relay information strategy** to restore the default handling strategy.

Syntax

dhcp relay information strategy { **drop** | **keep** | **replace** }

undo dhcp relay information strategy

Default

The handling strategy for messages that contain Option 82 is **replace**.

Views

Interface view

Predefined user roles

network-admin

Parameters

drop: Drops DHCP messages that contain Option 82 messages.

keep: Keeps the original Option 82 intact and forwards the DHCP messages.

replace: Replaces the original Option 82 with the configured Option 82 before forwarding the DHCP messages.

Usage guidelines

This command takes effect only on DHCP requests that contain Option 82.

For DHCP requests that do not contain Option 82, the DHCP relay agent always adds Option 82 to the requests before forwarding the requests to the DHCP server.

If the handling strategy is **replace**, configure a padding mode and padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure any padding mode or padding format. The settings do not take effect even if you configure them.

Examples

Specify the handling strategy for Option 82 as **keep**.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] dhcp relay information enable
[Switch-Vlan-interface10] dhcp relay information strategy keep
```

Related commands

dhcp relay information enable

display dhcp relay information

6.3.7. dhcp relay release ip

Use **dhcp relay release ip** to release a client IP address.

Syntax

dhcp relay release ip *ip-address* [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address to be released.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the specified IP address belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command releases the IP address on the public network.

Usage guidelines

After you execute this command, the relay agent sends a DHCP-RELEASE packet to the DHCP server and removes the relay entry of the IP address. Upon receiving the packet, the server removes binding information about the specified IP address to release the IP address.

Examples

Release IP address 1.1.1.1.

```
<Switch> system-view
[Switch] dhcp relay release ip 1.1.1.1
```

6.3.8. dhcp relay request-from-tunnel discard

Use **dhcp relay request-from-tunnel discard** to configure the DHCP relay agent to discard the DHCP requests that are delivered from VXLAN tunnels.

Use **undo dhcp relay request-from-tunnel discard** to restore the default.

Syntax

dhcp relay request-from-tunnel discard

undo dhcp relay request-from-tunnel discard

Default

The DHCP relay agent can forward the DHCP requests that are delivered from VXLAN tunnels.

Views

VXLAN VSI interface view

Predefined user roles

network-admin

Usage guidelines

In a VXLAN network, the DHCP relay agent feature can be configured on the VSI interface of a VTEP.

When the DHCP relay agent receives a DHCP request from an AC mapped to the VSI interface, the relay agent forwards this request to the DHCP servers and broadcasts this request to other VTEPs. If those VTEPs also function as the DHCP relay agents, each will forward the DHCP request to the DHCP servers they are connecting to. To prevent a DHCP server from receiving the same DHCP request from different VTEPs, you can configure this command on the VSI interface of the VTEPs that are not directly connecting to DHCP clients.

Examples

Configure the DHCP relay agent to discard the DHCP requests that are delivered from VXLAN tunnels.

```
<Switch> system-view
[Switch] interface vsi-interface 1
[Switch-Vsi-interface1] dhcp relay request-from-tunnel discard
```

6.3.9. dhcp relay server-address

Use **dhcp relay server-address** to specify DHCP servers on the DHCP relay agent.

Use **undo dhcp relay server-address** to remove DHCP servers.

Syntax

dhcp relay server-address *ip-address* [**class** *class-name*] [**public** | **vpn-instance** *vpn-instance-name*]

undo dhcp relay server-address [*ip-address* [**public** | **vpn-instance** *vpn-instance-name*]]

Default

No DHCP server is specified on the DHCP relay agent.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a DHCP server. The DHCP relay agent forwards DHCP packets received from DHCP clients to this DHCP server.

class *class-name*: Specifies a DHCP user class to match DHCP request packets. The class name is a case-sensitive string of 1 to 63 characters. If you do not specify this option, no DHCP user class is used to match DHCP requests.

public: Specifies that the DHCP server is on the public network.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the specified IP address belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays the relay entry for the specified IP address on the public network. If there is a specified DHCP server in the same VPN as the VLAN interface for which you want to set the **dhcp relay server-address** setting, the **vpn-instance** setting is not required.

Usage guidelines

The specified IP address of the DHCP server must not reside on the same subnet as the IP address of the DHCP relay agent interface. Otherwise, the DHCP clients might fail to obtain IP addresses.

You can specify a maximum of eight DHCP servers on an interface.

After receiving a DHCP request, the DHCP relay agent forwards the packets as follows:

- If the request matches a user class rule, the DHCP relay agent forwards the packet to DHCP servers that are configured with the user class.
- If the request does not match any user class rule, the DHCP relay agent forwards the request to DHCP servers with no user classes configured.

If you execute this command with the same user class but different values for the *ip-address* argument, you specify the same user class for different DHCP servers. If you execute the command with different user classes for the same *ip-address*, the most recent configuration takes effect.

If you do not specify an IP address, the **undo dhcp relay server-address** command removes all DHCP servers on the interface.

If the DHCP server selecting algorithm is **master-backup**, make sure both the master and backup servers have the same user class configured or have no user classes configured. Otherwise, DHCP clients cannot obtain IP addresses correctly.

Examples

Specify DHCP server address 1.1.1.1 on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] dhcp relay server-address 1.1.1.1
```

Related commands

dhcp select relay

display dhcp relay interface

6.3.10. display dhcp relay client-information

Use **display dhcp relay client-information** to display relay entries on the relay agent.

Syntax

display dhcp relay client-information [**interface** *interface-type interface-number* | **ip** *ip-address* [**vpn-instance** *vpn-instance-name*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays relay entries on the specified interface. If you do not specify an interface, this command displays relay entries on all interfaces.

ip *ip-address*: Displays the relay entry for the specified IP address. If you do not specify an IP address, this command displays relay entries for all IP addresses.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the specified IP address belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays the relay entry for the specified IP address on the public network.

Usage guidelines

The DHCP relay agent records relay entries only after you configure the **dhcp relay client-information record** command.

Examples

Display all relay entries on the relay agent.

```
<Switch> display dhcp relay client-information
Total number of client-information items: 2
Total number of dynamic items: 1
Total number of temporary items: 1
IP address       MAC address      Type        Interface           VPN name
10.1.1.5         00e0-0000-0000   Temporary   Vlan2               N/A
```

Table 6-8 Command output

Field	Description
Total number of client-information items	Total number of relay entries.
Total number of dynamic items	Total number of dynamic relay entries.
Total number of temporary items	Total number of temporary relay entries.
IP address	IP address of the DHCP client.
MAC address	MAC address of the DHCP client.
Type	Relay entry type: • **Dynamic**—The relay agent creates a dynamic relay entry upon receiving an ACK response from the DHCP server. • **Temporary**—The relay agent creates a temporary relay entry upon receiving a REQUEST packet from a DHCP client.
Interface	Layer 3 interface connected to the DHCP client. **N/A** is displayed for relay entries without interface information.
VPN name	Name of the VPN instance to which the DHCP client belongs. If the DHCP client does not belong to any VPN, this field displays **N/A**.

Related commands

dhcp relay client-information record

reset dhcp relay client-information

6.3.11. display dhcp relay information

Use **display dhcp relay information** to display Option 82 configuration information for the DHCP relay agent.

Syntax

display dhcp relay information [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays Option 82 configuration information for the specified interface. If you do not specify an interface, this command displays Option 82 configuration information about all interfaces.

Examples

Display Option 82 configuration information for all interfaces.

```
<Switch> display dhcp relay information
Interface: Vlan-interface100
   Status: Enable
   Strategy: Replace
   Circuit ID Pattern: Verbose
   Remote ID Pattern: Sysname
   Circuit ID format-type: Undefined
   Remote ID format-type: ASCII
   Node identifier: aabbcc
Interface: Vlan-interface200
   Status: Enable
   Strategy: Replace
   Circuit ID Pattern: User Defined
   Remote ID Pattern: User Defined
   Circuit ID format-type: ASCII
   Remote ID format-type: ASCII
   User defined:
   Circuit ID: vlan100
   Remote ID: device001
```

Table 6-9 Command output

Field	Description
Interface	Interface name.
Status	Option 82 states: • **Enable**—DHCP relay agent support for Option 82 is enabled. • **Disable**—DHCP relay agent support for Option 82 is disabled.
Strategy	Handling strategy for request messages containing Option 82, **Drop**, **Keep**, or **Replace**.
Circuit ID Pattern	Padding content mode of the Circuit ID sub-option, **Verbose**, **Normal**, or **User Defined**.
Remote ID Pattern	Padding content mode of the Remote ID sub-option, **Sysname**, **Normal**, or **User Defined**.
Circuit ID format-type	Padding format of the Circuit ID sub-option, **ASCII**, **Hex**, or **Undefined**.
Remote ID format-type	Padding format of the Remote ID sub-option, **ASCII**, **Hex**, or **Undefined**.
Node identifier	Access node identifier.
User defined	Content of the user-defined sub-options.
Circuit ID	User-defined content of the Circuit ID sub-option.
Remote ID	User-defined content of the Remote ID sub-option.

6.3.12. display dhcp relay server-address

Use **display dhcp relay server-address** to display DHCP server addresses configured on an interface.

Syntax

display dhcp relay server-address [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays DHCP server addresses on the specified interface. If you do not specify an interface, this command displays DHCP server addresses on all interfaces.

Examples

Display DHCP server addresses on all interfaces.

```
<Switch> display dhcp relay server-address
Interface name      Server IP address   Public/VRF name      Class name
Vlan2               2.2.2.2             Y/--                 --
Vlan2               2.2.2.3             Y/--                 abc
```

Table 6-10 Command output

Field	Description
Interface name	Interface name.
Server IP address	DHCP server IP address.
Public/VRF name	Location of the DHCP server, which is determined by the configuration of the **dhcp relay server-address** command. • If neither the **public** keyword nor the **vpn-instance** *vpn-instance-name* option is specified, this field displays **--/--**. • If the **public** keyword is specified, this field displays **Y/--**. • If the **vpn-instance** *vpn-instance-name* option is specified, the VPN instance name is displayed after the slash (/), for example, **--/abc**.
Class name	Name of a DHCP user class to match DHCP requests. This field displays hyphens (**--**) if the **class** *class-name* option is not specified in the **dhcp relay server-address** command.

Related commands

dhcp relay server-address

6.3.13. display dhcp relay statistics

Use **display dhcp relay statistics** to display DHCP packet statistics on the DHCP relay agent.

Syntax

display dhcp relay statistics [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Displays DHCP packet statistics on the specified interface. If you do not specify an interface, this command displays all DHCP packet statistics on the DHCP relay agent.

Examples

Display all DHCP packet statistics on the DHCP relay agent.

```
<Switch> display dhcp relay statistics
DHCP packets dropped:                   0
DHCP packets received from clients:     0
   DHCPDISCOVER:                        0
   DHCPREQUEST:                         0
   DHCPINFORM:                          0
   DHCPRELEASE:                         0
   DHCPDECLINE:                         0
   BOOTPREQUEST:                        0
DHCP packets received from servers:     0
   DHCPOFFER:                           0
   DHCPACK:                             0
   DHCPNAK:                             0
   BOOTPREPLY:                          0
DHCP packets relayed to servers:        0
   DHCPDISCOVER:                        0
   DHCPREQUEST:                         0

   DHCPRELEASE:                         0
   DHCPDECLINE:                         0
   BOOTPREQUEST:                        0
DHCP packets relayed to clients:        0
   DHCPOFFER:                           0
   DHCPACK:                             0
   DHCPNAK:                             0
   BOOTPREPLY:                          0
DHCP packets sent to servers:           0
```

```
    DHCPDISCOVER:                    0
    DHCPREQUEST:                     0
    DHCPINFORM:                      0
    DHCPRELEASE:                     0
    DHCPDECLINE:                     0
    BOOTPREQUEST:                    0
DHCP packets sent to clients:        0
    DHCPOFFER:                       0
    DHCPACK:                         0
    DHCPNAK:                         0
    BOOTPREPLY:                      0
```

Related commands

reset dhcp relay statistics

6.3.14. reset dhcp relay client-information

Use **reset dhcp relay client-information** to clear relay entries on the DHCP relay agent.

Syntax

reset dhcp relay client-information [**interface** *interface-type interface-number* | **ip** *ip-address* [**vpn-instance** *vpn-instance-name*]]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Clears relay entries on the specified interface. If you do not specify an interface, this command clears relay entries on all interfaces.

ip *ip-address*: Clears the relay entry for the specified IP address. If you do not specify an IP address, this command clears relay entries for all IP addresses.

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the specified IP address belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears the relay entry for the specified IP address on the public network.

Examples

Clear all relay entries on the DHCP relay agent.

```
<Switch> reset dhcp relay client-information
```

Related commands

display dhcp relay client-information

6.3.15. reset dhcp relay statistics

Use **reset dhcp relay statistics** to clear relay agent statistics.

Syntax

reset dhcp relay statistics [**interface** *interface-type interface-number*]

Views

User view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command clears all DHCP relay agent statistics.

Examples

Clear all DHCP relay agent statistics.

```
<Switch> reset dhcp relay statistics
```

Related commands

display dhcp relay statistics

6.4. DHCP client commands

6.4.1. dhcp client dad enable

Use **dhcp client dad enable** to enable duplicate address detection.

Use **undo dhcp client dad enable** to disable duplicate address detection.

Syntax

dhcp client dad enable

undo dhcp client dad enable

Default

Duplicate address detection is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

DHCP client detects IP address conflict through ARP packets. An attacker can act as the IP address owner to send an ARP reply. This makes the client unable to use the IP address assigned by the server. As a best practice, disable duplicate address detection when ARP attacks exist on the network.

Examples

Disable the duplicate address.

```
<Switch> system-view
[Switch] undo dhcp client dad enable
```

6.4.2. dhcp client dscp

Use **dhcp client dscp** to set the DSCP value for DHCP packets sent by the DHCP client.

Use **undo dhcp client dscp** to restore the default.

Syntax

dhcp client dscp *dscp-value*

undo dhcp client dscp

Default

The DSCP value is 56 in DHCP packets sent by the DHCP client.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Sets the DSCP value for DHCP packets, in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for DHCP packets sent by the DHCP client.

```
<Switch> system-view
[Switch] dhcp client dscp 30
```

6.4.3. display dhcp client

Use **display dhcp client** to display DHCP client information.

Syntax

display dhcp client [**verbose**] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

verbose: Displays detailed DHCP client information. If you do not specify this keyword, the command displays brief DHCP client information.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays DHCP client information on all interfaces.

Examples

Display brief DHCP client information on all interfaces.

```
<Switch> display dhcp client
Vlan-interface10 DHCP client information:
 Current state: BOUND
 Allocated IP: 40.1.1.20 255.255.255.0
 Allocated lease: 259200 seconds, T1: 129600 seconds, T2: 226800 seconds
 DHCP server: 40.1.1.2
```

Display detailed DHCP client information on all interfaces.

```
<Switch> display dhcp client verbose
Vlan-interface10 DHCP client information:
 Current state: BOUND
 Allocated IP: 40.1.1.20 255.255.255.0
 Allocated lease: 259200 seconds, T1: 129600 seconds, T2: 226800 seconds
 Lease from May 21 19:00:29 2012   to   May 31 19:00:29 2012
 DHCP server: 40.1.1.2
 Transaction ID: 0x1c09322d
 Default router: 40.1.1.2
 Classless static routes:
   Destination: 1.1.0.1, Mask: 255.0.0.0, NextHop: 192.168.40.16
   Destination: 10.198.122.63, Mask: 255.255.255.255, NextHop: 192.168.40.16
 DNS servers: 44.1.1.11 44.1.1.12
 Domain name: ddd.com
 Boot servers: 200.200.200.200  1.1.1.1
 ACS parameter:
   URL: http://192.168.1.1:7547/acs
   Username: bims
   Password: ******
 Client ID type: acsii(type value=00)
 Client ID value: 000c.29d3.8659-Vlan10
 Client ID (with type) hex: 0030-3030-632e-3239-
                            6433-2e38-3635-392d-
                            4574-6830-2f30-2f32
 T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.
```

Table 6-11 Command output

Field	Description
DHCP client information	Information about the interface that acts as the DHCP client.
Current state	Current state of the DHCP client: • **HALT**—The client stops applying for an IP address. • **INIT**—The initialization state. • **SELECTING**—The client has sent out a DHCP-DISCOVER message in search for a DHCP server and is waiting for the response from DHCP servers. • **REQUESTING**—The client has sent out a

Field	Description
	DHCP-REQUEST message requesting for an IP address and is waiting for the response from DHCP servers. • **BOUND**—The client has received the DHCP-ACK message from a DHCP server and obtained an IP address successfully. • **RENEWING**—The T1 timer expires. • **REBOUNDING**—The T2 timer expires.
Allocated IP	IP address allocated by the DHCP server.
Allocated lease	Allocated lease time.
T1	1/2 lease time (in seconds) of the DHCP client IP address.
T2	7/8 lease time (in seconds) of the DHCP client IP address.
Lease from….to….	Start and end time of the lease.
DHCP server	DHCP server IP address that assigned the IP address.
Transaction ID	Transaction ID, a random number chosen by the client to identify an IP address allocation.
Default router	Gateway address assigned to the client.
Classless static routes	Classless static routes assigned to the client.
Static routes	Classful static routes assigned to the client.
DNS servers	DNS server address assigned to the client.
Domain name	Domain name suffix assigned to the client.
Boot servers	PXE server addresses (up to 16 addresses) specified for the DHCP client, which are obtained through Option 43.
ACS parameter	Parameters about the ACS.
URL	URL of the ACS.
Username	Username for logging in to the ACS.
Password	Password for logging in to the ACS. If a password is configured, this field displays ******. If no password is configured, this field is not displayed.
Client ID type	DHCP client ID type: • If an ASCII string is used as the client ID value, the type value is 00. • If the MAC address of a specific interface is used as the client ID value, the type value is 01. • If a hexadecimal number is used as the client ID value, the type value is the first two characters in the string.
Client ID value	Value of the DHCP client ID.
Client ID (with type) hex	DHCP client ID with the type field, a hexadecimal number.
T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.	How long the T1 (1/2 lease time) timer will timeout.

Related commands

ip address dhcp-alloc

6.4.4. ip address dhcp-alloc

Use **ip address dhcp-alloc** to configure an interface to use DHCP for IP address acquisition.

Use **undo ip address dhcp-alloc** to cancel an interface from using DHCP.

Syntax

ip address dhcp-alloc

undo ip address dhcp-alloc

Default

An interface does not use DHCP for IP address acquisition.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

When you execute the **undo ip address dhcp-alloc** command, the interface sends a DHCP-RELEASE message to release the IP address obtained through DHCP. If the interface is down, the message cannot be sent out. This situation can occur when a subinterface obtained an IP address through DHCP, and the **shutdown** command is executed on its primary interface. The subinterface will fail to send a DHCP-RELEASE message.

Examples

Configure VLAN-interface 10 to use DHCP for IP address acquisition.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ip address dhcp-alloc
```

6.5. DHCP snooping commands

DHCP snooping works between the DHCP client and the DHCP server or between the DHCP client and the relay agent. DHCP snooping does not work between the DHCP server and the DHCP relay agent.

6.5.1. dhcp snooping binding record

Use **dhcp snooping binding record** to enable recording of client information in DHCP snooping entries.

Use **undo dhcp snooping binding record** to disable recording of client information in DHCP snooping entries.

Syntax

dhcp snooping binding record

undo dhcp snooping binding record

Default

DHCP snooping does not record client information.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

VSI view

VLAN view

Predefined user roles

network-admin

Usage guidelines

This command enables DHCP snooping on the port directly connecting to the clients to record client information in DHCP snooping entries.

If you configure this command in a VSI view, this command takes effect on the ACs that are mapped to the VSI and the VXLAN tunnel interfaces that are assigned to the VSI.

Examples

Enable the recording of client information in DHCP snooping entries on GigabitEthernet 1/0/1.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping binding record
```

6.5.2. dhcp snooping enable

Use **dhcp snooping enable** to enable DHCP snooping globally.

Use **undo dhcp snooping enable** to disable DHCP snooping globally.

Syntax

dhcp snooping enable

undo dhcp snooping enable

Default

DHCP snooping is disabled globally.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enable DHCP snooping globally on the device, trusted ports forward responses from DHCP servers and untrusted ports discard responses. This mechanism ensures that DHCP clients obtain IP addresses from authorized DHCP servers.

When DHCP snooping is disabled globally, all ports on the device can forward responses from DHCP servers.

Examples

Enable DHCP snooping globally.

```
<Switch> system-view
```

```
[Switch] dhcp snooping enable
```

6.5.3. dhcp snooping information circuit-id

Use **dhcp snooping information circuit-id** to configure the padding mode and padding format for the Circuit ID sub-option.

Use **undo dhcp snooping information circuit-id** to restore the default.

Syntax

dhcp snooping information circuit-id { [**vlan** *vlan-id*] **string** *circuit-id* | { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] } [**format** { **ascii** | **hex** }] }

undo dhcp snooping information circuit-id [**vlan** *vlan-id*]

Default

The padding mode is normal and the padding format is hex.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Pads the Circuit ID sub-option for packets received from the specified VLAN. If you do not specify a VLAN, the device pads the Circuit ID sub-option for packets received from the default VLAN.

string *circuit-id*: Specifies the string mode, in which the padding content for the Circuit ID sub-option is a case-sensitive string of 3 to 63 characters.

normal: Specifies the normal mode. The padding content includes the VLAN ID and interface number.

verbose: Specifies the verbose mode. The padding content includes the node identifier, interface information, and VLAN ID. The default node identifier is the MAC address of the access node. The default interface information consists of the Ethernet type (fixed to **eth**), chassis number, slot number, sub-slot number, and interface number.

node-identifier { **mac** | **sysname** | **user-defined** *node-identifier* }: Specifies the access node identifier.

- **mac**: Uses the MAC address of the access node as the node identifier.
- **sysname**: Uses the device name as the node identifier. You can set the device name by using the **sysname** command in system view. The padding format for the device name is always ASCII regardless of the specified padding format.

> **NOTE:**
> If **sysname** is specified as the node identifier, do not include any spaces when you set the device name. Otherwise, the DHCP snooping device fails to add or replace Option 82.

- **user-defined** *node-identifier*: Uses a case-sensitive string of 1 to 50 characters as the node identifier. The padding format for the specified character string is always ASCII regardless of the specified padding format.

format: Specifies the padding format for the Circuit ID sub-option.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

The Circuit ID sub-option cannot carry information about interface splitting or subinterfaces. For more information about interface splitting and subinterfaces, see *Interface Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

The padding format for the string mode, the normal mode, or the verbose mode varies by command configuration. Table 6-12 shows how the padding format is determined for different modes.

Table 6-12 Padding format for different modes

Keyword (mode)	If no padding format is set	If the padding format is ascii	If the padding format is hex
string *circuit-id*	The padding format is always ASCII, and is not configurable.	N/A	N/A
normal	Hex.	ASCII.	Hex.
verbose	Hex for the VLAN ID. ASCII for the node identifier, Ethernet type, chassis number, slot number, sub-slot number, and interface number.	ASCII.	ASCII for the node identifier and Ethernet type. Hex for the chassis number, slot number, sub-slot number, interface number, and VLAN ID.

Examples

Configure verbose as the padding mode, device name as the node identifier, and ASCII as the padding format for the Circuit ID sub-option.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping information enable
[Switch-GigabitEthernet1/0/1] dhcp snooping information strategy replace
[Switch-GigabitEthernet1/0/1] dhcp snooping information circuit-id verbose
node-identifier sysname format ascii
```

Related commands

dhcp snooping information strategy

display dhcp snooping information

6.5.4. dhcp snooping information enable

Use **dhcp snooping information enable** to enable DHCP snooping to support Option 82.

Use **undo dhcp snooping information enable** to disable this feature.

Syntax

dhcp snooping information enable

undo dhcp snooping information enable

Default

DHCP snooping does not support Option 82.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Usage guidelines

This command enables DHCP snooping to add Option 82 into DHCP requests that do not contain Option 82 before forwarding the requests to the DHCP server. The content of Option 82 is determined by the **dhcp snooping information circuit-id** and **dhcp snooping information remote-id** commands. If the received DHCP request packets contain Option 82, DHCP snooping handles the packets according to the strategy configured by the **dhcp snooping information strategy** command.

Examples

Enable DHCP snooping to support Option 82.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping information enable
```

Related commands

dhcp snooping information circuit-id

dhcp snooping information remote-id

dhcp snooping information strategy

6.5.5. dhcp snooping information remote-id

Use **dhcp snooping information remote-id** to configure the padding mode and padding format for the Remote ID sub-option.

Use **undo dhcp snooping information remote-id** to restore the default.

Syntax

dhcp snooping information remote-id { **normal** [**format** { **ascii** | **hex** }] | [**vlan** *vlan-id*] { **string** *remote-id* | **sysname** } }

undo dhcp snooping information remote-id [**vlan** *vlan-id*]

Default

The padding mode is normal and the padding format is hex.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

vlan *vlan-id*: Pads the Remote ID sub-option for packets received from the specified VLAN. If you do not specify a VLAN, the device pads the Remote ID sub-option for packets received from the default VLAN.

string *remote-id*: Specifies the string mode that uses a case-sensitive string of 1 to 63 characters as the content of the Remote ID sub-option.

sysname: Specifies the sysname mode that uses the device name as the Remote ID sub-option. You can configure the device name by using the **sysname** command in system view.

normal: Specifies the normal mode. The padding content is the MAC address of the receiving interface.

format: Specifies the padding format for the Remote ID sub-option. The default padding format is hex.

ascii: Specifies the ASCII padding format.

hex: Specifies the hex padding format.

Usage guidelines

DHCP snooping uses ASCII to pad the specified string or device name for the Remote ID sub-option. The padding format for the normal padding mode is determined by the command configuration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Pad the Remote ID sub-option with a character string of **device001**.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping information enable
[Switch-GigabitEthernet1/0/1] dhcp snooping information strategy replace
[Switch-GigabitEthernet1/0/1] dhcp snooping information remote-id string device001
```

Related commands

dhcp snooping information enable

dhcp snooping information strategy

display dhcp snooping information

6.5.6. dhcp snooping information strategy

Use **dhcp snooping information strategy** to configure the handling strategy for Option 82 in request messages.

Use **undo dhcp snooping information strategy** to restore the default.

Syntax

dhcp snooping information strategy { **drop** | **keep** | **replace** }

undo dhcp snooping information strategy

Default

The handling strategy for Option 82 in request messages is **replace**.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

drop: Drops DHCP messages that contain Option 82.

keep: Keeps the original Option 82 intact and forwards the DHCP messages.

replace: Replaces the original Option 82 with the configured Option 82 before forwarding the DHCP messages.

Usage guidelines

This command takes effect only on DHCP requests that contain Option 82. For DHCP requests that do not contain Option 82, the DHCP snooping device always adds Option 82 into the requests before forwarding them to the DHCP server.

If the handling strategy is **replace**, configure a padding mode and a padding format for Option 82. If the handling strategy is **keep** or **drop**, you do not need to configure a padding mode or padding format for Option 82.

Examples

Specify the handling strategy for Option 82 in request messages as **keep**.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping information enable
[Switch-GigabitEthernet1/0/1] dhcp snooping information strategy keep
```

dhcp snooping information remote-id

6.5.7. dhcp snooping trust

Use **dhcp snooping trust** to configure a port as a trusted port.

Use **undo dhcp snooping trust** to restore the default state of a port.

Syntax

dhcp snooping trust

undo dhcp snooping trust

Default

After you enable DHCP snooping, all ports are untrusted.

Views

Layer 2 Ethernet interface/Layer 2 aggregate interface view

Layer 3 Ethernet interface view

Ethernet service instance view

Predefined user roles

network-admin

Usage guidelines

Specify the ports facing the DHCP server as trusted ports and specify the other ports as untrusted ports so DHCP clients can obtain valid IP addresses.

Examples

Specify Layer 2 Ethernet interface GigabitEthernet 1/0/1 as a trusted port.

```
<Switch> system-view
[Switch] interface gigabitethernet 1/0/1
[Switch-GigabitEthernet1/0/1] dhcp snooping trust
```

Related commands

display dhcp snooping trust

6.5.8. dhcp snooping trust tunnel

Use **dhcp snooping trust tunnel** to configure VXLAN tunnel interfaces assigned to a VSI as trusted interfaces.

Use **undo dhcp snooping trust tunnel** to restore the default.

Syntax

dhcp snooping trust tunnel

undo dhcp snooping trust tunnel

Default

After you enable DHCP snooping, all tunnel interfaces are untrusted.

Views

VSI view

Predefined user roles

network-admin

Examples

Configure the tunnel interfaces as trusted in the VSI **a**.

```
<Switch> system-view
[Switch] vsi a
[Switch-vsi-a] dhcp snooping trust tunnel
```

6.5.9. display dhcp snooping binding

Use **display dhcp snooping binding** to display DHCP snooping entries.

Syntax

display dhcp snooping binding [**ip** *ip-address* [**vlan** *vlan-id*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip *ip-address*: Displays the DHCP snooping entry for the specified IP address.

vlan *vlan-id*: Specifies the VLAN ID where the IP address resides.

Usage guidelines

If you do not specify any parameters, this command displays all DHCP snooping entries.

Examples

Display summary information about all DHCP snooping entries.

```
<Switch> display dhcp snooping binding
 2 DHCP snooping entries found
 IP address      MAC address    Lease         VLAN  SVLAN Interface
 =============== ============== ============ ===== ===== =================
 1.1.1.7         0000-0101-0107 16907533     2     3     GE1/0/1
 1.1.1.11        0000-0101-010b 16907537     2     3     GE1/0/3
```

Display detailed information about all DHCP snooping entries.

```
<Switch> display dhcp snooping binding verbose
 IP address: 1.1.1.7
 MAC address: 0000-0101-0107
 Lease: 16907553 seconds
 VLAN: 2
 SVLAN: 3
 Interface: GigabitEthernet1/0/1
 Parameter request list: 03 06 21

 IP address: 1.1.1.104
 MAC address: 0000-0101-010b
 Lease: 16907537 seconds
 VLAN: 2
 SVLAN: 3
 Interface: GigabitEthernet1/0/3
 Parameter request list: 37 0B 01 0F 03 06 2C 2E 2F 1F 21 F9 2B
```

Table 6-13 Command output

Field	Description
DHCP snooping entries found	Number of DHCP snooping entries.
IP address	IP address assigned to the DHCP client.
MAC address	MAC address of the DHCP client.
Lease	Remaining lease duration in seconds.
VLAN	When both DHCP snooping and QinQ are enabled or the DHCP packet contains two VLAN tags, this field identifies the outer VLAN tag. Otherwise, it identifies the VLAN where the port connecting the DHCP client resides.
SVLAN	When both DHCP snooping and QinQ are enabled or the DHCP packet contains two VLAN tags, this field identifies the inner VLAN tag. Otherwise, it displays **N/A**.

Field	Description
Interface	Port connected to the DHCP client.
Parameter request list	Parameters that the DHCP client requests, in hexadecimal notation.

Related commands

dhcp snooping enable

reset dhcp snooping binding

6.5.10. display dhcp snooping information

Use **display dhcp snooping information** to display Option 82 configuration on the DHCP snooping device.

Syntax

display dhcp snooping information { **all** | **interface** *interface-type interface-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays Option 82 configuration on all Layer 2 Ethernet interfaces.

interface *interface-type interface-number*: Specifies an interface by its type and number.

Examples

Display Option 82 configuration on all interfaces.

```
<Switch> display dhcp snooping information all
Interface: Bridge-Aggregation1
   Status: Disable
   Strategy: Drop
   Circuit ID:
     Padding format: User Defined
       User defined: abcd
     Format: ASCII
   Remote ID:
     Padding format: Normal
     Format: ASCII
   VLAN 10:
     Circuit ID: abcd
     Remote ID: company
```

Table 6-14 Command output

Field	Description
Interface	Interface name.
Status	Option 82 status, **Enable** or **Disable**.
Strategy	Handling strategy for DHCP requests that contain Option 82, **Drop**, **Keep**, or **Replace**.
Circuit ID	Content of the Circuit ID sub-option.
Padding format	Padding format of Option 82: • For Circuit ID sub-option, the padding format can be **Normal**, **User Defined**, **Verbose (sysname)**, **Verbose (MAC)**, or **Verbose (user defined)**. • For Remote ID sub-option, the padding format can be **Normal**, **Sysname**, or **User Defined**.
Node identifier	Access node identifier.
User defined	Content of the user-defined sub-option.
Format	Code type of Option 82 sub-option: • For Circuit ID sub-option, the code type can be **ASCII**, **Default**, or **Hex**. • For Remote ID sub-option, the code type can be **ASCII** or **Hex**.
Remote ID	Content of the Remote ID sub-option.
VLAN	Pads Circuit ID sub-option and Remote ID sub-option in the DHCP packets received in the specified VLAN.

6.5.11. display dhcp snooping packet statistics

Use **display dhcp snooping packet statistics** to display DHCP packet statistics for DHCP snooping.

Syntax

display dhcp snooping packet statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DHCP packet statistics for the master device.

Examples

Display DHCP packet statistics for DHCP snooping.

```
<Switch> display dhcp snooping packet statistics
 DHCP packets received                  : 100
 DHCP packets sent                      : 200
 Invalid DHCP packets dropped           : 0
```

Related commands

reset dhcp snooping packet statistics

6.5.12. display dhcp snooping trust

Use **display dhcp snooping trust** to display information about trusted ports.

Syntax

display dhcp snooping trust

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display information about trusted ports.

```
<Switch> display dhcp snooping trust
 DHCP snooping is enabled.
 Interface                                Trusted          VLAN
 ========================                 =============    =======
 GigabitEthernet1/0/1                     Trusted
 GigabitEthernet1/0/2                     -                100
 GigabitEthernet1/0/3                     -                100, 200
```

Table 6-15 Command output

Field	Description
Interface	Interface name.
Trusted	For a DHCP snooping trusted port configured in system view, this field displays **Trusted**. For a trusted port configured in VLAN view, this field displays a hyphen (**-**).
VLAN	VLANs in which the port is configured as trusted. If a trusted port is configured after DHCP snooping is enabled globally, this field is empty.

Related commands

dhcp snooping trust

6.5.13. reset dhcp snooping binding

Use **reset dhcp snooping binding** to clear DHCP snooping entries.

Syntax

reset dhcp snooping binding { **all** | **ip** *ip-address* [**vlan** *vlan-id*] }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all DHCP snooping entries.

ip *ip-address*: Clears the DHCP snooping entry for the specified IP address.

vlan *vlan-id*: Clears DHCP snooping entries for the specified VLAN. If you do not specify a VLAN, this command clears DHCP snooping entries for the default VLAN.

Examples

Clear all DHCP snooping entries.

```
<Switch> reset dhcp snooping binding all
```

Related commands

display dhcp snooping binding

6.5.14. reset dhcp snooping packet statistics

Use **reset dhcp snooping packet statistics** to clear DHCP packet statistics for DHCP snooping.

Syntax

reset dhcp snooping packet statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears DHCP packet statistics for the master device.

Examples

Clear DHCP packet statistics for DHCP snooping.

```
<Switch> reset dhcp snooping packet statistics
```

Related commands

display dhcp snooping packet statistics

6.6. BOOTP client commands

6.6.1. display bootp client

Use **display bootp client** to display information about a BOOTP client.

Syntax

display bootp client [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays BOOTP client information on all interfaces.

Examples

Display BOOTP client information on VLAN-interface 10.

```
<Switch> display bootp client interface vlan-interface 10
Vlan-interface10 BOOTP client information:
Allocated IP: 169.254.0.2 255.255.0.0
Transaction ID: 0x3d8a7431
MAC Address: f474-880a-c3ef
```

Table 6-16 Command output

Field	Description
BOOTP client information	Information about the interface that acts as a BOOTP client.
Allocated IP	BOOTP client's IP address allocated by the BOOTP server.
Transaction ID	Value of the **XID** field in a BOOTP message. The BOOTP client chooses a random number for the **XID** field when sending a BOOTP request to the BOOTP server. It is used to match a response message from the BOOTP server. If the values of the **XID** field are different in the BOOTP response and request, the BOOTP client drops the BOOTP response.
Mac Address	MAC address of a BOOTP client.

Related commands

ip address bootp-alloc

6.6.2. ip address bootp-alloc

Use **ip address bootp-alloc** to configure an interface to use BOOTP for IP address acquisition.

Use **undo ip address bootp-alloc** to cancel an interface from using BOOTP.

Syntax

ip address bootp-alloc

undo ip address bootp-alloc

Default

An interface does not use BOOTP for IP address acquisition.

Views

Interface view

Predefined user roles

network-admin

Examples

Configure VLAN-interface 10 to use BOOTP for IP address acquisition.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ip address bootp-alloc
```

Related commands

display bootp client

7.1. DNS commands

7.1.1. display dns domain

Use **display dns domain** to display the domain name suffixes.

Syntax

display dns domain [**dynamic**] [**vpn-instance** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

dynamic: Displays the domain name suffixes dynamically obtained through DHCP or other protocols. If you do not specify this keyword, the command displays the statically configured and dynamically obtained domain name suffixes.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays domain name suffixes for the public network.

Examples

Display the statically configured and dynamically obtained domain name suffixes for the public network.

```
<Switch> display dns domain
Type:
  D: Dynamic    S: Static

No.     Type    Domain suffix
1       S       com
2       D       net
```

Table 7-1 Command output

Field	Description
No.	Sequence number.
Type	Domain name suffix type: • **S**—A statically configured domain name suffix. • **D**—A domain name suffix dynamically obtained through DHCP or other protocols.
Domain suffix	Domain name suffixes.

Related commands

dns domain

7.1.2. display dns host

Use **display dns host** to display information about domain name-to-IP address mappings.

Syntax

display dns host [**ip**] [**vpn-instance** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ip: Specifies type A queries. A type A query resolves a domain name to the mapped IPv4 address.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays domain name-to-IP address mappings for the public network.

Usage guidelines

If you do not specify the **ip** keyword, this command displays domain name-to-IP address mappings of all query types.

Examples

Display domain name-to-IP address mappings of all query types.

```
<Switch> display dns host
Type:
  D: Dynamic    S: Static

Total number: 3
No.  Host name          Type  TTL        Query type   IP addresses
1    sample.com         D     3132       A            192.168.10.1
                                                      192.168.10.2
                                                      192.168.10.3
2    zig.sample.com     S     -          A            192.168.1.1
3    sample.net         S     -          AAAA         FE80::4904:4448
```

Table 7-2 Command output

Field	Description
No.	Sequence number.
Host name	Domain name.
Type	Domain name-to-IP address mapping type: • **S**—A static mapping configured by the **ip host** command. • **D**—A mapping dynamically obtained through dynamic domain name resolution.

Field	Description
TTL	Time in seconds that a mapping can be stored in the cache. For a static mapping, a hyphen (-) is displayed.
Query type	Query type: A and AAAA.
IP addresses	Replied IP address: • For a type A query, the replied IP address is an IPv4 address. • For a type AAAA query, the replied IP address is an IPv6 address.

Related commands

ip host

reset dns host

7.1.3. display dns server

Use **display dns server** to display IPv4 DNS server information.

Syntax

display dns server [**dynamic**] [**vpn-instance** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

dynamic: Displays IPv4 DNS server information dynamically obtained through DHCP or other protocols. If you do not specify this keyword, the command displays statically configured and dynamically obtained IPv4 DNS server information.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv4 DNS server information for the public network.

Examples

Display IPv4 DNS server information for the public network.

```
<Switch> display dns server
Type:
  D: Dynamic    S: Static

No. Type  IP address
1   S     202.114.0.124
2   S     169.254.65.125
```

Table 7-3 Command output

Field	Description
No.	Sequence number.

Field	Description
Type	DNS server type: • **S**—A manually configured DNS server. • **D**—DNS server information dynamically obtained through DHCP or other protocols.
IP address	IPv4 address of the DNS server.

Related commands

dns server

7.1.4. dns domain

Use **dns domain** to configure a domain name suffix.

Use **undo dns domain** to delete the specified domain name suffix.

Syntax

dns domain *domain-name* [**vpn-instance** *vpn-instance-name*]

undo dns domain *domain-name* [**vpn-instance** *vpn-instance-name*]

Default

No domain name suffix is configured. Only the provided domain name is resolved.

Views

System view

Predefined user roles

network-admin

Parameters

domain-name: Specifies a domain name suffix. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), underscores (_), and dots (.), for example, aabbcc.com. The domain name suffix can include a maximum of 253 characters, and each separated string includes no more than 63 characters.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To configure a domain name suffix for the public network, do not specify this option.

Usage guidelines

For domain name resolution, the resolver automatically uses the suffix list to supply the missing part of an incomplete name entered by a user.

A domain name suffix applies to both IPv4 DNS.

The system allows a maximum of 16 domain name suffixes for the public network or each VPN instance. You can specify domain name suffixes for both public network and VPN instances.

Examples

Configure domain name suffix **com** for the public network.

```
<Switch> system-view
[Switch] dns domain com
```

Related commands

display dns domain

7.1.5. dns dscp

Use **dns dscp** to set the DSCP value for DNS packets sent by a DNS client or DNS proxy.

Use **undo dns dscp** to restore the default.

Syntax

dns dscp *dscp-value*

undo dns dscp

Default

The DSCP value is 0 in DNS packets sent by a DNS client or DNS proxy.

Views

System view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the range of 0 to 63.

Usage guidelines

The DSCP value of a packet specifies the priority level of the packet and affects the transmission priority of the packet. A bigger DSCP value represents a higher priority.

Examples

Set the DSCP value to 30 for outgoing DNS packets.

```
<Switch> system-view
[Switch] dns dscp 30
```

7.1.6. dns proxy enable

Use **dns proxy enable** to enable DNS proxy.

Use **undo dns proxy enable** to disable DNS proxy.

Syntax

dns proxy enable

undo dns proxy enable

Default

DNS proxy is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This configuration applies to both IPv4 DNS.

Examples

Enable DNS proxy.

```
<Switch> system-view
[Switch] dns proxy enable
```

7.1.7. dns server

Use **dns server** to specify the IPv4 address of a DNS server.

Use **undo dns server** to remove the IPv4 address of a DNS server.

Syntax

dns server *ip-address* [**vpn-instance** *vpn-instance-name*]

undo dns server [*ip-address*] [**vpn-instance** *vpn-instance-name*]

Default

No DNS server IPv4 address is specified.

Views

System view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IPv4 address of a DNS server.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To specify a DNS server IPv4 address for the public network, do not use this option.

Usage guidelines

The device sends a DNS query request to the DNS servers in the order their IPv4 addresses are specified.

The system allows a maximum of six DNS server IPv4 addresses for the public network or each VPN instance. You can specify DNS server IPv4 addresses for both public network and VPN instances.

If you do not specify an IPv4 address, the **undo dns server** command removes all DNS server IPv4 addresses for the public network or the specified VPN instance.

Examples

Specify DNS server IPv4 address 172.16.1.1.

```
<Switch> system-view
[Switch] dns server 172.16.1.1
```

Related commands

display dns server

7.1.8. ip host

Use **ip host** to create a host name-to-IPv4 address mapping.

Use **undo ip host** to remove a host name-to-IPv4 address mapping.

Syntax

ip host *host-name ip-address* [**vpn-instance** *vpn-instance-name*]

undo ip host *host-name ip-address* [**vpn-instance** *vpn-instance-name*]

Default

No host name-to-IPv4 address mappings exist.

Views

System view

Predefined user roles

network-admin

Parameters

host-name: Specifies a host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and dots (.).

ip-address: Specifies the IPv4 address of the host.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To create a host name-to-IP address mapping for the public network, do not specify this option.

Usage guidelines

The system allows a maximum of 1024 host name-to-IPv4 address mappings for the public network or each VPN instance. You can configure host name-to-IPv4 address mappings for both public network and VPN instances.

For the public network or a VPN instance, each host name maps to only one IPv4 address. If you execute this command multiple times, the most recent configuration takes effect.

Do not use the **ping** command parameter **ip**, **-a**, **-c**, **-f**, **-h**, **-i**, **-m**, **-n**, **-p**, **-q**, **-r**, **-s**, **-t**, **-tos**, **-v**, or **-vpn-instance** as the host name. For more information about the **ping** command parameters, see *Network Management and Monitoring Command Reference*.

Examples

Map IPv4 address 10.110.0.1 to host name **aaa** for the public network.

```
<Switch> system-view
[Switch] ip host aaa 10.110.0.1
```

Related commands

display dns host

7.1.9. reset dns host

Use **reset dns host** to clear dynamic DNS entries.

Syntax

reset dns host [**ip**] [**vpn-instance** *vpn-instance-name*]

Views

User view

Predefined user roles

network-admin

Parameters

ip: Specifies type A queries. A type A query resolves a domain name to the mapped IPv4 address.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears dynamic DNS entries for the public network.

Usage guidelines

If you do not specify the **ip** keyword, the **reset dns host** command clears dynamic DNS entries of all query types.

Examples

Clear dynamic DNS entries of all query types for the public network.

```
<Switch> reset dns host
```

Related commands

display dns host

8.1. Basic IP forwarding commands

8.1.1. display fib

Use **display fib** to display FIB entries.

Syntax

display fib [**vpn-instance** *vpn-instance-name*] [*ip-address* [*mask* | *mask-length*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. To display the FIB entries for the public network, do not specify any VPN.

ip-address: Displays the FIB entry that matches the specified destination IP address.

mask: Specifies the mask for the IP address.

mask-length: Specifies the mask length for the IP address. The value range is 0 to 32.

Usage guidelines

If you specify an IP address without a mask or mask length, this command displays the longest matching FIB entry.

If you specify an IP address and a mask or mask length, this command displays the exactly matching FIB entry.

Examples

Display all FIB entries of the public network.

```
<Switch> display fib

Destination count: 5 FIB entry count: 5

Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay     F:FRR

Destination/Mask   Nexthop         Flag     OutInterface/Token       Label

10.2.1.1/32         127.0.0.1       UH       InLoop0                  Null
```

Table 8-1 Command output

Field	Description
Destination count	Total number of destination addresses.
FIB entry count	Total number of FIB entries.
Destination/Mask	Destination address and the mask length.
Nexthop	Next hop address.
Flag	Flags of routes: • **U**—Usable route. • **G**—Gateway route. • **H**—Host route. • **B**—Blackhole route. • **D**—Dynamic route. • **S**—Static route. • **R**—Relay route. • **F**—Fast reroute.
OutInterface/Token	Output interface/LSP index number.
Label	Inner label.

9. IP performance optimization commands

9.1. IP performance optimization commands

9.1.1. display icmp statistics

Use **display icmp statistics** to display ICMP statistics.

Syntax

display icmp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ICMP statistics for all member devices.

Usage guidelines

ICMP statistics include information about received and sent ICMP packets.

Examples

Display ICMP statistics.

```
<Switch> display icmp statistics
  Input: bad formats   0                  bad checksum            0
         echo          175                destination unreachable 0
         source quench 0                  redirects               0
         echo replies  201                parameter problem       0
         timestamp     0                  information requests    0
         mask requests 0                  mask replies            0
         time exceeded 0                  invalid type            0
         router advert 0                  router solicit          0
         broadcast/multicast echo requests ignored           0
         broadcast/multicast timestamp requests ignored      0
 Output: echo          0                  destination unreachable 0
         source quench 0                  redirects               0
         echo replies  175                parameter problem       0
         timestamp     0                  information replies     0
         mask requests 0                  mask replies            0
         time exceeded 0                  bad address             0
         packet error  1442               router advert           3
```

9.1.2. display ip statistics

Use **display ip statistics** to display IP packet statistics.

Syntax

display ip statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IP packet statistics for all member devices.

Usage guidelines

IP statistics include information about received and sent packets, fragments, and reassembly.

Examples

Display IP packet statistics.

```
<Switch> display ip statistics
  Input:    sum            7120            local             112
            bad protocol   0               bad format        0
            bad checksum   0               bad options       0
  Output:   forwarding     0               local             27
            dropped        0               no route          2
            compress fails 0
  Fragment:input           0               output            0
            dropped        0
            fragmented     0               couldn't fragment 0
  Reassembling:sum         0               timeouts          0
```

Table 9-1 Command output

Field	Description
Input	Statistics about received packets: • **sum**—Total number of packets received. • **local**—Total number of packets destined for the device. • **bad protocol**—Total number of unknown protocol packets. • **bad format**—Total number of packets with incorrect format. • **bad checksum**—Total number of packets with incorrect checksum. • **bad options**—Total number of packets with incorrect option.
Output	Statistics about sent packets: • **forwarding**—Total number of packets forwarded. • **local**—Total number of packets locally sent. • **dropped**—Total number of packets discarded. • **no route**—Total number of packets for which no route is

Field	Description
	available. • **compress fails**—Total number of packets failed to be compressed.
Fragment	Statistics about fragments: • **input**—Total number of fragments received. • **output**—Total number of fragments sent. • **dropped**—Total number of fragments dropped. • **fragmented**—Total number of packets successfully fragmented. • **couldn't fragment**—Total number of packets failed to be fragmented.
Reassembling	Statistics about reassembly: • **sum**—Total number of packets reassembled. • **timeouts**—Total number of reassembly timeouts.

Related commands

display ip interface

reset ip statistics

9.1.3. display rawip

Use **display rawip** to display brief information about RawIP connections.

Syntax

display rawip [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about RawIP connections for all member devices.

Usage guidelines

Brief RawIP connection information includes local and peer addresses, protocol, and PCB.

Examples

Display brief information about RawIP connections.

```
<Switch> display rawip
 Local Addr       Foreign Addr     Protocol  Slot  Cpu PCB
 0.0.0.0          0.0.0.0          1         1     0   0x0000000000000009
 0.0.0.0          0.0.0.0          1         1     0   0x0000000000000008
 0.0.0.0          0.0.0.0          1         5     0   0x0000000000000002
```

Table 9-2 Command output

Field	Description
Local Addr	Local IP address.
Foreign Addr	Peer IP address.
Protocol	Protocol number.
PCB	Protocol control block.

9.1.4. display rawip verbose

Use **display rawip verbose** to display detailed information about RawIP connections.

Syntax

display rawip verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed RawIP connection information for the specified PCB. The *pcb-index* argument specifies the index of the PCB. The index is a hexadecimal value in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about RawIP connections for all member devices.

Usage guidelines

The detailed information includes socket creator, state, option, type, protocol number, and the source and destination IP addresses of RawIP connections.

Examples

Display detailed information about RawIP connections.

```
<Switch> display rawip verbose
Total RawIP socket number: 1

 Location: slot: 6 cpu: 0
 Creator: ping[320]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 9216 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 3
 Protocol: 1
 Connection info: src = 0.0.0.0, dst = 0.0.0.0
```

```
Inpcb flags: N/A
Inpcb extflag: INP_EXTRCVICMPERR INP_EXTFILTER
Inpcb vflag: INP_IPV4
TTL: 255(minimum TTL: 0)
Send VRF: 0xffff
Receive VRF: 0xffff
```

Table 9-3 Command output

Field	Description
Total RawIP socket number	Total number of RawIP sockets.
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.
State	State of the socket.
Options	Socket options.
Error	Error code.
Receiving buffer (cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **drop**—Number of dropped packets. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Sending buffer (cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1—SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2—SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3—SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.
Connection info	Source IP address and destination IP address.

Field	Description
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address. • **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_USEICMPSRC**—Uses the specified IP address as the source IP address for outgoing ICMP packets. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTRCVICMPERR**—Receives an ICMP error packet. • **INP_EXTFILTER**—Filters the contents in the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.
Send VRF	VRF from which packets are sent.

Field	Description
Receive VRF	VRF from which packets are received.

9.1.5. display tcp

Use **display tcp** to display brief information about TCP connections.

Syntax

display tcp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about TCP connections for all member devices.

Usage guidelines

Brief TCP connection information includes local IP address, local port number, peer IP address, peer port number, and TCP connection state.

Examples

Display brief information about TCP connections.

```
<Switch> display tcp
 *: TCP connection with authentication
 Local Addr:port       Foreign Addr:port     State       Slot  Cpu PCB
*0.0.0.0:21            0.0.0.0:0             LISTEN      1     0   0x000000000000c387
 192.168.20.200:23     192.168.20.14:1284    ESTABLISHED 1     0   0x0000000000000009
 192.168.20.200:23     192.168.20.14:1283    ESTABLISHED 1     0   0x0000000000000002
```

Table 9-4 Command output

Field	Description
*	Indicates that the TCP connection uses authentication.
Local Addr:port	Local IP address and port number.
Foreign Addr:port	Peer IP address and port number.
State	TCP connection state.
PCB	PCB index.

9.1.6. display tcp statistics

Use **display tcp statistics** to display TCP traffic statistics.

Syntax

display tcp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays TCP traffic statistics for all member devices.

Usage guidelines

TCP traffic statistics include information about received and sent TCP packets and Syncache/syncookie.

Examples

Display TCP traffic statistics.

```
<Switch> display tcp statistics
Received packets:
    Total: 4150
    packets in sequence: 1366 (134675 bytes)
    window probe packets: 0, window update packets: 0
    checksum error: 0, offset error: 0, short error: 0
    packets dropped for lack of memory: 0
    packets dropped due to PAWS: 0
    duplicate packets: 12 (36 bytes), partially duplicate packets: 0 (0 bytes)
    out-of-order packets: 0 (0 bytes)
    packets with data after window: 0 (0 bytes)
    packets after close: 0
    ACK packets: 3531 (795048 bytes)
    duplicate ACK packets: 33, ACK packets for unsent data: 0

Sent packets:
    Total: 4058
    urgent packets: 0
    control packets: 50
    window probe packets: 3, window update packets: 11
    data packets: 3862 (795012 bytes), data packets retransmitted: 0 (0 bytes)
    ACK-only packets: 150 (52 delayed)
    unnecessary packet retransmissions: 0

Syncache/syncookie related statistics:
    entries added to syncache: 12
    syncache entries retransmitted: 0
    duplicate SYN packets: 0
    reply failures: 0
    successfully build new socket: 12
```

```
    bucket overflows: 0
    zone failures: 0
    syncache entries removed due to RST: 0
    syncache entries removed due to timed out: 0
    ACK checked by syncache or syncookie failures: 0
    syncache entries aborted: 0
    syncache entries removed due to bad ACK: 0
    syncache entries removed due to ICMP unreachable: 0
    SYN cookies sent: 0
    SYN cookies received: 0

SACK related statistics:
    SACK recoveries: 1
    SACK retransmitted segments: 0 (0 bytes)
    SACK blocks (options) received: 0
    SACK blocks (options) sent: 0
    SACK scoreboard overflows: 0

Other statistics:
    retransmitted timeout: 0, connections dropped in retransmitted timeout: 0
    persist timeout: 0
    keepalive timeout: 21, keepalive probe: 0
    keepalive timeout, so connections disconnected: 0
    fin_wait_2 timeout, so connections disconnected: 0
    initiated connections: 29, accepted connections: 12, established connections:
23
    closed connections: 50051 (dropped: 0, initiated dropped: 0)
    bad connection attempt: 0
    ignored RSTs in the window: 0
    listen queue overflows: 0
    RTT updates: 3518(attempt segment: 3537)
    correct ACK header predictions: 0
    correct data packet header predictions: 568
    resends due to MTU discovery: 0
    packets dropped due to MD5 authentication failure: 0
    packets that passed MD5 authentication: 0
    sent Keychain-encrypted packets: 0
    packets that passed Keychain authentication: 0
    packets dropped due to Keychain authentication failure: 0
```

Related commands

reset tcp statistics

9.1.7. display tcp verbose

Use **display tcp verbose** to display detailed information about TCP connections.

Syntax

display tcp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed TCP connection information for the specified PCB. The index is a hexadecimal value in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about TCP connections for all member devices.

Usage guidelines

The detailed TCP connection information includes socket creator, state, option, type, protocol number, source IP address and port number, destination IP address and port number, and connection state.

Examples

Display detailed information about TCP connections.

```
<Switch> display tcp verbose
TCP inpcb number: 1(tcpcb number: 1)

 Location: slot: 6 cpu: 0
 NSR standby: N/A
 Creator: bgpd[199]
 State: ISCONNECTED
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/state): 0 / 65700 / 1 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 65700 / 512 / N/A
 Type: 1
 Protocol: 6
 Connection info: src = 192.168.20.200:179 ,  dst = 192.168.20.14:4181
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV4
 TTL: 255(minimum TTL: 0)
 Connection state: ESTABLISHED
 TCP options: TF_REQ_SCALE TF_REQ_TSTMP TF_SACK_PERMIT TF_NSR
 NSR state: READY(M)
 Send VRF: 0x0
 Receive VRF: 0x0
```

Table 9-5 Command output

Field	Description
TCP inpcb number	Number of TCP IP PCBs.
tcpcb number	Number of TCP PCBs. This field is not displayed if the state of the TCP connection is **TIME_WAIT**.
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.
State	State of the socket.
Options	Socket options.
Error	Error code.
Receiving buffer (cc/hiwat/lowat/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Sending buffer (cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.
Connection info	Source IP address and port number, and destination IP address and port number.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address.

Field	Description
	• **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTDONTDROP**—Does not drop the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.
TCP options	TCP options: • **TF_MD5SIG**—Enables MD5 signature. • **TF_NODELAY**—Disables the Nagle algorithm that buffers the sent data inside the TCP. • **TF_NOOPT**—No TCP options. • **TF_NOPUSH**—Forces TCP to delay sending any TCP data until a full sized segment is buffered in the TCP buffers. • **TF_BINDFOREIGNADDR**—Binds the peer IP address. • **TF_NSR**—Enables TCP NSR.

Field	Description
	• **TF_REQ_SCALE**—Enables the TCP window scale option. • **TF_REQ_TSTMP**—Enables the time stamp option. • **TF_SACK_PERMIT**—Enables the TCP selective acknowledgement option. • **TF_ENHANCED_AUTH**—Enables the enhanced authentication option.
NSR state	State of the TCP connections. Between the parentheses is the role of the connection: • **M**—Main connection. • **S**—Standby connection.
Send VRF	VRF from which packets are sent.
Receive VRF	VRF from which packets are received.

9.1.8. display udp

Use **display udp** to display brief information about UDP connections.

Syntax

display udp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about UDP connections for all member devices.

Usage guidelines

Brief UDP connection information includes local IP address and port number, and peer IP address and port number.

Examples

Display brief information about UDP connections.

```
<Switch> display udp
 Local Addr:port        Foreign Addr:port     Slot  Cpu PCB
 0.0.0.0:69             0.0.0.0:0             1     0   0x0000000000000003
 192.168.20.200:1024    192.168.20.14:69      5     0   0x0000000000000002
```

Table 9-6 Command output

Field	Description
Local Addr:port	Local IP address and port number.
Foreign Addr:port	Peer IP address and port number.

Field	Description
PCB	PCB index.

9.1.9. display udp statistics

Use **display udp statistics** to display UDP traffic statistics.

Syntax

display udp statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays UDP traffic statistics for all member devices.

Usage guidelines

UDP traffic statistics include information about received and sent UDP packets.

Examples

Display UDP traffic statistics.

```
<Switch> display udp statistics
Received packets:
     Total: 240
     checksum error: 0, no checksum: 0
     shorter than header: 0, data length larger than packet: 0
     no socket on port(unicast): 0
     no socket on port(broadcast/multicast): 240
     not delivered, input socket full: 0
Sent packets:
     Total: 0
```

Related commands

reset udp statistics

9.1.10. display udp verbose

Use **display udp verbose** to display detailed information about UDP connections.

Syntax

display udp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed UDP connection information for the specified PCB. The index is a hexadecimal value in the range of 1 to ffffffffffffffff.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about UDP connections for all member devices.

Usage guidelines

The detailed information includes socket creator, status, option, type, protocol number, source IP address and port number, and destination IP address and port number for UDP connections.

Examples

Display detailed UDP connection information.

```
<Switch> display udp verbose
Total UDP socket number: 1

 Location: slot: 6 cpu: 0
 Creator: sock_test_mips[250]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 41600 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 2
 Protocol: 17
 Connection info: src = 0.0.0.0:69, dst = 0.0.0.0:0
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV4
 TTL: 255(minimum TTL: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 9-7 Command output

Field	Description
Total UDP socket number	Total number of UDP sockets.
Creator	Name of the operation that created the socket. The number in brackets is the process number of the creator.
State	Socket state.
Options	Socket option.
Error	Error code.
Receiving buffer(cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order: • **cc**—Used space.

Field	Description
	• **hiwat**—Maximum space. • **lowat**—Minimum space. • **drop**—Number of dropped packets. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IP options. • **INP_RECVRETOPTS**—Receives replied IP options. • **INP_RECVDSTADDR**—Receives destination IP address. • **INP_HDRINCL**—Provides the entire IP header. • **INP_REUSEADDR**—Reuses the IP address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • I**NP_RECVIF**—Records the input interface of the packet. • **INP_RECVTTL**—Receives TTL of the packet. Only UDP and RawIP support this flag. • **INP_DONTFRAG**—Sets the **Don't Fragment** flag. • **INP_ROUTER_ALERT**—Receives packets with the router alert option. Only RawIP supports this flag. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **INP_RCVMACADDR**—Receives the MAC address

Field	Description
	of the frame. • **INP_RECVTOS**—Receives TOS of the packet. Only UDP and RawIP support this flag. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
TTL	TTL value in the Internet PCB.
Send VRF	VRF from which packets are sent.
Receive VRF	VRF from which packets are received.

9.1.11. ip forward-broadcast

Use **ip forward-broadcast** to enable an interface to forward directed broadcast packets destined for the directly connected network.

Use **undo ip forward-broadcast** to disable an interface from forwarding directed broadcast packets destined for the directly connected network.

Syntax

ip forward-broadcast

undo ip forward-broadcast

Default

An interface cannot forward directed broadcasts destined for the directly connected network.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

A directed broadcast packet is destined for all hosts on a specific network. In the destination IP address of the directed broadcast, the network ID identifies the target network, and the host ID is made up of all ones.

If an interface is allowed to forward directed broadcasts destined for the directly connected network, hackers can exploit this vulnerability to attack the target network. In some scenarios, however, an interface must send such directed broadcast packets to support UDP helper and Wake on LAN.

The command enables the interface to forward directed broadcast packets that are destined for the directly connected network and are received from another subnet to support Wake on LAN. Wake on LAN sends the directed broadcasts to wake up the hosts on the target network.

Examples

Enable VLAN-interface 2 to forward directed broadcast packets destined for the directly connected network.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip forward-broadcast
```

9.1.12. ip icmp error-interval

Use **ip icmp error-interval** to set the bucket size and the interval for tokens to arrive in the bucket for ICMP error messages.

Use **undo ip icmp error-interval** to restore the default.

Syntax

ip icmp error-interval *interval* [*bucketsize*]

undo ip icmp error-interval

Default

The bucket allows a maximum of 10 tokens, and a token is placed in the bucket every 100 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for tokens to arrive in the bucket. The value range is 0 to 2147483647 milliseconds. To disable the ICMP rate limit, set the value to 0.

bucketsize: Specifies the maximum number of tokens allowed in the bucket. The value range is 1 to 200.

Usage guidelines

This command limits the rate at which ICMP error messages are sent. Use this command to avoid sending excessive ICMP error messages within a short period that might cause network congestion. A token bucket algorithm is used with one token representing one ICMP error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMP error message is sent. When the bucket is empty, ICMP error messages are not sent until a new token is placed in the bucket.

Examples

Set the bucket size to 40 tokens and the interval for tokens to arrive in the bucket to 200 milliseconds for ICMP error messages.

```
<Switch> system-view
[Switch] ip icmp error-interval 200 40
```

9.1.13. ip mtu

Use **ip mtu** to set the MTU of IPv4 packets sent over an interface.

Use **undo ip mtu** to restore the default.

Syntax

ip mtu *mtu-size*

undo ip mtu

Default

The MTU of IPv4 packets sent over an interface is not set.

Views

Interface view

Predefined user roles

network-admin

Parameters

mtu-size: Specifies the MTU in bytes. The value range for the *mtu-size* argument is 128 to 9216.

Usage guidelines

When a packet exceeds the MTU of the sending interface, the device processes the packet in one of the following ways:

- If the packet disallows fragmentation, the device discards it.
- If the packet allows fragmentation, the device fragments it and forwards the fragments.

Fragmentation and reassembling consume system resources, so set an appropriate MTU to avoid fragmentation.

If an interface supports both the **mtu** and **ip mtu** commands, the device fragments a packet based on the MTU set by the **ip mtu** command.

Examples

Set the MTU of VLAN-interface 100 to 1280 bytes.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ip mtu 1280
```

9.1.14. ip redirects enable

Use **ip redirects enable** to enable sending ICMP redirect messages.

Use **undo ip redirects enable** to disable sending ICMP redirect messages.

Syntax

ip redirects enable

undo ip redirects enable

Default

Sending ICMP redirect messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

ICMP redirect messages simplify host management and enable hosts to gradually optimize their routing tables.

A host that has only one route destined for the default gateway sends all packets to the default gateway. The default gateway sends an ICMP redirect message to inform the host of a correct next hop by following these rules:

- The receiving and sending interfaces are the same.
- The selected route is not created or modified by any ICMP redirect messages.
- The selected route is not destined for 0.0.0.0.
- There is no source route option in the received packet.

Examples

Enable sending ICMP redirect messages.

```
<Switch> system-view
[Switch] ip redirects enable
```

9.1.15. ip ttl-expires enable

Use **ip ttl-expires enable** to enable sending ICMP time exceeded messages.

Use **undo ip ttl-expires enable** to disable sending ICMP time exceeded messages.

Syntax

ip ttl-expires enable

undo ip ttl-expires enable

Default

Sending ICMP time exceeded messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A device sends ICMP time exceeded messages by following these rules:

- The device sends an ICMP TTL exceeded in transit message to the source when the following conditions are met:
  - The received packet is not destined for the device.
  - The TTL field of the packet is 1.

- When the device receives the first fragment of an IP datagram destined for the device itself, it starts a timer. If the timer expires before all the fragments of the datagram are received, the device sends an ICMP fragment reassembly time exceeded message to the source.

A device disabled from sending ICMP time exceeded messages does not send ICMP TTL exceeded in transit messages but can still send ICMP fragment reassembly time exceeded messages.

Examples

Enable sending ICMP time exceeded messages.

```
<Switch> system-view
[Switch] ip ttl-expires enable
```

9.1.16. ip unreachables enable

Use **ip unreachables enable** to enable sending ICMP destination unreachable messages.

Use **undo ip unreachables enable** to disable sending ICMP destination unreachable messages.

Syntax

ip unreachables enable

undo ip unreachables enable

Default

Sending ICMP destination unreachable messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

A device sends ICMP destination unreachable messages by following these rules:

- The device sends the source an ICMP network unreachable message when the following conditions are met:
  - The received packet does not match any route.
  - No default route exists in the routing table.
- The device sends the source an ICMP protocol unreachable message when the following conditions are met:
  - The received packet is destined for the device.
  - The transport layer protocol of the packet is not supported by the device.
- The device sends the source an ICMP port unreachable message when the following conditions are met:
  - The received UDP packet is destined for the device.
  - The packet's port number does not match the running process.
- The device sends the source an ICMP source route failed message when the following conditions are met:
  - The source uses Strict Source Routing to send packets.
  - The intermediate device finds that the next hop specified by the source is not directly connected.

- The device sends the source an ICMP fragmentation needed and DF set message when the following conditions are met:
  - The MTU of the sending interface is smaller than the packet.
  - The packet has Don't Fragment set.

Examples

Enable sending ICMP destination unreachable messages.

```
<Switch> system-view
[Switch] ip unreachables enable
```

9.1.17. reset ip statistics

Use **reset ip statistics** to clear IP traffic statistics.

Syntax

reset ip statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears IP traffic statistics for all member devices.

Usage guidelines

Use this command to clear history IP traffic statistics before you collect IP traffic statistics for a time period.

Examples

Clear IP traffic statistics.

```
<Switch> reset ip statistics
```

Related commands

display ip interface

display ip statistics

9.1.18. reset tcp statistics

Use **reset tcp statistics** to clear TCP traffic statistics.

Syntax

reset tcp statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear TCP traffic statistics.

```
<Switch> reset tcp statistics
```

Related commands

display tcp statistics

9.1.19. reset udp statistics

Use **reset udp statistics** to clear UDP traffic statistics.

Syntax

reset udp statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear UDP traffic statistics.

```
<Switch> reset udp statistics
```

Related commands

display udp statistics

9.1.20. tcp path-mtu-discovery

Use **tcp path-mtu-discovery** to enable TCP path MTU discovery.

Use **undo tcp path-mtu-discovery** to disable TCP path MTU discovery.

Syntax

tcp path-mtu-discovery [**aging** *age-time* | **no-aging**]

undo tcp path-mtu-discovery

Default

TCP path MTU discovery is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

aging *age-time*: Specifies the aging time for the path MTU, in the range of 10 to 30 minutes. The default aging time is 10 minutes.

no-aging: Does not age out the path MTU.

Usage guidelines

After you enable TCP path MTU discovery, all new TCP connections detect the path MTU. The device uses the path MTU to calculate the MSS to avoid IP fragmentation.

After you disable TCP path MTU discovery, the system stops all path MTU timers. The TCP connections established later do not detect the path MTU, but the TCP connections previously established still can detect the path MTU.

Examples

Enable TCP path MTU discovery and set the path MTU aging time to 20 minutes.

```
<Switch> system-view
[Switch] tcp path-mtu-discovery aging 20
```

9.1.21. tcp timer fin-timeout

Use **tcp timer fin-timeout** to set the TCP FIN wait timer.

Use **undo tcp timer fin-timeout** to restore the default.

Syntax

tcp timer fin-timeout *time-value*

undo tcp timer fin-timeout

Default

The TCP FIN wait timer is 675 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-value: Specifies the TCP FIN wait timer in the range of 76 to 3600 seconds.

Usage guidelines

TCP starts the FIN wait timer when the state of a TCP connection changes to FIN_WAIT_2. If no FIN packet is received within the timer interval, the TCP connection is terminated.

If a FIN packet is received, TCP changes the connection state to TIME_WAIT. If a non-FIN packet is received, TCP restarts the timer and tears down the connection when the timer expires.

Examples

Set the TCP FIN wait timer to 800 seconds.

```
<Switch> system-view
[Switch] tcp timer fin-timeout 800
```

9.1.22. tcp timer syn-timeout

Use **tcp timer syn-timeout** to set the TCP SYN wait timer.

Use **undo tcp timer syn-timeout** to restore the default.

Syntax

tcp timer syn-timeout *time-value*

undo tcp timer syn-timeout

Default

The TCP SYN wait timer is 75 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time-value: Specifies the TCP SYN wait timer in the range of 2 to 600 seconds.

Usage guidelines

TCP starts the SYN wait timer after sending a SYN packet. Within the SYN wait timer if no response is received or the upper limit on TCP connection tries is reached, TCP fails to establish the connection.

Examples

Set the TCP SYN wait timer to 80 seconds.

```
<Switch> system-view
[Switch] tcp timer syn-timeout 80
```

9.1.23. tcp window

Use **tcp window** to set the size of the TCP receive/send buffer.

Use **undo tcp window** to restore the default.

Syntax

tcp window *window-size*

undo tcp window

Default

The size of the TCP receive/send buffer is 63 KB.

Views

System view

Predefined user roles

network-admin

Parameters

window-size: Specifies the size of the TCP receive/send buffer, in the range of 1 to 64 KB.

Examples

Set the size of the TCP receive/send buffer to 3 KB.

```
<Switch> system-view
[Switch] tcp window 3
```

10. UDP helper commands

10.1. UDP helper commands

10.1.1. display udp-helper interface

Use **display udp-helper interface** to display information about broadcast to unicast conversion by UDP helper on an interface.

Syntax

display udp-helper interface *interface-type interface-number*

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

This command displays information about destination servers and total number of unicast packets converted from UDP broadcast packets by UDP helper.

Examples

Display information about broadcast to unicast conversion by UDP helper on VLAN-interface 100.

```
<Switch> display udp-helper interface vlan-interface 100
Interface                Server VPN instance          Server address Packets sent
Vlan-interface100        N/A                          192.1.1.2      0
Vlan-interface100        N/A                          192.1.1.2      0
```

Table 10-1 Command output

Field	Description
Interface	Interface name.
Server VPN instance	VPN instance to which the destination server belongs.
Server address	Destination server to which UDP packets are forwarded.
Packets sent	Number of unicast packets that are converted from broadcast packets by UDP helper.

Related commands

reset udp-helper statistics

udp-helper server

10.1.2. reset udp-helper statistics

Use **reset udp-helper statistics** to clear statistics about broadcast to unicast conversion by UDP helper.

Syntax

reset udp-helper statistics

Views

User view

Predefined user roles

network-admin

Examples

Clear the statistics about broadcast to unicast conversion by UDP helper.

```
<Switch> reset udp-helper statistics
```

Related commands

display udp-helper interface

10.1.3. udp-helper enable

Use **udp-helper enable** to enable UDP helper.

Use **undo udp-helper enable** to disable UDP helper.

Syntax

udp-helper enable

undo udp-helper enable

Default

UDP helper is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

For UDP helper to take effect on an interface, make sure the following conditions are met:

- UDP helper is enabled.
- A UDP port number is specified by using the **udp-helper port** command.
- Packet conversion for UDP helper is configured on the interface.

Examples

Enable UDP helper.

```
<Switch> system-view
[Switch] udp-helper enable
```

Related commands

udp-helper port

udp-helper server

10.1.4. udp-helper port

Use **udp-helper port** to specify a UDP port number for UDP helper.

Use **undo udp-helper port** to remove UDP port numbers.

Syntax

udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

undo udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

Default

No UDP port numbers are specified for UDP helper.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies a UDP port number in the range of 1 to 65535 (except 67 and 68).

dns: Specifies the UDP port 53 used by DNS packets.

netbios-ds: Specifies the UDP port 138 used by NetBIOS distribution service packets.

netbios-ns: Specifies the UDP port 137 used by NetBIOS name service packets.

tacacs: Specifies the UDP port 49 used by TACACS packets.

tftp: Specifies the UDP port 69 used by TFTP packets.

time: Specifies the UDP port 37 used by time protocol packets.

Usage guidelines

Upon receiving a UDP broadcast or multicast packet, UDP helper uses the specified UDP ports to match the UDP destination port number of the packet.

To specify a UDP port, you can specify the port number or the protocol keyword. For example, **udp-helper port** 53 and **udp-helper port dns** specify the same UDP port.

You can specify a maximum of 256 UDP ports on a device.

Examples

Specify the UDP port 100 for UDP helper.

```
<Switch> system-view
[Switch] udp-helper port 100
```

10.1.5. udp-helper server

Use **udp-helper server** to specify a destination server for UDP helper to convert broadcast to unicast.

Use **undo udp-helper server** to remove a destination server.

Syntax

udp-helper server *ip-address* [**global** | **vpn-instance** *vpn-instance-name*]

undo udp-helper server [*ip-address* [**global** | **vpn-instance** *vpn-instance-name*]]

Default

No destination server is specified for UDP helper to convert broadcast to unicast.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a destination server, in dotted decimal notation.

global: Forwards converted unicast packets to the server on the public network.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

Specify destination servers on an interface that receives UDP broadcast packets. If the packets' destination UDP port numbers match the UDP helper ports, UDP helper forwards the broadcasts to the specified servers.

You can specify a maximum of 20 unicast and multicast addresses for UDP helper to convert broadcast packets on an interface.

If you do not specify the *ip-address* argument, the **undo udp-helper server** command removes all destination servers on the interface.

A destination server with the **global** keyword and the same destination server with the **vpn-instance** *vpn-instance-name* option do not overwrite each other. If you specify only the IP address, UDP helper forwards converted unicast packets in the VPN to which the receiving interface belongs. If the interface is not bound to any VPN instance, UDP helper forwards the unicast packets on the public network.

Examples

Specify the destination server 192.1.1.2 for UDP helper to convert broadcast to unicast on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] udp-helper server 192.1.1.2
```

Specify the destination server 192.1.1.2 on the public network for UDP helper to convert broadcast to unicast on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] udp-helper server 192.1.1.2 global
```

11. IPv6 basics commands

11.1. IPv6 basics commands

11.1.1. display ipv6 fib

Use **display ipv6 fib** to display IPv6 FIB entries.

Syntax

display ipv6 fib [**vpn-instance** *vpn-instance-name*] [*ipv6-address* [*prefix-length*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 FIB entries for the public network.

ipv6-address: Displays IPv6 FIB entries for a destination IPv6 address. If you do not specify an IPv6 address, this command displays all IPv6 FIB entries.

prefix-length: Specifies a prefix length for the IPv6 address, in the range of 0 to 128. If you do not specify the prefix length, this command displays the IPv6 FIB entry longest matching the IPv6 address.

Examples

Display all IPv6 FIB entries for the public network.

```
<Switch> display ipv6 fib

Destination count: 1 FIB entry count: 1

Flag:
  U:Usable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Relay     F:FRR

Destination: ::1                                        Prefix length: 128
Nexthop      : ::1                                       Flags: UH
Time stamp : 0x1                                        Label: Null
Interface  : InLoop0                                    Token: Invalid
```

Table 11-1 Command output

Field	Description
Destination count	Total number of destination addresses.

Field	Description
FIB entry count	Total number of IPv6 FIB entries.
Destination	Destination address.
Prefix length	Prefix length of the destination address.
Nexthop	Next hop address.
Flags	Route flag: • **U**—Usable route. • **G**—Gateway route. • **H**—Host route. • **B**—Black hole route. • **D**—Dynamic route. • **S**—Static route. • **R**—Recursive route. • **F**—Fast re-route.
Time stamp	Time when the IPv6 FIB entry was generated.
Label	Inner MPLS label. For IPv6 FIB entries for the public network, this field displays **Null**.
Interface	Outgoing interface.
Token	Label switched path index number.

11.1.2. display ipv6 interface

Use **display ipv6 interface** to display IPv6 interface information.

Syntax

display ipv6 interface [*interface-type* [*interface-number*]] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type: Specifies an interface by its type.

interface-number: Specifies an interface by its number.

brief: Displays brief IPv6 interface information, including physical status, link-layer protocols, and IPv6 address. If you do not specify the keyword, this command displays detailed IPv6 interface information, including IPv6 configuration and operating information, and IPv6 packet statistics.

Usage guidelines

If you do not specify an interface, this command displays IPv6 information about all interfaces.

If you specify only the *interface-type* argument, this command displays IPv6 information about the interfaces of the specified type.

If you specify both the *interface-type* and the *interface-number* arguments, this command displays IPv6 information about the specified interface.

Examples

Display IPv6 information about VLAN-interface 2.

```
<Switch> display ipv6 interface vlan-interface 2
Vlan-interface2 current state: UP
Line protocol current state: UP
IPv6 is enabled, link-local address is FE80::1234:56FF:FE65:4322 [TENTATIVE]
  Global unicast address(es):
    10::1234:56FF:FE65:4322, subnet is 10::/64 [TENTATIVE] [AUTOCFG]
      [valid lifetime 4641s/preferred lifetime 4637s]
    20::1234:56ff:fe65:4322, subnet is 20::/64 [TENTATIVE] [EUI-64]
    30::1, subnet is 30::/64 [TENTATIVE] [ANYCAST]
    40::2, subnet is 40::/64 [TENTATIVE] [DHCP]
    50::3, subnet is 50::/64 [TENTATIVE]
  Joined group address(es):
    FF02::1
    FF02::2
    FF02::1:FF00:1
    FF02::1:FF65:4322
  MTU is 1500 bytes
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
  Hosts use stateless autoconfig for addresses
IPv6 Packet statistics:
  InReceives:                    0
  InTooShorts:                   0
  InTruncatedPkts:               0
  InHopLimitExceeds:             0
  InBadHeaders:                  0
  InBadOptions:                  0
  ReasmReqds:                    0
  ReasmOKs:                      0
  InFragDrops:                   0
  InFragTimeouts:                0
  OutFragFails:                  0
  InUnknownProtos:               0
  InDelivers:                    0
  OutRequests:                   0
  OutForwDatagrams:              0
  InNoRoutes:                    0
  InTooBigErrors:                0
  OutFragOKs:                    0
  OutFragCreates:                0
  InMcastPkts:                   0
  InMcastNotMembers:             0
```

```
OutMcastPkts:                 0
InAddrErrors:                 0
InDiscards:                   0
OutDiscards:                  0
```

Table 11-2 Command output

Field	Description
Vlan-interface2 current state	Physical state of the interface: • **Administratively DOWN**—The interface has been administratively shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **UP**—The administrative and physical states of the interface are both up.
Line protocol current state	Link layer state of the interface: • **DOWN**—The link layer protocol state of the interface is down. • **UP**—The link layer protocol state of the interface is up.
IPv6 is enabled	IPv6 is enabled on the interface. This feature is automatically enabled after an IPv6 address is configured for an interface.
link-local address	Link-local address of the interface.
Global unicast address(es)	Global unicast addresses of the interface. IPv6 address states: • **TENTATIVE**—Initial state. DAD is being performed or is to be performed on the address. • **DUPLICATE**—The address is not unique on the link. • **PREFERRED**—The address is preferred and can be used as the source or destination address of a packet. If an address is in this state, the command does not display the address state. • **DEPRECATED**—The address is beyond the preferred lifetime but in the valid lifetime. It is valid, but it cannot be used as the source address for a new connection. Packets destined for the address are processed correctly. If a global unicast address is not manually configured, the following notations indicate how the address is obtained: • **AUTOCFG**—Stateless autoconfigured. • **DHCP**—Assigned by a DHCPv6 server. • **EUI-64**—Manually configured EUI-64 IPv6 address. • **RANDOM**—Random address automatically generated. If the address is a manually configured anycast address, it is noted with **ANYCAST**.
valid lifetime	Specifies how long autoconfigured global unicast addresses using a prefix are valid.
preferred lifetime	Specifies how long autoconfigured global unicast addresses using a prefix are preferred.
Joined group address(es)	Addresses of the multicast groups that the interface has joined.

Field	Description
MTU	MTU of the interface.
ND DAD is enabled, number of DAD attempts	DAD is enabled. • If DAD is enabled, this field displays the number of attempts to send an NS message for DAD (set by using the **`ipv6 nd dad attempts`** command). • If DAD is disabled, this field displays **ND DAD is disabled**. To disable DAD, set the number of attempts to 0.
ND reachable time	Time during which a neighboring device is reachable.
ND retransmit interval	Interval for retransmitting an NS message.
Hosts use stateless autoconfig for addresses	Hosts obtained IPv6 addresses through stateless autoconfiguration.
InReceives	Received IPv6 packets, including error messages.
InTooShorts	Received IPv6 packets that are too short. For example, the received IPv6 packet is less than 40 bytes.
InTruncatedPkts	Received IPv6 packets with a length less than the payload length field specified in the packet header.
InHopLimitExceeds	Received IPv6 packets with a hop count exceeding the hop limit field specified in the packet header.
InBadHeaders	Received IPv6 packets with incorrect basic headers.
InBadOptions	Received IPv6 packets with incorrect extension headers.
ReasmReqds	Received IPv6 fragments.
ReasmOKs	Number of reassembled IPv6 packets.
InFragDrops	Received IPv6 fragments that are discarded because of certain errors.
InFragTimeouts	Received IPv6 fragments that are discarded because the amount of time they stay in the system buffer exceeds the specified interval.
OutFragFails	IPv6 packets that fail to be fragmented on the output interface.
InUnknownProtos	Received IPv6 packets with unknown or unsupported protocol type.
InDelivers	Received IPv6 packets that are delivered to user protocols (such as ICMPv6, TCP, and UDP).
OutRequests	Local IPv6 packets sent by IPv6 user protocols.
OutForwDatagrams	IPv6 packets forwarded by the interface.
InNoRoutes	Received IPv6 packets that are discarded because no matching route can be found.
InTooBigErrors	Received IPv6 packets that fail to be forwarded because they exceeded the Path MTU.
OutFragOKs	Fragmented IPv6 packets on the output interface.
OutFragCreates	Number of IPv6 fragments on the output interface.
InMcastPkts	Received IPv6 multicast packets.

Field	Description
InMcastNotMembers	Received IPv6 multicast packets that are discarded because the interface is not in the multicast group.
OutMcastPkts	IPv6 multicast packets sent by the interface.
InAddrErrors	Received IPv6 packets that are discarded due to invalid destination addresses.
InDiscards	Received IPv6 packets that are discarded due to resource problems rather than packet errors.
OutDiscards	IPv6 packets that fail to be sent due to resource problems rather than packet errors.

Display brief IPv6 information about all interfaces.

```
<Switch> display ipv6 interface brief
*down: administratively down
(s): spoofing
Interface                          Physical Protocol IPv6 Address
Vlan-interface1                    down     down     Unassigned
Vlan-interface2                    up       up       2001::1
Vlan-interface100                  up       up       Unassigned
```

Table 11-3 Command output

Field	Description
*down: administratively down	The interface has been administratively shut down by using the **shutdown** command.
(s): spoofing	Spoofing attribute of the interface. The link protocol state of the interface is up, but the link is temporarily established on demand or does not exist.
Interface	Name of the interface.
Physical	Physical state of the interface: • ***down**—The interface has been administratively shut down by using the **shutdown** command. • **down**—The interface is administratively up but its physical state is down, possibly because of a connection or link failure. • **up**—The administrative and physical states of the interface are both up.
Protocol	Link layer protocol state of the interface: • **down**—The network layer protocol state of the interface is down. • **up**—The network layer protocol state of the interface is up.
IPv6 Address	IPv6 address of the interface. • If multiple global unicast addresses are configured, this field displays the lowest address. • If no global unicast address is configured, this field displays the link-local address. • If no address is configured, this field displays **Unassigned**.

11.1.3. display ipv6 neighbors

Use **display ipv6 neighbors** to display IPv6 neighbor information.

Syntax

display ipv6 neighbors { { *ipv6-address* | **all** | **dynamic** | **static** } [**slot** *slot-number*] | **interface** *interface-type interface-number* | **vlan** *vlan-id* } [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv6-address: Specifies the IPv6 address of a neighbor whose information is displayed.

all: Displays information about all neighbors, including neighbors acquired dynamically and configured statically on the public network and all private networks.

dynamic: Displays information about all neighbors acquired dynamically.

static: Displays information about all neighbors configured statically.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 neighbor information for all member devices.

interface *interface-type interface-number*: Specifies an interface by its type and number.

vlan *vlan-id*: Displays information about neighbors in the specified VLAN. The value range for VLAN ID is 1 to 4094.

verbose: Displays detailed neighbor information.

Examples

Display all neighbor information.

```
<Switch> display ipv6 neighbors all
Type: S-Static    D-Dynamic    O-Openflow     R-Rule    I-Invalid
IPv6 address                Link layer     VID       Interface/Link ID   State T  Age
1::2                        6864-6839-0202 1         GE1/0/1              STALE D  136
FE80::6A64:68FF:FE39:202  6864-6839-0202 1         GE1/0/1              STALE D  126
```

Display detailed information about all neighbors.

```
<Switch> display ipv6 neighbors all verbose
Type: S-Static    D-Dynamic    O-Openflow     R-Rule    I-Invalid
IPv6 Address: 1::2
Link Layer  : 6864-6839-0202      VID : 1    Interface: GE1/0/1
State       : STALE                 Type: D     Age      : 290
Vpn-instance: [No Vrf]
Nickname    : 0x0
IPv6 Address: FE80::6A64:68FF:FE39:202
Link Layer  : 6864-6839-0202      VID : 1    Interface: GE1/0/1
State       : STALE                 Type: D     Age      : 280
```

```
Vpn-instance: [No Vrf]
Nickname      : 0x0
```

Table 11-4 Command output

Field	Description
IPv6 Address	IPv6 address of a neighbor.
Link Layer	Link layer address (MAC address) of a neighbor.
VID	VLAN or virtual switch instance (VSI) to which the interface connected to a neighbor belongs. This field displays **N/A** if the VLAN ID or VSI index is invalid.
Interface/Link ID	Interface or link connected to a neighbor. • If the neighbor entry does not belong to a VSI, this field displays the interface name. If the interface name is not available, the field displays **N/A**. • If the neighbor entry belongs to a VSI and the interface is a tunnel interface, the displayed value depends on the address resolution status. ○ If the address is not resolved, this field displays the VSI. ○ If the address is resolved, this field displays the tunnel ID. • If the neighbor entry belongs to a VSI but the interface is not a tunnel interface, the displayed value depends on the address resolution status. ○ If the address is not resolved, this field displays the VSI. ○ If the address is resolved, this field displays the link ID. The link ID is a string with a maximum of eight hexadecimal numbers.
State	State of a neighbor: • **INCMP**—The address is being resolved. The link layer address of the neighbor is unknown. • **REACH**—The neighbor is reachable. • **STALE**—Whether the neighbor is reachable is unknown. The device does not verify the reachability any longer unless data is sent to the neighbor. • **DELAY**—Whether the neighbor is reachable is unknown. The device sends an NS message after a delay. • **PROBE**—Whether the neighbor is reachable is unknown. The device sends an NS message to verify the reachability of the neighbor.
Type	Neighbor information type: • **S**—Statically configured. • **D**—Dynamically obtained. • **O**—Learned from the OpenFlow module. • **R**—Learned from the Portal module. • **I**—Invalid.
Age	A hyphen (-) indicates a static entry. For a dynamic entry, this field displays the elapsed time in seconds. If the neighbor is never reachable, this field displays a pound sign (#).
Vpn-instance	Name of a VPN or **[No Vrf]** with no VPN configured.
Nickname	Nickname of a neighbor entry. The name is a string of four hexadecimal numbers.

Related commands

ipv6 neighbor

reset ipv6 neighbors

11.1.4. display ipv6 neighbors count

Use **display ipv6 neighbors count** to display the number of neighbor entries.

Syntax

display ipv6 neighbors { { **all** | **dynamic** | **static** } [**slot** *slot-number*] | **interface** *interface-type interface-number* | **vlan** *vlan-id* } **count**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all: Displays the total number of all neighbor entries, including neighbor entries created dynamically and configured statically.

dynamic: Displays the total number of neighbor entries created dynamically.

static: Displays the total number of neighbor entries configured statically.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the number of neighbor entries for all member devices.

interface *interface-type interface-number*: Specifies an interface by its type and number.

vlan *vlan-id*: Displays the total number of neighbor entries in the specified VLAN. The value range for VLAN ID is 1 to 4094.

Examples

Display the total number of neighbor entries created dynamically.

```
<Switch> display ipv6 neighbors dynamic count
 Total number of dynamic entries: 2
```

11.1.5. display ipv6 neighbors vpn-instance

Use **display ipv6 neighbors vpn-instance** to display neighbor information about a VPN instance.

Syntax

display ipv6 neighbors vpn-instance *vpn-instance-name* [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. The VPN instance must already exist.

count: Displays the total number of neighbor entries in the specified VPN instance.

Examples

Display neighbor information about the VPN instance **vpn1**.

```
<Switch> display ipv6 neighbors vpn-instance vpn1
Type: S-Static    D-Dynamic    O-Openflow     R-Rule    I-Invalid
IPv6 address                  Link Layer      VID  Interface      State T  Age
FE80::200:5EFF:FE32:B800    0000-5e32-b800  N/A  GE1/0/1        REACH IS -
```

Table 11-5 Command output

Field	Description
IPv6 address	IPv6 address of a neighbor.
Link-layer	Link layer address (MAC address) of a neighbor.
VID	VLAN to which the interface connected to a neighbor belongs.
Interface	Interface connected to a neighbor.
State	Neighbor state: • **INCMP**—The address is being resolved. The link layer address of the neighbor is unknown. • **REACH**—The neighbor is reachable. • **STALE**—Whether the neighbor is reachable is unknown. The device does not verify the reachability any longer unless data is sent to the neighbor. • **DELAY**—Whether the neighbor is reachable is unknown. The device sends an NS message after a delay. • **PROBE**—Whether the neighbor is reachable is unknown. The device sends an NS message to verify the reachability of the neighbor.
T	Neighbor information type: • **S**—Statically configured. • **D**—Dynamically obtained. • **O**—Learned from the OpenFlow module. • **I**—Invalid.
Age	A hyphen (-) indicates a static entry. For a dynamic entry, this field displays the elapsed time in seconds. If the neighbor is never reachable, this field displays a pound sign (#).

11.1.6. display ipv6 pathmtu

Use the **display ipv6 pathmtu** command to display IPv6 Path MTU information.

Syntax

display ipv6 pathmtu [**vpn-instance** *vpn-instance-name*] { *ipv6-address* | { **all** | **dynamic** | **static** } [**count**] }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 Path MTU information about the public network.

ipv6-address: Specifies the destination IPv6 address for which the Path MTU information is to be displayed.

all: Displays all Path MTU information for the public network.

dynamic: Displays all dynamic Path MTU information.

static: Displays all static Path MTU information.

count: Displays the total number of Path MTU entries.

Examples

Display all Path MTU information.

```
<Switch> display ipv6 pathmtu all
IPv6 destination address                PathMTU   Age    Type
1:2::3:2                                   1800       -      Static
1:2::4:2                                   1400       10     Dynamic
1:2::5:2                                   1280       10     Dynamic
```

Displays the total number of Path MTU entries.

```
<Switch> display ipv6 pathmtu all count
Total number of entries: 3
```

Table 11-6 Command output

Field	Description
PathMTU	Path MTU value on the network path to an IPv6 address.
Age	Time for a Path MTU to live. For a static Path MTU, this field displays a hyphen (-).
Type	Path MTU type: • **Dynamic**—Dynamically negotiated. • **Static**—Statically configured.
Total number of entries	Total number of Path MTU entries.

Related commands

ipv6 pathmtu

reset ipv6 pathmtu

11.1.7. display ipv6 rawip

Use **display ipv6 rawip** to display brief information about IPv6 RawIP connections.

Syntax

display ipv6 rawip [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about IPv6 RawIP connections for all member devices.

Examples

Display brief information about IPv6 RawIP connections.

```
<Switch> display ipv6 rawip
Local Addr            Foreign Addr        Protocol Slot    PCB
2001:2002:2003:2      3001:3002:3003:3    58       1       0x0000000000000009
004:2005:2006:20      004:3005:3006:30
07:2008                 07:3008
2002::100             2002::138            58       2       0x0000000000000008
::                      ::                   58       5       0x0000000000000002
```

Table 11-7 Command output

Field	Description
Local Addr	Local IPv6 address.
Foreign Addr	Peer IPv6 address.
Protocol	Protocol number.
PCB	PCB index.

11.1.8. display ipv6 rawip verbose

Use **display ipv6 rawip verbose** to display detailed information about IPv6 RawIP connections.

Syntax

display ipv6 rawip verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed information about IPv6 RawIP connections of the specified PCB. The value range for the *pcb-index* argument is 1 to 16.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about IPv6 RawIP connections for all member devices.

Examples

Display detailed information about an IPv6 RawIP connection.

```
<Switch> display ipv6 rawip verbose
Total RawIP socket number: 1

 Location: slot: 6
 Creator: ping ipv6[320]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 9216 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 3
 Protocol: 58
 Connection info: src = ::, dst = ::
 Inpcb flags: N/A
 Inpcb extflag: INP_EXTRCVICMPERR INP_EXTFILTER
 Inpcb vflag: INP_IPV6
 Hop limit: 255 (minimum hop limit: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 11-8 Command output

Field	Description
Total RawIP socket number	Total number of IPv6 RawIP sockets.
Creator	Task name of the socket. The process number is in the square brackets.
State	Socket state.
Options	Socket options.
Error	Error code.
Receiving buffer (cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **drop**—Number of dropped packets. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space.

Field	Description
	• **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of protocol using the socket. 58 represents ICMP.
Connection info	Connection information, including the source and destination IPv6 addresses.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address. • **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support

Field	Description
	this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_USEICMPSRC**—Uses the specified IPv6 address as the source IPv6 address for outgoing ICMP packets. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTRCVICMPERR**—Receives an ICMP error packet. • **INP_EXTFILTER**—Filters the contents in the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flag in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Send VRF	VRF from which packets are sent.
Receive VRF	VRF from which packets are received.

11.1.9. display ipv6 statistics

Use **display ipv6 statistics** to display IPv6 and ICMPv6 packet statistics.

Syntax

display ipv6 statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 and ICMPv6 packet statistics for all member devices.

Examples

Display IPv6 and ICMPv6 packet statistics.

```
<Switch> display ipv6 statistics
  IPv6 statistics:

    Sent packets:
      Total:      0
        Sent locally:          0            Forwarded:               0
        Raw packets:           0            Discarded:               0
        Fragments:             0            Fragments failed:      0
        Routing failed:        0

    Received packets:
      Total:      0
        Received locally:      0            Hop limit exceeded:  0
        Fragments:              0            Reassembled:            0
        Reassembly failures:   0            Reassembly timeout:  0
        Format errors:          0            Option errors:         0
        Protocol errors:       0

  ICMPv6 statistics:

    Sent packets:
      Total:      0
        Unreachable:            0             Too big:                 0
        Hop limit exceeded:    0            Reassembly timeouts: 0
        Parameter problems:    0
        Echo requests:          0             Echo replies:           0
        Neighbor solicits:     0            Neighbor adverts:      0
        Router solicits:       0            Router adverts:         0
        Redirects:              0              Router renumbering:    0
      Send failed:
        Rate limitation:       0            Other errors:           0

    Received packets:
      Total:      0
        Checksum errors:       0            Too short:               0
        Bad codes:              0
        Unreachable:            0             Too big:                  0
        Hop limit exceeded:    0            Reassembly timeouts:    0
        Parameter problems:    0            Unknown error types:    0
        Echo requests:          0             Echo replies:             0
        Neighbor solicits:     0            Neighbor adverts:       0
        Router solicits:        0             Router adverts:         0
```

```
    Redirects:                0            Router renumbering:    0
    Unknown info types:    0
  Deliver failed:
    Bad length:            0
```

Related commands

reset ipv6 statistics

11.1.10. display ipv6 tcp

Use **display ipv6 tcp** to display brief information about IPv6 TCP connections.

Syntax

display ipv6 tcp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about IPv6 TCP connections for all member devices.

Examples

Display brief information about IPv6 TCP connections.

```
<Switch> display ipv6 tcp
*: TCP connection with authentication
 LAddr->port          FAddr->port       State        Slot   PCB
*2001:2002:2003:2    3001:3002:3003:3 ESTABLISHED 1      0x000000000000c387
004:2005:2006:20     004:3005:3006:30
07:2008->1200         07:3008->1200
2001::1->23           2001::5->1284     ESTABLISHED 2      0x0000000000000008
2003::1->25           2001::2->1283     LISTEN       3      0x0000000000000009
```

Table 11-9 Command output

Field	Description
*	Indicates that the TCP connection uses authentication.
LAddr->port	Local IPv6 address and port number.
FAddr->port	Peer IPv6 address and port number.
State	IPv6 TCP connection state.
PCB	PCB index.

11.1.11. display ipv6 tcp verbose

Use **display ipv6 tcp verbose** to display detailed information about IPv6 TCP connections.

Syntax

display ipv6 tcp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed information about IPv6 TCP connections of the specified PCB. The value range for the *pcb-index* argument is 1 to 16.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about IPv6 TCP connections for all member devices.

Examples

Display detailed information about an IPv6 TCP connection.

```
<Switch> display ipv6 tcp verbose
TCP inpcb number: 1(tcpcb number: 1)

 Location: Slot: 6
 NSR standby: N/A
 Creator: bgpd[199]
 State: ISCONNECTED
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/state): 0 / 65536 / 1 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 65536 / 512 / N/A
 Type: 1
 Protocol: 6
 Connection info: src = 2001::1->179 ,  dst = 2001::2->4181
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV6
 Hop limit: 255 (minimum hop limit: 0)
 Connection state: ESTABLISHED
 TCP options: TF_REQ_SCALE TF_REQ_TSTMP TF_SACK_PERMIT TF_NSR
 NSR state: READY(M)
 Send VRF: 0x0
 Receive VRF: 0x0
```

Table 11-10 Command output

Field	Description
TCP inpcb number	Number of IPv6 TCP Internet PCBs.
tcpcb number	Number of IPv6 TCP PCBs (excluding PCBs of TCP in TIME_WAIT state).
Creator	Task name of the socket. The process number is in the square brackets.
State	Socket state.
Options	Socket options.
Error	Error code.
Receiving buffer(cc/hiwat/lowat/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket. 6 represents TCP.
Connection info	Connection information, including source IPv6 address and port number, and destination IPv6 address and port number.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address.

Field	Description
	• **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **INP_EXTDONTDROP**—Does not drop the received packet. • **INP_EXLISTEN**—Listening socket. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of

Field	Description
	the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Connection state	TCP connection state: • **CLOSED**—The server receives a disconnection request's reply from the client. • **LISTEN**—The server is waiting for connection requests. • **SYN_SENT**—The client is waiting for the server to reply to the connection request. • **SYN_RCVD**—The server receives a connection request. • **ESTABLISHED**—The server and client have established connections and can transmit data bidirectionally. • **CLOSE_WAIT**—The server receives a disconnection request from the client. • **FIN_WAIT_1**—The client is waiting for the server to reply to a disconnection request. • **CLOSING**—The server and client are waiting for peer's disconnection reply when receiving disconnection requests from each other. • **LAST_ACK**—The server is waiting for the client to reply to a disconnection request. • **FIN_WAIT_2**—The client receives a disconnection reply from the server. • **TIME_WAIT**—The client receives a disconnection request from the server.
TCP options	TCP options: • **TF_MD5SIG**—Enables MD5 signature. • **TF_NODELAY**—Disables the Nagle algorithm that buffers the sent data inside the TCP. • **TF_NOOPT**—No TCP options. • **TF_NOPUSH**—Forces TCP to delay sending any TCP data until a full sized segment is buffered in the TCP buffers. • **TF_BINDFOREIGNADDR**—Binds the peer IP address. • **TF_NSR**—Enables TCP NSR. • **TF_REQ_SCALE**—Enables the TCP window scale option. • **TF_REQ_TSTMP**—Enables the time stamp option. • **TF_SACK_PERMIT**—Enables the TCP selective acknowledgement option. • **TF_ENHANCED_AUTH**—Enables the enhanced authentication option.
NSR state	State of the TCP connections. Between the parentheses is the role of the connection: • **M**—Main connection. • **S**—Standby connection.
Send VRF	VRF from which packets are sent.
Receive VRF	VRF from which packets are received.

11.1.12. display ipv6 udp

Use **display ipv6 udp** to display brief information about IPv6 UDP connections.

Syntax

display ipv6 udp [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays brief information about IPv6 UDP connections for all member devices.

Examples

Displays brief information about IPv6 UDP connections.

```
<Switch> display ipv6 udp
 LAddr->port          FAddr->port          Slot    PCB
 2001:2002:2003:2    3001:3002:3003:3    1        0x000000000000c387
 004:2005:2006:20    004:3005:3006:30
 07:2008->1200       07:3008->1200
 2001::1->23          2001::5->1284        2        0x0000000000000008
 2003::1->25          2001::2->1283        3        0x0000000000000009
```

Table 11-11 Command output

Field	Description
LAddr->port	Local IPv6 address and port number.
FAddr->port	Peer IPv6 address and port number.
PCB	PCB index.

11.1.13. display ipv6 udp verbose

Use **display ipv6 udp verbose** to display detailed information about IPv6 UDP connections.

Syntax

display ipv6 udp verbose [**slot** *slot-number* [**pcb** *pcb-index*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

pcb *pcb-index*: Displays detailed information about IPv6 UDP connections of the specified PCB. The value range for the *pcb-index* argument is 1 to 16.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays detailed information about IPv6 UDP connections for all member devices.

Examples

Display detailed information about an IPv6 UDP connection.

```
<Switch> display ipv6 udp verbose
Total UDP socket number: 1

 Location: slot: 6
 Creator: sock_test_mips[250]
 State: N/A
 Options: N/A
 Error: 0
 Receiving buffer(cc/hiwat/lowat/drop/state): 0 / 41600 / 1 / 0 / N/A
 Sending buffer(cc/hiwat/lowat/state): 0 / 9216 / 512 / N/A
 Type: 2
 Protocol: 17
 Connection info: src = ::->69, dst = ::->0
 Inpcb flags: N/A
 Inpcb extflag: N/A
 Inpcb vflag: INP_IPV6
 Hop limit: 255 (minimum hop limit: 0)
 Send VRF: 0xffff
 Receive VRF: 0xffff
```

Table 11-12 Command output

Field	Description
Total UDP socket number	Total number of IPv6 UDP sockets.
Creator	Task name of the socket. The progress number is in the square brackets.
State	Socket state.
Options	Socket options.
Error	Error code.
Receiving buffer(cc/hiwat/lowat/drop/state)	Displays receive buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **drop**—Number of dropped packets. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag.

Field	Description
	○ **N/A**—None of the above states.
Sending buffer(cc/hiwat/lowat/state)	Displays send buffer information in the following order: • **cc**—Used space. • **hiwat**—Maximum space. • **lowat**—Minimum space. • **state**—Buffer state: ○ **CANTSENDMORE**—Unable to send data to the peer. ○ **CANTRCVMORE**—Unable to receive data from the peer. ○ **RCVATMARK**—Receiving tag. ○ **N/A**—None of the above states.
Type	Socket type: • **1**—**SOCK_STREAM**. This socket uses TCP to provide reliable transmission of byte streams. • **2**—**SOCK_DGRAM**. This socket uses UDP to provide datagram transmission. • **3**—**SOCK_RAW**. This socket allows an application to change the next upper-layer protocol header. • **N/A**—None of the above types.
Protocol	Number of the protocol using the socket. 17 represents UDP.
Connection info	Connection information, including source IPv6 address and port number, and destination IPv6 address and port number.
Inpcb flags	Flags in the Internet PCB: • **INP_RECVOPTS**—Receives IPv6 options. • **INP_RECVRETOPTS**—Receives replied IPv6 options. • **INP_RECVDSTADDR**—Receives destination IPv6 address. • **INP_HDRINCL**—Provides the entire IPv6 header. • **INP_REUSEADDR**—Reuses the IPv6 address. • **INP_REUSEPORT**—Reuses the port number. • **INP_ANONPORT**—Port number not specified. • **INP_PROTOCOL_PACKET**—Identifies a protocol packet. • **INP_RCVVLANID**—Receives the VLAN ID of the packet. Only UDP and RawIP support this flag. • **IN6P_IPV6_V6ONLY**—Only supports IPv6 protocol stack. • **IN6P_PKTINFO**—Receives the source IPv6 address and input interface of the packet. • **IN6P_HOPLIMIT**—Receives the hop limit. • **IN6P_HOPOPTS**—Receives the hop-by-hop options extension header. • **IN6P_DSTOPTS**—Receives the destination options extension header. • **IN6P_RTHDR**—Receives the routing extension header. • **IN6P_RTHDRDSTOPTS**—Receives the destination options extension header preceding the routing

Field	Description
	extension header. • **IN6P_TCLASS**—Receives the traffic class of the packet. • **IN6P_AUTOFLOWLABEL**—Attaches a flow label automatically. • **IN6P_RFC2292**—Uses the API specified in RFC 2292. • **IN6P_MTU**—Discovers differences in the MTU size of every link along a given data path. TCP does not support this flag. • **INP_RCVMACADDR**—Receives the MAC address of the frame. • **INP_SYNCPCB**—Waits until Internet PCB is synchronized. • **N/A**—None of the above flags.
Inpcb extflag	Extension flags in the Internet PCB: • **INP_EXTRCVPVCIDX**—Records the PVC index of the received packet. • **INP_RCVPWID**—Records the PW ID of the received packet. • **N/A**—None of the above flags.
Inpcb vflag	IP version flags in the Internet PCB: • **INP_IPV4**—IPv4 protocol. • **INP_IPV6**—IPv6 protocol. • **INP_IPV6PROTO**—Creates an Internet PCB based on IPv6 protocol. • **INP_TIMEWAIT**—In **TIMEWAIT** state. • **INP_ONESBCAST**—Sends broadcast packets. • **INP_DROPPED**—Protocol dropped flag. • **INP_SOCKREF**—Strong socket reference. • **INP_DONTBLOCK**—Do not block synchronization of the Internet PCB. • **N/A**—None of the above flags.
Hop limit	Hop limit in the Internet PCB.
Send VRF	VRF from which packets are sent.
Receive VRF	VRF from which packets are received.

11.1.14. ipv6 address

Use **ipv6 address** to configure an IPv6 global unicast address for an interface.

Use **undo ipv6 address** to delete an IPv6 global unicast address of the interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* }

undo ipv6 address [*ipv6-address prefix-length* | *ipv6-address*/*prefix-length*]

Default

No IPv6 global unicast address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 address.

prefix-length: Specifies a prefix length in the range of 1 to 128.

Usage guidelines

Like public IPv4 addresses, IPv6 global unicast addresses are assigned to ISPs. This type of address allows for prefix aggregation to reduce the number of global routing entries.

If you do not specify any parameters, the **undo ipv6 address** command deletes all IPv6 addresses of an interface.

Examples

Set the IPv6 global unicast address of VLAN-interface 100 to 2001::1 with prefix length 64.

Method 1:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1/64
```

Method 2:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1 64
```

11.1.15. ipv6 address anycast

Use **ipv6 address anycast** to configure an IPv6 anycast address for an interface.

Use **undo ipv6 address anycast** to delete the IPv6 anycast address of the interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **anycast**

undo ipv6 address { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* } **anycast**

Default

No IPv6 anycast address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

*ipv6-address*s: Specifies an IPv6 anycast address.

prefix-length: Specifies a prefix length in the range of 1 to 128.

Examples

Set the IPv6 anycast address of VLAN-interface 100 to 2001::1 with prefix length 64.

Method 1:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1/64 anycast
```

Method 2:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1 64 anycast
```

11.1.16. ipv6 address auto

Use **ipv6 address auto** to enable the stateless address autoconfiguration feature on an interface, so that the interface can automatically generate a global unicast address.

Use **undo ipv6 address auto** to disable this feature.

Syntax

ipv6 address auto

undo ipv6 address auto

Default

The stateless address autoconfiguration feature is disabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After a global unicast address is generated through stateless autoconfiguration, a link-local address is generated automatically.

To delete the global unicast address and the link-local address that are automatically generated, use either of the following commands:

- **undo ipv6 address auto**
- **undo ipv6 address**

Examples

Enable stateless address autoconfiguration on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address auto
```

11.1.17. ipv6 address auto link-local

Use **ipv6 address auto link-local** to automatically generate a link-local address for an interface.

Use **undo ipv6 address auto link-local** to restore the default.

Syntax

ipv6 address auto link-local

undo ipv6 address auto link-local

Default

No link-local address is configured on an interface. A link-local address is automatically generated after an IPv6 global unicast address is configured for the interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Link-local addresses are used for neighbor discovery and stateless autoconfiguration on the local link. Packets using link-local addresses as the source or destination addresses cannot be forwarded to other links.

After an IPv6 global unicast address is configured for an interface, a link-local address is automatically generated. This link-local address is the same as the one generated by using the **ipv6 address auto link-local** command.

The **undo ipv6 address auto link-local** command deletes only the link-local addresses generated through the **ipv6 address auto link-local** command. If the **undo** command is executed on an interface with an IPv6 global unicast address configured, the interface still has a link-local address.

You can also manually assign an IPv6 link-local address for an interface by using the **ipv6 address link-local** command. Manual assignment takes precedence over automatic generation for IPv6 link-local addresses.

- If you first use automatic generation and then manual assignment, the manually assigned link-local address overwrites the automatically generated address.
- If you first use manual assignment and then automatic generation, both of the following occur:
  - The automatically generated link-local address does not take effect.
  - The link-local address of an interface is still the manually assigned address.

  If you delete the manually assigned address, the automatically generated link-local address takes effect.

Examples

Configure VLAN-interface 100 to automatically generate a link-local address.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address auto link-local
```

Related commands

ipv6 address link-local

11.1.18. ipv6 address eui-64

Use **ipv6 address eui-64** to configure an EUI-64 IPv6 address for an interface.

Use **undo ipv6 address eui-64** to delete an EUI-64 IPv6 address from an interface.

Syntax

ipv6 address { *ipv6-address prefix-length* | *ipv6-address/prefix-length* } **eui-64**

undo ipv6 address [*ipv6-address prefix-length* | *ipv6-address/prefix-length*] **eui-64**

Default

No EUI-64 IPv6 address is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address/prefix-length: Specifies an IPv6 address and IPv6 prefix length. The *ipv6-address* and *prefix-length* arguments jointly specify the prefix of an EUI-64 IPv6 address. The value range for the *prefix-length* argument is 1 to 64.

Usage guidelines

An EUI-64 IPv6 address is generated based on the specified prefix and the automatically generated interface ID. To display the EUI-64 IPv6 address, use the **display ipv6 interface** command.

The prefix length of an EUI-64 IPv6 address cannot be greater than 64.

Examples

Configure an EUI-64 IPv6 address for VLAN-interface 100. The prefix of the address is the same as that of 2001::1/64, and the interface ID is generated based on the MAC address of the device.

Method 1:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1/64 eui-64
```

Method 2:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001::1 64 eui-64
```

Related commands

display ipv6 interface

11.1.19. ipv6 address link-local

Use **ipv6 address link-local** to configure a link-local address for the interface.

Use **undo ipv6 address link-local** to restore the default.

Syntax

ipv6 address *ipv6-address* **link-local**

undo ipv6 address *ipv6-address* **link-local**

Default

No link-local address is configured for the interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies an IPv6 link-local address. The first 10 bits of an address must be 1111111010 (binary). The first group of hexadecimals in the address must be FE80 to FEBF.

Usage guidelines

Manual assignment takes precedence over automatic generation.

If you use automatic generation, and then use manual assignment, the manually assigned link-local address overwrites the one that is automatically generated.

If you use manual assignment and then use automatic generation, both of the following occur:

- The automatically generated link-local address does not take effect.
- The manually assigned link-local address of an interface remains.

After you delete the manually assigned address, the automatically generated link-local address takes effect. For automatic generation of an IPv6 link-local address, see the **ipv6 address auto link-local** command.

Examples

Configure a link-local address for VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address fe80::1 link-local
```

Related commands

ipv6 address auto link-local

11.1.20. ipv6 hop-limit

Use **ipv6 hop-limit** to set the Hop Limit field in the IPv6 header.

Use **undo ipv6 hop-limit** to restore the default.

Syntax

ipv6 hop-limit *value*

undo ipv6 hop-limit

Default

The hop limit is 64.

Views

System view

Predefined user roles

network-admin

Parameters

value: Specifies the number of hops, in the range of 1 to 255.

Usage guidelines

The hop limit determines the number of hops that an IPv6 packet generated by the device can travel.

The device advertises the hop limit in RA messages. All RA message receivers use the advertised value to fill in the Hop Limit field for IPv6 packets to be sent.

Examples

Set the maximum number of hops to 100.

```
<Switch> system-view
[Switch] ipv6 hop-limit 100
```

11.1.21. ipv6 hoplimit-expires enable

Use **ipv6 hoplimit-expires enable** to enable sending ICMPv6 time exceeded messages.

Use **undo ipv6 hoplimit-expires** to disable sending ICMPv6 time exceeded messages.

Syntax

ipv6 hoplimit-expires enable

undo ipv6 hoplimit-expires enable

Default

Sending ICMPv6 time exceeded messages is enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

ICMPv6 time exceeded messages are sent to the source of IPv6 packets after the device discards IPv6 packets because hop or reassembly times out.

To prevent too many ICMPv6 error messages from affecting device performance, disable this feature. Even with the feature disabled, the device still sends fragment reassembly time exceeded messages.

Examples

Disable sending ICMPv6 time exceeded messages.

```
<Switch> system-view
[Switch] undo ipv6 hoplimit-expires enable
```

11.1.22. ipv6 icmpv6 error-interval

Use **ipv6 icmpv6 error-interval** to set the bucket size and the interval for tokens to arrive in the bucket for ICMPv6 error messages.

Use **undo ipv6 icmpv6 error-interval** to restore the default.

Syntax

ipv6 icmpv6 error-interval *interval* [*bucketsize*]

undo ipv6 icmpv6 error-interval

Default

The bucket allows a maximum of 10 tokens, and a token is placed in the bucket every 100 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval for tokens to arrive in the bucket. The value range is 0 to 2147483647 milliseconds. To disable the ICMPv6 rate limit, set the value to 0.

bucketsize: Specifies the maximum number of tokens allowed in the bucket. The value range is 1 to 200.

Usage guidelines

This command limits the rate at which ICMPv6 error messages are sent. Use this command to prevent network congestion caused by excessive ICMPv6 error messages generated within a short period. A token bucket algorithm is used with one token representing one ICMPv6 error message.

A token is placed in the bucket at intervals until the maximum number of tokens that the bucket can hold is reached.

A token is removed from the bucket when an ICMPv6 error message is sent. When the bucket is empty, ICMPv6 error messages are not sent until a new token is placed in the bucket.

Examples

Set the bucket size to 40 tokens and the interval for tokens to arrive in the bucket to 200 milliseconds for ICMPv6 error messages.

```
<Switch> system-view
[Switch] ipv6 icmpv6 error-interval 200 40
```

11.1.23. ipv6 icmpv6 multicast-echo-reply enable

Use **ipv6 icmpv6 multicast-echo-reply enable** to enable replying to multicast echo requests.

Use **undo ipv6 icmpv6 multicast-echo-reply** to restore the default.

Syntax

ipv6 icmpv6 multicast-echo-reply enable

undo ipv6 icmpv6 multicast-echo-reply enable

Default

The device is disabled from replying to multicast echo requests.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If a host is configured to reply to multicast echo requests, an attacker can use this mechanism to attack the host. For example, the attacker can send an echo request to a multicast address with Host A as the source. All hosts in the multicast group will send echo replies to Host A.

To prevent attacks, do not enable the device to reply to multicast echo requests unless necessary.

Examples

Enable replying to multicast echo requests.

```
<Switch> system-view
[Switch] ipv6 icmpv6 multicast-echo-reply enable
```

11.1.24. ipv6 mtu

Use **ipv6 mtu** to configure the MTU of IPv6 packets sent over an interface.

Use **undo ipv6 mtu** to restore the default MTU.

Syntax

ipv6 mtu *size*

undo ipv6 mtu

Default

No MTU is configured for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

size: Specifies the size of the MTUs of an interface in bytes. The following are value ranges for different interface types:

- 1280 to 9216 for VLAN interfaces.
- 1280 to 1500 for management Ethernet interfaces.
- 1280 to 1560 for Layer 3 Ethernet interfaces.
- 1280 to 64000 for tunnel interfaces.

Usage guidelines

IPv6 routers do not support packet fragmentation. After an IPv6 router receives an IPv6 packet, if the packet size is greater than the MTU of the forwarding interface, the router discards the packet. Meanwhile, the router sends the MTU to the source host through an ICMPv6 packet — Packet Too Big message. The source host fragments the packet according to the MTU and resends it. To reduce the extra flow overhead resulting from packet drops, set an appropriate interface MTU for your network.

Examples

Set the MTU of IPv6 packets sent over VLAN-interface 100 to 1280 bytes.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 mtu 1280
```

11.1.25. ipv6 nd autoconfig managed-address-flag

Use **ipv6 nd autoconfig managed-address-flag** to set the managed address configuration flag (M) to 1 in RA advertisements to be sent.

Use **undo ipv6 nd autoconfig managed-address-flag** to restore the default.

Syntax

ipv6 nd autoconfig managed-address-flag

undo ipv6 nd autoconfig managed-address-flag

Default

The M flag is set to **0** in RA advertisements. Hosts receiving the advertisements will obtain IPv6 addresses through stateless autoconfiguration.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The M flag in RA advertisements determines whether receiving hosts use stateful autoconfiguration to obtain IPv6 addresses.

- If the M flag is set to 1 in RA advertisements, receiving hosts use stateful autoconfiguration (for example, from an DHCPv6 server) to obtain IPv6 addresses.
- If the M flag is set to 0 in RA advertisements, receiving hosts use stateless autoconfiguration. Stateless autoconfiguration generates IPv6 addresses according to link-layer addresses and the prefix information in the RA advertisements.

Examples

Set the M flag to 1 in RA advertisements to be sent.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd autoconfig managed-address-flag
```

11.1.26. ipv6 nd autoconfig other-flag

Use **ipv6 nd autoconfig other-flag** to set the other stateful configuration flag (O) to 1 in RA advertisements to be sent.

Use **undo ipv6 nd autoconfig other-flag** to restore the default.

Syntax

ipv6 nd autoconfig other-flag

undo ipv6 nd autoconfig other-flag

Default

The O flag is set to **0** in RA advertisements. Hosts receiving the advertisements will acquire other information through stateless autoconfiguration.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

The O flag in RA advertisements determines whether receiving hosts use stateful autoconfiguration to obtain configuration information other than IPv6 addresses.

- If the O flag is set to 1 in RA advertisements, receiving hosts use stateful autoconfiguration (for example, from a DHCPv6 server) to obtain configuration information other than IPv6 addresses.
- If the O flag is set to 0 in RA advertisements, receiving hosts use stateless autoconfiguration to obtain configuration information other than IPv6 addresses.

Examples

Set the O flag to 0 in RA advertisements to be sent.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] undo ipv6 nd autoconfig other-flag
```

11.1.27. ipv6 nd dad attempts

Use **ipv6 nd dad attempts** to set the number of attempts to send an NS message for DAD.

Use **undo ipv6 nd dad attempts** to restore the default.

Syntax

ipv6 nd dad attempts *interval*

undo ipv6 nd dad attempts

Default

The number of attempts to send an NS message for DAD is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

interval: Specifies the number of attempts to send an NS message for DAD, in the range of 0 to 600. If it is set to 0, DAD is disabled.

Usage guidelines

An interface sends an NS message for DAD after obtaining an IPv6 address.

If the interface does not receive a response within the time specified by using **ipv6 nd ns retrans-timer**, it resends an NS message.

If the interface receives no response after making the maximum sending attempts (set by using **ipv6 nd dad attempts**), the interface uses the obtained address.

Examples

Set the number of attempts to send an NS message for DAD to 20.

```
<Switch> system-view
[Switch] interface vlan-interface 100
```

```
[Switch-Vlan-interface100] ipv6 nd dad attempts 20
```

Related commands

display ipv6 interface

ipv6 nd ns retrans-timer

11.1.28. ipv6 nd ns retrans-timer

Use **ipv6 nd ns retrans-timer** to set the interval for retransmitting an NS message.

Use **undo ipv6 nd ns retrans-timer** to restore the default.

Syntax

ipv6 nd ns retrans-timer *value*

undo ipv6 nd ns retrans-timer

Default

The local interface sends NS messages at every an interval of 1000 milliseconds, and the Retrans Timer field in the RA messages sent is 0. The interval for retransmitting an NS message is determined by the receiving device.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Specifies the interval value in the range of 1000 to 4294967295 milliseconds.

Usage guidelines

If a device does not receive a response from the peer within the specified interval, the device resends an NS message. The device retransmits an NS message at the specified interval and uses the interval value to fill the Retrans Timer field in RA messages to be sent.

Examples

Specify VLAN-interface 100 to retransmit NS messages every 10000 milliseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd ns retrans-timer 10000
```

Related commands

display ipv6 interface

11.1.29. ipv6 nd nud reachable-time

Use **ipv6 nd nud reachable-time** to set the neighbor reachable time on an interface.

Use **undo ipv6 nd nud reachable-time** to restore the default.

Syntax

ipv6 nd nud reachable-time *time*

undo ipv6 nd nud reachable-time

Default

The neighbor reachable time on the local interface is 30000 milliseconds, and the value of the Reachable Time field in RA messages is 0. The reachable time is determined by the receiving device.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the neighbor reachable time in the range of 1 to 3600000 milliseconds.

Usage guidelines

If the neighbor reachability detection shows that a neighbor is reachable, the device considers the neighbor reachable within the specified reachable time. If the device must send a packet to the neighbor after the specified reachable time expires, the device reconfirms whether the neighbor is reachable. The device sets the specified value as the neighbor reachable time on the local interface and uses the value to fill the Reachable Time field in RA messages to be sent.

Examples

Set the neighbor reachable time on VLAN-interface 100 to 10000 milliseconds.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd nud reachable-time 10000
```

Related commands

display ipv6 interface

11.1.30. ipv6 nd ra halt

Use **ipv6 nd ra halt** to suppress an interface from advertising RA messages.

Use **undo ipv6 nd ra halt** to disable this feature.

Syntax

ipv6 nd ra halt

undo ipv6 nd ra halt

Default

An interface is suppressed from sending RA messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable RA message suppression on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] undo ipv6 nd ra halt
```

11.1.31. ipv6 nd ra interval

Use **ipv6 nd ra interval** to set the maximum and minimum intervals for advertising RA messages.

Use **undo ipv6 nd ra interval** to restore the default.

Syntax

ipv6 nd ra interval *max-interval min-interval*

undo ipv6 nd ra interval

Default

The maximum interval between RA messages is 600 seconds, and the minimum interval is 200 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

max-interval: Specifies the maximum interval value in seconds, in the range of 4 to 1800.

min-interval: Specifies the minimum interval value in the range of 3 seconds to three-fourths of the maximum interval.

Usage guidelines

The device advertises RA messages randomly between the maximum interval and the minimum interval.

The maximum interval for sending RA messages should be less than or equal to the router lifetime in RA messages.

Examples

Set the maximum interval for advertising RA messages to 1000 seconds and the minimum interval to 700 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd ra interval 1000 700
```

Related commands

ipv6 nd ra router-lifetime

11.1.32. ipv6 nd ra prefix

Use **ipv6 nd ra prefix** to configure the prefix information in RA messages.

Use **undo ipv6 nd ra prefix** to restore the default.

Syntax

ipv6 nd ra prefix { *ipv6-prefix prefix-length* | *ipv6-prefix*/*prefix-length* } [*valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link**] *]

undo ipv6 nd ra prefix { *ipv6-prefix* | *ipv6-prefix*/*prefix-length* }

Default

No prefix information is configured for RA messages. Instead, the IPv6 address of the interface sending RA messages is used as the prefix information.

If the IPv6 address is manually configured, the prefix uses the fixed valid lifetime 2592000 seconds (30 days) and preferred lifetime 604800 seconds (7 days).

If the IPv6 address is automatically obtained (through DHCP, for example), the prefix uses the valid and preferred lifetime of the IPv6 address.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-prefix: Specifies the IPv6 prefix.

prefix-length: Specifies the prefix length of the IPv6 address.

valid-lifetime: Specifies the valid lifetime of a prefix, in the range of 0 to 4294967295 seconds. The default value is 2592000 seconds (30 days).

preferred-lifetime: Specifies the preferred lifetime of a prefix used for stateless autoconfiguration, in the range of 0 to 4294967295 seconds. The preferred lifetime cannot be longer than the valid lifetime. The default value is 604800 seconds (7 days).

no-autoconfig: Specifies a prefix not to be used for stateless autoconfiguration. If you do not specify this keyword, the prefix is used for stateless autoconfiguration.

off-link: Indicates that the address with the prefix is not directly reachable on the link. If you do not specify this keyword, the address with the prefix is directly reachable on the link.

Usage guidelines

After hosts on the same link receive RA messages, they can use the prefix information in the RA messages for stateless autoconfiguration.

The prefix uses the following settings:

- Valid lifetime of 2592000 seconds (30 days).
- Preferred lifetime of 604800 seconds (7 days).
- The prefix is used for stateless autoconfiguration.
- The address with the prefix is directly reachable on the link.

Examples

Configure the prefix information in RA messages on VLAN-interface 100.

Method 1:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd ra prefix 2001:10::100/64 100 10
```

Method 2:

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd ra prefix 2001:10::100 64 100 10
```

11.1.33. ipv6 nd ra router-lifetime

Use **ipv6 nd ra router-lifetime** to set the router lifetime in RA messages.

Use **undo ipv6 nd ra router-lifetime** to restore the default.

Syntax

ipv6 nd ra router-lifetime *time*

undo ipv6 nd ra router-lifetime

Default

The router lifetime in RA messages is 1800 seconds.

Views

Interface view

Predefined user roles

network-admin

Parameters

time: Specifies the router lifetime in the range of 0 to 9000 seconds. If the value is set to 0, the router does not act as the default router.

Usage guidelines

The router lifetime in RA messages specifies how long the router sending the RA messages acts as the default router. Hosts receiving the RA messages check this value to determine whether to use the sending router as the default router. If the router lifetime is 0, the router cannot be used as the default router.

The router lifetime in RA messages must be greater than or equal to the advertising interval.

Examples

Set the router lifetime in RA messages on VLAN-interface 100 to 1000 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 nd ra router-lifetime 1000
```

Related commands

ipv6 nd ra interval

11.1.34. ipv6 neighbor

Use **ipv6 neighbor** to configure a static neighbor entry.

Use **undo ipv6 neighbor** to delete a static neighbor entry.

Syntax

ipv6 neighbor *ipv6-address mac-address* { *vlan-id port-type port-number* | **interface** *interface-type interface-number* } [**vpn-instance** *vpn-instance-name*]

undo ipv6 neighbor *ipv6-address interface-type interface-number*

Default

No static neighbor entries exist.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the IPv6 address of the static neighbor entry.

mac-address: Specifies the MAC address (48 bits) of the static neighbor entry, in the format of H-H-H.

vlan-id: Specifies the VLAN ID of the static neighbor entry, in the range of 1 to 4094.

port-type port-number: Specifies a Layer 2 port of the static neighbor entry by its type and number.

interface *interface-type interface-number*: Specifies a Layer 3 interface of the static neighbor entry by its type and number.

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the static neighbor entry belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command configures a static neighbor entry for the public network.

Usage guidelines

A neighbor entry stores information about a link-local node. The entry can be created dynamically through NS and NA messages, or configured statically.

The device uniquely identifies a static neighbor entry by using the neighbor's IPv6 address and the number of the Layer 3 interface that connects to the neighbor. You can configure a static neighbor entry by using either of the following methods:

- **Method 1**—Associate a neighbor IPv6 address and link-layer address with the Layer 3 interface of the local node.
- **Method 2**—Associate a neighbor IPv6 address and link-layer address with a Layer 2 port in a VLAN containing the local node.

You can use either of the previous configuration methods to configure a static neighbor entry for a VLAN interface.

- If Method 1 is used, the neighbor entry is in INCMP state. After the device obtains the corresponding Layer 2 port information, the neighbor entry goes into REACH state.
- If Method 2 is used, the port specified by *port-type port-number* must belong to the VLAN specified by *vlan-id* and the corresponding VLAN interface must already exist. After the static neighbor entry is configured, the device associates the VLAN interface with the IPv6 address to uniquely identify the static neighbor entry. The entry will be in REACH state.

To delete a static neighbor entry for a VLAN interface, specify only the corresponding VLAN interface.

Examples

Configure a static neighbor entry for VLAN-interface 1.

```
<Switch> system-view
[Switch] ipv6 neighbor 2000::1 fe-e0-89 interface Vlan-interface 1
```

Related commands

display ipv6 neighbors

reset ipv6 neighbors

11.1.35. ipv6 neighbor stale-aging

Use **ipv6 neighbor stale-aging** to set the aging timer for ND entries in stale state.

Use **undo ipv6 neighbor stale-aging** to restore the default.

Syntax

ipv6 neighbor stale-aging *aging-time*

undo ipv6 neighbor stale-aging

Default

The aging timer for ND entries in stale state is 240 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

aging-time: Specifies the aging timer for ND entries in stale state, in the range of 1 to 1440 minutes.

Usage guidelines

This aging time applies to all ND entries in stale state. If an ND entry in stale state is not updated before the timer expires, it moves to the delay state. If it is still not updated in 5 seconds, the ND entry moves to the probe state. The device sends an NS message for detection a maximum of three times. If no response is received, the device deletes the ND entry.

Examples

Set the aging timer for ND entries in stale state to 120 minutes.

```
<Switch> system-view
[Switch] ipv6 neighbor stale-aging 120
```

11.1.36. ipv6 neighbors max-learning-num

Use **ipv6 neighbors max-learning-num** to set the maximum number of dynamic neighbor entries that an interface can learn. This prevents the interface from occupying too many neighbor table resources.

Use **undo ipv6 neighbors max-learning-num** to restore the default.

Syntax

ipv6 neighbors max-learning-num *max-number*

undo ipv6 neighbors max-learning-num

Default

An interface can learn a maximum of 7680 dynamic neighbor entries.

Views

Layer 2/Layer 3 interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

Parameters

max-number: Specifies the maximum number of dynamic neighbor entries that an interface can learn. The value range for this argument is 1 to 7680.

Usage guidelines

The device can dynamically acquire the link-layer address of a neighboring node through NS and NA messages and add it into the neighbor table.

When the number of dynamic neighbor entries reaches the threshold, the interface stops learning neighbor information.

Examples

Set the maximum number of dynamic neighbor entries that VLAN-interface 100 can learn to 10.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 neighbors max-learning-num 10
```

11.1.37. ipv6 pathmtu

Use **ipv6 pathmtu** to set a static Path MTU for an IPv6 address.

Use **undo ipv6 pathmtu** to delete the Path MTU configuration for an IPv6 address.

Syntax

ipv6 pathmtu [**vpn-instance** *vpn-instance-name*] *ipv6-address value*

undo ipv6 pathmtu [**vpn-instance** *vpn-instance-name*] *ipv6-address*

Default

No static Path MTU is set.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance to which the Path MTU belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command sets the Path MTU for the public network.

ipv6-address: Specifies an IPv6 address.

value: Specifies the Path MTU of the specified IPv6 address, in the range of 1280 to 10240 bytes.

Usage guidelines

You can set a static Path MTU for a destination IPv6 address. When a source host sends a packet through an interface, it compares the interface MTU with the static Path MTU of the specified destination IPv6 address. If the packet size is larger than the smaller one of the two values, the host fragments the packet according to the smaller value.

Examples

Set a static Path MTU for an IPv6 address.

```
<Switch> system-view
[Switch] ipv6 pathmtu fe80::12 1300
```

Related commands

display ipv6 pathmtu

reset ipv6 pathmtu

11.1.38. ipv6 pathmtu age

Use **ipv6 pathmtu age** to set the aging time for a dynamic Path MTU.

Use **undo ipv6 pathmtu age** to restore the default.

Syntax

ipv6 pathmtu age *age-time*

undo ipv6 pathmtu age

Default

The aging time for dynamic Path MTU is 10 minutes.

Views

System view

Predefined user roles

network-admin

Parameters

age-time: Specifies the aging time for Path MTU in minutes, in the range of 10 to 100.

Usage guidelines

After the path MTU from a source host to a destination host is dynamically determined, the source host sends subsequent packets to the destination host based on this MTU. After the aging time expires, the following events occur:

- The dynamic Path MTU is removed.
- The source host determines a dynamic path MTU through the Path MTU mechanism again.

The aging time is invalid for a static Path MTU.

Examples

Set the aging time for a dynamic Path MTU to 40 minutes.

```
<Switch> system-view
[Switch] ipv6 pathmtu age 40
```

Related commands

display ipv6 pathmtu

11.1.39. ipv6 unreachables enable

Use **ipv6 unreachables enable** to enable sending ICMPv6 destination unreachable messages.

Use **undo ipv6 unreachables** to disable sending ICMPv6 destination unreachable messages.

Syntax

ipv6 unreachables enable

undo ipv6 unreachables enable

Default

Sending ICMPv6 destination unreachable messages is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

If the device fails to forward a received IPv6 packet because of a destination unreachable error, it performs the following operations:

- Drops the packet.
- Sends an ICMPv6 destination unreachable message to the source.

If the device is generating ICMPv6 destination unreachable messages incorrectly, disable sending ICMPv6 destination unreachable messages to prevent attack risks.

Examples

Enable sending ICMPv6 destination unreachable messages.

```
<Switch> system-view
[Switch] ipv6 unreachables enable
```

11.1.40. local-proxy-nd enable

Use **local-proxy-nd enable** to enable local ND proxy.

Use **undo local-proxy-nd enable** to disable local ND proxy.

Syntax

local-proxy-nd enable

undo local-proxy-nd enable

Default

Local ND proxy is disabled.

Views

VLAN interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

Examples

Enable local ND proxy on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
```

```
[Switch-Vlan-interface100] local-proxy-nd enable
```

11.1.41. reset ipv6 neighbors

Use **reset ipv6 neighbors** to clear IPv6 neighbor information.

Syntax

reset ipv6 neighbors { **all** | **dynamic** | **interface** *interface-type interface-number* | **slot** *slot-number* | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears static and dynamic neighbor information for all interfaces.

dynamic: Clears dynamic neighbor information for all interfaces.

interface *interface-type interface-number*: Clears dynamic neighbor information for the interface specified by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears dynamic neighbor information for all member devices.

static: Clears static neighbor information for all interfaces.

Examples

Clear neighbor information for all interfaces.

```
<Switch> reset ipv6 neighbors all
This will delete all the entries. Continue? [Y/N]:Y
```

Clear dynamic neighbor information for all interfaces.

```
<Switch> reset ipv6 neighbors dynamic
This will delete all the dynamic entries. Continue? [Y/N]:Y
```

Clear all neighbor information for GigabitEthernet 1/0/1.

```
<Switch> reset ipv6 neighbors interface gigabitethernet 1/0/1
This will delete all the dynamic entries by the interface you specified. Continue? [Y/N]:Y
```

Related commands

display ipv6 neighbors

11.1.42. reset ipv6 pathmtu

Use **reset ipv6 pathmtu** to clear the Path MTU information.

Syntax

reset ipv6 pathmtu { **all** | **dynamic** | **static** }

Views

User view

Predefined user roles

network-admin

Parameters

all: Clears all Path MTUs.

dynamic: Clears all dynamic Path MTUs.

static: Clears all static Path MTUs.

Examples

Clear all Path MTUs.

```
<Switch> reset ipv6 pathmtu all
```

Related commands

display ipv6 pathmtu

11.1.43. reset ipv6 statistics

Use **reset ipv6 statistics** to clear IPv6 and ICMPv6 packet statistics.

Syntax

reset ipv6 statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears IPv6 and ICMPv6 packet statistics for all member devices.

Examples

Clear IPv6 and ICMPv6 packet statistics.

```
<Switch> reset ipv6 statistics
```

Related commands

12. Tunneling commands

12.1. Tunneling commands

12.1.1. description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of a tunnel interface is **Tunnel***number* **Interface**, for example, **Tunnel1 Interface**.

Views

Tunnel interface view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure descriptions for different interfaces for identification and management purposes.

You can use the **display interface** command to display the configured interface description.

Examples

Configure the description of Tunnel 1 as **tunnel1**.

```
<Switch> system-view
[Switch] interface tunnel 1
[Switch-Tunnel1] description tunnel1
```

Related commands

display interface tunnel

12.1.2. destination

Use **destination** to specify the destination address for a tunnel interface.

Use **undo destination** to restore the default.

Syntax

destination { *ipv4-address* | *ipv6-address* }

undo destination

Default

No tunnel destination address is configured.

Views

Tunnel interface view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the tunnel destination IPv4 address.

ipv6-address: Specifies the tunnel destination IPv6 address.

Usage guidelines

The tunnel destination address must be the address of the receiving interface on the tunnel peer. It is used as the destination address of tunneled packets.

The destination address of the local tunnel interface must be the source address of the peer tunnel interface. The source address of the local tunnel interface must be the destination address of the peer tunnel interface.

Do not specify the same tunnel source and destination addresses for the tunnel interfaces on the same device.

Examples

VLAN-interface 100 on Switch1 uses the IP address 193.101.1.1 and VLAN-interface 100 on Switch2 uses the IP address 192.100.1.1. Configure the source address 193.101.1.1 and destination address 192.100.1.1 for the tunnel interface on Switch1.

```
<Switch1> system-view
[Switch1] interface tunnel 1 mode ipv6-ipv4
[Switch1-Tunnel1] source 193.101.1.1
[Switch1-Tunnel1] destination 192.100.1.1
```

Configure the source address 192.100.1.1 and destination address 193.101.1.1 for the tunnel interface on Switch2.

```
<Switch2> system-view
[Switch2] interface tunnel 1 mode ipv6-ipv4
[Switch2-Tunnel1] source 192.100.1.1
[Switch2-Tunnel1] destination 193.101.1.1
```

Related commands

display interface tunnel

interface tunnel

source

12.1.3. display interface tunnel

Use **display interface tunnel** to display tunnel interface information.

Syntax

display interface [**tunnel** [*number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

tunnel [*number*]: Specifies a tunnel interface. The *number* argument specifies the tunnel interface number. The specified tunnel interface must have been created. If you do not specify the **tunnel** keyword, this command displays information about all interfaces on the device. If you specify the **tunnel** keyword without the *number* argument, this command displays information about all existing tunnel interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in the physical state of DOWN and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Examples

Display detailed IPv4 information about Tunnel 1.

```
<Switch> display interface tunnel 1
Tunnel1
Current state: UP
Line protocol state: UP
Description: Tunnel1 Interface
Bandwidth: 64kbps
Maximum transmission unit: 1476
Internet address: 10.1.2.1/24 (primary)
Tunnel source 2002::1:1 (Vlan-interface10), destination 2001::2:1
Tunnel TTL 255
Tunnel protocol/transport GRE/IPv6
    GRE key disabled
    Checksumming of GRE packets disabled
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 12-1 Command output

Field	Description
Tunnel1	Information about the tunnel interface Tunnel 1.
Current state	Physical link state of the tunnel interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical

Field	Description
	link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces. • **DOWN**—The data link layer protocol is down.
Description	Description of the tunnel interface.
Bandwidth	Expected bandwidth of the tunnel interface.
Maximum transmission unit	MTU of the tunnel interface.
Internet protocol processing: Disabled	The tunnel interface is not assigned an IP address and cannot process IP packets.
Internet address	IP address of the tunnel interface. The **primary** attribute indicates that the address is the primary IP address.
Tunnel source	Source address of the tunnel. If a source interface is specified for the tunnel interface, this field also displays the source interface in parentheses.
destination	Destination address of the tunnel.
Tunnel TTL	TTL of tunneled packets.
Tunnel protocol/transport	Tunnel mode and transport protocol: • **GRE/IP**—GRE/IPv4 tunnel mode. • **GRE/IPv6**—GRE/IPv6 tunnel mode. • **IP/IP**—IPv4 over IPv4 tunnel mode. • **IP/IPv6**—IPv4 over IPv6 tunnel mode. • **IPv6/IP**—IPv6 over IPv4 tunnel mode. • **IPv6/IPv6**—IPv6 over IPv6 tunnel mode. • **UDP_VXLAN/IP**—UDP-encapsulated IPv4 VXLAN tunnel mode.
GRE key disabled	No GRE tunnel interface key is configured.
Checksumming of GRE packets disabled	The GRE packet checksum feature is disabled.
Last clearing of counters	Last time when counters were cleared.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate in the last 300 seconds.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate in the last 300 seconds.
Input: 0 packets, 0 bytes, 0 drops	Total input packets, total input bytes, and total input packets dropped. Input packets are counted after they are de-encapsulated by software.

Field	Description
Output: 0 packets, 0 bytes, 0 drops	Total output packets, total output bytes, and total output packets dropped. Output packets are counted before they are encapsulated by software.

Display brief information about Tunnel 1.

```
<Switch> display interface tunnel 1 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP     Description
Tun1                 UP   UP       1.1.1.1        aaaaaaaaaaaaaaaaaaaaaaaaaaa
```

Display brief information about Tunnel 1, including the complete interface description.

```
<Switch> display interface tunnel 1 brief description
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP     Description
Tun1                 UP    UP      1.1.1.1        aaaaaaaaaaaaaaaaaaaaaaaaaaaaa
Aaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

Table 12-2 Command output

Field	Description
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command.

Field	Description
	• **Not connected**—The tunnel is not established.

Related commands

destination

interface tunnel

source

12.1.4. interface tunnel

Use **interface tunnel** to create a tunnel interface, specify the tunnel mode, and enter tunnel interface view, or enter the view of an existing tunnel interface.

Use **undo interface tunnel** to delete a tunnel interface.

Syntax

interface tunnel *number* [**mode** { **gre** [**ipv6**] | **ipv4-ipv4** | **ipv4-ipv6** | **ipv6-ipv4** | **ipv6-ipv6** | **vxlan** }]

undo interface tunnel *number*

Default

No tunnel interfaces exist.

Views

System view

Predefined user roles

network-admin

Parameters

number: Specifies the number of the tunnel interface. The value range is 0 to 8.

mode gre: Specifies the GRE/IPv4 tunnel mode.

mode gre ipv6: Specifies the GRE/IPv6 tunnel mode.

mode ipv4-ipv4: Specifies the IPv4 over IPv4 tunnel mode.

mode ipv4-ipv6: Specifies the IPv4 over IPv6 tunnel mode.

mode ipv6-ipv4: Specifies the IPv6 over IPv4 tunnel mode.

mode ipv6-ipv6: Specifies the IPv6 over IPv6 tunnel mode.

mode vxlan: Specifies the VXLAN tunnel mode.

Usage guidelines

To create a new tunnel interface, you must specify the tunnel mode in this command. To enter the view of an existing tunnel interface, you do not need to specify the tunnel mode.

A tunnel interface number is locally significant. The tunnel interfaces on the two ends of a tunnel can use the same or different interface numbers.

Examples

Create GRE/IPv4 tunnel interface Tunnel 1 and enter tunnel interface view.

```
<Switch> system-view
```

```
[Switch] interface tunnel 1 mode gre
[Switch-Tunnel1]
```

Related commands

destination

display interface tunnel

source

12.1.5. mtu

Use **mtu** to set the MTU on a tunnel interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

If the tunnel interface has never been up, the MTU is 64000 bytes.

If the tunnel interface is up, its MTU is identical to the outgoing interface's MTU minus the length of the tunnel headers. The outgoing interface is automatically obtained through routing table lookup based on the tunnel destination address.

Views

Tunnel interface view

Predefined user roles

network-admin

Parameters

size: Specifies the MTU, in the range of 100 to 64000 bytes.

Usage guidelines

After you configure an MTU for a tunnel interface, the configured MTU applies regardless of the tunnel interface status (up/down) and the outgoing interface MTU.

To avoid fragmentation after tunnel encapsulation, set the tunnel interface MTU no greater than the value of the outgoing interface MTU minus the length of the tunnel headers.

Examples

Set the MTU on Tunnel 1 to 10000 bytes.

```
<Switch> system-view
[Switch] interface tunnel 1
[Switch-Tunnel1] mtu 10000
```

Related commands

display interface tunnel

12.1.6. reset counters interface tunnel

Use **reset counters interface tunnel** to clear tunnel interface statistics.

Syntax

reset counters interface [**tunnel** [*number*]]

Views

User view

Predefined user roles

network-admin

Parameters

tunnel [*number*]: Specifies a tunnel interface. The *number* argument specifies the tunnel interface number. If you do not specify the **tunnel** keyword, this command clears statistics for all interfaces. If you specify the **tunnel** keyword without the *number* argument, this command clears statistics for all tunnel interfaces.

Usage guidelines

Use this command to clear old statistics so you can observe new traffic statistics on a tunnel interface.

Examples

Clear statistics for Tunnel 1.

```
<Switch> reset counters interface tunnel 1
```

Related commands

display interface tunnel

12.1.7. shutdown

Use **shutdown** to shut down a tunnel interface.

Use **undo shutdown** to bring up a tunnel interface.

Syntax

shutdown

undo shutdown

Default

A tunnel interface is down.

Views

Tunnel interface view

Predefined user roles

network-admin

Usage guidelines

This command disconnects all links set up on the interface. Make sure you fully understand the impact of the command on your network.

Examples

Shut down Tunnel 1.

```
<Switch> system-view
[Switch] interface tunnel 1
[Switch-Tunnel1] shutdown
```

Related commands

display interface tunnel

12.1.8. source

Use **source** to specify the source address or source interface for a tunnel interface.

Use **undo source** to restore the default.

Syntax

source { *ipv4-address* | *ipv6-address* | *interface-type interface-number* }

undo source

Default

No source address or source interface is specified for a tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the tunnel source IPv4 address.

ipv6-address: Specifies the tunnel source IPv6 address.

interface-type interface-number: Specifies the source interface by its type and number. The interface must be up and must have an IP address.

Usage guidelines

The specified source address or the address of the specified source interface is used as the source address of tunneled packets. To display the configured tunnel source address, use the **display interface tunnel** command.

The destination address of the local tunnel interface must be the source address of the peer tunnel interface. The source address of the local tunnel interface must be the destination address of the peer tunnel interface.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify VLAN-interface 10 as the source interface of Tunnel 1.

```
<Switch> system-view
[Switch] interface tunnel 1 mode gre
[Switch-Tunnel1] source vlan-interface 10
```

Specify 192.100.1.1 as the source address of Tunnel 1.

```
<Switch> system-view
[Switch] interface tunnel 1 mode gre
[Switch-Tunnel1] source 192.100.1.1
```

Related commands

destination

display interface tunnel

interface tunnel

12.1.9. tunnel vpn-instance

Use **tunnel vpn-instance** to specify a VPN instance for the destination address of a tunnel interface.

Use **undo tunnel vpn-instance** to restore the default.

Syntax

tunnel vpn-instance *vpn-instance-name*

undo tunnel vpn-instance

Default

No VPN instance for the destination address of a tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

Parameters

vpn-instance-name: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After this command is executed, the device looks up the routing table of the specified VPN instance to forward tunneled packets on the tunnel interface.

For a tunnel interface to come up, the tunnel source and destination must belong to the same VPN instance. To specify a VPN instance for the tunnel source, use the ip binding vpn-instance command on the tunnel source interface.

Examples

Specify VPN instance **vpn10** for the tunnel destination on Tunnel 1.

```
<Switch> system-view
[Switch] ip vpn-instance vpn10

13.1.1. http-redirect https-port 13-1
13.1.2. http-redirect ssl-server-policy 13-1

13. HTTP redirect commands

13.1. HTTP redirect commands

13.1.1. http-redirect https-port

Use **http-redirect https-port** to specify the HTTPS redirect listening port number.

Use **undo http-redirect https-port** to disable.

Syntax

http-redirect https-port *port-number*

undo http-redirect https-port

Default

HTTPS redirect listening port number is 8443.

Views

System view

Predefined user roles

network-admin

Parameters

port-number: Specifies the TCP port number on which the HTTPS redirect service listens for HTTPS requests. The value range for the port number is 1 to 65535.

Usage guidelines

To avoid service unavailability caused by port conflict, do not specify a TCP port number used by a well-known protocol or used by any other service. To display TCP port numbers that have been used by services, use the **display tcp** command.

If you execute this command multiple times, the most recent configuration takes effect.

Using **undo http-redirect https-port** redirects to port 6654. You must use the **http-redirect https-port 8443** command to reconfigure the HTTPS redirect listening port number.

If you set **undo http-redirect https-port** command, QX does not redirect user HTTPS requests to the Web authentication. NEC recommends that you do not change this setting to disable.

Examples

Specify 8888 as the HTTPS redirect listening port number.

```
<Switch> system-view
[Switch] http-redirect https-port 8888
```

13.1.2. http-redirect ssl-server-policy

Use **http-redirect ssl-server-policy** to associate an SSL server policy with the HTTPS redirect service.

Use **undo http-redirect ssl-server-policy** to restore the default.

Syntax

http-redirect ssl-server-policy *policy-name*

undo http-redirect ssl-server-policy

Default

No SSL server policy is associated with the HTTPS redirect service. The HTTPS redirect service uses a self-assigned certificate and the default SSL parameters.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies an SSL server policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

HTTPS redirect is unavailable if the associated SSL server policy does not exist. You can first associate a nonexistent SSL server policy with the HTTPS redirect service and then configure the SSL server policy.

If you change the SSL server policy associated with the HTTPS redirect service, the new policy takes effect immediately.

If you perform this task multiple times, the most recent configuration takes effect.

Examples

Associate SSL server policy **policy1** with the HTTPS redirect service.

```
<Switch> system-view
[Switch] http-redirect ssl-server-policy policy1
```

1. Basic IP routing commands

1.1. Basic IP routing commands

1.1.1. address-family ipv4

Use **address-family ipv4** to create the RIB IPv4 address family and enter its view, or enter the view of the existing RIB IPv4 address family.

Use **undo address-family ipv4** to delete the RIB IPv4 address family and all configurations in the view.

Syntax

address-family ipv4

undo address-family ipv4

Default

No RIB IPv4 address family exists.

Views

RIB view

Predefined user roles

network-admin

Examples

Create the RIB IPv4 address family and enter its view.

```
<Switch> system-view
[Switch] rib
[Switch-rib] address-family ipv4
[Switch-rib-ipv4]
```

1.1.2. address-family ipv6

Use **address-family ipv6** to create the RIB IPv6 address family and enter its view, or enter the view of the existing RIB IPv6 address family.

Use **undo address-family ipv6** to delete the RIB IPv6 address family and all configurations in the view.

Syntax

address-family ipv6

undo address-family ipv6

Default

No RIB IPv6 address family exists.

Views

RIB view

Predefined user roles

network-admin

Examples

Create the RIB IPv6 address family and enter its view.

```
<Switch> system-view
[Switch] rib
[Switch-rib] address-family ipv6
[Switch-rib-ipv6]
```

1.1.3. display ip routing-table

Use **display ip routing-table** to display routing table information.

Syntax

display ip routing-table [**vpn-instance** *vpn-instance-name*] [**verbose**]

display ip routing-table [**all-routes**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

all-routes: Displays routing table information for the public network and all VPN instances.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

If you do not specify any parameters, the command displays routing table information for the public network.

Examples

Display brief information about active routes in the routing table.

```
<Switch> display ip routing-table

Table 1-1 Command output

Field	Description
VPN instance	Public network or VPN instance that the routing table belongs to. For the public network, this field displays **public instance**. For a VPN instance, this field displays the VPN instance name.
Destinations	Number of destination addresses.
Routes	Number of routes.
Destination/Mask	Destination address/mask length.
Proto	Protocol that installed the route.
Pre	Preference of the route.
Cost	Cost of the route.
NextHop	Next hop address of the route.
Interface	Output interface for packets to be forwarded along the route.
Summary count	Number of routes.

Display detailed information about all routes in the routing table.

```

```

Table 1-2 Command output

Field	Description
VPN instance	Public network or VPN instance that the routing table belongs to. For the public network, this field displays **public instance**. For a VPN instance, this field displays the VPN instance name.
Destinations	Number of destination addresses.
Routes	Number of routes.
Destination	Destination address/mask length.
Protocol	Protocol that installed the route.
SubProtID	ID of the subprotocol for routing.
Age	Time for which the route has been in the routing table.

Field	Description
Cost	Cost of the route.
Preference	Preference of the route.
IpPre	IP precedence.
QosLocalID	This field is not supported in the current software version. Local QoS ID.
Tag	Route tag.
State	Route status: • **Active**—Active unicast route. • **Adv**—Route that can be advertised. • **Inactive**—Inactive route. • **NoAdv**—Route that the router must not advertise. • **Vrrp**—Routes generated by VRRP. • **Nat**—Routes generated by NAT. • **TunE**—Tunnel.
OrigTblID	Original routing table ID.
OrigVrf	Original VPN instance that the route belongs to. This field displays **default-vrf** if the route is on the IPv4 public network.
TableID	ID of the routing table.
OrigAs	Original AS number.
NibID	ID of the next hop.
LastAs	Last AS number.
AttrID	Attribute ID.
Neighbor	Address of the neighbor determined by the routing protocol.
Flags	Flags of the route.
OrigNextHop	Next hop address of the route.
RealNextHop	Real next hop of the route.
BkLabel	Backup label.
BkNexthop	Backup next hop.
Tunnel ID	Tunnel ID.
Interface	Output interface for packets to be forwarded along the route.
BkTunnel ID	Backup tunnel ID.
BkInterface	Backup output interface.
FtnIndex	Index of the FTN entry.
TrafficIndex	Traffic index in the range of 1 to 64. This field displays **N/A** when the value is invalid.
Connector	BGP connector attribute exchanged between BGP peers along with a VPN IPv4 route. The value of the attribute is the IP address of the remote PE device. The BGP connector attribute is used for MD VPN. This field displays **N/A** if the BGP connector attribute is not supported.
Summary count	Number of routes.

1.1.4. display ip routing-table acl

Use **display ip routing-table acl** to display information about routes permitted by a basic ACL.

Syntax

display ip routing-table [**vpn-instance** *vpn-instance-name*] **acl** *ipv4-acl-number* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

ipv4-acl-number: Specifies a basic ACL by its number in the range of 2000 to 2999.

verbose: Displays detailed information about all routes permitted by the basic ACL. If you do not specify this keyword, the command displays only brief information about active routes permitted by the basic ACL.

Usage guidelines

If the specified ACL does not exist or has no rules configured, the command displays information about all routes.

Examples

Define basic ACL 2000 and set the route filtering rules.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] rule deny source any
```

Display brief information about active routes permitted by basic ACL 2000.

```
[Switch-acl-ipv4-basic-2000] display ip routing-table acl 2000

Summary count : 4

Destination/Mask    Proto   Pre  Cost         NextHop         Interface
192.168.1.0/24      Direct  0    0            192.168.1.111   Vlan11

1.1.5. display ip routing-table *ip-address*

Use **display ip routing-table** *ip-address* to display information about routes to a specific destination address.

Use **display ip routing-table** *ip-address1* **to** *ip-address2* to display information about routes to a range of destination addresses.

Syntax

display ip routing-table [**vpn-instance** *vpn-instance-name*] *ip-address* [*mask-length* | *mask*] [**longer-match**] [**verbose**]

display ip routing-table [**vpn-instance** *vpn-instance-name*] *ip-address1* **to** *ip-address2* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

ip-address: Specifies a destination IP address in dotted decimal notation.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the IP address mask in dotted decimal notation.

longer-match: Displays the route entry with the longest mask.

ip-address1 **to** *ip-address2*: Specifies a destination IP address range.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays brief information about active routes.

Usage guidelines

Executing the command with different parameters yields different outputs.

- **display ip routing-table** *ip-address*
  - The system ANDs the entered destination IP address with the subnet mask in each active route entry.
  - The system ANDs the destination IP address in each active route entry with its own subnet mask.

  If the two operations yield the same result for an entry, the entry is displayed.
- **display ip routing-table** *ip-address mask*
  - The system ANDs the entered destination IP address with the entered subnet mask.
  - The system ANDs the destination IP address in each active route entry with the entered subnet mask.

  If the two operations yield the same result for an entry with a subnet mask not greater than the entered subnet mask, the entry is displayed.
- **display ip routing-table** *ip-address* **longer-match**
  - The system ANDs the entered destination IP address with the subnet mask in each active route entry.
  - The system ANDs the destination IP address in each active route entry with its own subnet mask.

  If the two operations yield the same result for multiple entries, the entry with the longest mask length is displayed.
- **display ip routing-table** *ip-address mask* **longer-match**
  - The system ANDs the entered destination IP address with the entered subnet mask.
  - The system ANDs the destination IP address in each active route entry with the entered subnet mask.

  If the two operations yield the same result for multiple entries with a mask not greater than the entered subnet mask, the entry with the longest mask length is displayed.
- **display ip routing-table** *ip-address1* **to** *ip-address2*

  The system displays active route entries with destinations in the range of *ip-address1*/32 to *ip-address2*/32.

Examples

Display brief information about the routes to the destination IP address 11.0.0.1.

```
<Switch> display ip routing-table 11.0.0.1

Summary count : 3

Destination/Mask    Proto   Pre  Cost         NextHop         Interface
11.0.0.0/8          Static  60   0            0.0.0.0         NULL0
11.0.0.0/16         Static  60   0            0.0.0.0         NULL0
11.0.0.0/24         Static  60   0            0.0.0.0         NULL0
```

Display brief information about the routes to the destination IP address 11.0.0.1 and mask length 20.

```
<Switch> display ip routing-table 11.0.0.1 20

Summary count : 2

Destination/Mask    Proto   Pre  Cost         NextHop         Interface
11.0.0.0/8          Static  60   0            0.0.0.0         NULL0
11.0.0.0/16         Static  60   0            0.0.0.0         NULL0
```

Display brief information about the most specific route to the destination address 11.0.0.1.

```
<Switch> display ip routing-table 11.0.0.1 longer-match

Summary count : 1

Destination/Mask    Proto   Pre  Cost         NextHop         Interface
11.0.0.0/24         Static  60   0            0.0.0.0         NULL0
```

Display brief information about the most specific route to the destination IP address 11.0.0.1 and mask length 20.

```
<Switch> display ip routing-table 11.0.0.1 20 longer-match

Summary count : 1

Destination/Mask    Proto   Pre  Cost         NextHop         Interface
11.0.0.0/16         Static  60   0            0.0.0.0         NULL0
```

Display brief information about the routes to destination addresses in the range of 1.1.1.0 to 5.5.5.0.

```
<Switch> display ip routing-table 1.1.1.0 to 5.5.5.0

Summary count : 4

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

  Connector: N/A
```

For command output, see Table 1-1 .

1.1.6. display ip routing-table prefix-list

Use **display ip routing-table prefix-list** to display routes permitted by an IP prefix list.

Syntax

display ip routing-table [**vpn-instance** *vpn-instance-name*] **prefix-list** *prefix-list-name* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

prefix-list-name: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters.

verbose: Displays detailed information about all routes permitted by the IP prefix list. If you do not specify this keyword, the command displays brief information about active routes permitted by the IP prefix list.

Usage guidelines

If the specified IP prefix list does not exist, the command displays information about all routes.

Examples

Create an IP prefix list named **test** to permit the route 1.1.1.0/24.

```
<Switch> system-view
[Switch] ip prefix-list test permit 1.1.1.0 24
```

Display brief information about the active route permitted by the IP prefix list.

```
[Switch] display ip routing-table prefix-list test

Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
1.1.1.0/24          Direct 0    0            1.1.1.2         Vlan11
```

For command output, see Table 1-1 .

Display detailed information about all routes permitted by the IP prefix list.

```
[Switch] display ip routing-table prefix-list test verbose

Summary count : 1

Destination: 1.1.1.0/24
   Protocol: Direct
 Process ID: 0
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 0               Preference: 0
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0x2                 OrigAs: 0
      NibID: 0x10000003          LastAs: 0
     AttrID: 0xffffffff        Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 1.1.1.2
      Label: NULL           RealNextHop: 1.1.1.2
    BkLabel: NULL             BkNextHop: N/A
  Tunnel ID: Invalid            Interface: Vlan-interface11
BkTunnel ID: Invalid         BkInterface: N/A
   FtnIndex: 0x0            TrafficIndex: N/A
  Connector: N/A
```

For command output, see Table 1-2 .

1.1.7. display ip routing-table protocol

Use **display ip routing-table protocol** to display information about routes installed by a protocol.

Syntax

display ip routing-table [**vpn-instance** *vpn-instance-name*] **protocol** *protocol* [**inactive** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

protocol: Specifies a routing protocol.

inactive: Displays information about inactive routes. If you do not specify this keyword, the command displays information about both active and inactive routes.

verbose: Displays detailed routing table information. If you do not specify this keyword, the command displays brief routing information.

Examples

Display brief information about direct routes.

```
<Switch> display ip routing-table protocol direct

Summary count : 9

Direct Routing Table Status : <Active>
Summary count : 9

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

```

For command output, see Table 1-1 .

1.1.8. display ip routing-table statistics

Use **display ip routing-table statistics** to display IPv4 route statistics, including numbers of total routes, routes installed by the protocol, routes marked as deleted, and active routes.

Syntax

display ip routing-table [**all-routes** | **all-vpn-instance** | **vpn-instance** *vpn-instance-name*] **statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays IPv4 route statistics for the public network and all VPN instances.

all-vpn-instance: Specifies all VPN instances.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify any parameters, the command displays IPv4 route statistics for the public network.

Examples

Display IPv4 route statistics for the public network.

```
<Switch> display ip routing-table statistics

Total prefixes: 15        Active prefixes: 15

Proto       route       active      added       deleted
DIRECT      12          12          30          18
STATIC      3           3           5           2
RIP         0           0           0           0
OSPF        0           0           0           0
IS-IS       0           0           0           0
BGP         0           0           0           0
Total       15          15          35          20
```

Display IPv4 route statistics for the public network and all VPN instances.

```
<Switch> display ip routing-table all-routes statistics

VPN instance: public instance
Total prefixes: 11        Active prefixes: 11

Total       8           8           8           0
```

Table 1-3 Command output

Field	Description
VPN instance	Public network or VPN instance that the routing table belongs to. For the public network, this field displays **public instance**. For a VPN instance, this field displays the VPN instance name.
Proto	Protocol that installed the route.
route	Number of routes installed by the protocol.
active	Number of active routes.
added	Number of routes added to the routing table after the router started up or the routing table was cleared most recently.
deleted	Number of routes marked as deleted, which will be cleared after a period.
Total	Total number of routes.

1.1.9. display ipv6 rib graceful-restart

Use **display ipv6 rib graceful-restart** to display IPv6 RIB GR state information.

Syntax

display ipv6 rib graceful-restart

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display IPv6 RIB GR state information.

```
<Switch> display ipv6 rib graceful-restart
RIB GR state     : Phase2-calculation end
RCOM GR state    : Flush end
Protocol GR state:
 No.  Protocol   Lifetime FD   State    Start/End
-------------------------------------------------
 1    DIRECT6    480      29   End      No/No
 2    STATIC6    480      32   End      No/No
 3    ISISV6     480      30   End      No/No
 4    BGP4+ instance default
                 480      31   End      No/No
 5    BGP4+ instance ebcdefg
                 480      32   End      No/No
```

For command output, see Table 1-8 .

1.1.10. display ipv6 routing-table

Use **display ipv6 routing-table** to display IPv6 routing table information.

Syntax

display ipv6 routing-table [**all-vpn-instance** | **vpn-instance** *vpn-instance-name*] [**verbose**]

display ipv6 routing-table [**all-routes**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-vpn-instance: Specifies all VPN instances.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

all-routes: Displays IPv6 routing table information for the public network and all VPN instances.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

If you do not specify any parameters, the command displays IPv6 routing table information for the public network.

Examples

Display brief information about active routes in the IPv6 routing table.

```
<Switch> display ipv6 routing-table

Destinations : 2 Routes : 2

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct
NextHop    : ::                                     Preference: 0
Interface  : InLoop0                                Cost      : 0
```

Display brief information about active routes in the IPv6 routing table for the public network and all VPN instances.

```
<Switch> display ipv6 routing-table all-routes

VPN instance: public instance
Destinations : 2 Routes : 2

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct

Table 1-5 Command output

Field	Description
VPN instance	Public network or VPN instance that the routing table belongs to. For the public network, this field displays **public instance**. For a VPN instance, this field displays the VPN instance name.
Destination	IPv6 address and prefix of the destination network or host.
Protocol	Protocol that installed the route.
SubProtID	ID of the subprotocol for routing.
Age	Time for which the route has been in the routing table.
Cost	Cost of the route.
Preference	Preference of the route.
IpPre	IP precedence.
QosLocalID	This field is not supported in the current software version. Local QoS ID.
Tag	Tag of the route.
State	Route status: • **Active**—Active unicast route. • **Adv**—Route that can be advertised.

Field	Description
	• **Inactive**—Inactive route. • **NoAdv**—Route that the router must not advertise. • **Vrrp**—Routes generated by VRRP. • **Nat**—Routes generated by NAT. • **TunE**—Tunnel.
OrigTblID	Original routing table ID.
OrigVrf	Original VPN instance that the route belongs to. This field displays **default-vrf** if the route is on an IPv6 network.
TableID	ID of the routing table.
OrigAs	Original AS number.
NibID	ID of the next hop.
LastAs	Last AS number.
AttrID	Attribute ID.
Neighbor	Address of the neighbor determined by the routing protocol.
Flags	Flags of the route.
OrigNextHop	Next hop address of the route.
RealNextHop	Real next hop of the route.
BkLabel	Backup label.
BkNexthop	Backup next hop.
Tunnel ID	Tunnel ID.
Interface	Output interface for packets to be forwarded along the route.
BkTunnel ID	Backup tunnel ID.
BkInterface	Backup output interface.
FtnIndex	Index of the FTN entry.
TrafficIndex	Traffic index in the range of 1 to 64. This field displays **N/A** when the value is invalid.
Connector	BGP connector attribute exchanged between BGP peers along with a VPN IPv4 route. The value of the attribute is the IP address of the remote PE device. The BGP connector attribute is used for MD VPN. This field displays **N/A** if BGP connector attribute is not supported.
Summary count	Number of routes.

1.1.11. display ipv6 routing-table acl

Use **display ipv6 routing-table acl** to display routing information permitted by an IPv6 basic ACL.

Syntax

display ipv6 routing-table [**vpn-instance** *vpn-instance-name*] **acl** *ipv6-acl-number* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

ipv6-acl-number: Specifies a basic IPv6 ACL by its number in the range of 2000 to 2999.

verbose: Displays detailed information about all routes permitted by the basic IPv6 ACL. If you do not specify this keyword, the command displays only brief information about active routes permitted by the basic IPv6 ACL.

Usage guidelines

If the specified IPv6 ACL does not exist or has no rules configured, the command displays information about all IPv6 routes.

Examples

Display brief information about active routes permitted by IPv6 ACL 2000.

```
<Switch> display ipv6 routing-table acl 2000

For command output, see Table 1-5 .

1.1.12. display ipv6 routing-table *ipv6-address*

Use **display ipv6 routing-table** *ipv6-address* to display information about routes to an IPv6 destination address.

Use **display ipv6 routing-table** *ipv6-address1* **to** *ipv6-address2* to display information about routes to a range of IPv6 destination addresses.

Syntax

display ipv6 routing-table [**vpn-instance** *vpn-instance-name*] *ipv6-address* [*prefix-length*] [**longer-match**] [**verbose**]

display ipv6 routing-table [**vpn-instance** *vpn-instance-name*] *ipv6-address1* **to** *ipv6-address2* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

ipv6-address: Specifies a destination IPv6 address.

prefix-length: Specifies the prefix length in the range of 0 to 128.

longer-match: Displays the route entry with the longest prefix.

ipv6-address1 **to** *ipv6-address2*: Specifies a destination IPv6 address range.

verbose: Displays detailed routing table information, including information about both active and inactive routes. If you do not specify this keyword, the command displays only brief information about active routes.

Usage guidelines

Executing the command with different parameters yields different output.

- **display ipv6 routing-table** *ipv6-address*
  - The system ANDs the entered destination IPv6 address with the prefix length in each active route entry.
  - The system ANDs the destination IPv6 address in each active route entry with the prefix length in the entry.

  If the two operations yield the same result for an entry, the entry is displayed.
- **display ipv6 routing-table** *ipv6-address prefix-length*
  - The system ANDs the entered destination IPv6 address with the entered prefix length.
  - The system ANDs the destination IPv6 address in each active route entry with the entered prefix length.

  If the two operations yield the same result for an entry with a prefix length not greater than the entered prefix length, the entry is displayed.
- **display ipv6 routing-table** *ipv6-address* **longer-match**
  - The system ANDs the entered destination IPv6 address with the prefix length in each active route entry.
  - The system ANDs the destination IPv6 address in each active route entry with the prefix length in the entry.

  If the two operations yield the same result for multiple entries, the entry with the longest prefix length is displayed.
- **display ipv6 routing-table** *ipv6-address prefix-length* **longer-match**
  - The system ANDs the entered destination IPv6 address with the entered prefix length.
  - The system ANDs the destination IPv6 address in each active route entry with the entered prefix length.

  If the two operations yield the same result for multiple entries with a prefix length not greater than the entered prefix length, the entry with the longest prefix length is displayed.
- **display ipv6 routing-table** *ipv6-address1* **to** *ipv6-address2*

  The system displays route entries with destinations in the range of *ipv6-address1*/128 to *ipv6-address2*/128.

Examples

Display brief information about the routes to the destination IPv6 address 10::1 127.

```
<Switch> display ipv6 routing-table 10::1 127
```

```
Summary count: 3

Destination: 10::/64                                  Protocol  : Static

```

For command output, see Table 1-4 .

1.1.13. display ipv6 routing-table prefix-list

Use **display ipv6 routing-table prefix-list** to display information about IPv6 routes permitted by an IPv6 prefix list.

Syntax

display ipv6 routing-table [**vpn-instance** *vpn-instance-name*] **prefix-list** *prefix-list-name* [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

prefix-list-name: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

verbose: Displays detailed information about all IPv6 routes permitted by the IPv6 prefix list. If you do not specify this keyword, the command displays brief information about active IPv6 routes permitted by the IPv6 prefix list.

Usage guidelines

If the specified IPv6 prefix list does not exist, the command displays information about all routes.

Examples

Create an IPv6 prefix list named test to permit the prefix ::1/128.

```
<Switch> system-view
[Switch] ipv6 prefix-list test permit ::1 128
```

Display brief information about the active IPv6 route permitted by the IPv6 prefix list.

```
[Switch] display ipv6 routing-table prefix-list test

Summary count : 1

Destination: ::1/128                                    Protocol   : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost       : 0
```

For command output, see Table 1-4 .

Display detailed information about all routes permitted by the IPv6 prefix list.

```
[Switch] display ipv6 routing-table prefix-list test verbose

Summary count : 1

Destination: ::1/128
   Protocol: Direct
 Process ID: 0
  SubProtID: 0x0                    Age: 08h57m19s
       Cost: 0                Preference: 0
      IpPre: N/A              QosLocalID: N/A
        Tag: 0                     State: Active NoAdv
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0xa                 OrigAs: 0
      NibID: 0x20000000          LastAs: 0
     AttrID: 0xffffffff        Neighbor: ::
      Flags: 0x10004        OrigNextHop: ::1
      Label: NULL           RealNextHop: ::1
    BkLabel: NULL             BkNextHop: N/A
  Tunnel ID: Invalid           Interface: InLoopBack0
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A
```

For command output, see Table 1-5 .

1.1.14. display ipv6 routing-table protocol

Use **display ipv6 routing-table protocol** to display information about IPv6 routes installed by a protocol.

Syntax

display ipv6 routing-table [**vpn-instance** *vpn-instance-name*] **protocol** *protocol* [**inactive** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command displays routing information for the public network.

protocol: Specifies a routing protocol.

inactive: Displays information about inactive routes. If you do not specify this keyword, the command displays information about both active and inactive routes.

verbose: Displays detailed routing table information. If you do not specify this keyword, the command displays brief routing information.

Examples

Display brief information about IPv6 direct routes.

```
<Switch> display ipv6 routing-table protocol direct

Summary count : 3

Direct Routing Table Status : <Active>
Summary count : 3

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0
Interface  : InLoop0                                Cost      : 0

Destination: FE80::/10                              Protocol  : Direct
NextHop    : ::                                     Preference: 0

1.1.15. display max-ecmp-num

Use **display max-ecmp-num** to display the maximum number of IPv4 ECMP routes.

Syntax

display max-ecmp-num

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the maximum number of IPv4 ECMP routes.

```
<Switch> display max-ecmp-num
  Max-ECMP-Num in use: 6
  Max-ECMP-Num at the next reboot: 10
```

Table 1-6 Command output

Field	Description
Max-ECMP-Num in use	Maximum number of current IPv4 ECMP routes in use.
Max-ECMP-Num at the next reboot	Maximum number of IPv4 ECMP routes at the next reboot of the device.

Related commands

max-ecmp-num

1.1.16. display ipv6 routing-table statistics

Use **display ipv6 routing-table statistics** to display IPv6 route statistics, including numbers of total routes, routes installed and deleted by the protocol, and active routes.

Syntax

display ipv6 routing-table [**all-routes** | **all-vpn-instance** | **vpn-instance** *vpn-instance-name*] **statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

all-routes: Displays IPv6 route statistics for the public network and all VPN instances.

all-vpn-instance: Specifies all VPN instances.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you do not specify any parameters, the command displays IPv6 route statistics for the public network.

Examples

Display IPv6 route statistics for the public network.

```
<Switch> display ipv6 routing-table statistics

Total prefixes: 8        Active prefixes: 8

Proto       route       active      added       deleted
```

```
DIRECT     5           5           5           0

```

Table 1-7 Command output

Field	Description
Proto	Public network or VPN instance that the IPv6 routing table belongs to. For the public network, this field displays **public instance**. For a VPN instance, this field displays the VPN instance name.
Proto	Protocol that installed the route.
route	Number of routes installed by the protocol.
active	Number of active routes.
added	Number of routes added to the routing table after the router started up or the routing table was cleared most recently.
deleted	Number of routes marked as deleted, which will be cleared after a period.
Total	Total number of routes.

1.1.17. display rib graceful-restart

Use **display rib graceful-restart** to display RIB GR state information.

Syntax

display rib graceful-restart

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display RIB GR state information.

```
<Switch> display rib graceful-restart
```

```
RIB GR state     : Phase2-calculation end
RCOM GR state    : Flush end
Protocol GR state:
 No.  Protocol   Lifetime FD   State    Start/End
-----------------------------------------------
 1    DIRECT     100      30   End      No/No
 2    STATIC     480      34   End      No/No
 3    OSPF       480      36   End      No/No
 4    ISIS       480      32   End      No/No
 5    BGP instance abc
                 480      22   End      No/No
 6    BGP instance default
                 480      25   End      No/No
 7    LDP        480      35   End      No/No
 8    SLSP       480      29   End      No/No
```

Table 1-8 Command output

Field	Description
RIB GR state	RIB GR status: • **Start**—GR starts. • **IGP end**—All IGP protocols complete GR. • **VPN-triggering end**—Optimal route selection triggered by VPN routes completes. • **VPN-calculation end**—Optimal VPN route selection completes. • **Routing protocol end**—All routing protocols complete GR. • **NSR-calculation unfinished**—NSR has not finished optimal route selection. • **Triggering start**—All triggered optimal route selection starts. • **Triggering end**—All triggered optimal route selection completes. • **Phase1-calculation end**—Optimal route selection phase 1 completes. • **All end**—All protocols complete GR. • **Phase2-calculation end**—Optimal route selection phase 2 completes.
RCOM GR state	RCOM GR status: • **Start**—GR starts. • **VPN-calculation end**—Optimal VPN route selection completes. • **VPN-notification end**—VPN routes have been delivered to the route management module. • **Routing protocol end**—All routing protocols complete GR. • **NSR-calculation unfinished**—NSR has not finished optimal route selection. • **Phase1-calculation end**—Optimal route selection phase 1 completes. • **Notification end**—All routes have been delivered to the route management module. • **Phase2-calculation end**—Optimal route selection phase 2 completes.

Field	Description
	• **Flush start**—Starts to flush routes to the FIB. • **Flush end**—Completes flushing routes to the FIB.
No.	Protocol number.
Lifetime	Lifetime (in seconds) of routes/labels in the RIB during GR.
FD	Handle between the protocol and the RIB.
State	Protocol GR state: • **Init**—Initialization state. • **Listen**—Listening state. • Idle. • Active. • **Start**—GR starts. • **End**—GR completes.
Start/End	Message sending state: • **No**—The message has not been sent. • **Yes**—The message has been sent.

1.1.18. ip route fast-switchover enable

Use **ip route fast-switchover enable** to enable IPv4 route fast switchover.

Use **undo ip route fast-switchover enable** to disable IPv4 route fast switchover.

Syntax

```
ip route fast-switchover enable
undo ip route fast-switchover enable
```

Default

IPv4 route fast switchover is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command applies to a device that provides the same physical output interface for large numbers of routes, including ECMP routes and primary/secondary routes. When a link failure occurs on the interface, the device must perform the following tasks before switching the traffic to another route:

1. Deletes all ARP entries for the link.
2. Instructs the FIB to delete the associated FIB entries.

This procedure is time consuming and interrupts traffic for a long time. To resolve this problem, you can enable route fast switchover. This feature allows the device to first instruct the FIB to delete the invalid FIB entries for route switchover.

Examples

Enable IPv4 route fast switchover.

```
<Switch> system-view
[Switch] ip route fast-switchover enable
```

1.1.19. ipv6 route fast-switchover enable

Use **ipv6 route fast-switchover enable** to enable IPv6 route fast switchover.

Use **undo ipv6 route fast-switchover enable** to disable IPv6 route fast switchover.

Syntax

ipv6 route fast-switchover enable

undo ipv6 route fast-switchover enable

Default

IPv6 route fast switchover is disabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

This command applies to a device that provides the same physical output interface for large numbers of routes, including ECMP routes and primary/secondary routes. When a link failure occurs on the interface, the device must perform the following tasks before switching the traffic to another route:

1. Deletes all ND entries for the link.
2. Instructs the FIB to delete the associated FIB entries.

This procedure is time consuming and interrupts traffic for a long time. To resolve this problem, you can enable route fast switchover. This feature allows the device to instruct the FIB to delete the invalid FIB entries for route switchover first.

Examples

Enable IPv6 route fast switchover.

```
<Switch> system-view
[Switch] ipv6 route fast-switchover enable
```

1.1.20. max-ecmp-num

Use **max-ecmp-num** to set the maximum number of IPv4 ECMP routes.

Syntax

max-ecmp-num *number*

Default

The maximum number of ECMP routes is 8.

Views

System view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of IPv4 ECMP routes. The value range for this argument is 1 to 32.

Usage guidelines

This command takes effect after a device reboot. Before you reboot the device, make sure you understand the potential impact on the network.

Examples

Set the maximum number of IPv4 ECMP routes to 10.

```
<Switch> system-view
[Switch] max-ecmp-num 10
The configuration will take effect at the next reboot. Continue? [Y/N]:y
Reboot device to make the configuration take effect.
```

After reboot, the maximum number of IPv4 ECMP routes is 10.

Related commands

display max-ecmp-num

1.1.21. non-stop-routing

MEMO:

non-stop-routing command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable RIB NSR.

Use **undo non-stop-routing** to disable RIB NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

RIB NSR is disabled.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Examples

Enable NSR for the RIB IPv4 address family.

```
<Switch> system-view
[Switch] rib
[Switch-rib] address-family ipv4
[Switch-rib-ipv4] non-stop-routing
```

1.1.22. protocol lifetime

Use **protocol lifetime** to set the maximum lifetime for IPv4 or IPv6 routes and labels in the RIB.

Use **undo protocol lifetime** to restore the default.

Syntax

protocol *protocol* **lifetime** *seconds*

undo protocol *protocol* **lifetime**

Default

The maximum lifetime for IPv4 or IPv6 routes and labels in the RIB is 480 seconds.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Parameters

protocol: Specifies a routing protocol.

seconds: Specifies the maximum lifetime for routes and labels in the RIB, in the range of 1 to 6000 seconds.

Usage guidelines

When GR is enabled, make sure the protocol can complete GR and install all route entries to the RIB within the lifetime configured in this command.

Examples

Set the maximum lifetime for RIP routes and labels in the RIB to 60 seconds.

```
<Switch> system-view
[Switch] rib
[Switch-rib] address-family ipv4
[Switch-rib-ipv4] protocol rip lifetime 60
```

1.1.23. reset ip routing-table statistics protocol

Use **reset ip routing-table statistics protocol** to clear IPv4 route statistics.

Syntax

reset ip routing-table statistics protocol [**vpn-instance** *vpn-instance-name*] { *protocol* | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command clears IPv4 route statistics for the public network.

protocol: Clears route statistics for a routing protocol.

all: Clears route statistics for all IPv4 routing protocols.

Examples

Clear all IPv4 route statistics for the public network.

```
<Switch> reset ip routing-table statistics protocol all
```

1.1.24. reset ipv6 routing-table statistics protocol

Use **reset ipv6 routing-table statistics protocol** to clear IPv6 route statistics.

Syntax

reset ipv6 routing-table statistics protocol [**vpn-instance** *vpn-instance-name*] { *protocol* | **all** }

Views

User view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command clears the IPv6 route statistics for the public network.

protocol: Clears route statistics for an IPv6 routing protocol.

all: Clears route statistics for all IPv6 routing protocols.

Examples

Clear all IPv6 route statistics for the public network.

```
<Switch> reset ipv6 routing-table statistics protocol all
```

1.1.25. rib

Use **rib** to enter RIB view.

Use **undo rib** to remove all configurations in RIB view.

Syntax

rib

undo rib

Views

System view

Predefined user roles

network-admin

Examples

Enter RIB view.

```
<Switch> system-view
[Switch] rib
[Switch-rib]
```

1.1.26. routing-table limit

Use **routing-table limit** to set the maximum number of active IPv4/IPv6 routes supported by the device.

Use **undo routing-table limit** to restore the default.

Syntax

routing-table limit *number* **simply-alert**

undo routing-table limit

Default

The maximum number of active IPv4/IPv6 routes is not set for the device.

Views

RIB IPv4 address family view

RIB IPv6 address family view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of active IPv4/IPv6 routes supported by the device, in the range of 1 to 4294967295.

simply-alert: Enables the device to still accept active routes but generate a log message when the number of active IPv4/IPv6 routes exceed the maximum number.

Usage guidelines

Configuration in RIB IPv4 address family view limits the number of active IPv4 routes for the public network and all VPN instances.

Configuration in RIB IPv6 address family view limits the number of active IPv6 routes for the public network and all VPN instances.

Examples

In RIB IPv4 address family view, set the maximum number of active IPv4 routes to 1000 for the public network and all VPN instances. The device still accepts new active routes but generates a system log message when the maximum number of active routes is exceeded.

<Switch> system-view

[Switch] rib

[Switch-rib] address-family ipv4

[Switch-rib-ipv4] routing-table limit 1000 simply-alert

2.1. Static routing commands

2.1.1. delete static-routes all

Use **delete static-routes all** to delete all static routes.

Syntax

delete [**vpn-instance** *vpn-instance-name*] **static-routes all**

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command deletes all static routes for the public network.

Usage guidelines

When you use this command, the system will prompt you to confirm the operation before deleting all the static routes.

To delete one static route, use the **undo ip route-static** command. To delete all static routes, including the default route, use the **delete static-routes all** command.

Examples

Delete all static routes.

```
<Switch> system-view
[Switch] delete static-routes all
This will erase all IPv4 static routes and their configurations, you must reconfigure all
static routes.
Are you sure?[Y/N]:y
```

Related commands

ip route-static

2.1.2. ip route-static

Use **ip route-static** to configure a static route.

Use **undo ip route-static** to delete a static route.

Syntax

ip route-static *dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**bfd control-packet bfd-source** *ip-address* | **permanent** | **track**

undo ip route-static *dest-address* { *mask-length* | *mask* } [*interface-type interface-number* [*next-hop-address*] | *next-hop-address* | **vpn-instance** *d-vpn-instance-name next-hop-address*] [**preference** *preference*]

ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] [**bfd control-packet bfd-source** *ip-address* | **permanent** | **track** *track-entry-number*] | **vpn-instance** *d-vpn-instance-name next-hop-address* [**bfd control-packet bfd-source** *ip-address* | **permanent** | **track** *track-entry-number*] } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

undo ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } [*interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address*] [**preference** *preference*]

Default

No static route is configured.

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *s-vpn-instance-name*: Specifies a source VPN instance by its name, a case-sensitive string of 1 to 31 characters. Each VPN instance has its own routing table, and the configured static route is installed in the routing tables of the specified VPN instances.

dest-address: Specifies the destination IP address of the static route, in dotted decimal notation.

mask-length: Specifies the mask length, an integer in the range of 0 to 32.

mask: Specifies the subnet mask in dotted decimal notation.

vpn-instance *d-vpn-instance-name*: Specifies a destination VPN instance by its name, a case-sensitive string of 1 to 31 characters. If a destination VPN instance is specified, packets will search for the output interface in the destination VPN instance based on the configured next hop address.

interface-type interface-number: Specifies an output interface by its type and number. For more information, see *Layer 3—IP Routing Configuration Guide*.

next-hop-address: Specifies the IP address of the next hop, in dotted decimal notation. For more information, see *Layer 3—IP Routing Configuration Guide*.

bfd: Enables BFD to detect reachability of the static route's next hop. When the next hop is unreachable, the system immediately switches to the backup route.

control-packet: Specifies the BFD control mode.

bfd-source *ip-address*: Specifies the source IP address of BFD packets. As a best practice, specify the loopback interface address.

echo-packet: Specifies the BFD echo mode.

permanent: Specifies the route as a permanent static route. If the output interface is down, the permanent static route is still active.

track *track-entry-number*: Associates the static route with a track entry specified by its number in the range of 1 to 1024. For more information about Track, see *High Availability Configuration Guide*.

public: Indicates that the specified next hop address is on the public network.

preference *preference*: Specifies a preference for the static route, in the range of 1 to 255. The default is 60.

tag *tag-value*: Sets a tag value for marking the static route, in the range of 1 to 4294967295. The default is 0. Tags of routes are used for route control in routing policies. For more information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

description *text*: Configures a description of 1 to 60 characters for the static route. The description can include special characters, such as the space, except the question mark (?).

Usage guidelines

If the destination IP address and the mask are both 0.0.0.0 (or 0), the configured route is a default route. The default route is used for forwarding a packet matching no entry in the routing table.

Implement different routing policies to configure different route preferences. For example, to enable load sharing for multiple routes to the same destination, assign the same preference to the routes. To enable the routes to back up one another, assign different preferences to them.

Follow these guidelines when you specify the output interface or the next hop address of the static route:

- If the output interface is a Null 0 interface, no next hop address is required.
- If the output interface is a point-to-point interface, you can specify only the output interface. You do not need to change the configuration of the route even if the peer address is changed.
- NBMA or P2MP interfaces need IP address-to-link layer address mappings for successful packet delivery. As a best practice, specify the next hop address for the route at the same time if the output interface is an NBMA or P2MP interface.
- If the output interface is a broadcast interface, the device uses the next hop IP address to obtain the MAC address of the next hop. Therefore, you must specify both the output interface and next hop IP address, except for certain cases such as the VXLAN across VPNs networking.

Follow these guidelines when you configure a static route:

- Enabling BFD for a flapping route could worsen the route flapping situation. Therefore, use it with caution. For more information about BFD, see *High Availability Configuration Guide*.
- For static routing-Track-NQA collaboration, you must configure the same VPN instance ID for the next hop to be detected and the NQA operation.
- Do not specify the **permanent** keyword together with the **bfd** or **track** keyword.

Examples

Configure a static route, whose destination address is 1.1.1.1/24, next hop address is 2.2.2.2, tag value is 45, and description information is **for internet**.

```
<Switch> system-view
[Switch] ip route-static 1.1.1.1 24 2.2.2.2 tag 45 description for internet
```

Related commands

display ip routing-table protocol

2.1.3. ip route-static default-preference

Use **ip route-static default-preference** to configure a default preference for static routes.

Use **undo ip route-static default-preference** to restore the default.

Syntax

ip route-static default-preference *default-preference*

undo ip route-static default-preference

Default

The default preference of static routes is 60.

Views

System view

Predefined user roles

network-admin

Parameters

default-preference: Specifies a default preference for static routes, in the range of 1 to 255.

Usage guidelines

If no preference is specified for a static route, the default preference applies.

When the default preference is reconfigured, it applies only to newly added static routes.

Examples

Set a default preference of 120 for static routes.

```
<Switch> system-view
[Switch] ip route-static default-preference 120
```

3. RIP commands

3.1. RIP commands

3.1.1. checkzero

Use **checkzero** to enable zero field check on RIPv1 messages.

Use **undo checkzero** to disable zero field check.

Syntax

checkzero

undo checkzero

Default

The zero field check function is enabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

When the zero field check is enabled, the router discards RIPv1 messages in which zero fields contain non-zero values. If all messages are trustworthy, disable this feature to reduce the workload of the CPU.

Examples

Disable zero field check on RIPv1 messages for RIP process 1.

```
<Switch> system-view
[Switch] rip
[Switch-rip-1] undo checkzero
```

3.1.2. default cost

Use **default cost** to configure a default metric for redistributed routes.

Use **undo default cost** to restore the default.

Syntax

default cost *cost-value*

undo default cost

Default

The default metric of redistributed routes is 0.

Views

RIP view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a default metric for redistributed routes, in the range of 0 to 16.

Usage guidelines

When you use the **import-route** command to redistribute routes from another routing protocol without specifying a metric, the metric specified by the **default cost** command applies.

Examples

Configure a default metric of 3 for redistributed routes.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] default cost 3
```

Related commands

import-route

3.1.3. default-route

Use **default-route** to configure all interfaces running a RIP process to advertise a default route with a specified metric to RIP neighbors.

Use **undo default-route** to restore the default.

Syntax

default-route { **only** | **originate** } [**cost** *cost-value*] *

undo default-route

Default

No default route is sent to RIP neighbors.

Views

RIP view

Predefined user roles

network-admin

Parameters

only: Advertises only a default route.

originate: Advertises both a default route and other routes.

cost-value: Specifies a cost for the default route, in the range of 1 to 15. The default is 1.

Usage guidelines

A RIP router configured with this feature does not receive any default route from RIP neighbors.

Examples

Configure all interfaces running RIP process 100 to send only a default route with a metric of 2 to RIP neighbors.

```
<Switch> system-view
[Switch] rip 100
[Switch-rip-100] default-route only cost 2
```

Related commands

rip default-route

3.1.4. display rip

Use **display rip** to display state and configuration information for a RIP process.

Syntax

display rip [*process-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. If no process is specified, the command displays state and configuration information for all RIP processes.

Examples

Display current state and configuration information for all RIP processes.

```
<Switch> display rip
  Public VPN-instance name:
    RIP process: 1
       RIP version: 1
       Preference: 100
           Routing policy: abc
       Fast-reroute:
           Routing policy: frr
       Checkzero: Enabled
       Default cost: 0
```

```
Summary: Enabled
Host routes: Enabled
Maximum number of load balanced routes: 8
Update time   :   30 secs  Timeout time         :  180 secs
Suppress time :  120 secs  Garbage-collect time :  120 secs
Update output delay:   20(ms)  Output count:    3
Graceful-restart interval:   60 secs
Triggered Interval : 5 50 200
Silent interfaces: None
Default routes: Originate  Default routes cost: 3
Verify-source: Enabled
Networks:
    1.0.0.0
Configured peers:
    197.168.6.2
Triggered updates sent: 0
Number of routes changes: 1
Number of replies to queries: 0
```

Table 3-1 Command output

Field	Description
Public VPN-instance name	The RIP process runs on the public network.
Private VPN-instance name	VPN instance where the RIP process runs.
RIP process	RIP process ID.
RIP version	RIP version 1 or 2.
Preference	RIP preference.
Fast-reroute	RIP FRR.
Checkzero	Indicates whether the zero field check is enabled for RIPv1 messages: **Enabled** or **Disabled**.
Default cost	Default cost of redistributed routes.
Summary	Indicates whether route summarization is enabled: **Enabled** or **Disabled**.
Host routes	Indicates whether to receive host routes: **Enabled** or **Disabled**.
Maximum number of load balanced routes	Maximum number of ECMP routes for load balancing.
Update time	RIP update interval, in seconds.
Timeout time	RIP timeout time, in seconds.
Suppress time	RIP suppress interval, in seconds.
Garbage-collect time	RIP garbage-collect interval, in seconds.
Update output delay	RIP packet sending interval, in seconds.
Output count	Maximum number of RIP packets sent at each interval.

Field	Description
Graceful-restart interval	GR interval, in seconds.
Triggered Interval	Triggered update sending interval.
Silent interfaces	Silent interfaces, which do not periodically send updates.
Default routes	Indicates whether a default route is sent to RIP neighbors. • **only**—Only a default route is advertised. • **originate**—A default route is advertised along with other routes. • **disable**—No default route is advertised.
Default routes cost	Metric for a default route.
Verify-source	Indicates whether the source IP address is checked for received RIP routing updates: **Enabled** or **Disabled**.
Networks	Networks enabled with RIP.
Configured peers	Configured neighbors.
Triggered updates sent	Number of triggered updates sent.
Number of routes changes	Number of route changes.
Number of replies to queries	Number of RIP responses.

3.1.5. display rip database

Use **display rip database** to display active routes for a RIP process.

Syntax

display rip *process-id* **database** [*ip-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

ip-address { *mask-length* | *mask* }: Displays active routes for the specified IP address. If you do not specify this argument, the command displays all actives routes for a RIP process.

Examples

Display active routes for RIP process 100.

```
<Switch> display rip 100 database
   1.0.0.0/8, auto-summary
       1.1.1.0/24, cost 16, interface summary
       1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
       1.1.2.0/24, cost 0, imported
   2.0.0.0/8, auto-summary
   2.0.0.0/8, cost 1, nexthop 1.1.1.2
```

Display active routes with destination IP address 1.1.1.0 and mask length 24 for RIP process 100.

```
<Switch> display rip 100 database 1.1.1.0 24
   1.1.1.0/24, cost 16, interface summary
   1.1.1.0/24, cost 0, nexthop 1.1.1.1, RIP-interface
```

Table 3-2 Command output

Field	Description
cost	Cost of the route.
auto-summary	Indicates that the route is a RIP automatic summary route.
interface summary	Indicates that the route is a RIP interface summary route.
nexthop	Address of the next hop.
RIP-interface	Direct route on a RIP-enabled interface.
imported	Indicates that the route is redistributed from another routing protocol.

3.1.6. display rip interface

Use **display rip interface** to display RIP interface information for a RIP process.

Syntax

display rip *process-id* **interface** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

interface-type interface-number: Specifies an interface by its type and number. If no interface is specified, the command displays information about all RIP interfaces for the RIP process.

Examples

Display information about all interfaces for RIP process 1.

```
<Switch> display rip 1 interface
Total: 1

 Interface: Vlan-interface10
    Address/Mask: 1.1.1.1/24          Version: RIPv1
    MetricIn: 0                       MetricIn route policy: Not designated
    MetricOut: 1                      MetricOut route policy: Not designated
    Split-horizon/Poison-reverse: On/Off  Input/Output: On/On
    Default route: Off
    Update output delay:  20(ms)      Output count: 3
    Current number of packets/Maximum number of packets: 0/2000
```

Table 3-3 Command output

Field	Description
Total	Number of interfaces running RIP.
Interface	Name of an interface running RIP.
Address/Mask	IP address and mask of the interface.
Version	RIP version running on the interface.
MetricIn	Additional metric added to incoming routes.
MetricIn route policy	Name of the routing policy used to add an additional metric for incoming routes. If no routing policy is used, the field displays **Not designated**.
MetricOut	Additional metric added to outgoing routes.
MetricOut route policy	Name of the routing policy used to add an additional routing metric for outgoing routes. If no routing policy is used, the field displays **Not designated**.
Split-horizon	Indicates whether split horizon is enabled: • **on**—Enabled. • **off**—Disabled.
Poison-reverse	Indicates whether poison reverse is enabled: • **on**—Enabled. • **off**—Disabled.
Input/Output	Indicates whether the interface is enabled to receive and send RIP messages: • **on**—Enabled. • **off**—Disabled.
Default route	Indicates whether to send a default route to RIP neighbors: • **Only**—Advertises only a default route. • **Originate**—Advertises both a default route and other routes. • **No-originate**—Advertises only non-default routes. • **Off**—Advertises no default route.
Default route cost	Metric for a default route.

Field	Description
Update output delay	RIP packet sending interval.
Output count	Maximum number of RIP packets that can be sent at each interval.
Current number of packets /Maximum number of packets	Number of RIP packets to be sent/maximum number of RIP packets that can be sent within a certain interval.

3.1.7. display rip route

Use **display rip route** to display routing information for a RIP process.

Syntax

display rip *process-id* **route** [*ip-address* { *mask-length* | *mask* } [**verbose**] | **peer** *ip-address* | **statistics**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

ip-address { *mask-length* | *mask* }: Displays route information for the specified IP address.

verbose: Displays all routing information for the specified destination IP address. If you do not specify this keyword, the command displays only information about optimal routes with the specified destination IP address.

peer *ip-address*: Displays route information learned from the specified neighbor.

statistics: Displays route statistics, including the total number of routes and number of routes from each neighbor.

Usage guidelines

If no optional parameters are specified, the **display rip** *process-id* **route** command displays all routing information for a RIP process.

Examples

Display all routing information for RIP process 1.

```
<Switch> display rip 1 route
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
```

```
------------------------------------------------------------------------------
 Peer 1.1.1.1 on Vlan-interface10
      Destination/Mask        Nexthop          Cost    Tag     Flags   Sec
      3.0.0.0/8               1.1.1.1          1       0       RAOF    24
 Local route
      Destination/Mask        Nexthop          Cost    Tag     Flags   Sec
      4.4.4.4/32              0.0.0.0          0       0       RDOF    -
      1.1.1.0/24              0.0.0.0          0       0       RDOF    -
```

Display specified routing information for RIP process 1.

```
<Switch> display rip 1 route 3.0.0.0 8 verbose
 Route Flags: R - RIP, T - TRIP
              P - Permanent, A - Aging, S - Suppressed, G - Garbage-collect
              D - Direct, O - Optimal, F - Flush to RIB
------------------------------------------------------------------------------
 Peer 1.1.1.1 on Vlan-interface10
  Destination/Mask    OrigNexthop/RealNexthop          Cost  Tag    Flags Sec
  3.0.0.0/8           1.1.1.1/1.1.1.1                  1     0      RAOF  16
```

Table 3-4 Command output

Field	Description
Route Flags	• **R**—RIP route. • **P**—The route never ages out. • **A**—The route is aging. • **S**—The route is suppressed. • **G**—The route is in Garbage-collect state. • **D**—The route is a direct route. • **O**—The route is an optimal route. • **F**—The route has been flushed to the RIB.
Peer *X.X.X.X* on *interface-type interface-number*	Routing information learned from a neighbor on a RIP interface.
Local route	Locally generated direct routes.
Destination/Mask	Destination IP address and subnet mask.
Nexthop	Next hop of the route.
OrigNexthop/RealNexthop	If the route is from a directly connected neighbor, the original next hop is the real next hop. If the route is from an indirectly connected neighbor, the **RealNexthop** field displays the recursive next hop for the route. Otherwise, the field is blank.
Cost	Cost of the route.
Tag	Route tag.
Flags	Route state.
Sec	Remaining time of the timer corresponding to the route state.

Display routing statistics for RIP process 1.

```
<Switch> display rip 1 route statistics
 Peer                    Optimal/Aging       Optimal/Permanent       Garbage
 1.1.1.1                 1/1                 0/0                     0
 Local                   2/0                 0/0                     0
 Total                   3/1                 0/0                     0
```

Table 3-5 Command output

Field	Description
Peer	IP address of a neighbor.
Optimal	Total number of optimal routes.
Aging	Total number of aging routes.
Permanent	Total number of routes that never age out.
Garbage	Total number of routes in the Garbage-collection state.
Local	Total number of locally generated direct routes.
Total	Total number of routes learned from all RIP neighbors.

3.1.8. filter-policy export

Use **filter-policy export** to configure RIP to filter redistributed routes.

Use **undo filter-policy export** to remove the filtering.

Syntax

filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*] | *interface-type interface-number*]

undo filter-policy export [*protocol* [*process-id*] | *interface-type interface-number*]

Default

RIP does not filter redistributed routes.

Views

RIP view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter redistributed routes.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter redistributed routes.

protocol: Filters routes redistributed from the specified routing protocol.

process-id: Specifies the process ID of the specified routing protocol, in the range of 1 to 65535. Specify a process ID when the routing protocol is **rip**, or **ospf**. If no process ID is specified, the default process ID is 1.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure only one filtering policy to filter routes redistributed from a routing protocol or an interface. Without any protocol or interface specified, the filtering policy applies globally. If you execute this command multiple times, the most recent configuration takes effect.

To remove the filtering policy configured for a protocol or an interface, use the **undo filter-policy export** command with the protocol or interface specified.

To reference an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the route. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Use basic ACL 2000 to filter redistributed routes.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] rip 1
[Switch-rip-1] filter-policy 2000 export
```

Use IP prefix list **abc** to filter redistributed routes.

```
<Switch> system-view
[Switch] ip prefix-list abc index 10 permit 11.0.0.0 8
[Switch] rip 1
[Switch-rip-1] filter-policy prefix-list abc export
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16 to pass. Use ACL 3000 to filter redistributed routes.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
```

```
[Switch-acl-ipv4-adv-3000] rule 100 deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] rip 1
[Switch-rip-1] filter-policy 3000 export
```

Related commands

acl (*ACL and QoS Command Reference*)

import-route

ip prefix-list

3.1.9. filter-policy import

Use **filter-policy import** to configure RIP to filter received routes.

Use **undo filter-policy import** to remove the filtering.

Syntax

filter-policy { *ipv4-acl-number* | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] } **import** [*interface-type interface-number*]

undo filter-policy import [*interface-type interface-number*]

Default

RIP does not filter received routes.

Views

RIP view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter received routes.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter received routes.

gateway *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter routes based on their next hops.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can configure only one filtering policy to filter routes received on an interface. Without any interface specified, the filtering policy applies globally. If you execute this command multiple times, the most recent configuration takes effect.

To remove the filtering policy configured for an interface, use the **undo filter-policy import** command with the interface specified.

To reference an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the route. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Use basic ACL 2000 to filter received RIP routes.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] rip 1
[Switch-rip-1] filter-policy 2000 import
```

Use IP prefix list **abc** to filter received RIP routes.

```
<Switch> system-view
[Switch] ip prefix-list abc index 10 permit 11.0.0.0 8
[Switch] rip 1
[Switch-rip-1] filter-policy prefix-list abc import
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16 to pass. Use ACL 3000 to filter received routes.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
[Switch-acl-ipv4-adv-3000] rule 100 deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] rip 1
[Switch-rip-1] filter-policy 3000 import
```

Related commands

acl (*ACL and QoS Command Reference*)

ip prefix-list

3.1.10. graceful-restart

Use **graceful-restart** to enable RIP GR.

Use **undo graceful-restart** to disable RIP GR.

Syntax

graceful-restart

undo graceful-restart

Default

RIP GR is disabled.

Views

RIP view

Predefined user roles

network-admin

Examples

Enable GR for RIP process 1.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] graceful-restart
```

3.1.11. host-route

Use **host-route** to enable host route reception.

Use **undo host-route** to disable host route reception.

Syntax

host-route

undo host-route

Default

RIP receives host routes.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

A router might receive many host routes from the same subnet. These routes are not helpful for routing and occupy a large number of resources. To solve this problem, use the **undo host-route** command to disable RIP from receiving host routes.

This command takes effect only for RIPv2 routes.

Examples

Disable RIP from receiving host routes.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] undo host-route
```

3.1.12. import-route

Use **import-route** to enable route redistribution from another routing protocol.

Use **undo import-route** to remove routes redistributed from another routing protocol.

Syntax

import-route bgp [**allow-ibgp**] [**cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route bgp

import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route { **direct** | **static** }

import-route { **ospf** | **rip** } [*process-id* | **all-processes**] [**cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route { **ospf** | **rip** } [*process-id* | **all-processes**]

Default

RIP does not redistribute routes from any other routing protocol.

Views

RIP view

Predefined user roles

network-admin

Parameters

bgp: Redistributes BGP routes.

direct: Redistributes direct routes.

ospf: Redistributes OSPF routes.

rip: Redistributes RIP routes.

static: Redistributes static routes.

process-id: Specifies an OSPF, or RIP process by its ID in the range of 1 to 65535. The default is 1.

all-processes: Enables route redistribution from all OSPF or RIP processes.

allow-ibgp: Allows redistribution of IBGP routes. The **import-route bgp** command redistributes only EBGP routes. The **import-route bgp allow-ibgp** command additionally redistributes IBGP routes and might cause routing loops. Therefore, use it with caution.

cost *cost-value*: Specifies a cost for redistributed routes, in the range of 0 to 16. The default cost is 0.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

tag *tag*: Specifies a tag for marking redistributed routes, in the range of 0 to 65535. The default is 0.

Usage guidelines

This command redistributes only active routes. To view route state information, use the **display ip routing-table protocol** command.

The **undo import-route** { **ospf** | **rip** } **all-processes** command removes only the configuration made by the **import-route** { **ospf** | **rip** } **all-processes** command. It does not remove the configuration made by the **import-route** { **ospf** | **rip** } *process-id* command.

Examples

Redistribute static routes into RIP, and set the cost for redistributed routes to 4.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] import-route static cost 4
```

Related commands

default cost

3.1.13. maximum load-balancing

Use **maximum load-balancing** to set the maximum number of RIP equal-cost multi-path (ECMP) routes for load balancing.

Use **undo maximum load-balancing** to restore the default.

Syntax

maximum load-balancing *number*

undo maximum load-balancing

Default

8

Views

RIP view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of RIP ECMP routes in the range of 1 to 8. Load balancing is not implemented when the value is 1.

Examples

Set the maximum number of RIP ECMP routes to 2.

```
<Switch> system-view
[Switch] rip
[Switch-rip-1] maximum load-balancing 2
```

Related commands

max-ecmp-num

3.1.14. network

Use **network** to enable RIP on an interface attached to a specified network.

Use **undo network** to disable RIP on an interface attached to a specified network.

Syntax

network *network-address* [*wildcard-mask*]

undo network *network-address*

Default

RIP is disabled on an interface.

Views

RIP view

Predefined user roles

network-admin

Parameters

network-address: Specifies a subnet address where an interface resides.

wildcard-mask: Specifies an IP address wildcard mask. A wildcard mask can be thought of as a subnet mask, with 1s and 0s inverted. For example, a wildcard mask of 255.255.255.0

corresponds to a subnet mask of 0.0.0.255. If you do not specify this argument, the command uses the natural mask.

Usage guidelines

RIP runs only on an interface attached to the specified network, which can be configured with a wildcard mask. An interface not on the specified network does not receive or send RIP routes, or advertise its direct routes.

For a single RIP process, the **network** 0.0.0.0 command can enable RIP on all interfaces. If multiple RIP processes exist, the command is not applicable.

If a physical interface is attached to multiple networks, you cannot advertise these networks in different RIP processes.

Examples

Enable RIP process 100 on the interface attached to the network 129.102.0.0.

```
<Switch> system-view
[Switch] rip 100
[Switch-rip-100] network 129.102.0.0
```

3.1.15. non-stop-routing

MEMO:

non-stop-routing command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable RIP NSR.

Use **undo non-stop-routing** to disable RIP NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

RIP NSR is disabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

RIP NSR enabled for a RIP process takes effect only on that process. As a best practice, enable RIP NSR for each process if multiple RIP processes exist.

The **non-stop-routing** command and the **graceful-restart** command are mutually exclusive.

Examples

Enable NSR for RIP process 1.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] non-stop-routing
```

3.1.16. output-delay

Use **output-delay** to set the rate at which an interface sends RIP packets.

Use **undo output-delay** to restore the default.

Syntax

output-delay *time* **count** *count*

undo output-delay

Default

An interface sends up to three RIP packets every 20 milliseconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

time: Specifies the sending interval in the range of 10 to 100 milliseconds.

count: Specifies the maximum number of RIP packets sent at each interval, in the range of 1 to 30.

Examples

Configure all interfaces running RIP process 1 to send up to 10 RIP packets every 60 milliseconds.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] output-delay 60 count 10
```

3.1.17. peer

Use **peer** to specify a RIP neighbor in the NBMA network, where routing updates destined for the neighbor are only unicasts and not multicast or broadcast.

Use **undo peer** to remove a RIP neighbor.

Syntax

peer *ip-address*

undo peer *ip-address*

Default

RIP does not unicast updates to any neighbor.

Views

RIP view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a RIP neighbor, in dotted decimal notation.

Usage guidelines

Do not use the **peer** *ip-address* command when the neighbor is directly connected. Otherwise, the neighbor might receive both unicast and multicast (or broadcast) messages with the same routing information.

This command must be executed together with the **undo validate-source-address** command, which disables source IP address check on inbound RIP routing updates.

Examples

Configure RIP to unicast updates to peer 202.38.165.1.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] peer 202.38.165.1
```

Related commands

validate-source-address

3.1.18. preference

Use **preference** to specify a preference for RIP routes.

Use **undo preference** to restore the default.

Syntax

preference { *preference* | **route-policy** *route-policy-name* } *

undo preference

Default

The preference of RIP routes is 100.

Views

RIP view

Predefined user roles

network-admin

Parameters

preference: Specifies a preference for RIP routes, in the range of 1 to 255. The smaller the value, the higher the preference.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify a routing policy by using the keyword **route-policy** to set a preference for matching RIP routes.

- The preference set by the routing policy applies to all matching RIP routes. The preference of other routes is set by the **preference** command.
- If no preference is set by the routing policy, the preference of all RIP routes is set by the **preference** command.

Examples

Set a preference of 120 for RIP routes.

```
<Switch> system-view
[Switch] rip 1
[Switch-rip-1] preference 120
```

3.1.19. reset rip process

Use **reset rip process** to reset a RIP process.

Syntax

reset rip *process-id* **process**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Usage guidelines

After executing the command, you are prompted to confirm the operation.

Examples

Reset RIP process 100.

```
<Switch> reset rip 100 process
Reset RIP process? [Y/N]:y
```

3.1.20. reset rip statistics

Use **reset rip statistics** to clear statistics for a RIP process.

Syntax

reset rip *process-id* **statistics**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Examples

Clear statistics for RIP process 100.

```
<Switch> reset rip 100 statistics
```

3.1.21. rip

Use **rip** to enable RIP and enter RIP view.

Use **undo rip** to disable RIP.

Syntax

rip [*process-id*] [**vpn-instance** *vpn-instance-name*]

undo rip [*process-id*]

Default

RIP is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535. The default is 1.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the RIP process runs on the public network.

Usage guidelines

You must enable a RIP process before configuring global parameters for it. This restriction does not apply to configuring interface parameters.

If you disable a RIP process, the configured interface parameters become invalid.

Examples

Enable RIP process 1 and enter RIP view.

```
<Switch> system-view
[Switch] rip
[Switch-rip-1]
```

3.1.22. rip authentication-mode

Use **rip authentication-mode** to configure RIPv2 authentication.

Use **undo rip authentication-mode** to restore the default.

Syntax

rip authentication-mode { **md5** { **rfc2082** { **cipher** | **plain** } *string key-id* | **rfc2453** { **cipher** | **plain** } *string* } | **simple** { **cipher** | **plain** } *string* }

undo rip authentication-mode

Default

RIPv2 authentication is not configured.

Views

Interface view

Predefined user roles

network-admin

Parameters

md5: Specifies the MD5 authentication.

rfc2082: Uses the message format defined in RFC 2082.

cipher: Specifies a password in encrypted form.

plain: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

key-id: Specifies the key ID in the range of 1 to 255.

rfc2453: Uses the message format defined in RFC 2453 (IETF standard).

simple: Specifies the simple authentication mode.

Usage guidelines

A newly configured key overwrites the old one, if any.

Although you can specify an authentication mode for RIPv1 in interface view, the configuration does not take effect because RIPv1 does not support authentication.

Examples

Configure MD5 authentication on VLAN-interface 10 and specify a plaintext key **rose** in the format defined in RFC 2453.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip version 2
[Switch-Vlan-interface10] rip authentication-mode md5 rfc2453 plain rose
```

Related commands

rip version

3.1.23. rip bfd enable

Use **rip bfd enable** to enable BFD for RIP on an interface.

Use **undo rip bfd enable** to restore the default.

Syntax

rip bfd enable

undo rip bfd enable

Default

BFD for RIP is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

RIP supports BFD echo-mode detection for a directly connected neighbor, and BFD control-mode detection for an indirectly neighbor.

BFD echo-mode detection only applies to a RIP neighbor one hop away.

Using the **undo peer** command does not delete the neighbor relationship immediately and cannot bring down the BFD session immediately.

Examples

Enable BFD for RIP on VLAN-interface 11.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] rip bfd enable
```

3.1.24. rip default-route

Use **rip default-route** to configure a RIP interface to advertise a default route with a specified metric.

Use **undo rip default-route** to disable a RIP interface from sending a default route.

Syntax

rip default-route { { **only** | **originate** } [**cost** *cost-value*] * | **no-originate** }

undo rip default-route

Default

A RIP interface advertises a default route if the RIP process that the interface runs is enabled to advertise a default route.

Views

Interface view

Predefined user roles

network-admin

Parameters

only: Advertises only a default route.

originate: Advertises both a default route and other routes.

cost-value: Specifies a cost for the default route, in the range of 1 to 15. The default is 1.

no-originate: Advertises only non-default routes.

Usage guidelines

An interface that is enabled to advertise a default route does not receive any default route from RIP neighbors.

Examples

Configure VLAN-interface 10 to advertise only a default route with a metric of 2.

```
<Switch> system-view
[Switch] interface vlan-interface 10
```

```
[Switch-Vlan-interface10] rip default-route only cost 2
```

Configure VLAN-interface 10 to advertise a default route with a metric of 2 and other routes.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip default-route originate cost 2
```

Related commands

default-route

3.1.25. rip input

Use **rip input** to enable an interface to receive RIP messages.

Use **undo rip input** to disable an interface from receiving RIP messages.

Syntax

rip input

undo rip input

Default

An interface is enabled to receive RIP messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable VLAN-interface 10 from receiving RIP messages.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] undo rip input
```

3.1.26. rip metricin

Use **rip metricin** to configure an interface to add a metric to inbound routes.

Use **undo rip metricin** to restore the default.

Syntax

rip metricin [**route-policy** *route-policy-name*] *value*

undo rip metricin

Default

The additional metric of an inbound route is 0.

Views

Interface view

Predefined user roles

network-admin

Parameters

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command adds an additional metric for the routes that match the routing policy.

value: Adds an additional metric to inbound routes, in the range of 0 to 16.

Usage guidelines

When a valid RIP route is received, the system adds a metric to it and then installs it into the routing table. The metric of the route received on the configured interface is then increased. If the sum of the additional metric and the original metric is greater than 16, the metric of the route will be 16.

If a routing policy is referenced with the **route-policy** keyword, the following operations can be performed:

- Routes matching the policy are added with the metric specified in the **apply cost** command configured in the policy. Routes not matching it are added with the metric specified in the **rip metricin** command. The **rip metricin** command does not support specifying the **+** or **–** keyword in the **apply cost** command to add or reduce a metric.
- If the **apply cost** command is not configured in the policy, all the inbound routes are added with the metric specified in the **rip metricin** command.

Examples

Configure VLAN-interface 10 to add a metric of 6 to the inbound route 1.0.0.0/8 and to add a metric of 2 to other inbound routes.

```
<Switch> system-view
[Switch] ip prefix-list 123 permit 1.0.0.0 8
[Switch] route-policy abc permit node 10
[Switch-route-policy-abc-10] if-match ip address prefix-list 123
[Switch-route-policy-abc-10] apply cost 6
[Switch-route-policy-abc-10] quit
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip metricin route-policy abc 2
```

Related commands

apply cost

3.1.27. rip metricout

Use **rip metricout** to configure an interface to add a metric to outbound routes.

Use **undo rip metricout** to restore the default.

Syntax

rip metricout [**route-policy** *route-policy-name*] *value*

undo rip metricout

Default

The additional metric for outbound routes is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

route-policy *route-policy-name*: Specifies a routing policy by its name, a case sensitive string of 1 to 63 characters. If you specify this option, the command adds an additional metric for the routes that match the routing policy.

value: Adds an additional metric to outbound routes, in the range of 1 to 16.

Usage guidelines

With the command configured on an interface, the metric of RIP routes sent on the interface will be increased.

If a routing policy is referenced with the **route-policy** keyword, the following operations can be performed:

- Routes matching the policy is added with the metric specified in the **apply cost** command configured in the policy. Routes not matching it are added with the metric specified in the **rip metricout** command. The **rip metricout** command does not support specifying the **+** or **–** keyword in the **apply cost** command to add or reduce a metric.
- If the **apply cost** command is not configured in the policy, all the outbound routes are added with the metric specified in the **rip metricout** command.

Examples

Configure VLAN-interface 10 to add a metric of 6 to the outbound route 1.0.0.0/8 and to add a metric of 2 to other outbound routes.

```
<Switch> system-view
[Switch] ip prefix-list 123 permit 1.0.0.0 8
[Switch] route-policy abc permit node 10
[Switch-route-policy-abc-10] if-match ip address prefix-list 123
```

```
[Switch-route-policy-abc-10] apply cost 6
[Switch-route-policy-abc-10] quit
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip metricout route-policy abc 2
```

Related commands

apply cost

3.1.28. rip mib-binding

Use **rip mib-binding** to bind a RIP process to MIB.

Use **undo rip mib-binding** to restore the default.

Syntax

rip mib-binding *process-id*

undo rip mib-binding

Default

MIB operation is bound to the RIP process with the smallest process ID.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIP process by its ID in the range of 1 to 65535.

Usage guidelines

If the specified process ID does not exist, the MIB binding configuration does not take effect.

Deleting a RIP process bound to MIB operation deletes the MIB binding configuration. After the RIP process is deleted, MIB operation is bound to the RIP process with the smallest process ID.

Examples

Bind RIP process 100 to MIB.

```
<Switch> system-view
[Switch] rip mib-binding 100
```

3.1.29. rip output

Use **rip output** to enable an interface to send RIP messages.

Use **undo rip output** to disable an interface from sending RIP messages.

Syntax

rip output

undo rip output

Default

An interface sends RIP messages.

Views

Interface view

Predefined user roles

network-admin

Examples

Disable VLAN-interface 10 from sending RIP messages.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] undo rip output
```

3.1.30. rip poison-reverse

Use **rip poison-reverse** to enable the poison reverse feature.

Use **undo rip poison-reverse** to disable the poison reverse feature.

Syntax

rip poison-reverse

undo rip poison-reverse

Default

The poison reverse feature is disabled.

Views

Interface view

Predefined user roles

network-admin

Examples

Enable the poison reverse feature on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip poison-reverse
```

3.1.31. rip split-horizon

Use **rip split-horizon** to enable the split horizon feature.

Use **undo rip split-horizon** to disable the split horizon feature.

Syntax

rip split-horizon

undo rip split-horizon

Default

The split horizon feature is enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

- The split horizon feature prevents routing loops. If you want to disable the feature, make sure the operation is necessary.
- If both split horizon and poison reverse are enabled, only the poison reverse feature takes effect.

Examples

Enable the split horizon feature on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip split-horizon
```

3.1.32. rip summary-address

Use **rip summary-address** to configure a summary route on an interface.

Use **undo rip summary-address** to remove a summary route on an interface.

Syntax

rip summary-address *ip-address* { *mask-length* | *mask* }

undo rip summary-address *ip-address* { *mask-length* | *mask* }

Default

No summary route is configured on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route.

mask-length: Specifies the subnet mask length of the summary route, in the range of 0 to 32.

mask: Specifies the subnet mask of the summary route, in dotted decimal notation.

Usage guidelines

This command takes effect only when automatic route summarization is disabled.

Examples

Configure a summary route on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip summary-address 10.0.0.0 255.255.255.0
```

Related commands

summary

3.1.33. rip version

Use **rip version** to specify a RIP version on an interface.

Use **undo rip version** to restore the default.

Syntax

rip version { **1** | **2** [**broadcast** | **multicast**] }

undo rip version

Default

No RIP version is configured on an interface. The interface can send RIPv1 broadcasts, and receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

Views

Interface view

Predefined user roles

network-admin

Parameters

1: Specifies the RIP version as RIPv1.

2: Specifies the RIP version as RIPv2.

[**broadcast** | **multicast**]: Sends RIPv2 messages in broadcast mode or multicast mode (default).

Usage guidelines

If an interface has no RIP version configured, it uses the global RIP version. Otherwise, it uses the RIP version configured on it.

An interface running RIPv1 can perform the following operations:

- Sends RIPv1 broadcast messages.
- Receives RIPv1 broadcast and unicast messages.

An interface running RIPv2 in broadcast mode can perform the following operations:

- Sends RIPv2 broadcast messages.
- Receives RIPv1 broadcast and unicast messages, and RIPv2 broadcast, multicast, and unicast messages.

An interface running RIPv2 in multicast mode can perform the following operations:

- Sends RIPv2 multicast messages.
- Receives RIPv2 broadcast, multicast, and unicast messages.

Only a limited number of broadcasts can be received and processed by both RIPv1 and RIPv2. It is limited broadcast only. RIP packets for other broadcasts (local/direct) cannot be processed.

Examples

Configure RIPv2 in broadcast mode on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] rip version 2 broadcast
```

Related commands

version

3.1.34. silent-interface

Use **silent-interface** to disable interfaces from sending RIP messages. The interfaces can still receive RIP messages.

Use **undo silent-interface** to enable interfaces to send RIP messages.

Syntax

silent-interface { *interface-type interface-number* | **all** }

undo silent-interface { *interface-type interface-number* | **all** }

Default

All RIP interfaces can send RIP messages.

Views

RIP view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Disables a specified interface from sending RIP messages.

all: Disables all interfaces from sending RIP messages.

Examples

Disable all VLAN interfaces from sending RIP messages except VLAN-interface 10.

```
<Switch> system-view
[Switch] rip 100
[Switch-rip-100] silent-interface all
[Switch-rip-100] undo silent-interface vlan-interface 10
[Switch-rip-100] network 131.108.0.0
```

3.1.35. summary

Use **summary** to enable automatic RIPv2 route summarization. Natural masks are used to advertise summary routes to reduce the size of routing tables.

Use **undo summary** to disable automatic RIPv2 route summarization to advertise all subnet routes.

Syntax

summary

undo summary

Default

Automatic RIPv2 route summarization is enabled.

Views

RIP view

Predefined user roles

network-admin

Usage guidelines

Automatic RIPv2 route summarization can reduce the routing table size to enhance the scalability and efficiency for large networks.

Examples

Disable automatic RIPv2 route summarization.

```
<Switch> system-view
[Switch] rip
[Switch-rip-1] undo summary
```

Related commands

rip summary-address

rip version

3.1.36. timers

Use **timers** to set RIP timers.

Use **undo timers** to restore the default.

Syntax

timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *

undo timers { **garbage-collect** | **suppress** | **timeout** | **update** } *

Default

The garbage-collect timer is 120 seconds, the suppress timer is 120 seconds, the timeout timer is 180 seconds, and the update timer is 30 seconds.

Views

RIP view

Predefined user roles

network-admin

Parameters

garbage-collect-value: Specifies the garbage-collect timer in the range of 1 to 3600 seconds.

suppress-value: Specifies the suppress timer in the range of 0 to 3600 seconds.

timeout-value: Specifies the timeout timer in the range of 1 to 3600 seconds.

update-value: Specifies the update timer in the range of 1 to 3600 seconds.

Usage guidelines

RIP uses the following timers:

- **Update timer**—Specifies the interval between routing updates.
- **Timeout timer**—Specifies the route aging time. If no update for a route is received before the timer expires, RIP sets the metric of the route to 16.
- **Suppress timer**—Specifies how long a RIP route stays in suppressed state. When the metric of a route becomes 16, the route enters the suppressed state. If RIP receives an update for the route with a metric less than 16 from the same neighbor, RIP uses this route to replace the suppressed route.

- **Garbage-collect timer**—Specifies the interval from when the metric of a route becomes 16 to when it is deleted from the routing table. During the garbage-collect timer length, RIP advertises the route with a metric of 16. If no update is announced for that route before the garbage-collect timer expires, RIP deletes the route from the routing table.

As a best practice, do not change the default values of these timers.

The timer lengths must be consistent on all routers on the network.

The timeout timer must be greater than the update timer.

Examples

Set the update, timeout, suppress, and garbage-collect timers to 5, 15, 15, and 30 seconds.

```
<Switch> system-view
[Switch] rip 100
[Switch-rip-100] timers update 5 timeout 15 suppress 15 garbage-collect 30
```

3.1.37. validate-source-address

Use **validate-source-address** to enable source IP address check on inbound RIP routing updates.

Use **undo validate-source-address** to disable source IP address check on inbound RIP routing updates.

Syntax

validate-source-address

undo validate-source-address

Default

Source IP address check on inbound RIP routing updates is enabled.

Views

RIP view

Predefined user roles

network-admin

Examples

Disable source IP address check on inbound RIP routing updates.

```
<Switch> system-view
[Switch-rip] rip 100
[Switch-rip-100] undo validate-source-address
```

3.1.38. version

Use **version** to specify a global RIP version.

Use **undo version** to restore the default.

Syntax

version { **1** | **2** }

undo version

Default

No global RIP version is configured. An RIP interface can send RIPv1 broadcasts and receive RIPv1 broadcasts and unicasts, and RIPv2 broadcasts, multicasts, and unicasts.

Views

RIP view

Predefined user roles

network-admin

Parameters

1: Specifies the RIP version as RIPv1.

2: Specifies the RIP version as RIPv2. RIPv2 messages are multicast.

Usage guidelines

An interface prefers the RIP version configured on it over the global RIP version.

If no RIP version is specified for the interface and the global version is RIPv1, the interface uses RIPv1 and can perform the following operations:

- Send RIPv1 broadcasts.
- Receive RIPv1 broadcasts and unicasts.

If no RIP version is specified for the interface and the global version is RIPv2, the interface uses RIPv2 multicast mode and can perform the following operations:

- Send RIPv2 multicasts.
- Receive RIPv2 broadcasts, multicasts, and unicasts.

Examples

Specify the global RIP version as RIPv2.

```
<Switch> system-view
[Switch] rip 100
[Switch-rip-100] version 2
```

4. OSPF commands

4.1. OSPF commands

4.1.1. abr-summary (OSPF area view)

Use **abr-summary** to configure route summarization on an ABR.

Use **undo abr-summary** to remove the configuration.

Syntax

abr-summary *ip-address* { *mask-length* | *mask* } [**advertise** | **not-advertise**] [**cost** *cost-value*]

undo abr-summary *ip-address* { *mask-length* | *mask* }

Default

Route summarization is not configured on an ABR.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route in dotted decimal notation.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask of the IP address, in dotted decimal notation.

advertise | **not-advertise**: Advertises the summary route or not. By default, the command advertises the summary route.

cost *cost-value*: Specifies the cost of the summary route, in the range of 1 to 16777215. The default cost is the largest cost value among routes that are summarized.

Usage guidelines

This command applies only to an ABR to summarize multiple contiguous networks into one network.

To enable ABR to advertise specific routes that have been summarized, use the **undo abr-summary** command.

Examples

Summarize networks 36.42.10.0/24 and 36.42.110.0/24 in Area 1 into 36.42.0.0/16.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 1
[Switch-ospf-100-area-0.0.0.1] network 36.42.10.0 0.0.0.255
[Switch-ospf-100-area-0.0.0.1] network 36.42.110.0 0.0.0.255
[Switch-ospf-100-area-0.0.0.1] abr-summary 36.42.0.0 255.255.0.0
```

4.1.2. area (OSPF view)

Use **area** to create an OSPF area and enter OSPF area view.

Use **undo area** to remove an OSPF area.

Syntax

area *area-id*

undo area *area-id*

Default

No OSPF areas exist.

Views

OSPF view

Predefined user roles

network-admin

Parameters

area-id: Specifies an area by its ID, an IP address or a decimal integer in the range of 0 to 4294967295 that is translated into the IP address format.

Examples

Create Area 0 and enter Area 0 view.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 0
[Switch-ospf-100-area-0.0.0.0]
```

4.1.3. asbr-summary (OSPF view)

Use **asbr-summary** to configure route summarization on an ASBR.

Use **undo asbr-summary** to remove the configuration.

Syntax

asbr-summary *ip-address* { *mask-length* | *mask* } [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

undo asbr-summary *ip-address* { *mask-length* | *mask* }

Default

Route summarization is not configured on an ASBR.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the destination IP address of the summary route.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask in dotted decimal notation.

cost *cost-value*: Specifies the cost of the summary route, in the range of 1 to 16777214. If you do not specify this option, the largest cost among the summarized routes applies. If the routes in Type-5 LSAs translated from Type-7 LSAs are Type-2 external routes, the largest cost among the summarized routes plus 1 applies.

not-advertise: Disables advertising the summary route. If you do not specify this keyword, the command advertises the route.

nssa-only: Limits the route advertisement to the NSSA area by setting the P-bit of Type-7 LSAs to 0. By default, the P-bit of Type-7 LSAs is set to 1. If the ASBR is also an ABR and **FULL** state neighbors exist in the backbone area, the P-bit of Type-7 LSAs originated by the ASBR is set to 0. This keyword applies to the NSSA ASBR.

tag *tag*: Specifies a tag for the summary route, in the range of 0 to 4294967295. The default is 1. The tag can be used by a routing policy to control summary route advertisement.

Usage guidelines

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.
- Type-5 LSAs translated by the ASBR (also an ABR) from Type-7 LSAs in an NSSA area.

  If the ASBR (ABR) is not a translator, it cannot summarize routes in Type-5 LSAs translated from Type-7 LSAs.

To enable ASBR to advertise specific routes that have been summarized, use the **undo asbr-summary** command.

Examples

Summarize redistributed static routes into a single route, and specify a tag value of 2 and a cost of 100 for the summary route.

```
<Switch> system-view
[Switch] ip route-static 10.2.1.0 24 null 0
[Switch] ip route-static 10.2.2.0 24 null 0
[Switch] ospf 100
[Switch-ospf-100] import-route static
[Switch-ospf-100] asbr-summary 10.2.0.0 255.255.0.0 tag 2 cost 100
```

4.1.4. authentication-mode

Use **authentication-mode** to specify an authentication mode for an OSPF area.

Use **undo authentication-mode** to remove the configuration.

Syntax

For MD5/HMAC-MD5 authentication:

authentication-mode { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string*

undo authentication-mode [{ **hmac-md5** | **md5** } *key-id*]

For simple authentication:

authentication-mode simple { **cipher** | **plain** } *string*

undo authentication-mode

Default

No authentication is performed for an area.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

hmac-md5: Specifies the HMAC-MD5 authentication mode.

md5: Specifies the MD5 authentication mode.

simple: Specifies the simple authentication mode.

key-id: Specifies a key by its ID in the range of 0 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive.

- In simple authentication mode, the plaintext form of the key is a string of 1 to 8 characters. The encrypted form of the key is a string of 33 to 41 characters.
- In MD5/HMAC-MD5 authentication mode, the plaintext form of the key is a string of 1 to 16 characters. The encrypted form of the key is a string of 33 to 53 characters.

Usage guidelines

To establish or maintain adjacencies, routers in the same area must have the same authentication mode and key.

If MD5 or HMAC-MD5 authentication is configured, you can configure multiple keys, each having a unique key ID and key string. As a best practice to minimize the risk of key compromise, use only one key for an area and delete the old key after key replacement.

To replace the key used for MD5 or HMAC-MD5 authentication in an area, you must configure the new key before removing the old key from each router. OSPF uses the key rollover mechanism to ensure that the routers can pass authentication before the replacement is complete across the area. After you configure a new key on a router, the router sends copies of the same packet, each authenticated by a different key, including the new key and the keys in use. This practice continues until the router detects that all its neighbors have the new key.

The authentication algorithm can only be MD5 or HMAC-MD5 and the ID of keys used for authentication can only be in the range of 0 to 255.

Examples

Configure OSPF Area 0 to use the MD5 authentication mode, and set the key ID to 15 and the key to **abc** in plaintext form.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 0
[Switch-ospf-100-area-0.0.0.0] authentication-mode md5 15 plain abc
```

Related commands

ospf authentication-mode

4.1.5. bandwidth-reference (OSPF view)

Use **bandwidth-reference** to set a reference bandwidth value for link cost calculation.

Use **undo bandwidth-reference** to restore the default value.

Syntax

bandwidth-reference *value*

undo bandwidth-reference

Default

The reference bandwidth value is 100 Mbps for link cost calculation.

Views

OSPF view

Predefined user roles

network-admin

Parameters

value: Specifies the reference bandwidth value for link cost calculation, in the range of 1 to 4294967 Mbps.

Usage guidelines

If no cost values are configured for links, OSPF calculates their cost values by using the following formula: Cost = Reference bandwidth value(100 Mbps) / Expected interface bandwidth(Mbps). If the calculated cost is greater than 65535, the value of 65535 is used. If the calculated cost is less than 1, the value of 1 is used.

Examples

Set the reference bandwidth value to 1000 Mbps.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] bandwidth-reference 1000
```

Related commands

ospf cost

4.1.6. default (OSPF view)

Use **default** to configure default parameters for redistributed routes.

Use **undo default** to remove the configuration.

Syntax

default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *

undo default { **cost** | **tag** | **type** } *

Default

The cost is 1, the tag is 1, and the route type is 2.

Views

OSPF view

Predefined user roles

network-admin

Parameters

cost *cost-value*: Specifies a default cost for redistributed routes, in the range of 0 to 16777214.

tag *tag*: Specifies a tag for redistributed routes, in the range of 0 to 4294967295.

type *type*: Specifies a type for redistributed routes: 1 or 2.

Examples

Set the default cost, tag, and type to 10, 100, and 2 for redistributed external routes.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] default cost 10 tag 100 type 2
```

Related commands

import-route

4.1.7. default-cost (OSPF area view)

Use **default-cost** to set a cost for the default route advertised to the stub or NSSA area.

Use **undo default-cost** to restore the default value.

Syntax

default-cost *cost-value*

undo default-cost

Default

The cost is 1.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a cost for the default route advertised to the Stub or NSSA area, in the range of 0 to 16777214.

Usage guidelines

This command takes effect only on the ABR of a stub area or the ABR or ASBR of an NSSA area.

Examples

Configure Area 1 as a stub area, and set the cost of the default route advertised to the stub area to 20.

```
<Switch> system-view
[Switch] ospf 100
```

```
[Switch-ospf-100] area 1
[Switch-ospf-100-area-0.0.0.1] stub
[Switch-ospf-100-area-0.0.0.1] default-cost 20
```

Related commands

nssa

stub

4.1.8. default-route-advertise (OSPF view)

Use **default-route-advertise** to redistribute a default route into the OSPF routing domain.

Use **undo default-route-advertise** to restore the default.

Syntax

default-route-advertise [**always** | **permit-calculate-other** | **cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *

default-route-advertise [**summary cost** *cost-value*]

undo default-route-advertise

Default

No default route is redistributed into the OSPF routing domain.

Views

OSPF view

Predefined user roles

network-admin

Parameters

always: Redistributes a default route in a Type-5 LSA into the OSPF routing domain regardless of whether a default route exists in the routing table. If you do not specify this keyword, the router redistributes a default route only when an active default route that does not belong to the current OSPF process exists in the IP routing table.

permit-calculate-other: Enables OSPF to calculate default routes received from other routers. If you do not specify this keyword, OSPF does not calculate default routes from other routers. If the router does not redistribute any default route in a Type-5 LSA into the OSPF routing domain, the router calculates default routes from other routers. It calculates these routes regardless of whether this keyword is specified.

cost *cost-value*: Specifies a cost for the default route, in the range of 0 to 16777214. If you do not specify this option, the default cost specified by the **default-cost** command applies.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters. When the routing policy is matched and one of the

following conditions is met, the command redistributes a default route in a Type-5 LSA into the OSPF routing domain:

- A default route exists in the routing table.
- The **always** keyword is specified.

The routing policy modifies values in the Type-5 LSA.

type *type*: Specifies a type for the Type-5 LSA: 1 or 2. If you do not specify this option, the default type for the Type-5 LSA specified by the **default type** command applies.

summary: Advertises the specified default route in a Type-3 LSA. This keyword is available only for VPNs.

Usage guidelines

This command redistributes a default route in a Type-5 LSA, which cannot be redistributed with the **import-route** command. If the local routing table has no default route, you must specify the **always** keyword for the command.

The **default-route-advertise summary cost** command is applicable only to VPNs. It enables a PE router to redistribute a default external route in a Type-3 LSA to CE routers.

Examples

Redistribute a default route into the OSPF routing domain, regardless of whether the default route exists in the local routing table.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] default-route-advertise always
```

Related commands

default

import-route

4.1.9. description (OSPF/OSPF area view)

Use **description** to configure a description for an OSPF process or area.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an OSPF process or area.

Views

OSPF view

OSPF area view

Predefined user roles

network-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Usage guidelines

The description specified by this command is used to identify an OSPF process or area.

Examples

Describe OSPF process 100 as **abc**.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] description abc
```

Describe OSPF Area 0 as **bone area**.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 0
[Switch-ospf-100-area-0.0.0.0] description bone area
```

4.1.10. display ospf

Use **display ospf** to display OSPF process information.

Syntax

display ospf [*process-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about all OSPF processes.

verbose: Displays detailed OSPF process information. If you do not specify this keyword, the command displays brief OSPF process information.

Examples

Display detailed OSPF process information.

```
<Switch> display ospf verbose
```

```
          OSPF Process 1 with Router ID 192.168.1.2
                  OSPF Protocol Information

RouterID: 192.168.1.2      Router type:  NSSA
Route tag: 0
Multi-VPN-Instance is not enabled

Table 4-1 Command output

Field	Description
OSPF Process 1 with Router ID 192.168.1.2	OSPF process ID and OSPF router ID.
RouterID	Router ID.
Router type	Router type: • ABR. • ASBR. • NSSA. • Null.
Route tag	Tag of redistributed routes.
Multi-VPN-Instance is not enabled	The OSPF process does not support multi-VPN-instance.
Ext-community type	OSPF extended community attribute type codes: • **domain ID**—Domain ID code. • **router type**—Router type code. • **router ID**—Router ID code.
Domain ID	OSPF domain ID (primary ID).
Opaque capable	Opaque LSA advertisement and reception capability is enabled.
Originating router-LSAs with maximum metric	The maximum cost value for router LSAs (excluding stub links) is used.
Condition	Status of the stub router: • Always. • On startup while BGP is converging. • On startup while BGP is converging for *xxx* seconds, where *xxx* is specified by the user. • On startup for *xxx* seconds, where *xxx* is specified by the user.
State	Whether the stub router is active.
SPF-schedule-interval	Interval for SPF calculations.

Field	Description
LSA generation interval	LSA generation interval.
LSA arrival interval	LSA arrival interval.
Transmit pacing	LSU packet transmit rate of the interface: • **Interval**—LSU transmit interval of the interface. • **Count**—Maximum number of LSU packets sent at each interval.
Default ASE parameters	Default ASE parameters: **Metric**, **Tag**, and **Type**.
Route preference	Internal route preference.
ASE route preference	External route preference.
SPF computation count	SPF computation count of the OSPF process.
RFC1583 compatible	Compatible with RFC 1583.
Graceful restart interval	GR interval.
SNMP trap rate limit interval	SNMP notification sending interval.
Count	Number of sent SNMP notifications.
ExChange/Loading neighbors	Neighbors in ExChange/Loading state.
Full neighbors	Neighbors in Full state.
Calculation trigger type	Route calculation trigger type: • **Full**—Calculation of all routes is triggered. • **Area topology change**—Topology change in an area. • **Intra router change**—Incremental intra-area route change. • **ASBR change**—Incremental ASBR route change. • **7to5 translator**—Type-7-to-Type-5 LSA translator role change. • **Full IP prefix**—Calculation of all IP prefixes is triggered. • **Full intra AS**—Calculation of all intra-AS prefixes is triggered. • **Inc intra AS**—Calculation of incremental intra-AS prefixes is triggered. • **Full inter AS**—Calculation of all AS-external prefixes is triggered. • **Inc inter AS**—Calculation of incremental AS-external prefixes is triggered. • **N/A**—Route calculation is not triggered.
Current calculation type	Current route calculation type: • SPF calculation. • **Intra router calculation**—Intra-area route calculation. • **ASBR calculation**—Inter-area ASBR route calculation. • **Inc intra router**—Incremental intra-area route calculation. • **Inc ASBR calculation**—Incremental

Field	Description
	inter-area ASBR route calculation. • **7to5 translator**—Type-7-to-Type-5 LSA calculation. • **Full intra AS**—Calculation of all intra-AS prefixes. • **Inc intra AS**—Calculation of incremental intra-AS prefixes. • **Full inter AS**—Calculation of all AS-external prefixes. • **Inc inter AS**—Calculation of incremental AS-external prefixes. • **Forward address**—Forwarding address calculation. • **N/A**—Route calculation is not triggered.
Current calculation phase	Current route calculation phase: • **Calculation area topology**—Calculating area topology. • **Calculation router**—Calculating routes on routers. • **Calculation intra AS**—Calculating intra-AS routes. • **7to5 translator**—Calculating Type-7-to-Type-5 LSAs. • **Forward address**—Calculating forwarding addresses. • **Calculation inter AS**—Calculating AS-external routes. • **Calculation end**—Ending phase of calculation. • **N/A**—Route calculation is not triggered.
Process reset state	Process reset state: • **N/A**—The process is not reset. • **Under reset**—The process is in the reset progress. • **Under RIB smooth**—The process is synchronizing the RIB.
Current reset type	Current process reset type: • **N/A**—The process is not reset. • **Normal**—Normal reset. • **GR quit**—Normal reset when GR quits abnormally. • **Delete**—Delete OSPF process. • **VPN delete**—Delete VPN.
Next reset type	Next process reset type: • **N/A**—The process is not reset. • **Normal**—Normal reset. • **GR quit**—Normal reset when GR quits abnormally. • **Delete**—Delete OSPF process.
Reset prepare message replied	Modules that reply reset prepare messages: • **P**—Neighbor maintenance module.

Field	Description
	• **L**—LSDB synchronization module. • **C**—Route calculation module. • **R**—Route redistribution module.
Reset process message replied	Modules that reply reset process messages: • **P**—Neighbor maintenance module. • **L**—LSDB synchronization module. • **C**—Route calculation module. • **R**—Route redistribution module.
Reset phase of module	Reset phase of each module: • Main control module: ○ **N/A**—Not reset. ○ Delete area. ○ Delete process. • Neighbor maintenance (P) module: ○ **N/A**—Not reset. ○ Delete neighbor. ○ Delete interface. ○ **Delete vlink**—Delete virtual link. • LSDB synchronization (L) module: ○ **N/A**—Not reset. ○ Stop timer. ○ **Delete ASE**—Delete all ASE LSAs. ○ **Delete ASE maps**—Delete ASE LSA maps. ○ Clear process data. ○ **Delete area LSA**—Delete LSAs and maps from an area. ○ **Delete area interface**—Delete interfaces from an area. ○ **Delete process**—Delete process-related resources. ○ **Restart**—Restart process-related resources. • Route calculation (C) module: ○ **N/A**—Not reset. ○ **Delete topology**—Delete area topology. ○ **Delete router**—Delete routes of routers. ○ **Delete intra AS**—Delete intra-AS routes ○ **Delete inter AS**—Delete AS-external routes. ○ **Delete forward address**—Delete forwarding address list. ○ **Delete advertise**—Delete advertising router list. • Route redistribution (R) module: ○ **N/A**—Not reset. ○ **Delete ABR summary**—Delete summary routes of the ABR. ○ **Delete ASBR summary**—Delete summary routes of the ASBR. ○ **Delete import**—Delete redistributed routes.

Field	Description
Area	Area ID in the IP address format.
MPLS TE not enabled	This field is not supported in the current software version. Whether MPLS TE is enabled for the OSPF area.
Authtype	Authentication type of the area: • **None**—No authentication. • **Simple**—Simple authentication. • **MD5**—MD5 authentication. • **Keychain**—Keychain authentication.
Area flag	Type of the area: • Normal. • Stub. • StubNoSummary (totally stub area). • NSSA. • NSSANoSummary (totally NSSA area).
7/5 translator state	State of the translator that translates Type-7 LSAs to Type-5 LSAs: • **Enabled**—The translator is specified through commands. • **Elected**—The translator is designated through election. • **Disabled**—The device is not a translator.
7/5 translate stability timer interval	Stability interval for Type-7 LSA-to-Type-5 LSA translation.
SPF scheduled Count	SPF calculation count in the OSPF area.
Interface	Interface in the area.
Cost	Interface cost.
State	Interface state.
Type	Interface network type.
MTU	Interface MTU.
Priority	Router priority.
Timers	OSPF timers: • **Hello**—Interval for sending hello packets. • **Dead**—Interval within which the neighbor is down. • **Poll**—Interval for sending hello packets. • **Retransmit**—Interval for retransmitting LSAs.
FRR backup	Whether Loop Free Alternate (LFA) calculation is enabled on an interface.
Simple authentication enabled	Simple authentication is enabled.
Keychain authentication enabled, name is *xx*	Keychain authentication is enabled. The name of the keychain is *xx*.
MD5 authentication enabled	MD5/HMAC-MD5 authentication is enabled.
The last key is *xx*	The most recent MD5/HMAC-MD5 authentication

Field	Description
	key ID is *xx*.
The rollover is in progress, *xx* neighbor(s) left	Key rollover for MD5/HMAC-MD5 authentication is in progress. The number of neighbors that have not completed rollover is *xx*.
Packet size	Maximum length of OSPF packets that can be sent by the interface.

4.1.11. display ospf abr-asbr

Use **display ospf abr-asbr** to display routes to the ABR or ASBR.

Syntax

display ospf [*process-id*] **abr-asbr** [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays routes to the ABR and ASBR for all OSPF processes.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

Usage guidelines

If you use this command on routers in a stub area, the commands displays no ASBR information.

Examples

Display brief information about routes to the ABR or ASBR.

```
<Switch> display ospf abr-asbr

          OSPF Process 1 with Router ID 192.168.1.2
                  Routing Table to ABR and ASBR

                 Topology base (MTID 0)
 Type        Destination       Area        Cost  Nexthop         RtType
 Inter       3.3.3.3           0.0.0.0     3124  10.1.1.2        ASBR
 Intra       2.2.2.2           0.0.0.0     1562  10.1.1.2        ABR
```

Display detailed information about routes to the ABR or ASBR.

```
<Switch> display ospf abr-asbr verbose

          OSPF Process 10 with Router ID 101.1.1.11
                  Routing Table to ABR and ASBR

                Topology base (MTID 0)

 Destination: 1.1.1.1            RtType      : ASBR
 Area       : 0.0.0.1            Type        : Intra
 Nexthop    : 150.0.1.12         BkNexthop   : 0.0.0.0
 Interface  : Vlan10             BkInterface: N/A
 Cost       : 1000
```

Table 4-2 Command output

Field	Description
Type	Type of the route to the ABR or ASBR: • **Intra**—Intra-area route. • **Inter**—Inter-area route.
Topology	This field is not supported in the current software version. Topology name. The topology name for base topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Destination	Router ID of an ABR or ASBR.
Area	ID of the area of the next hop.
Cost	Cost from the router to the ABR or ASBR.
Nexthop	Next hop address.
BkNexthop	Backup next hop address.
RtType	Router type: ABR or ASBR.
Interface	Output interface.
BkInterface	Backup output interface.

4.1.12. display ospf abr-summary

Use **display ospf abr-summary** to display ABR summary route information.

Syntax

display ospf [*process-id*] [**area** *area-id*] **abr-summary** [*ip-address* { *mask-length* | *mask* }] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about ABR summary routes for all OSPF processes.

area *area-id*: Specifies an OSPF area by its ID. The area ID is an IP address or a decimal integer in the range of 0 to 4294967295 that is translated into the IP address format. If you do not specify this option, the command displays information about ABR summary routes for all OSPF areas.

ip-address: Specifies a summary route by its IP address.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask in dotted decimal notation.

verbose: Displays detailed ABR summary route information. If you do not specify this keyword, the command displays brief ABR summary route information.

Usage guidelines

If you do not specify an IP address, this command displays information about all summary routes on the ABR.

Examples

Display brief information about summary routes on the ABR.

```
<Switch> display ospf abr-summary

          OSPF Process 1 with Router ID 2.2.2.2
                  ABR Summary Addresses

                Topology base (MTID 0)
                        Area: 0.0.0.1
 Total summary address count: 1
 Net             Mask            Status        Count      Cost
 100.0.0.0       255.0.0.0       Advertise     1          (Not Configured)
```

Table 4-3 Command output

Field	Description
Topology	This field is not supported in the current software version. Topology name. The topology name for base

Field	Description
	topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Area	Area to which the summary routes belong.
Total summary address count	Total number of summary routes.
Net	Address of the summary route.
Mask	Mask of the summary route address.
Status	Advertisement status of the summary route: **Advertise** or **Non-Advertise**.
Count	Number of summarized routes.
Cost	Cost of the summary route.

Display detailed information about summary routes on the ABR.

```
<Switch> display ospf abr-summary verbose

          OSPF Process 1 with Router ID 2.2.2.2
                  ABR Summary Addresses

                Topology base (MTID 0)
                        Area: 0.0.0.1
 Total summary address count: 1

 Net          : 100.0.0.0
 Mask         : 255.0.0.0
 Status       : Advertise
 Cost         : (Not Configured)
 Routes count: 1
   Destination            NetMask                Metric
   100.1.1.0              255.255.255.0          1000
```

Table 4-4 Command output

Field	Description
Topology	This field is not supported in the current software version. Topology name. The topology name for base topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Destination	Destination address of a summarized route.
NetMask	Network mask of a summarized route.

Field	Description
Metric	Metric of a summarized route.

4.1.13. display ospf asbr-summary

Use **display ospf asbr-summary** to display ASBR summary route information.

Syntax

display ospf [*process-id*] **asbr-summary** [*ip-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about ASBR summary routes for all OSPF processes.

ip-address: Specifies an IP address in dotted decimal notation.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask in dotted decimal notation.

Usage guidelines

If you do not specify an IP address, this command displays information about all ASBR summary routes.

Examples

Display ASBR summary route information in OSPF process 1.

```
<Switch> display ospf 1 asbr-summary

          OSPF Process 1 with Router ID 2.2.2.2
                  Summary Addresses

                Topology base (MTID 0)
 Total summary address count: 1

                  Summary Address

 Net         : 30.1.0.0
```

```
Mask         : 255.255.0.0
Tag          : 20
Status       : Advertise
Cost         : 10 (Configured)
Route count : 2

Destination     Net mask        Proto      Process   Type     Metric

30.1.2.0        255.255.255.0   OSPF       2         2        1
30.1.1.0        255.255.255.0   OSPF       2         2        1
```

Table 4-5 Command output

Field	Description
Topology	This field is not supported in the current software version. Topology name. The topology name for base topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Total summary address count	Total number of summary routes.
Net	Address of the summary route.
Mask	Mask of the summary route address.
Tag	Tag of the summary route.
Status	Advertisement status of the summary route.
Cost	Cost of the summary route.
Route count	Number of summarized routes.
Destination	Destination address of a summarized route.
Net mask	Network mask of a summarized route.
Proto	Routing protocol from which the route was redistributed.
Process	Process ID of the routing protocol from which the route was redistributed.
Type	Type of a summarized route.
Metric	Metric of a summarized route.

4.1.14. display ospf event-log

Use **display ospf event-log** to display OSPF log information.

Syntax

display ospf [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays OSPF log information for all processes.

lsa-flush: Specifies LSA aging log information.

peer: Specifies neighbor log information.

spf: Specifies route calculation log information.

Usage guidelines

Route calculation logs show the number of routes newly installed in the IP routing table.

Neighbor logs include information about the following events:

- The OSPF neighbor state goes down.
- The OSPF neighbor state goes backward because the local end receives BadLSReq, SeqNumberMismatch, and 1-Way events.

Examples

Display OSPF LSA aging log information for all processes.

```
<Switch> display ospf event-log lsa-flush

          OSPF Process 1 with Router ID 1.1.1.1
                  LSA Flush Log

 Date: 2013-09-22 Time: 14:47:33 Received MaxAge LSA from 10.1.1.1
 Type: 1   LS ID: 2.2.2.2         AdvRtr: 2.2.2.2           Seq#: 80000001

 Date: 2013-09-22 Time: 14:47:33 Flushed MaxAge LSA by the self
 Type: 1   LS ID: 1.1.1.1         AdvRtr: 1.1.1.1           Seq#: 80000001

 Date: 2013-09-22 Time: 14:47:33 Received MaxAge LSA from 10.1.2.2
 Type: 1   LS ID: 2.2.2.2         AdvRtr: 2.2.2.2           Seq#: 80000001

 Date: 2013-09-22 Time: 14:47:33 Flushed MaxAge LSA by the self
 Type: 1   LS ID: 1.1.1.1         AdvRtr: 1.1.1.1           Seq#: 80000001
```

Table 4-6 Command output

Field	Description
Date/Time	Time when the device receives an LSA that has reached the maximum age.

Field	Description
Received MaxAge LSA from *X.X.X.X*	The device received an LSA that has reached the maximum age from *X.X.X.X*.
Flushed MaxAge LSA by the self	The device flushed the LSA that has reached the maximum age.
Type	LSA type.
LS ID	LSA link state ID.
AdvRtr	Advertising router.
Seq#	LSA sequence number.

Display OSPF route calculation log information for all processes.

```
<Switch> display ospf event-log spf

          OSPF Process 1 with Router ID 1.1.1.2
                  SPF Log

                Topology base (MTID 0)

Date       Time     Duration   Intra Inter External Reason
2012-06-27 15:28:26 0.95       1     1     10000    Intra-area LSA
2012-06-27 15:28:23 0.2        0     0     0        Area 0 full neighbor
2012-06-27 15:28:19 0          0     0     0        Intra-area LSA
2012-06-27 15:28:19 0          0     0     0        external LSA
2012-06-27 15:28:19 0.3        0     0     0        Intra-area LSA
2012-06-27 15:28:12 0          1     0     0        Intra-area LSA
2012-06-27 15:28:11 0          0     0     0        Routing policy
2012-06-27 15:28:11 0          0     0     0        Intra-area LSA
```

Table 4-7 Command output

Field	Description
Topology	This field is not supported in the current software version. Topology name. The topology name for base topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Date/Time	Time when the route calculation starts.
Duration	Duration of the route calculation, in seconds.
Intra	Number of intra-area routes newly installed in the IP routing table.
Inter	Number of inter-area routes newly installed in the IP routing table.
External	Number of external routes newly installed in the IP routing table.
Reason	Reasons why the route calculation is performed: • **Intra-area LSA**—Intra-area LSA changes. • **Inter-area LSA**—Inter-area LSA changes.

Field	Description
	• **External LSA**—External LSA changes. • **Configuration**—Configuration changes. • **Area 0 full neighbor**—Number of **FULL**-state neighbors in Area 0 changes. • **Area 0 up interface**—Number of interfaces in up state in Area 0 changes. • **LSDB overflow state**—Overflow status changes. • **AS number**—AS number changes. • **ABR summarization**—ABR summarization changes. • **GR end**—GR ends. • **Routing policy**—Routing policy changes. • **Intra-area tunnel**—Intra-area tunnel changes. • **Others**—Other reasons.

Display OSPF neighbor log information for OSPF process 1.

```
<Switch> display ospf 1 event-log peer

          OSPF Process 1 with Router ID 1.1.1.1
                 Neighbors Log

Date       Time     Local Address   Remote Address  Router ID       Reason
2012-12-31 12:35:45 197.168.1.1     197.168.1.2     2.2.2.2         IntPhyChange
2012-12-31 12:35:19 197.168.1.1     197.168.1.2     2.2.2.2         ConfNssaArea
2012-12-31 12:34:59 197.168.1.1     197.168.1.2     2.2.2.2         SilentInt
```

Table 4-8 Command output

Field	Description
Date/Time	Time when the neighbor state changes.
Local Address	Local address of the neighbor relationship.
Remote Address	Peer address of the neighbor relationship.
Router ID	Neighbor router ID.
Reason	Reasons for neighbor state changes: • **ResetConnect**—The connection is lost due to insufficient memory. • **IntChange**—The interface parameter has changed. • **VlinkChange**—The virtual link parameter has changed. • **ResetOspf**—The OSPF process is reset. • **UndoOspf**—The OSPF process is deleted. • **UndoArea**—The OSPF area is deleted. • **UndoNetwork**—The interface is disabled. • **SilentInt**—The interface is configured as a silent interface. • **IntLogChange**—The logical attribute of the interface has changed. • **IntPhyChange**—The physical attribute of the interface has changed. • **IntVliChange**—The virtual link attribute of the interface has changed.

Field	Description
	• **VlinkDown**—The virtual link goes down. • **DeadExpired**—The dead timer expires. • **ConfStubArea**—The interface is configured with stub area parameters. • **ConfNssaArea**—The interface is configured with NSSA area parameters. • **AuthChange**—The authentication type has changed. • **OpaqueChange**—The Opaque capability has changed. • **Retrans**—Excessive retransmissions. • **LLSChange**—The LLS capability has changed. • **OOBChange**—The OOB capability has changed. • **GRChange**—The GR capability has changed. • **BFDDown**—The interface is shut down by BFD. • **BadLSReq**—The interface receives BadLSReq events. • **SeqMismatch**—The interface receives SeqNumberMismatch events. • **1-Way**—The interface receives 1-Way events. • **LocalNoLSA**—The requested LSA does not exist. • **SameLSAReq**—The received LSA is in the local request queue. • **OldLSAReq**—The received LSA has a larger aging time than the requested LSA in the local request queue. • **DdTimerOut**—Receives a DD packet after the hello timer expires. • **EAChange**—The External Attribute bit has changed. • **RecvNoDupPkt**—Receives a non-duplicate DD packet in loading or full status. • **EbitChange**—The E bit has changed. • **MSbitChange**—The MS bit has changed. • **IbitChange**—The I bit has changed. • **MSeqNumError**—The primary router receives an unexpected serial number from the secondary router. • **SSeqNumError**—The secondary router receives an unexpected serial number from the primary router. • **RecvOpqIntf**—A DD packet that contains a type 9 LSA is received when the opaque LSA reception and advertisement capability is disabled. • **RecvOpqArea**—A DD packet that contains a type 10 LSA is received when the opaque LSA reception and advertisement capability is disabled. • **RecvOpqAs**—A DD packet that contains a type 11 LSA is received when the opaque LSA reception and advertisement capability is disabled. • **RecvNSSA**—A DD packet that contains a type 7 LSA is received in a non-NSSA area. • **InvalidLSA**—A DD packet that contains an invalid LSA is received. • **RecvASE**—A DD packet that contains a type 5 LSA is received on a virtual link or in a stub area.

Related commands

`reset ospf event-log`

4.1.15. display ospf graceful-restart

Use **display ospf graceful-restart** to display GR information.

Syntax

display ospf [*process-id*] **graceful-restart** [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays GR information for all processes.

verbose: Displays detailed GR information. If you do not specify this keyword, the command displays brief GR information.

Examples

Display detailed GR information.

```
<Switch> display ospf graceful-restart verbose

          OSPF Process 1 with Router ID 1.1.1.1
              Graceful Restart information

Graceful Restart capability     : Enable(IETF)
Graceful Restart support        : Planned and un-planned,Partial
Helper capability                 : Enable(IETF)
Helper support                  : Planned and un-planned(IETF),Strict LSA check
Current GR state                : Normal
Graceful Restart period         : 40 seconds
Number of neighbors under Helper: 0
Number of restarting neighbors  : 0
Last exit reason:
  Restarter  : None
  Helper     : None

Area: 0.0.0.0
Authtype: None Area flag: Normal
Area up Interface count: 2

Interface: 40.4.0.1 (Vlan-interface40)
Restarter state: Normal  State: P-2-P     Type: PTP
Last exit reason:
```

```
  Restarter  : None
  Helper     : None
Neighbor count of this interface: 1
Number of neighbors under Helper: 0
Neighbor        IP address      GR state     Last Helper exit reason
3.3.3.3         40.4.0.3        Normal       None

Virtual-link Neighbor-ID  -> 4.4.4.4, Neighbor-State: Full
Restarter state: Normal
Interface: 20.2.0.1 (Vlink)
Transit Area: 0.0.0.1
Last exit reason:
  Restarter  : None
  Helper     : None
Neighbor        IP address      GR state     Last Helper exit reason
4.4.4.4         20.2.0.4        Normal       Reset neighbor
```

Table 4-9 Command output

Field	Description
OSPF Process 1 with Router ID 1.1.1.1 Graceful Restart information	GR information for OSPF process 1 with router ID 1.1.1.1.
Graceful Restart capability	Whether GR is enabled: • **Enable(IETF)**—IETF GR is enabled. • **Enable(Nonstandard)**—Non-IETF GR is enabled. • **Disable**—GR is disabled.
Graceful Restart support	GR modes that the process supports (displayed only when GR is enabled): • **Planned and un-planned**—Supports both planned and unplanned GR. • **Planned only**—Supports only planned GR. • **Partial**—Supports partial GR. • **Global**—Supports global GR.
Helper capability	Helper capability that the process supports: • **Enable (IETF)**—Supports IETF GR helper capability. • **Enable (Nonstandard)**—Supports non-IETF GR helper capability. • **Enable (IETF and nonstandard)**—Supports both IETF GR helper capability and non-IETF GR helper capability. • **Disable**—Does not support GR helper capability.
Helper support	Policies that the helper supports (displayed only when GR helper is enabled): • **Strict lsa check**—The helper supports strict LSA checking. • **Planned and un-planned**—The helper supports planned and unplanned GR.

Field	Description
	• **Planned only**—The helper supports only planned GR.
Current GR state	GR state: • **Normal**—GR is not in progress or has completed. • **Under GR**—GR is in process. • **Under Helper**—The process is acting as GR helper.
Last exit reason	Last exit reason: • **Restarter**—Reason that the restarter exited most recently. • **Helper**—Reason that the helper exited most recently.
Area	Area ID in IP address format.
Authtype	Authentication type of the area: • **None**—No authentication. • **Simple**—Simple authentication. • **MD5**—MD5 authentication. • **Keychain**—Keychain authentication.
Area flag	Type of the area: • Normal. • Stub. • StubNoSummary (totally stub area). • NSSA. • NSSANoSummary (totally NSSA area).
Area up Interface count	Number of up interfaces in the area.
Interface	Interface in the area.
Restarter state	Restarter state on the interface.
State	Interface state.
Type	Interface network type.
Neighbor count of this interface	Neighbors of an interface.
Neighbor	Neighbor router ID.
IP address	Neighbor IP address.
GR state	Neighbor GR state: • **Normal**—GR is not in progress or has completed. • **Under GR**—GR is in process. • **Under Helper**—The process is acting as GR helper.
Last Helper exit reason	Reason that the helper exited most recently.
Virtual-link Neighbor-ID	Router ID of the virtual link's neighbor.
Neighbor-State	Neighbor state: Down, Init, 2-Way, ExStart, Exchange, Loading, and Full.
Interface	Output interface of the virtual link.

4.1.16. display ospf interface

Use **display ospf interface** to display OSPF interface information.

Syntax

display ospf [*process-id*] **interface** [*interface-type interface-number* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process ID in the range of 1 to 65535. If you do not specify this argument, the command displays the OSPF interface information for all OSPF processes.

interface-type interface-number: Specifies an interface by its type and number.

verbose: Displays detailed OSPF information for all interfaces.

Usage guidelines

If you do not specify the *interface-type interface-number* argument or the **verbose** keyword, this command displays OSPF brief information for all interfaces.

Examples

Display all OSPF interface brief information.

```
<Switch> display ospf interface

          OSPF Process 1 with Router ID 192.168.1.1
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type         State    Cost  Pri   DR              BDR
 192.168.1.1     PTP          P-2-P    1562  1     0.0.0.0         0.0.0.0

 Area: 0.0.0.1
 IP Address      Type         State    Cost  Pri   DR              BDR
 172.16.0.1      Broadcast    DR       1     1     172.16.0.1      0.0.0.0
```

Table 4-10 Command output

Field	Description
Area	Area ID of the interface.
IP Address	Interface IP address (regardless of whether TE is enabled or not).

Field	Description
Type	Interface network type: PTP (P2P), PTMP (P2MP), Broadcast, or NBMA.
State	Interface state: • **DOWN**—No protocol traffic can be sent or received on the interface. • **Loopback**—The interface is in loopback state and it cannot forward traffic. • **Waiting**—The interface starts sending and receiving Hello packets. The router is trying to determine the identity of the (Backup) designated router for the network. • **P-2-P**—The interface will send Hello packets at the hello interval, and try to establish an adjacency with the neighbor. • **DR**—The router is the designated router on the network. • **BDR**—The router is the backup designated router on the network. • **DROther**—The router is a DR Other router on the attached network.
Cost	Interface cost.
Pri	Router priority.
DR	DR on the interface's network segment.
BDR	BDR on the interface's network segment.

Display detailed information about VLAN-interface 10.

```
<Switch> display ospf interface vlan-interface 10

          OSPF Process 1 with Router ID 192.168.1.1
                  Interfaces

 Area: 0.0.0.0

 Interface: 172.16.0.1 (Vlan-interface10)
 Cost: 1       State: DR        Type: Broadcast    MTU: 1500
 Priority: 1
 Designated router: 172.16.0.1
 Backup designated router: 0.0.0.0
 Timers: Hello 10, Dead 40, Poll  40, Retransmit 5, Transmit Delay 1
 FRR backup: Enabled
 Primary path detection mode: BFD ctrl
 Enabled by interface configuration (including secondary IP addresses)
 BFD: echo
 MD5 authentication enabled.
    The last key is 3.
    The rollover is in progress, 2 neighbor(s) left.
 LDP state: No-LDP
 LDP sync state: Achieved
 Packet size: 1000
```

Table 4-11 Command output

Field	Description
Interface	Information about the interface, such as the IP address.
Timers	OSPF timers (in seconds): **Hello**, **Dead**, **Poll**, and **Retransmit**.
Transmit Delay	LSA transmission delay on the interface, in seconds.
FRR backup	Whether LFA calculation is enabled on an interface.
Primary path detection mode	Primary link detection mode: • **BFD ctrl**—BFD control packet mode. • **BFD echo**—BFD echo packet mode.
Enabled by interface configuration (including secondary IP addresses)	OSPF is enabled on the interface (including secondary IP addresses).
BFD	BFD session mode enabled on the interface: • **ctrl**—BFD control packet mode. • **echo**—BFD echo packet mode.
Simple authentication enabled	Simple authentication is enabled.
Keychain authentication enabled, name is *xx*	Keychain authentication is enabled. The name of the keychain is *xx*.
MD5 authentication enabled	MD5/HMAC-MD5 authentication is enabled.
The last key is *xx*	The most recent MD5/HMAC-MD5 authentication key ID is *xx*.
The rollover is in progress, *xx* neighbor(s) left.	Key rollover for MD5/HMAC-MD5 authentication is in progress. The number of neighbors that have not completed rollover is *xx*.
LDP state	LDP state: • **Init**—Initialization state. LDP has not been delivered. • **No-LDP**—LDP is not configured. • **Not ready**—LDP sessions have not been established. • **Ready**—LDP sessions have been established.
LDP sync state	LDP IGP synchronization state: • **Init**—Initialization state. • **Achieved**—LDP has been synchronized. • **Max cost**—OSPF advertises the maximum cost in LSAs.
Packet size	Maximum length of OSPF packets that can be sent by the interface.

4.1.17. display ospf lsdb

Use **display ospf lsdb** to display OSPF LSDB information.

Syntax

display ospf [*process-id*] **lsdb** [**brief** | **originate-router** *advertising-router-id* | **self-originate**]

display ospf [*process-id*] **lsdb** { **opaque-as** | **ase** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**]

display ospf [*process-id*] [**area** *area-id*] **lsdb** { **asbr** | **network** | **nssa** | **opaque-area** | **opaque-link** | **router** | **summary** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays LSDB information for all OSPF processes.

area *area-id*: Specifies an OSPF area by its ID. The area ID is an IP address or a decimal integer in the range of 0 to 4294967295 that is translated into the IP address format. If you do not specify this option, the command displays LSDB information for all OSPF areas.

brief: Displays brief LSDB information.

asbr: Displays Type-4 LSA (ASBR Summary LSA) information in the LSDB.

ase: Displays Type-5 LSA (AS External LSA) information in the LSDB.

network: Displays Type-2 LSA (Network LSA) information in the LSDB.

nssa: Displays Type-7 LSA (NSSA External LSA) information in the LSDB.

opaque-area: Displays Type-10 LSA (Opaque-area LSA) information in the LSDB.

opaque-as: Displays Type-11 LSA (Opaque-AS LSA) information in the LSDB.

opaque-link: Displays Type-9 LSA (Opaque-link LSA) information in the LSDB.

router: Displays Type-1 LSA (Router LSA) information in the LSDB.

summary: Displays Type-3 LSA (Network Summary LSA) information in the LSDB.

link-state-id: Specifies a link state ID in the IP address format.

originate-router *advertising-router-id*: Specifies an advertising router by its ID.

self-originate: Displays information about self-originated LSAs.

Examples

Display OSPF LSDB information.

```
<Switch> display ospf lsdb
         OSPF Process 1 with Router ID 192.168.0.1
                 Link State Database
```

```
                        Area: 0.0.0.0

Table 4-13 Command output

Field	Description
Type	LSA type.
LS ID	DR IP address.
Adv Rtr	Router that advertised the LSA.
LS age	LSA age time.
Len	LSA length.
Options	LSA options: • **O**—Opaque LSA advertisement capability. • **E**—AS External LSA reception capability. • **EA**—External extended LSA reception capability. • **DC**—On-demand link support. • **N**—NSSA external LSA support. • **P**—Capability of an NSSA ABR to translate Type-7 LSAs into Type-5 LSAs.
Seq#	LSA sequence number.
Checksum	LSA checksum.
Net mask	Network mask.
Attached router	ID of the router that established adjacency with the DR, and ID of the DR itself.

4.1.18. display ospf nexthop

Use **display ospf nexthop** to display OSPF next hop information.

Syntax

display ospf [*process-id*] **nexthop**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays next hop information for all OSPF processes.

Examples

Display OSPF next hop information.

```
<Switch> display ospf nexthop

          OSPF Process 1 with Router ID 1.1.1.2
                  Neighbor Nexthop Information

 NbrID           Nexthop         Interface               RefCount   Status
 192.168.12.1    0.0.0.0         Vlan10                  4          Valid
 192.168.12.2    192.168.12.2    Vlan10                  3          Valid
 192.168.12.1    0.0.0.0         Loop100                 1          Valid
```

Table 4-14 Command output

Field	Description
NbrID	Neighbor router ID.
Nexthop	Next hop address.
Interface	Output interface.
RefCount	Reference count (routes that use the next hop).
Status	Next hop status: valid or invalid.

4.1.19. display ospf peer

Use **display ospf peer** to display information about OSPF neighbors.

Syntax

display ospf [*process-id*] **peer** [**verbose**] [*interface-type interface-number*] [*neighbor-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by ID in the range of 1 to 65535. If you do not specify this argument, the command displays OSPF neighbor information for all OSPF processes.

verbose: Displays detailed neighbor information. If you do not specify this keyword, the command displays brief OSPF neighbor information.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays neighbor information for all interfaces.

neighbor-id: Specifies a neighbor router ID. If you do not specify this argument, the command displays all neighbor information.

Examples

Display detailed OSPF neighbor information.

```
<Switch> display ospf peer verbose

          OSPF Process 1 with Router ID 1.1.1.1
                  Neighbors

 Area 0.0.0.0 interface 1.1.1.1(Vlan-interface100)'s neighbors
 Router ID: 1.1.1.2          Address: 1.1.1.2          GR state: Normal
   State: Full  Mode: Nbr is master  Priority: 1
   DR: 1.1.1.2  BDR: 1.1.1.1  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 33  sec
   Neighbor is up for 02:03:35
   Authentication sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Last Neighbor Down Event:
 Router ID: 22.22.22.22
 Local Address: 11.11.11.11
 Remote Address: 22.22.22.22
 Time: Apr  9 03:18:19 2014
 Reason: Ospf_ifachange
```

Table 4-15 Command output

Field	Description
Area *areaID* interface *IPAddress*(*InterfaceName*)'s neighbors	Neighbor information for the interface in the specified area:

Field	Description
	• **areaID**—Area to which the neighbor belongs. • **IPAddress**—Interface IP address. • **InterfaceName**—Interface name.
Router ID	Neighbor router ID.
Address	Neighbor router address.
GR state	GR state: • Normal. • Restarter. • Complete. • Helper.
State	Neighbor state: • **Down**—Initial state of a neighbor conversation. • **Init**—The router has received a Hello packet from the neighbor. However, the router has not established bidirectional communication with the neighbor. The router did not appear in the neighbor's hello packet. • **Attempt**—Available only in an NBMA network. In this state, the OSPF router has not received any information from a neighbor for a period. The router can send Hello packets at a longer interval to keep the neighbor relationship. • **2-Way**—Communication between the two routers is bidirectional. The local router appears in the neighbor's Hello packet. • **Exstart**—The goal of this state is to decide which router is the master, and to decide upon the initial Database Description (DD) sequence number. • **Exchange**—The router is sending DD packets to the neighbor, describing its entire link-state database. • **Loading**—The router sends LSRs packets to the neighbor, requesting more recent LSAs. • **Full**—The neighboring routers are fully adjacent.
Mode	Neighbor mode for LSDB synchronization.
Priority	Neighboring router priority.
DR	DR on the interface's network segment.
BDR	BDR on the interface's network segment.
MTU	Interface MTU.
Options	LSA options: • **O**—Opaque LSA advertisement capability. • **E**—AS External LSA reception capability. • **EA**—External extended LSA reception capability. • **DC**—On-demand link support. • **N**—NSSA external LSA support. • **P**—Capability of an NSSA ABR to translate

Field	Description
	Type-7 LSAs into Type-5 LSAs.
Dead timer due in 33 sec	This dead timer will expire in 33 seconds.
Neighbor is up for 02:03:35	The neighbor has been up for 02:03:35.
Authentication sequence	Authentication sequence number.
Neighbor state change count	Count of neighbor state changes.
BFD status	BFD status: • Disabled. • Enabled (Control mode). • Enabled (Echo mode).
Last Neighbor Down Event	The most recent neighbor down event.
Time	Time when the neighbor went down.
Reason	Reason for the neighbor down event.

Display brief OSPF neighbor information.

```
<Switch> display ospf peer

          OSPF Process 1 with Router ID 1.1.1.1
               Neighbor Brief Information

 Area: 0.0.0.0
 Router ID       Address         Pri Dead-Time  State             Interface
 1.1.1.2         1.1.1.2         1   40         Full/DR           Vlan10
```

Table 4-16 Command output

Field	Description
Area	Neighbor area.
Router ID	Neighbor router ID.
Address	Neighbor interface address.
Pri	Neighboring router priority.
Dead-Time	Dead interval remained.
Interface	Interface connected to the neighbor.
State	Neighbor state: Down, Init, Attempt, 2-Way, Exstart, Exchange, Loading, or Full.

4.1.20. display ospf peer statistics

Use **display ospf peer statistics** to display OSPF neighbor statistics.

Syntax

display ospf [*process-id*] **peer statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays OSPF neighbor statistics for all OSPF processes.

Examples

Display OSPF neighbor statistics.

```
<Switch> display ospf peer statistics
          OSPF Process 1 with Router ID 10.3.1.1
                    Neighbor Statistics
  Area ID          Down Attempt Init 2-Way ExStart Exchange Loading Full Total
  0.0.0.0          0    0       0    0     0       0        0       1    1
  0.0.0.2          0    0       0    0     0       0        0       1    1
  Total            0    0       0    0     0       0        0       2    2
```

Table 4-17 Command output

Field	Description
Area ID	The state statistics for all the routers in the area to which the router belongs is displayed.
Down	Number of neighboring routers in Down state in the same area.
Attempt	Number of neighboring routers in Attempt state in the same area.
Init	Number of neighboring routers in Init state in the same area.
2-Way	Number of neighboring routers in 2-Way state in the same area.
ExStart	Number of neighboring routers in ExStart state in the same area.
Exchange	Number of neighboring routers in Exchange state in the same area.
Loading	Number of neighboring routers in Loading state in the same area.
Full	Number of neighboring routers in Full state in the same area.
Total	Total number of neighbors in the same state: Down, Attempt, Init, 2-Way, ExStart, Exchange, Loading, or Full.

4.1.21. display ospf request-queue

Use **display ospf request-queue** to display OSPF request queue information.

Syntax

display ospf [*process-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the OSPF request queue information for all OSPF processes.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays the OSPF request queue information for all interfaces.

neighbor-id: Specifies a neighbor's router ID. If you do not specify this argument, the command displays the OSPF request queue information for all OSPF neighbors.

Examples

Display OSPF request queue information.

```
<Switch> display ospf request-queue

          OSPF Process 100 with Router ID 192.168.1.59
                  Link State Request List

  The Router's Neighbor is Router ID 2.2.2.2         Address 10.1.1.2
  Interface 10.1.1.1         Area 0.0.0.0
  Request list:
       Type       LinkState ID      AdvRouter         Sequence   Age
       Router     2.2.2.2           1.1.1.1           80000004   1
       Network    192.168.0.1       1.1.1.1           80000003   1
       Sum-Net    192.168.1.0       1.1.1.1           80000002   2
```

Table 4-18 Command output

Field	Description
The Router's Neighbor is Router ID	Neighbor router ID.
Address	Neighbor interface IP address.
Interface	Local interface IP address.
Area	Area ID.
Request list	Request list information.
Type	LSA type.
LinkState ID	Link state ID.
AdvRouter	Advertising router.

Field	Description
Sequence	LSA sequence number.
Age	LSA age.

4.1.22. display ospf retrans-queue

Use **display ospf retrans-queue** to display retransmission queue information.

Syntax

display ospf [*process-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays retransmission queue information for all OSPF processes.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays retransmission queue information for all interfaces.

neighbor-id: Specifies a neighbor's router ID. If you do not specify this argument, the command displays retransmission queue information for all neighbors.

Examples

Display OSPF retransmission queue information.

```
<Switch> display ospf retrans-queue

          OSPF Process 100 with Router ID 192.168.1.59
                  Link State Retransmission List

  The Router's Neighbor is Router ID 2.2.2.2         Address 10.1.1.2
  Interface 10.1.1.1         Area 0.0.0.0
  Retransmit list:
       Type       LinkState ID      AdvRouter         Sequence   Age
       Router     2.2.2.2           2.2.2.2           80000004   1
       Network    12.18.0.1         2.2.2.2           80000003   1
       Sum-Net    12.18.1.0         2.2.2.2           80000002   2
```

Table 4-19 Command output

Field	Description
The Router's Neighbor is Router ID	Neighbor router ID.
Address	Neighbor interface IP address.
Interface	Interface address of the router.
Area	Area ID.
Retrans List	Retransmission list.
Type	LSA type.
LinkState ID	Link state ID.
AdvRouter	Advertising router.
Sequence	LSA sequence number.
Age	LSA age.

4.1.23. display ospf routing

Use **display ospf routing** to display OSPF routing information.

Syntax

display ospf [*process-id*] **routing** [*ip-address* { *mask-length* | *mask* }] [**interface** *interface-type interface-number*] [**nexthop** *nexthop-address*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the routing information for all OSPF processes.

ip-address: Specifies a destination IP address.

mask-length: Specifies mask length in the range of 0 to 32.

mask: Specifies the mask in dotted decimal notation.

interface *interface-type interface-number*: Displays routes passing the specified output interface. If you do not specify this option, the command displays OSPF routing information for all interfaces.

nexthop *nexthop-address*: Displays routes passing the specified next hop. If you do not specify this option, the command displays all OSPF routing information.

verbose: Displays detailed OSPF routing information. If you do not specify this keyword, the command displays brief OSPF routing information.

Examples

Display OSPF routing information.

```
<Switch> display ospf routing

          OSPF Process 1 with Router ID 192.168.1.2
                   Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost  Type       NextHop         AdvRouter      Area

Table 4-21 Command output

Field	Description
Topology	This field is not supported in the current software version. Topology name. The topology name for base topology is **base**.
MTID	This field is not supported in the current software version. Topology ID. The value of 0 indicates the base topology.
Priority	Prefix priority: critical, high, medium, and low.
Type	Route type: intra-area, transit, stub, inter-area, Type-1 external, and Type-2 external.
AdvRouter	Advertising router.
Area	Area ID.
SubProtoID	Sub protocol ID.
Preference	OSPF route preference.
NextHop	Primary next hop IP address.
BkNextHop	Backup next hop IP address.
IfType	Type of the network to which the primary next hop belongs.
BkIfType	Type of the network to which the backup next hop belongs.
Interface	Output interface.
BkInterface	Backup output interface.
NibID	Next hop ID.
Status	Route status: • **Local**—The route is on the local end and is not sent to the route management module. • **Invalid**—The next hop is invalid. • **Stale**—The next hop is stale. • **Normal**—The route is available. • **Delete**—The route is deleted. • **Host-Adv**—The route is a host route. • **Rely**—The route is a recursive route.
Cost	Cost to destination.
SpfCost	SPF cost.

4.1.24. display ospf statistics

Use **display ospf statistics** to display OSPF statistics.

Syntax

display ospf [*process-id*] **statistics** [**error** | **packet** [*interface-type interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays OSPF statistics for all OSPF processes.

error: Displays error statistics. If you do not specify this keyword, the command displays OSPF packet, LSA, and route statistics.

packet: Displays OSPF packet statistics.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays statistics for all interfaces.

Examples

Display OSPF statistics.

```
<Switch> display ospf statistics

          OSPF Process 1 with Router ID 2.2.2.2
                  Statistics

 I/O statistics
  Type                    Input     Output
  Hello                   61        122
  DB Description          2          3
  Link-State Req          1          1
  Link-State Update       3          3
  Link-State Ack          3          2

 LSAs originated by this router
  Router  : 4
  Network : 0
  Sum-Net : 0
  Sum-Asbr: 0
```

```
 External: 0
 NSSA    : 0
 Opq-Link: 0
 Opq-Area: 0
 Opq-As  : 0

LSAs originated: 4  LSAs received: 7

Routing table:
  Intra area: 2  Inter area: 3  ASE/NSSA: 0
```

Table 4-22 Command output

Field	Description
I/O statistics	Statistics about input/output packets and LSAs.
Type	OSPF packet type.
Input	Packets received.
Output	Packets sent.
Hello	Hell packet.
DB Description	Database Description packet.
Link-State Req	Link-State Request packet.
Link-State Update	Link-State Update packet.
Link-State Ack	Link-State Acknowledge packet.
LSAs originated by this router	LSAs originated by this router.
Router	Number of Type-1 LSAs originated.
Network	Number of Type-2 LSAs originated.
Sum-Net	Number of Type-3 LSAs originated.
Sum-Asbr	Number of Type-4 LSAs originated.
External	Number of Type-5 LSAs originated.
NSSA	Number of Type-7 LSAs originated.
Opq-Link	Number of Type-9 LSAs originated.
Opq-Area	Number of Type-10 LSAs originated.
Opq-As	Number of Type-11 LSAs originated.
LSA originated	Number of LSAs originated.
LSA received	Number of LSAs received.
Routing table	Routing table information.
Intra area	Number of intra-area routes.
Inter area	Number of inter-area routes.
ASE	Number of ASE routes.

Display OSPF error statistics.

```
<Switch> display ospf statistics error

          OSPF Process 1 with Router ID 192.168.1.112
                  OSPF Packet Error Statistics

0          : Router ID confusion         0          : Bad packet
0          : Bad version                 0          : Bad checksum
0          : Bad area ID                 0          : Drop on unnumbered link
0          : Bad virtual link            0          : Bad authentication type
0          : Bad authentication key      0          : Packet too small
0          : Neighbor state low          0          : Transmit error
0          : Interface down              0          : Unknown neighbor
0          : HELLO: Netmask mismatch     0          : HELLO: Hello-time mismatch
0          : HELLO: Dead-time mismatch   0          : HELLO: Ebit option mismatch
0          : HELLO: Mbit option mismatch 0          : DD: MTU option mismatch
0          : DD: Unknown LSA type        0          : DD: Ebit option mismatch
0          : ACK: Bad ack                0          : ACK: Unknown LSA type
0          : REQ: Empty request          0          : REQ: Bad request
0          : UPD: LSA checksum bad       0          : UPD: Unknown LSA type
0          : UPD: Less recent LSA
```

Table 4-23 Command output

Field	Description
Router ID confusion	Packets with duplicate router ID.
Bad packet	Packets illegal.
Bad version	Packets with wrong version.
Bad checksum	Packets with wrong checksum.
Bad area ID	Packets with invalid area ID.
Drop on unnumbered link	Packets dropped on the unnumbered interface.
Bad virtual link	Packets on wrong virtual links.
Bad authentication type	Packets with invalid authentication type.
Bad authentication key	Packets with invalid authentication key.
Packet too small	Packets too small in length.
Neighbor state low	Packets received in low neighbor state.
Transmit error	Packets with error when being transmitted.
Interface down	Shutdown times of the interface.
Unknown neighbor	Packets received from unknown neighbors.
HELLO: Netmask mismatch	Hello packets with mismatched mask.
HELLO: Hello-time mismatch	Hello packets with mismatched hello timer.
HELLO: Dead-time mismatch	Hello packets with mismatched dead timer.
HELLO: Ebit option mismatch	Hello packets with mismatched E-bit in the option field.

Field	Description
HELLO: Mbit option mismatch	Hello packets with mismatched M-bit in the option field.
DD: MTU option mismatch	DD packets with mismatched MTU.
DD: Unknown LSA type	DD packets with unknown LSA type.
DD: Ebit option mismatch	DD packets with mismatched E-bit in the option field.
ACK: Bad ack	Bad LSAck packets for LSU packets.
ACK: Unknown LSA type	LSAck packets with unknown LSA type.
REQ: Empty request	LSR packets with no request information.
REQ: Bad request	Bad LSR packets.
UPD: LSA checksum bad	LSU packets with wrong LSA checksum.
UPD: Unknown LSA type	LSU packets with unknown LSA type.
UPD: Less recent LSA	LSU packets without the most recent LSA.

Display OSPF packet statistics for all processes and interfaces.

```
<Switch> display ospf statistics packet

          OSPF Process 100 with Router ID 192.168.1.59
                  Packet Statistics

 Waiting to send packet count: 0
         Hello       DD          LSR         LSU         ACK         Total
 Input : 489         6           2           44          40          581
 Output: 492         8           2           45          40          587

 Input : 3           1           22          16          42
 Output: 2           1           19          20          42
```

Table 4-24 Command output

Field	Description
Waiting to send packet count	Number of packets waiting to be sent.
Total	Total number of packets.
Input	Number of received packets.
Output	Number of sent packets.

Field	Description
Area	Area ID.
Interface	Interface address and interface name.

Related commands

reset ospf statistics

4.1.25. display ospf vlink

Use **display ospf vlink** to display OSPF virtual link information.

Syntax

display ospf [*process-id*] **vlink**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the OSPF virtual link information for all OSPF processes.

Examples

Display OSPF virtual link information.

```
<Switch> display ospf vlink

          OSPF Process 1 with Router ID 3.3.3.3
                  Virtual Links

 Virtual-link Neighbor-ID  -> 2.2.2.2, Neighbor-State: Full
 Interface: 10.1.2.1 (Vlan-interface100)
 Cost: 1562  State: P-2-P  Type: Virtual
 Transit Area: 0.0.0.1
 Timers: Hello 10 , Dead 40 , Retransmit 5 , Transmit Delay 1
 MD5 authentication enabled.
    The last key is 3.
    The rollover is in progress, 2 neighbor(s) left.
```

Table 4-25 Command output

Field	Description
Virtual-link Neighbor-ID	ID of the neighbor on the virtual link.
Neighbor-State	Neighbor state: Down, Init, 2-Way, ExStart, Exchange, Loading, Full.
Interface	IP address and name of the local interface on the virtual link.
Cost	Interface route cost.
State	Interface state.
Type	Virtual link.
Transit Area	Transit area ID.
Timers	Values of timers (in seconds): **Hello**, **Dead**, and **Retransmit**.
Transmit Delay	LSA transmission delay on the interface, in seconds.
Simple authentication enabled	Simple authentication is enabled.
Keychain authentication enabled, name is *xx*	Keychain authentication is enabled. The name of the keychain is *xx*.
MD5 authentication enabled	MD5/HMAC-MD5 authentication is enabled.
The last key is *xx*	The most recent MD5 authentication key ID is *xx*.
The rollover is in progress, *xx* neighbor(s) left	Key rollover for MD5/HMAC-MD5 authentication is in progress. The number of neighbors that have not completed rollover is *xx*.

4.1.26. display router id

Use **display router id** to display the global router ID.

Syntax

display router id

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display the global router ID.

```
<Switch> display router id
         Configured router ID is 1.1.1.1
```

4.1.27. dscp

Use **dscp** to set the DSCP value for outgoing OSPF packets.

Use **undo dscp** to restore the default.

Syntax

dscp *dscp-value*

undo dscp

Default

The DSCP value for outgoing OSPF packets is 48.

Views

OSPF view

Predefined user roles

network-admin

Parameters

dscp-value: Specifies the DSCP value in the range of 0 to 63 for outgoing OSPF packets.

Examples

Set the DSCP value for outgoing OSPF packets to 63 in OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] dscp 63
```

4.1.28. enable link-local-signaling

Use **enable link-local-signaling** to enable the OSPF link-local signaling (LLS) capability.

Use **undo enable link-local-signaling** to disable the OSPF LLS capability.

Syntax

enable link-local-signaling

undo enable link-local-signaling

Default

OSPF link-local signaling capability is disabled.

Views

OSPF view

Predefined user roles

network-admin

Examples

Enable link-local signaling for OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] enable link-local-signaling
```

4.1.29. enable out-of-band-resynchronization

Use **enable out-of-band-resynchronization** to enable the OSPF out-of-band resynchronization (OOB-Resynch) capability.

Use **undo enable out-of-band-resynchronization** to disable the OSPF out-of-band resynchronization capability.

Syntax

enable out-of-band-resynchronization

undo enable out-of-band-resynchronization

Default

The OSPF out-of-band resynchronization capability is disabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

Before you configure this command, enable the link-local signaling capability.

Examples

Enable the out-of-band resynchronization capability for OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] enable link-local-signaling
[Switch-ospf-1] enable out-of-band-resynchronization
```

Related commands

enable link-local-signaling

4.1.30. event-log

Use **event-log** to set the number of OSPF logs.

Use **undo event-log** to remove the configuration.

Syntax

event-log { **lsa-flush** | **peer** | **spf** } **size** *count*

undo event-log { **lsa-flush** | **peer** | **spf** } **size**

Default

The device can generate a maximum of 10 logs for each type, including route calculation logs, LSA aging logs, and neighbor logs.

Views

OSPF view

Predefined user roles

network-admin

Parameters

lsa-flush: Specifies the number of LSA aging logs.

peer: Specifies the number of neighbor logs.

spf: Specifies the number of route calculation logs.

size *count*: Specifies the number of OSPF logs, in the range of 0 to 65535.

Examples

Set the number of route calculation logs to 50 in OSPF process 100.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] event-log spf size 50
```

4.1.31. fast-reroute (OSPF view)

Use **fast-reroute** to configure OSPF FRR.

Use **undo fast-reroute** to restore the default.

Syntax

fast-reroute { **lfa** [**abr-only**] | **route-policy** *route-policy-name* }

undo fast-reroute

Default

OSPF FRR is disabled.

Views

OSPF view

Predefined user roles

network-admin

Parameters

lfa: Uses the LFA algorithm to calculate a backup next hop for all routes.

abr-only: Uses the next hop of the route to the ABR as the backup next hop.

route-policy *route-policy-name*: Uses a routing policy to designate a backup next hop. The *route-policy-name* argument is a case-sensitive string of 1 to 63 characters.

Usage guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Examples

Enable FRR to calculate a backup next hop for all routes by using LFA algorithm in OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] fast-reroute lfa
```

4.1.32. filter (OSPF area view)

Use **filter** to configure OSPF to filter inbound/outbound Type-3 LSAs on an ABR.

Use **undo filter** to disable Type-3 LSA filtering.

Syntax

filter { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

undo filter { **export** | **import** }

Default

Type-3 LSAs are not filtered.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter inbound/outbound Type-3 LSAs.

prefix-list-name: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter inbound/outbound Type-3 LSAs.

route-policy-name: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter inbound/outbound Type-3 LSAs.

export: Filters Type-3 LSAs advertised to other areas.

import: Filters Type-3 LSAs advertised into the local area.

Usage guidelines

This command applies only to an ABR.

Examples

Use IP prefix list **my-prefix-list** to filter inbound Type-3 LSAs. Use basic ACL 2000 to filter outbound Type-3 LSAs in OSPF Area 1.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 1
[Switch-ospf-100-area-0.0.0.1] filter prefix-list my-prefix-list import
[Switch-ospf-100-area-0.0.0.1] filter 2000 export
```

4.1.33. filter-policy export (OSPF view)

Use **filter-policy export** to configure OSPF to filter redistributed routes.

Use **undo filter-policy export** to remove the configuration.

Syntax

filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

undo filter-policy export [*protocol* [*process-id*]]

Default

OSPF does not filter redistributed routes.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter redistributed routes by destination address.

prefix-list-name: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter redistributed routes by destination address.

protocol: Filters routes redistributed from the specified routing protocol. If you do not specify this argument, the command filters all redistributed routes.

process-id: Specifies a process by its ID in the range of 1 to 65535. This argument is available only when the *protocol* argument is **rip**, or **ospf**.

Usage guidelines

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following methods:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Configure OSPF process 100 to filter redistributed routes by using basic ACL 2000.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
[Switch] ospf 100
[Switch-ospf-100] filter-policy 2000 export
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16. Configure OSPF process 100 to filter redistributed routes by using advanced ACL 3000.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
[Switch-acl-ipv4-adv-3000] rule 100 deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] ospf 100
[Switch-ospf-100] filter-policy 3000 export
```

Related commands

import-route

4.1.34. filter-policy import (OSPF view)

Use **filter-policy import** to configure OSPF to filter routes calculated using received LSAs.

Use **undo filter-policy import** to restore the default.

Syntax

filter-policy { *ipv4-acl-number* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-policy** *route-policy-name* } **import**

undo filter-policy import

Default

OSPF does not filter routes calculated using received LSAs.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999 to filter received routes by destination.

gateway *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter received routes by next hop.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter received routes by destination.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter received routes.

Usage guidelines

To use an advanced ACL (with a number from 3000 to 3999) in the command or in the specified routing policy, configure the ACL in one of the following ways:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

Use basic ACL 2000 to filter received routes.

```
<Switch> system-view
[Switch] acl basic 2000
[Switch-acl-ipv4-basic-2000] rule deny source 192.168.10.0 0.0.0.255
[Switch-acl-ipv4-basic-2000] quit
```

```
[Switch] ospf 100
[Switch-ospf-100] filter-policy 2000 import
```

Configure advanced ACL 3000 to permit only route 113.0.0.0/16. Use ACL 3000 to filter received routes.

```
<Switch> system-view
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule 10 permit ip source 113.0.0.0 0 destination 255.255.0.0
0
[Switch-acl-ipv4-adv-3000] rule 100 deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] ospf 100
[Switch-ospf-100] filter-policy 3000 import
```

4.1.35. graceful-restart (OSPF view)

Use **graceful-restart** to enable OSPF GR.

Use **undo graceful-restart** to disable OSPF GR.

Syntax

graceful-restart [**ietf** | **nonstandard**] [**global** | **planned-only**] *

undo graceful-restart

Default

OSPF GR is disabled.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ietf: Enables IETF GR.

nonstandard: Enables non-IETF GR.

global: Enables global GR. In global GR mode, a GR process can be completed only when all GR helpers exist. A GR process fails if a GR helper fails (for example, the interface connected to the GR helper goes down). If you do not specify this keyword, the command enables partial GR. In partial GR mode, a GR process can be completed if a GR helper exists.

planned-only: Enables only planned GR. If you do not specify this keyword, the command enables both planned GR and unplanned GR.

Usage guidelines

GR includes planned GR and unplanned GR.

- **Planned GR**—Manually restarts OSPF by using the **reset ospf process** command or performs an active/standby process switchover by using the **placement reoptimize** command. Before OSPF restart or active/standby switchover, the GR restarter sends Grace-LSAs to GR helpers.
- **Unplanned GR**—OSPF restarts or an active/standby switchover occurs because of device failure. Before OSPF restart or active/standby switchover, the GR restarter does not send Grace-LSAs to GR helpers.

Before enabling IETF GR for OSPF, enable Opaque LSA advertisement and reception with the **opaque-capability enable** command.

Before enabling non-IETF GR for OSPF, enable OSPF LLS with the **enable link-local-signaling** command and OOB-Resynch with the **enable out-of-band-resynchronization** command.

If you do not specify the **nonstandard** or **ietf** keyword, this command enables non-IETF GR for OSPF.

Examples

Enable IETF GR for OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] opaque-capability enable
[Switch-ospf-1] graceful-restart ietf
```

Enable non-IETF GR for OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] enable link-local-signaling
[Switch-ospf-1] enable out-of-band-resynchronization
[Switch-ospf-1] graceful-restart nonstandard
```

Related commands

enable link-local-signaling

enable out-of-band-resynchronization

opaque-capability enable

4.1.36. graceful-restart helper enable

Use **graceful-restart helper enable** to enable OSPF GR helper capability.

Use **undo graceful-restart helper enable** to disable OSPF GR helper capability.

Syntax

graceful-restart helper enable [**planned-only**]

undo graceful-restart helper enable

Default

OSPF GR helper capability is enabled.

Views

OSPF view

Predefined user roles

network-admin

Parameters

planned-only: Enables only planned GR for the GR helper. If you do not specify this keyword, the command enables both planned GR and unplanned GR for the GR helper.

Usage guidelines

The **planned-only** keyword is available only for the IETF GR helper.

Examples

Enable GR helper capability for OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] graceful-restart helper enable
```

4.1.37. graceful-restart helper strict-lsa-checking

Use **graceful-restart helper strict-lsa-checking** to enable strict LSA checking capability for GR helper.

Use **undo graceful-restart helper strict-lsa-checking** to disable strict LSA checking capability for GR helper.

Syntax

graceful-restart helper strict-lsa-checking

undo graceful-restart helper strict-lsa-checking

Default

Strict LSA checking capability for GR helper is disabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Examples

Enable strict LSA checking capability for GR helper in OSPF process 1.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] graceful-restart helper strict-lsa-checking
```

4.1.38. graceful-restart interval (OSPF view)

Use **graceful-restart interval** to set the GR interval.

Use **undo graceful-restart interval** to restore the default.

Syntax

graceful-restart interval *interval*

undo graceful-restart interval

Default

The GR interval is 120 seconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

interval: Specifies the GR interval in the range of 40 to 1800 seconds.

Usage guidelines

For GR restart to succeed, the value of the GR restart interval cannot be smaller than the maximum OSPF neighbor dead time of all the OSPF interfaces.

Examples

Set the GR interval for OSPF process 1 to 100 seconds.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] graceful-restart interval 100
```

Related commands

ospf timer dead

4.1.39. host-advertise

Use **host-advertise** to advertise a host route.

Use **undo host-advertise** to remove a host route.

Syntax

host-advertise *ip-address cost-value*

undo host-advertise *ip-address*

Default

No host route is advertised.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a host.

cost-value: Specifies a cost for the route, in the range of 1 to 65535.

Examples

Advertise host route 1.1.1.1 with a cost of 100.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 0
[Switch-ospf-100-area-0.0.0.0] host-advertise 1.1.1.1 100
```

4.1.40. import-route (OSPF view)

Use **import-route** to redistribute AS-external routes from another routing protocol.

Use **undo import-route** to disable route redistribution from another routing protocol.

Syntax

import-route bgp [**allow-ibgp**] [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

undo import-route bgp

import-route { **direct** | **static** } [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

undo import-route { **direct** | **static** }

import-route { **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

undo import-route { **ospf** | **rip** } [*process-id* | **all-processes**]

Default

OSPF does not redistribute AS-external routes from any other routing protocol.

Views

OSPF view

Predefined user roles

network-admin

Parameters

bgp: Redistributes BGP routes.

direct: Redistributes direct routes.

ospf: Redistributes OSPF routes.

rip: Redistributes RIP routes.

static: Redistributes static routes.

process-id: Specifies a process by its ID in the range of 1 to 65535. The default is 1.

all-processes: Redistributes routes from all the processes of the specified routing protocol.

allow-ibgp: Redistributes IBGP routes. The **import-route bgp** command redistributes only EBGP routes. Because the **import-route bgp allow-ibgp** command redistributes both EBGP and IBGP routes and might cause routing loops, use it with caution.

allow-direct: Redistributes the networks of the local interfaces enabled with the specified routing protocol. If you do not specify this keyword, the networks of the local interfaces are not redistributed. If you specify both the **allow-direct** keyword and the **route-policy** *route-policy-name* option, make sure the **if-match** rule defined in the routing policy does not conflict with the **allow-direct** keyword. For example, if you specify the **allow-direct** keyword, do not configure the **if-match route-type** rule for the routing policy. Otherwise, the **allow-direct** keyword does not take effect.

cost *cost-value*: Specifies a route cost in the range of 0 to 16777214. The default is 1.

nssa-only: Limits the route advertisement to the NSSA area by setting the P-bit of Type-7 LSAs to 0. If you do not specify this keyword, the P-bit of Type-7 LSAs is set to 1. If the router acts as both an ASBR and an ABR and **FULL** state neighbors exist in the backbone area, the P-bit is set to 0. This keyword applies to NSSA routers.

route-policy *route-policy-name*: Specifies a routing policy to filter redistributed routes. The *route-policy-name* argument is a case-sensitive string of 1 to 63 characters.

tag *tag*: Specifies a tag for external LSAs, in the range of 0 to 4294967295. The default is 1.

type *type*: Specifies a cost type, 1 or 2. The default is 2.

Usage guidelines

This command redistributes routes destined for other ASs from another protocol. AS external routes include the following types:

- **Type-1 external routes**—Have high credibility. The cost of Type-1 external routes is comparable with the cost of OSPF internal routes. The cost of a Type-1 external route equals the cost from the router to the ASBR plus the cost from the ASBR to the external route's destination.
- **Type-2 external routes**—Have low credibility. OSPF considers the cost from the ASBR to the destination of a Type-2 external route is much bigger than the cost from the ASBR to an OSPF internal router. The cost of a Type-2 external route equals the cost from the ASBR to the Type-2 external route's destination.

The **import-route** command redistributes only active routes. To display information about active routes, use the **display ip routing-table protocol** command. The **import-route** command cannot redistribute default external routes.

The **import-route nssa-only** command redistributes AS-external routes in Type-7 LSAs only into the NSSA area.

The **undo import-route** { **ospf** | **rip** } **all-processes** command removes only the configuration made by the **import-route** { **ospf** | **rip** } **all-processes** command, instead of the configuration made by the **import-route** { **ospf** | **rip** } *process-id* command.

Examples

Redistribute routes from RIP process 40 and specify the type, tag, and cost as 2, 33, and 50 for redistributed routes.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] import-route rip 40 type 2 tag 33 cost 50
```

Related commands

default-route-advertise (OSPF view)

4.1.41. log-peer-change

Use **log-peer-change** to enable logging for OSPF neighbor state changes.

Use **undo log-peer-change** to disable logging for OSPF neighbor state changes.

Syntax

log-peer-change

undo log-peer-change

Default

Logging for OSPF neighbor state changes is enabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

This command enables output of OSPF neighbor state changes to the information center. The information center processes the logs according to user-defined output rules (whether and where to output logs). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Disable logging for neighbor state changes for OSPF process 100.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] undo log-peer-change
```

4.1.42. lsa-arrival-interval

Use **lsa-arrival-interval** to set the LSA arrival interval.

Use **undo lsa-arrival-interval** to restore the default.

Syntax

lsa-arrival-interval *interval*

undo lsa-arrival-interval

Default

The LSA arrival interval is 1000 milliseconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

interval: Specifies the LSA arrival interval in the range of 0 to 60000 milliseconds.

Usage guidelines

If an LSA that has the same LSA type, LS ID, and originating router ID as the previous LSA is received within the interval, OSPF discards the LSA. This feature helps avoid overuse of system resources due to frequent network changes.

As a best practice, set the interval with the **lsa-arrival-interval** command to be smaller than or equal to the minimum interval set with the **lsa-generation-interval** command.

Examples

Set the LSA arrival interval to 200 milliseconds.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] lsa-arrival-interval 200
```

Related commands

lsa-generation-interval

4.1.43. lsa-generation-interval

Use **lsa-generation-interval** to set the OSPF LSA generation interval.

Use **undo lsa-generation-interval** to restore the default.

Syntax

lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo lsa-generation-interval

Default

The maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

maximum-interval: Specifies the maximum LSA generation interval in the range of 1 to 60 seconds.

minimum-interval: Specifies the minimum LSA generation interval in the range of 10 to 60000 milliseconds.

incremental-interval: Specifies the LSA generation incremental interval in the range of 10 to 60000 milliseconds.

Usage guidelines

When network changes are infrequent, LSAs are generated at the minimum interval. If network changes become frequent, the LSA generation interval is incremented by the incremental interval × 2^{n-2} for each generation until the maximum interval is reached. The value n is the number of generation times.

The minimum interval and the incremental interval cannot be greater than the maximum interval.

Examples

Set the maximum LSA generation interval to 2 seconds, minimum interval to 100 milliseconds, and incremental interval to 100 milliseconds.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] lsa-generation-interval 2 100 100
```

Related commands

lsa-arrival-interval

4.1.44. lsdb-overflow-interval

Use **lsdb-overflow-interval** to set the interval that OSPF exits overflow state.

Use **undo lsdb-overflow-interval** to restore the default.

Syntax

lsdb-overflow-interval *interval*

undo lsdb-overflow-interval

Default

The OSPF exit overflow interval is 300 seconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

interval: Specifies the interval that OSPF exits overflow state, in the range of 0 to 2147483647 seconds.

Usage guidelines

When the number of LSAs in the LSDB exceeds the upper limit, the LSDB is in an overflow state. In this state, OSPF does not receive any external LSAs and deletes the external LSAs generated by itself to save system resources.

You can configure the interval that OSPF exits overflow state. An interval of 0 indicates that the timer is not started and OSPF does not exit overflow state.

Examples

Set the OSPF exit overflow interval to 10 seconds.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] lsdb-overflow-interval 10
```

4.1.45. lsdb-overflow-limit

Use **lsdb-overflow-limit** to set the upper limit of external LSAs in the LSDB.

Use **undo lsdb-overflow-limit** to restore the default.

Syntax

lsdb-overflow-limit *number*

undo lsdb-overflow-limit

Default

The number of external LSAs is not limited.

Views

OSPF view

Predefined user roles

network-admin

Parameters

number: Specifies the upper limit of external LSAs in the LSDB, in the range of 1 to 1000000.

Examples

Set the upper limit of external LSAs to 400000.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] lsdb-overflow-limit 400000
```

4.1.46. maximum load-balancing (OSPF view)

Use **maximum load-balancing** to set the maximum number of equal-cost multi-path (ECMP) routes for load balancing.

Use **undo maximum load-balancing** to restore the default.

Syntax

maximum load-balancing *number*

undo maximum load-balancing

Default

8

Views

OSPF view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of ECMP routes in the range of 1 to 8. No ECMP load balancing is available when the number is set to 1.

Examples

Set the maximum number of ECMP routes to 2.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] maximum load-balancing 2
```

Related commands

> 🕮 **MEMO:**
>
> **non-stop-routing** command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable OSPF NSR.

Use **undo non-stop-routing** to disable OSPF NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

OSPF NSR is disabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only for the current process. As a best practice, enable OSPF NSR for each process if multiple OSPF processes exist.

OSPF NSR and OSPF GR are mutually exclusive. Do not configure the **non-stop-routing** command and the **graceful-restart** command at the same time.

Examples

Enable NSR for OSPF process 100.

```
<Switch> system-view
[Switch] ospf 100
```

```
[Switch-ospf-100] non-stop-routing
```

4.1.48. network (OSPF area view)

Use **network** to enable OSPF on the interface attached to the specified network in the area.

Use **undo network** to disable OSPF for the interface attached to the specified network in the area.

Syntax

network *ip-address wildcard-mask*

undo network *ip-address wildcard-mask*

Default

OSPF is not enabled for any interface.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

ip-address: Specifies the IP address of a network.

wildcard-mask: Specifies the wildcard mask of the IP address. For example, the wildcard mask of mask 255.0.0.0 is 0.255.255.255.

Usage guidelines

This command enables OSPF on the interface attached to the specified network. The interface's primary IP address must be in the specified network. If only the interface's secondary IP address is in the network, the interface cannot run OSPF.

Examples

Specify the interface whose primary IP address is on network 131.108.20.0/24 to run OSPF in Area 2.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 2
[Switch-ospf-100-area-0.0.0.2] network 131.108.20.0 0.0.0.255
```

Related commands

ospf

4.1.49. nssa (OSPF area view)

Use **nssa** to configure an area as an NSSA area.

Use **undo nssa** to restore the default.

Syntax

nssa [**default-route-advertise** * | **no-import-route** | **no-summary** | **translate-always** | **translator-stability-interval** *value*] *

undo nssa [**default-route-advertise** * | **no-import-route** | **no-summary** | **translate-always** | **translator-stability-interval**] *

Default

No area is configured as an NSSA area.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

default-route-advertise: Used on an NSSA ABR or an ASBR only. With this keyword, an NSSA ABR redistributes a default route in a Type-7 LSA into the NSSA area. The ABR redistributes a default route regardless of whether a default route exists in the routing table. With this keyword, an ASBR redistributes a default route in a Type-7 LSA only when the default route exists in the routing table.

no-import-route: Used on an NSSA ABR to control the **import-route** command to not redistribute routes into the NSSA area.

no-summary: Used only on an ABR to advertise a default route in a Type-3 summary LSA into the NSSA area and to not advertise other summary LSAs into the area. The area is a totally NSSA area.

translate-always: Always translates Type-7 LSAs to Type-5 LSAs. This keyword takes effect only on an NSSA ABR.

translator-stability-interval *value*: Specifies the stability interval of the translator. During the interval, the translator can maintain its translating capability after another device becomes the new translator. The *value* argument is the stability interval in the range of 0 to 900 seconds and defaults to 0. A value of 0 means the translator does not maintain its translating capability when a new translator arises.

Usage guidelines

All routers attached to an NSSA area must be configured with the **nssa** command in area view.

If you specify the **translate-ignore-checking-backbone** keyword for an ABR, you must also specify the keyword for other ABRs in the NSSA area. This ensures that a translator can be elected among the ABRs.

Examples

Configure Area 1 as an NSSA area.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 1
[Switch-ospf-100-area-0.0.0.1] nssa
```

Related commands

default-cost (OSPF area view)

4.1.50. opaque-capability enable

Use **opaque-capability enable** to enable opaque LSA advertisement and reception.

Use **undo opaque-capability** to disable opaque LSA advertisement and reception.

Syntax

opaque-capability enable

undo opaque-capability

Default

The feature is enabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

After the opaque LSA advertisement and reception capability is enabled, OSPF can receive and advertise Type-9, Type-10, and Type-11 opaque LSAs.

Examples

Disable opaque LSA advertisement and reception.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] undo opaque-capability
```

4.1.51. ospf

Use **ospf** to enable OSPF and enter OSPF view.

Use **undo ospf** to disable OSPF.

Syntax

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

undo ospf [*process-id*]

Default

OSPF is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535.

router-id *router-id*: Specifies an OSPF router ID in dotted decimal notation.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the OSPF process runs on the public network.

Usage guidelines

You can enable multiple OSPF processes on a router and specify different router IDs for them.

Enable an OSPF process before performing other tasks.

For correct OSPF neighbor relationship establishment, do not bind an OSPF-enabled VLAN interface to an OpenFlow instance.

Examples

Enable OSPF process 100 and specify router ID 10.10.10.1.

```
<Switch> system-view
[Switch] ospf 100 router-id 10.10.10.1
[Switch-ospf-100]
```

4.1.52. ospf authentication-mode

Use **ospf authentication-mode** to set the authentication mode and key on an interface.

Use **undo ospf authentication-mode** to remove specified configuration.

Syntax

For MD5/HMAC-MD5 authentication:

ospf authentication-mode { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string*

undo ospf authentication-mode { **hmac-md5** | **md5** } *key-id*

For simple authentication:

ospf authentication-mode simple { **cipher** | **plain** } *string*

undo ospf authentication-mode simple

Default

No authentication is performed for an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

hmac-md5: Specifies HMAC-MD5 authentication.

md5: Specifies MD5 authentication.

simple: Specifies simple authentication.

key-id: Specifies a key by its ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive.

- In simple authentication mode, the plaintext form of the key is a string of 1 to 8 characters. The encrypted form of the key is a string of 33 to 41 characters.
- In MD5/HMAC-MD5 authentication mode, the plaintext form of the key is a string of 1 to 16 characters. The encrypted form of the key is a string of 33 to 53 characters.

Usage guidelines

To establish or maintain adjacencies, interfaces attached to the same network segment must have the same authentication mode and key.

If MD5 or HMAC-MD5 authentication is configured, you can configure multiple keys, each having a unique key ID and key string. To minimize the risk of key compromise, use only one key for an interface and delete the old key after key replacement.

To replace the key used for MD5 or HMAC-MD5 authentication on an interface, you must configure the new key before removing the old key from each router. OSPF uses the key rollover mechanism to ensure that the routers can pass authentication before the replacement is complete on the interface. After you configure a new key on a router, the router sends copies of

the same packet, each authenticated by a different key, including the new key and the keys in use. This practice continues until the router detects that all its neighbors have the new key.

The authentication algorithm can only be MD5 or HMAC-MD5 and the ID of keys used for authentication can only be in the range of 0 to 255.

Examples

On VLAN-interface 10, enable MD5 authentication, and set the interface key ID to 15 and the key to **123456** in plaintext form.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf authentication-mode md5 15 plain 123456
```

On VLAN-interface 10, enable simple authentication, and set the key to **123456** in plaintext form.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf authentication-mode simple plain 123456
```

Related commands

authentication-mode

4.1.53. ospf bfd enable

Use **ospf bfd enable** to enable BFD on an OSPF interface.

Use **undo ospf bfd enable** to disable BFD on an OSPF interface.

Syntax

ospf bfd enable [**echo**]

undo ospf bfd enable

Default

BFD for OSPF is disabled.

Views

Interface view

Predefined user roles

network-admin

Parameters

echo: Enables BFD single-hop echo detection. If you do not specify this keyword, the command enables BFD bidirectional control detection.

Examples

Enable BFD for OSPF on VLAN-interface 11.

```
<Switch> system-view
```

```
[Switch] ospf
[Switch-ospf-1] area 0
[Switch-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.255.255
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] ospf bfd enable
```

4.1.54. ospf cost (interface view)

Use **ospf cost** to set an OSPF cost for an interface.

Use **undo ospf cost** to restore the default.

Syntax

ospf cost *cost-value*

undo ospf cost

Default

An interface computes its OSPF cost according to the interface bandwidth. For a loopback interface, the cost is 0.

Views

Interface view

Predefined user roles

network-admin

Parameters

cost-value: Specifies an OSPF cost in the range of 0 to 65535 for a loopback interface, and in the range of 1 to 65535 for other interfaces.

Usage guidelines

If you do not execute this command, the interface automatically computes its OSPF cost.

Examples

Set the OSPF cost on VLAN-interface 10 to 65.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf cost 65
```

Related commands

bandwidth-reference

4.1.55. ospf dr-priority

Use **ospf dr-priority** to set the router priority for DR/BDR election on an interface.

Use **undo ospf dr-priority** to restore the default value.

Syntax

ospf dr-priority *priority*

undo ospf dr-priority

Default

The router priority is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

priority: Specifies the router priority for the interface, in the range of 0 to 255.

Usage guidelines

The greater the value, the higher the priority for DR/BDR election. If a device has a priority of 0, it will not be elected as a DR or BDR.

Examples

Set the router priority on VLAN-interface 10 to 8.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf dr-priority 8
```

4.1.56. ospf mib-binding

Use **ospf mib-binding** to bind an OSPF process to the public MIB.

Use **undo ospf mib-binding** to restore the default.

Syntax

ospf mib-binding *process-id*

undo ospf mib-binding

Default

The public MIB is bound to the OSPF process with the smallest process ID.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535.

Usage guidelines

To access information or data about an OSPF process in **RFC4750-OSPF.MIB**, use this command. To access information or data about an OSPF process in a private MIB for the device, you do not need to use this command. You can access information or data about all OSPF processes in the private MIBs.

If the specified process ID does not exist, a notification is displayed to report that the MIB binding configuration has failed.

Deleting an OSPF process that has been bound to the public MIB unbinds the OSPF process from the MIB, and re-binds the MIB to the OSPF process with the smallest process ID.

Examples

Bind OSPF process 100 to the public MIB.

```
<Switch> system-view
[Switch] ospf mib-binding 100
```

4.1.57. ospf mtu-enable

Use **ospf mtu-enable** to enable an interface to add the interface MTU into DD packets.

Use **undo ospf mtu-enable** to restore the default.

Syntax

ospf mtu-enable

undo ospf mtu-enable

Default

The MTU in DD packets is 0.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

After a virtual link is established through a Virtual-Template or Tunnel, two devices on the link from different vendors might have different MTU values. To make them consistent, restore the interfaces' MTU to the default value 0.

After you configure this command, the interface checks whether the MTU in a received DD packet is greater than its own MTU. If yes, the interface discards the packet.

Examples

Enable VLAN-interface 10 to add the interface MTU value into DD packets.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf mtu-enable
```

4.1.58. ospf network-type

Use **ospf network-type** to specify the network type for an interface.

Use **undo ospf network-type** to restore the default.

Syntax

ospf network-type { **broadcast** | **nbma** | **p2mp** [**unicast**] | **p2p** }

undo ospf network-type

Default

The network type of an interface is broadcast.

Views

Interface view

Predefined user roles

network-admin

Parameters

broadcast: Specifies the network type as broadcast.

nbma: Specifies the network type as NBMA.

p2mp: Specifies the network type as P2MP.

unicast: Specifies the P2MP interface to unicast OSPF packets. By default, a P2MP interface multicasts OSPF packets.

p2p: Specifies the network type as P2P.

Usage guidelines

If a router on a broadcast network does not support multicast, configure the network type for the connected interfaces as NBMA.

When the network type of an interface is NBMA or P2MP unicast, you must use the **peer** command to specify the neighbor.

If only two routers run OSPF on a network, you can configure the network type for the connected interfaces as P2P.

When the network type of an interface is P2MP unicast, all OSPF packets are unicast by the interface.

Examples

Specify the OSPF network type for VLAN-interface 10 as NBMA.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf network-type nbma
```

Related commands

ospf dr-priority

4.1.59. ospf peer sub-address enable

Use **ospf peer sub-address enable** to enable OSPF to establish neighbor relationships through the secondary IP addresses of an interface.

Use **undo ospf peer sub-address enable** to disable OSPF from establishing neighbor relationships through the secondary IP addresses of an interface.

Syntax

ospf peer sub-address enable [*ip-address*]

undo ospf peer sub-address enable

Default

OSPF cannot establish neighbor relationships through the secondary IP addresses of an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a secondary IP address of the interface in dotted decimal notation.

Usage guidelines

By default, OSPF uses the primary IP address of an interface to establish neighbor relationships.

You can execute this command to enable OSPF to establish neighbor relationships through both the primary and secondary IP addresses of an interface.

When you execute this command without specifying the *ip-address* argument, follow these guidelines:

- If you have advertised only the primary address of the interface in an area of an OSPF process, OSPF uses only the primary address to establish neighbor relationships. For OSPF to establish neighbor relationships through the secondary IP addresses, you must also advertise the secondary IP addresses in the same area of the same OSPF process.
- If the interface does not have a primary address but has multiple secondary addresses, OSPF uses the lowest secondary address to establish neighbor relationships. For OSPF to

establish neighbor relationships through the other secondary addresses, you must advertise these addresses in the same area of the same OSPF process.

When a customer-side device accesses the OSPF network through both M-LAG member devices in an M-LAG system, the M-LAG member devices provide Layer 3 gateway services. The gateway interfaces (such as VLAN interfaces) on different M-LAG member devices might have the same IP address and the same MAC address. In this case, the M-LAG member devices cannot establish OSPF neighbor relationships with the customer-side device. To resolve this issue, perform the following tasks:

1. Configure different M-LAG virtual IPv4 addresses for the gateway interfaces on different M-LAG member devices.
2. Execute the **ospf peer sub-address enable** *ip-address* command on each M-LAG member device, and set the ip-address argument to the M-LAG virtual IPv4 address of the gateway interface.

When you use the **ospf peer sub-address enable** *ip-address* command on an interface, follow these guidelines:

- After you use this command, OSPF uses only the specified address to establish neighbor relationships.
- To ensure successful OSPF neighbor relationship establishment, configure the specified address as the secondary address or the M-LAG virtual IPv4 address for the interface.
- If you execute this command multiple times, the most recent configuration takes effect.

After you execute the **ospf peer sub-address enable** command on a P2P OSPF interface, the device automatically checks the local and remote interface IP addresses before neighbor establishment. If the IP addresses belong to different networks, they cannot establish a neighbor relationship.

Examples

On interface VLAN-interface 10, enable OSPF to establish neighbor relationships through the secondary IP addresses of the interface.

```
<Sysname> system-view
[Sysname] interface vlan-interface 10
[Sysname-Vlan-interface10] ospf peer sub-address enable
```

4.1.60. ospf timer dead

Use **ospf timer dead** to set the neighbor dead interval.

Use **undo ospf timer dead** to restore the default.

Syntax

ospf timer dead *seconds*

undo ospf timer dead

Default

The dead interval is 40 seconds for broadcast and P2P interfaces. The dead interval is 120 seconds for P2MP and NBMA interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the dead interval in the range of 1 to 2147483647 seconds.

Usage guidelines

If an interface receives no hello packet from a neighbor within the dead interval, the interface considers the neighbor down.

The dead interval on an interface is a minimum of four times the hello interval. Routers attached to the same segment must have the same dead interval.

Examples

Set the dead interval for VLAN-interface 10 to 60 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf timer dead 60
```

Related commands

ospf timer hello

4.1.61. ospf timer hello

Use **ospf timer hello** to set the hello interval on an interface.

Use **undo ospf timer hello** to restore the default.

Syntax

ospf timer hello *seconds*

undo ospf timer hello

Default

The hello interval is 10 seconds for P2P and broadcast interfaces, and is 30 seconds for P2MP and NBMA interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the hello interval in the range of 1 to 65535 seconds.

Usage guidelines

The shorter the hello interval, the faster the topology converges, and the more resources are consumed. Make sure the hello interval on two neighboring interfaces is the same.

Examples

Set the hello interval on VLAN-interface to 20 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf timer hello 20
```

Related commands

ospf timer dead

4.1.62. ospf timer poll

Use **ospf timer poll** to set the poll interval on an NBMA interface.

Use **undo ospf timer poll** to restore the default.

Syntax

ospf timer poll *seconds*

undo ospf timer poll

Default

The poll interval is 120 seconds on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the poll interval in the range of 1 to 2147483647 seconds.

Usage guidelines

When an NBMA interface finds its neighbor is down, it sends hello packets at the poll interval.

The poll interval must be a minimum of four times the hello interval.

Examples

Set the poll timer interval on VLAN-interface 10 to 130 seconds.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf timer poll 130
```

Related commands

ospf timer hello

4.1.63. ospf timer retransmit

Use **ospf timer retransmit** to set the LSA retransmission interval on an interface.

Use **undo ospf timer retransmit** to restore the default.

Syntax

ospf timer retransmit *seconds*

undo ospf timer retransmit

Default

The LSA retransmission interval is 5 seconds on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the LSA retransmission interval in the range of 1 to 3600 seconds.

Usage guidelines

After sending an LSA, an interface waits for an acknowledgment packet. If the interface receives no acknowledgment within the retransmission interval, it retransmits the LSA.

To avoid unnecessary retransmissions, set an appropriate retransmission interval. For example, you can set a large retransmission interval value on a low-speed link.

Examples

Set the LSA retransmission interval to 8 seconds on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf timer retransmit 8
```

4.1.64. ospf trans-delay

Use **ospf trans-delay** to set the LSA transmission delay on an interface.

Use **undo ospf trans-delay** to restore the default.

Syntax

ospf trans-delay *seconds*

undo ospf trans-delay

Default

The LSA transmission delay is 1 second.

Views

Interface view

Predefined user roles

network-admin

Parameters

seconds: Specifies the LSA transmission delay in the range of 1 to 3600 seconds.

Usage guidelines

Each LSA in the LSDB has an age that is incremented by 1 every second, but the age does not change during transmission. Adding a transmission delay into the age time is important in low speed networks.

Examples

Set the LSA transmission delay to 3 seconds on VLAN-interface 10.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospf trans-delay 3
```

4.1.65. peer (OSPF view)

Use **peer** to specify a neighbor in an NBMA or P2MP network.

Use **undo peer** to remove a neighbor in an NBMA or P2MP network.

Syntax

peer *ip-address* [**cost** *cost-value* | **dr-priority** *priority*]

undo peer *ip-address*

Default

No neighbor is specified.

Views

OSPF view

Predefined user roles

network-admin

Parameters

ip-address: Specifies a neighbor by its IP address.

cost *cost-value*: Specifies the cost to reach the neighbor, in the range of 1 to 65535.

dr-priority *priority*: Specifies the DR priority for the neighbor, in the range of 0 to 255. The default neighbor DR priority is 1.

Usage guidelines

In an NBMA or P2MP network, OSPF packets are sent in unicast, so you must use this command to specify neighbors.

The cost set with the **peer** command applies only to P2MP neighbors. If no cost is specified, the cost to the neighbor equals the local interface's cost.

A router uses the priority set with the **peer** command to determine whether to send a hello packet to the neighbor rather than for DR election. The DR priority set with the **ospf dr-priority** command is used for DR election.

Examples

Specify the neighbor 1.1.1.1.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] peer 1.1.1.1
```

Related commands

ospf dr-priority

4.1.66. preference (OSPF view)

Use **preference** to set a preference for OSPF.

Use **undo preference** to remove the configuration.

Syntax

preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

undo preference [**ase**]

Default

The preference is 10 for OSPF internal routes and 150 for OSPF external routes (ASE routes).

Views

OSPF view

Predefined user roles

network-admin

Parameters

ase: Specifies a preference for OSPF external routes. If you do not specify this keyword, the command sets a preference for OSPF internal routes.

preference: Specifies the preference value in the range of 1 to 255. A smaller value represents a higher preference.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to set a preference for the specified routes.

Usage guidelines

If multiple routing protocols find routes to the same destination, the router uses the route found by the protocol with the highest preference.

When the **route-policy** *route-policy-name* option is specified, the following preferences take effect:

- For routes matching the routing policy, the preference set in the routing policy takes effect.
- For other routes, the preference set with the **preference** command takes effect.

Examples

Set a preference of 200 for OSPF external routes.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] preference ase 200
```

Set a preference of 100 for OSPF internal routes matching the specified routing policy, and set a preference of 150 for other routes.

```
<Switch> system-view
[Switch] ip prefix-list test index 10 permit 100.1.1.0 24
[Switch] route-policy pre permit node 10
[Switch-route-policy-pre-10] if-match ip address prefix-list test
[Switch-route-policy-pre-10] apply preference 100
[Switch-route-policy-pre-10] quit
[Switch] ospf 100
[Switch-ospf-100] preference route-policy pre 150
```

4.1.67. reset ospf event-log

Use **reset ospf event-log** to clear OSPF log information.

Syntax

reset ospf [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify this argument, the command clears OSPF log information for all OSPF processes.

lsa-flush: Clears LSA aging log information.

peer: Clears neighbor log information.

spf: Clears route calculation log information.

Usage guidelines

If you do not specify a log type, this command clears all log information.

Examples

Clear OSPF route calculation log information for all OSPF processes.

```
<Switch> reset ospf event-log spf
```

Related commands

display ospf event-log

4.1.68. reset ospf process

Use **reset ospf process** to restart all OSPF processes or a specified process.

Syntax

reset ospf [*process-id*] **process** [**graceful-restart**]

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify a process, this command restarts all OSPF processes.

graceful-restart: Resets the OSPF process by using GR.

Usage guidelines

The **reset ospf process** command performs the following actions:

- Clears all invalid LSAs without waiting for their timeouts.
- Makes a newly configured router ID take effect.
- Starts a new DR/BDR election.
- Keeps previous OSPF configurations.

The system prompts you to select whether to restart OSPF process upon execution of this command.

Examples

Restart all OSPF processes.

```
<Switch> reset ospf process
Reset OSPF process? [Y/N]:y
```

4.1.69. reset ospf redistribution

Use **reset ospf redistribution** to restart route redistribution.

Syntax

reset ospf [*process-id*] **redistribution**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPF process by its ID in the range of 1 to 65535. If you do not specify a process, this command restarts route redistribution for all OSPF processes.

Examples

Restart route redistribution.

```
<Switch> reset ospf redistribution
```

4.1.70. reset ospf statistics

Use **reset ospf statistics** to clear OSPF statistics.

Syntax

reset ospf [*process-id*] **statistics**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Clears the statistics for an OSPF process specified by its ID in the range of 1 to 65535.

Examples

Clear OSPF statistics for all processes.

```
<Switch> reset ospf statistics
```

Related commands

display ospf statistics

4.1.71. rfc1583 compatible

Use **rfc1583 compatible** to enable compatibility with RFC 1583.

Use **undo rfc1583 compatible** to disable compatibility with RFC 1583.

Syntax

rfc1583 compatible

undo rfc1583 compatible

Default

Compatibility with RFC 1583 is enabled.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

RFC 1583 specifies a different method than RFC 2328 for selecting the optimal route to a destination in another AS. When multiple routes are available to the ASBR, OSPF selects the optimal route by using the following procedure:

1. Selects the route with the highest preference.
   - If RFC 2328 is compatible with RFC 1583, all these routes have equal preference.
   - If RFC 2328 is not compatible with RFC 1583, the intra-area route in a non-backbone area is preferred to reduce the burden of the backbone area. The inter-area route and intra-area route in the backbone area have equal preference.
2. Selects the route with lower cost if two routes have equal preference.
3. Selects the route with larger originating area ID if two routes have equal cost.

To avoid routing loops, set identical RFC 1583-compatibility on all routers in a routing domain.

Examples

Disable compatibility with RFC 1583.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] undo rfc1583 compatible
```

4.1.72. router id

Use **router id** to configure a global router ID.

Use **undo router id** to restore the default.

Syntax

router id *router-id*

undo router id

Default

No global router ID is configured.

Views

System view

Predefined user roles

network-admin

Parameters

router-id: Specifies the router ID, in the format of an IPv4 address.

Usage guidelines

OSPF uses a router ID to identify a device. If no router ID is specified, the global router ID is used.

If no global router ID is configured, the highest loopback interface IP address is used as the router ID. If no loopback interface IP address is available, the highest physical interface IP address is used, regardless of the interface status (up or down).

During an active/standby process switchover, the new active process checks whether the previously backed up router ID is valid. If not, the process selects a new router ID.

A new router ID is selected only when the interface IP address used as the router ID is removed or changed. Other events will not trigger a router ID re-selection. For example, router ID re-selection is not triggered in the following situations:

- The interface goes down.
- You change the router ID to the address of a loopback interface after a physical interface address is selected as the router ID.
- A higher interface IP address is configured as the router ID.

After a router ID is changed, you must use the **reset** command to enable it.

Examples

Configure a global router ID as 1.1.1.1.

```
<Switch> system-view
[Switch] router id 1.1.1.1
```

4.1.73. silent-interface (OSPF view)

Use **silent-interface** to disable an interface or all interfaces from receiving and sending OSPF packets.

Use **undo silent-interface** to remove the configuration.

Syntax

silent-interface { *interface-type interface-number* | **all** }

undo silent-interface { *interface-type interface-number* | **all** }

Default

An interface can receive and send OSPF packets.

Views

OSPF view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all interfaces.

Usage guidelines

To disable a network from receiving and sending OSPF routes, use the command on the interface connected to the network.

Examples

Disable VLAN-interface 10 from receiving and sending OSPF packets.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] silent-interface vlan-interface 10
```

4.1.74. snmp-agent trap enable ospf

Use **snmp-agent trap enable ospf** to enable SNMP notifications for OSPF.

Use **undo snmp-agent trap enable ospf** to disable SNMP notifications for OSPF.

Syntax

snmp-agent trap enable ospf [**authentication-failure** | **bad-packet** | **config-error** | **grhelper-status-change** | **grrestarter-status-change** | **if-state-change** | **lsa-maxage** | **lsa-originate** | **lsdb-approaching-overflow** | **lsdb-overflow** | **neighbor-state-change** | **nssatranslator-status-change** | **retransmit** | **virt-authentication-failure** | **virt-bad-packet** | **virt-config-error** | **virt-retransmit** | **virtgrhelper-status-change** | **virtif-state-change** | **virtneighbor-state-change**] *

undo snmp-agent trap enable ospf [**authentication-failure** | **bad-packet** | **config-error** | **grhelper-status-change** | **grrestarter-status-change** | **if-state-change** | **lsa-maxage** | **lsa-originate** |

lsdb-approaching-overflow | **lsdb-overflow** | **neighbor-state-change** | **nssatranslator-status-change** | **retransmit** | **virt-authentication-failure** | **virt-bad-packet** | **virt-config-error** | **virt-retransmit** | **virtgrhelper-status-change** | **virtif-state-change** | **virtneighbor-state-change**] *

Default

SNMP notifications for OSPF are enabled.

Views

System view

Predefined user roles

network-admin

Parameters

authentication-failure: Specifies notifications about authentication failures on an interface.

bad-packet: Specifies notifications about error messages received on an interface.

config-error: Specifies notifications about error configuration of an interface.

grhelper-status-change: Specifies notifications about GR helper state change.

grrestarter-status-change: Specifies notifications about GR restarter state change.

if-state-change: Specifies notifications about interface state change.

lsa-maxage: Specifies LSA max age notifications.

lsa-originate: Specifies notifications about locally generated LSAs.

lsdb-approaching-overflow: Specifies notifications about approaching LSDB overflows.

lsdb-overflow: Specifies LSDB overflow notifications.

neighbor-state-change: Specifies notifications about neighbor state change.

nssatranslator-status-change: Specifies notifications about NSSA translator state change.

retransmit: Specifies notifications about packets that are received and forwarded on an interface.

virt-authentication-failure: Specifies notifications about authentication failures on a virtual interface.

virt-bad-packet: Specifies notifications about error messages received on a virtual interface.

virt-config-error: Specifies notifications about error configuration of a virtual interface.

virt-retransmit: Specifies notifications about packets that are received and forwarded on a virtual interface.

virtgrhelper-status-change: Specifies notifications about neighbor GR helper state changes of a virtual interface.

virtif-state-change: Specifies notifications about virtual interface state change.

virtneighbor-state-change: Specifies notifications about the neighbor state change of a virtual interface.

Examples

Disable SNMP notifications for OSPF.

```
<Switch> system-view
[Switch] undo snmp-agent trap enable ospf
```

4.1.75. spf-schedule-interval (OSPF view)

Use **spf-schedule-interval** to set the OSPF SPF calculation interval.

Use **undo spf-schedule-interval** to restore the default.

Syntax

spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo spf-schedule-interval

Default

The maximum calculation interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

maximum-interval: Specifies the maximum OSPF SPF calculation interval in the range of 1 to 60 seconds.

minimum-interval: Specifies the minimum OSPF SPF calculation interval in the range of 10 to 60000 milliseconds.

incremental-interval: Specifies the incremental OSPF SPF calculation interval in the range of 10 to 60000 milliseconds.

Usage guidelines

Based on the LSDB, an OSPF router uses SPF to calculate a shortest path tree with itself as the root. OSPF uses the shortest path tree to determine the next hop to a destination. By adjusting the SPF calculation interval, you can prevent overconsumption of bandwidth and router resources due to frequent topology changes.

For a stable network, the minimum interval is used. If network changes become frequent, the SPF calculation interval is incremented by the incremental interval × 2^{n-2} for each calculation until the maximum interval is reached. The value n is the number of calculation times.

The minimum interval and the incremental interval cannot be greater than the maximum interval.

Examples

Set the maximum SPF calculation interval to 10 seconds, minimum interval to 500 milliseconds, and incremental interval to 300 milliseconds.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] spf-schedule-interval 10 500 300
```

4.1.76. stub (OSPF area view)

Use **stub** to configure an area as a stub area.

Use **undo stub** to restore the default.

Syntax

stub [**default-route-advertise-always** | **no-summary**] *

undo stub

Default

No area is a stub area.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

default-route-advertise-always: Enables the ABR to advertise a default route in a Type-3 LSA into the stub area regardless of whether **FULL**-state neighbors exist in the backbone area. If you do not specify this keyword, the ABR advertises a default route in a Type-3 LSA into the stub area only when a minimum of one **FULL**-state neighbor exists in the backbone area.

no-summary: Enables the ABR to advertise only a default route in a Type-3 LSA into the stub area without advertising any other Type-3 LSAs. The area is a totally stub area.

Usage guidelines

To configure an area as a stub area, use the **stub** command on all routers attached to the area.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure Area 1 as a stub area.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 1
[Switch-ospf-100-area-0.0.0.1] stub
```

Related commands

default-cost (OSPF area view)

4.1.77. stub-router (OSPF view)

Use **stub-router** to configure a router as a stub router.

Use **undo stub-router** to restore the default.

Syntax

stub-router

undo stub-router

Default

The router is not configured as a stub router.

Views

OSPF view

Predefined user roles

network-admin

Usage guidelines

The router LSAs sent by the stub router over different links contain different link type values. A value of 3 represents a link to a stub network, and the cost of the link is not changed. A value of 1, 2, or 4 represents a point-to-point link, a link to a transit network, or a virtual link. The cost of these links is set to 65535. Neighbors on such links will not send packets to the stub router as long as they have a route with a smaller cost.

Examples

Configure a stub router.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] stub-router
```

4.1.78. transmit-pacing

Use **transmit-pacing** to set the LSU transmission interval and the maximum number of LSU packets that can be sent at each interval.

Use **undo transmit-pacing** to restore the default.

Syntax

transmit-pacing interval *interval* **count** *count*

undo transmit-pacing

Default

An OSPF interface sends a maximum of three LSU packets every 20 milliseconds.

Views

OSPF view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies an interval at which an interface sends LSU packets, in the range of 10 to 1000 milliseconds. If the router has multiple OSPF interfaces, increase this interval to reduce the total number of LSU packets sent by the router every second.

count *count*: Specifies the maximum number of LSU packets sent by an interface at each interval, in the range of 1 to 200. If the router has multiple OSPF interfaces, decrease the maximum number to reduce the total number of LSU packets sent by the router every second.

Examples

Configure all the interfaces running OSPF process 1 to send a maximum of 10 LSU packets every 30 milliseconds.

```
<Switch> system-view
[Switch] ospf 1
[Switch-ospf-1] transmit-pacing interval 30 count 10
```

4.1.79. vlink-peer (OSPF area view)

Use **vlink-peer** to configure a virtual link.

Use **undo vlink-peer** to remove a virtual link.

Syntax

vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | { { **hmac-md5** | **md5** } *key-id* { **cipher** | **plain** } *string* | **simple** { **cipher** | **plain** } *string* } | **retransmit** *seconds* | **trans-delay** *seconds*] *

undo vlink-peer *router-id* [**dead** | **hello** | { **hmac-md5** | **md5** } *key-id* | **retransmit** | **simple** | **trans-delay**] *

Default

No virtual links exist.

Views

OSPF area view

Predefined user roles

network-admin

Parameters

router-id: Specifies the router ID of the neighbor on the virtual link.

dead *seconds*: Specifies the dead interval in the range of 1 to 32768 seconds. The default is 40. The dead interval must be identical with that on the virtual link neighbor, and a minimum of four times the hello interval.

hello *seconds*: Specifies the hello interval in the range of 1 to 8192 seconds. The default is 10. It must be identical with the hello interval on the virtual link neighbor.

hmac-md5: Specifies the HMAC-MD5 authentication mode.

md5: Specifies the MD5 authentication mode.

simple: Specifies the simple authentication mode.

key-id: Specifies the key ID for MD5 or HMAC-MD5 authentication, in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. This argument is case sensitive.

- In simple authentication mode, the plaintext form of the key is a string of 1 to 8 characters. The encrypted form of the key is a string of 33 to 41 characters.
- In MD5/HMAC-MD5 authentication mode, the plaintext form of the key is a string of 1 to 16 characters. The encrypted form of the key is a string of 33 to 53 characters.

retransmit *seconds*: Specifies the retransmission interval in the range of 1 to 3600 seconds. The default is 5.

trans-delay *seconds*: Specifies the transmission delay interval in the range of 1 to 3600 seconds. The default is 1.

Usage guidelines

As defined in RFC 2328, all non-backbone areas must maintain connectivity to the backbone. You can use the **vlink-peer** command to configure a virtual link to connect an area to the backbone.

When you configure this command, follow these guidelines:

- The smaller the hello interval is, the faster the network converges, and the more network resources are consumed.
- A retransmission interval that is too small can cause unnecessary retransmissions. A large value is appropriate for a low speed link.
- Specify an appropriate transmission delay with the **trans-delay** keyword.

You can specify either MD5/HMAC-MD5 authentication or simple authentication for a virtual link. For MD5/HMAC-MD5 authentication, you can configure multiple keys by executing this command multiple times, and each command must have a unique key ID and key string.

To modify the key of a virtual link, perform the following key rollover configurations:

1. Configure a new MD5/HMAC-MD5 authentication key for the virtual link on the local device. If the new key is not configured on the neighbor device, MD5/HMAC-MD5 authentication key rollover is triggered. During key rollover, OSPF sends multiple packets that contain both the new and old MD5/HMAC-MD5 authentication keys to ensure that the neighbor device can pass the authentication.
2. Configure the new MD5/HMAC-MD5 authentication key on the neighbor device. When the local device receives packets with the new key from the neighbor device, it exits MD5 key rollover.
3. Delete the old MD5/HMAC-MD5 authentication key from the local device and the neighbor. This step helps prevent attacks from devices that use the old key for communication and reduces system resources and bandwidth consumption caused by key rollover.

OSPF supports the MD5 and HMAC-MD5 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 255.

Examples

Configure a virtual link to the neighbor with router ID 1.1.1.1.

```
<Switch> system-view
[Switch] ospf 100
[Switch-ospf-100] area 2
[Switch-ospf-100-area-0.0.0.2] vlink-peer 1.1.1.1
```

5. BGP commands

5.1. BGP commands

5.1.1. additional-paths select-best

Use **additional-paths select-best** to set the maximum total number of Add-Path optimal routes that can be advertised to all peers.

Use **undo additional-paths select-best** to restore the default.

Syntax

additional-paths select-best *best-number*

undo additional-paths select-best

Default

A maximum of one Add-Path optimal route can be advertised to all peers.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

best-number: Specifies the maximum total number of Add-Path optimal routes that can be advertised to all peers, in the range of 2 to 32.

Usage guidelines

The number of optimal routes cannot exceed the maximum total number of Add-Path optimal routes that can be advertised to all peers.

Examples

In BGP IPv4 unicast address family view, set the maximum total number to 3 for Add-Path optimal routes that can be advertised to all peers.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] additional-paths select-best 3
```

Related commands

peer additional-paths

peer advertise additional-paths best

5.1.2. address-family ipv4

Use **address-family ipv4** to create the BGP IPv4 unicast address family, or BGP-VPN IPv4 unicast address family, and enter its view, or enter the view of the existing address family.

Use **undo address-family ipv4** to remove the BGP IPv4 unicast address family, or BGP-VPN IPv4 unicast address family, and all its configurations.

Syntax

address-family ipv4 [**unicast**]

undo address-family ipv4 [**unicast**]

Default

No BGP IPv4 unicast address family, or BGP-VPN IPv4 unicast address family exists.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

unicast: Specifies the IPv4 unicast address family. If this command is executed with the **unicast** keyword in BGP instance view, it places you into BGP IPv4 unicast address family view. If this command is executed with the **unicast** keyword in BGP-VPN instance view, it places you into BGP-VPN IPv4 unicast address family view.

Usage guidelines

Configurations made in BGP IPv4 unicast address family view apply only to the BGP IPv4 unicast routes and peers of the public network.

Configurations made in BGP-VPN IPv4 unicast address family view apply only to the BGP IPv4 unicast routes and peers of the specified VPN instance.

Examples

In BGP instance view, create the BGP IPv4 unicast address family and enter its view.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4]
```

5.1.3. address-family ipv6

Use **address-family ipv6** to create the BGP IPv6 unicast address family, or BGP-VPN IPv6 unicast address family, and enter its view, or enter the view of the existing address family.

Use **undo address-family ipv6** to remove the BGP IPv6 unicast address family, or BGP-VPN IPv6 unicast address family, and all its configurations.

Syntax

address-family ipv6 [**unicast**]

undo address-family ipv6 [**unicast**]

Default

No BGP IPv6 unicast address family, or BGP-VPN IPv6 unicast address family exists.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

unicast: Specifies the IPv6 unicast address family. If this command is executed with the **unicast** keyword in BGP instance view, it places you into BGP IPv6 unicast address family view. If this command is executed with the **unicast** keyword in BGP-VPN instance view, it places you into BGP-VPN IPv6 unicast address family view.

Usage guidelines

Configurations made in BGP IPv6 unicast address family view apply only to the BGP IPv6 unicast routes and peers of the public network.

Configurations made in BGP-VPN IPv6 unicast address family view apply only to the BGP IPv6 unicast routes and peers of the specified VPN instance.

Examples

In BGP instance view, create the BGP IPv6 unicast address family and enter its view.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv6 unicast
[Switch-bgp-default-ipv6]
```

5.1.4. aggregate

Use **aggregate** to create a summary route in the BGP routing table.

Use **undo aggregate** to remove a summary route.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

aggregate *ipv4-address* { *mask-length* | *mask* } [**as-set** | **attribute-policy** *route-policy-name* | **detail-suppressed** | **origin-policy** *route-policy-name* | **suppress-policy** *route-policy-name*] *

undo aggregate ipv4-address { *mask-length* | *mask* }

In BGP IPv6 unicast address family view:

aggregate *ipv6-address prefix-length* [**as-set** | **attribute-policy** *route-policy-name* | **detail-suppressed** | **origin-policy** *route-policy-name* | **suppress-policy** *route-policy-name*] *

undo aggregate *ipv6-address prefix-length*

Default

No summary routes are configured.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 summary address.

mask-length: Specifies a mask length for the IPv4 summary address, in the range of 0 to 32.

mask: Specifies a mask for the IPv4 summary address, in dotted decimal notation.

ipv6-address: Specifies an IPv6 summary address.

prefix-length: Specifies a prefix length for the IPv6 summary address, in the range of 0 to 128.

as-set: Enables the AS_PATH attribute of the summary route to contain the AS path information for all summarized routes. The AS_PATH attribute is of the AS_SET type that requires no sequence when arranging AS numbers. If you do not specify this keyword, the AS_PATH attribute of the summary route contains only the AS number of the local router.

attribute-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to set attributes for the summary route.

detail-suppressed: Advertises only the summary route. If you do not specify this keyword, BGP advertises both the summary route and the more specific routes.

origin-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to select routes to be summarized.

suppress-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter more specific routes to be advertised. Routes permitted by the specified routing policy are not advertised. Routes denied by the specified routing policy are advertised.

Usage guidelines

This command creates a summary route. If the BGP routing table has routes whose destination addresses fall within the specified network, the summary route is added to the BGP routing table. For example, if two routes 10.1.1.0/24 and 10.1.2.0/24 exist in the BGP routing table, configuring the **aggregate 10.1.0.0 16** command creates a summary route 10.1.0.0/16.

If the summarized routes have different ORIGIN attributes, the summary route selects the ORIGIN attribute in the sequence of INCOMPLETE, EGP, and IGP. For example, if the ORIGIN attributes of the summarized routes include INCOMPLETE and IGP, the ORIGIN attribute of the summary route is INCOMPLETE.

The COMMUNITY attribute of the summary route includes all the COMMUNITY (or extended community) attribute values if the routes have the following details:

- Summarized routes have different COMMUNITY (or extended community) attribute values.
- The summary route does not have the ATOMIC_AGGREGATE attribute.

Table 5-1 Functions of the keywords

Keywords	Function
as-set	Enables the summary route to carry the AS path information for all summarized routes. This feature can help avoid routing loops. However, if many routes are summarized and are changed frequently, do not specify this keyword. This configuration causes the summary route to flap with the more specific routes.
attribute-policy	Sets attributes except the AS-PATH attribute for the summary route. The **peer route-policy** command can achieve the same purpose. If you modify the AS_PATH attribute of the summary route through the routing policy specified by the **attribute-policy** keyword, you cannot specify the **as-set** keyword. Modifying the AS_PATH attribute of the summary route might cause routing loops.
detail-suppressed	Disables advertisement of all more specific routes. To disable advertisement of some more specific routes, use the **suppress-policy** keyword or the **peer filter-policy** command.
origin-policy	Summarizes only routes matching a routing policy. If the destination address of a route falls within the summary network but does not match the routing policy, the route is not summarized. It is not controlled by the **detail-suppressed** and **suppress-policy** keywords. There is no need to configure **apply** clauses for the routing policy applied by the **origin-policy** keyword because they do not

Keywords	Function
	take effect.
suppress-policy	Disables advertisement of some more specific routes filtered by a routing policy. The routing policy uses **if-match** clauses to filter routes. There is no need to configure **apply** clauses for the routing policy applied by the **suppress-policy** keyword because they do not take effect.

Examples

In BGP IPv4 unicast address family view, create summary route 1.1.0.0/16 in the BGP routing table.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] aggregate 1.1.0.0 255.255.0.0
```

5.1.5. balance

Use **balance** to enable load balancing and set the maximum number of BGP ECMP routes for load balancing.

Use **undo balance** to disable load balancing.

Syntax

balance [**ebgp** | **eibgp** | **ibgp**] *number*

undo balance [**ebgp** | **eibgp** | **ibgp**]

Default

Load balancing is disabled.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ebgp: Enables load balancing over EBGP routes.

eibgp: Enables load balancing between EBGP and IBGP routes.

ibgp: Enables load balancing over IBGP routes.

number: Specifies the maximum number of BGP ECMP routes for load balancing, in the range of 1 to 8. When it is set to 1, load balancing is disabled.

Usage guidelines

Unlike IGP, BGP has no explicit metric for making load balancing decision. Instead, it implements load balancing by modifying route selection rules.

BGP uses the following load balancing criteria to determine load balanced routes:

- The routes have the same ORIGIN, LOCAL_PREF, and MED attributes.
- The routes meet the following requirements on the AS_PATH attribute:
  - If the **balance as-path-neglect** command is configured or only the **balance as-path-neglect** command is configured, the routes can have different AS_PATH attributes.
  - If the **balance as-path-neglect** is not configured, the routes must have the same AS_PATH attribute.

If you do not specify the **ibgp**, **eibgp**, or **ebgp** keyword, this command enables load balancing over EBGP routes and IBGP routes, but not between EBGP and IBGP routes.

After you execute the **balance eibgp** *number* command, the **balance** [**ebgp** | **ibgp**] *number* and **undo balance** [**ebgp** | **ibgp**] commands cannot be executed; and vice versa.

Examples

In BGP IPv4 unicast address family view, enable load balancing and set the maximum number of BGP ECMP routes used for load balancing to 2.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] balance 2
```

Related commands

balance as-path-neglect

5.1.6. balance as-path-neglect

Use **balance as-path-neglect** to enable BGP to ignore the AS_PATH attribute when it implements load balancing.

Use **undo balance as-path-neglect** to restore the default.

Syntax

balance as-path-neglect

undo balance as-path-neglect

Default

BGP does not ignore the AS_PATH attribute when it implements load balancing.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Usage guidelines

For BGP to implement load balancing over routes with different AS_PATH attributes, you must use this command together with the **balance** command.

After this command is executed, BGP ignores the AS_PATH attributes in the routes for load balancing and changes the attributes of the advertised routes to those of the optimal route. The operations might cause routing loops. In addition, this command might also affect the NetStream data. Therefore, use this command with caution.

Examples

In BGP IPv4 unicast address family view, enable BGP to ignore the AS_PATH attribute when it implements load balancing.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] balance as-path-neglect
```

Related commands

5.1.7. bestroute compare-med

Use **bestroute compare-med** to enable MED comparison for routes on a per-AS basis.

Use **undo bestroute compare-med** to restore the default.

Syntax

bestroute compare-med

undo bestroute compare-med

Default

MED comparison for routes on a per-AS basis is disabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Usage guidelines

By default, BGP does not compare MEDs for routes from the same AS. When a router learns a new route, it compares the route with the optimal route in its BGP routing table. If the new route is more optimal, it becomes the optimal route in the BGP routing table. In this way, route learning sequence might affect optimal route selection.

To solve the selection problem, the router puts routes received from the same AS into a group when the **bestroute compare-med** command is configured. The router then selects the route with the lowest MED from the same group, and compares routes from different groups.

Examples

In BGP instance view, enable MED comparison for routes on a per-AS basis.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] bestroute compare-med
```

5.1.8. bestroute med-confederation

Use **bestroute med-confederation** to enable MED comparison for routes received from confederation peers.

Use **undo bestroute med-confederation** to restore the default.

Syntax

bestroute med-confederation

undo bestroute med-confederation

Default

MED comparison is disabled for routes received from confederation peers.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Usage guidelines

This command enables BGP to compare the MEDs of routes received from confederation peers. However, if a route from a confederation peer has an AS number that does not belong to the confederation, BGP does not compare the route with other routes. For example, a confederation has three AS numbers 65006, 65007, and 65009. BGP receives three routes from different confederation peers. The AS_PATH attributes of these routes are 65006 65009, 65007 65009, and 65008 65009, and the MED values of them are 2, 3, and 1. Because the third route's AS_PATH attribute contains AS number 65008, which does not belong to the confederation, BGP does not compare it with other routes. As a result, the first route becomes the optimal route.

Examples

In BGP instance view, enable MED comparison for routes received from confederation peers.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] bestroute med-confederation
```

5.1.9. bgp

Use **bgp** to enable a BGP instance and enter its view.

Use **undo bgp** to disable a BGP instance.

Syntax

bgp *as-number*

undo bgp [*as-number*]

Default

BGP is disabled and no BGP instances exist.

Views

System view

Predefined user roles

network-admin

Parameters

as-number: Specifies a local AS by its number in the range of 1 to 4294967295.

Usage guidelines

A router supports 4-byte AS number.

A BGP router can run multiple BGP processes. Each BGP process corresponds to a BGP instance. BGP maintains an independent routing table for each BGP instance.

You can create multiple public address families for a BGP instance. However, each public address family (except for public IPv4/IPv6 unicast address family) can belong to only one BGP instance.

You can create multiple VPN instances for a BGP instance, and each VPN instance can have multiple address families. A VPN instance can belong to only one BGP instance.

You cannot specify the same peer for the same address family of different BGP instances.

Different BGP instances can have the same AS number but cannot have the same name.

Examples

Enable BGP instance **default**, set the local AS number to 100, and enter BGP instance view.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default]
```

5.1.10. compare-different-as-med

Use **compare-different-as-med** to enable MED comparison for routes from peers in different ASs.

Use **undo compare-different-as-med** to restore the default.

Syntax

compare-different-as-med

undo compare-different-as-med

Default

MED comparison is disabled for routes from peers in different ASs.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Usage guidelines

If multiple routes to a destination exist, the route with the smallest MED is selected.

Do not use this command unless relevant ASs adopt the same IGP protocol and routing selection method.

Examples

In BGP instance view, enable MED comparison for routes from peers in different ASs.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] compare-different-as-med
```

5.1.11. confederation id

Use **confederation id** to configure a confederation ID.

Use **undo confederation id** to restore the default.

Syntax

confederation id *as-number*

undo confederation id

Default

No confederation ID is configured.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

as-number: Specifies an AS number that identifies the confederation, in the range of 1 to 4294967295.

Usage guidelines

You can split an AS into several sub-ASs, and each sub-AS remains fully meshed. These sub-ASs form a confederation. Key path attributes of a route, such as the Next_HOP, MED, and LOCAL_PREF, are not discarded when crossing each sub-AS. The sub-ASs still look like one AS from the perspective of other ASs. The AS number is the confederation ID.

Confederation can ensure the integrity of the former AS, and solve the problem of too many IBGP connections in the AS.

Configure the same confederation ID for all routers in one confederation.

For a non-confederation BGP router that establishes a BGP connection to a router in a confederation, the confederation ID is the AS number of the router.

Examples

Confederation 9 consists of four sub-ASs numbered 38, 39, 40 and 41. Peer 10.1.1.1 is a member of sub-AS 38. Peer 200.1.1.1 is a member outside of confederation 9, which belongs to AS 98. Confederation 9 looks like one AS (with AS number 9) from the perspective of peer 200.1.1.1. This example uses a router in sub-AS 41.

```
<Switch> system-view
[Switch] bgp 41
[Switch-bgp-default] confederation id 9
[Switch-bgp-default] confederation peer-as 38 39 40
[Switch-bgp-default] group Confed38 external
[Switch-bgp-default] peer Confed38 as-number 38
```

```
[Switch-bgp-default] peer 10.1.1.1 group Confed38
[Switch-bgp-default] group Remote98 external
[Switch-bgp-default] peer Remote98 as-number 98
[Switch-bgp-default] peer 200.1.1.1 group Remote98
```

Related commands

confederation nonstandard

confederation peer-as

5.1.12. confederation nonstandard

Use **confederation nonstandard** to enable compatibility with routers not compliant with RFC 3065 in the confederation.

Use **undo confederation nonstandard** to restore the default.

Syntax

confederation nonstandard

undo confederation nonstandard

Default

The device is compatible with only routers compliant with RFC 3065 in the confederation.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

Configure this command on all routers compliant with RFC 3065 to interact with those routers not compliant with RFC 3065 in the confederation.

Examples

Confederation 100 consists of two sub-ASs, 64000 and 65000, and contains routers not compliant with RFC 3065. Enable compatibility with routers not compliant with RFC 3065 in the confederation.

```
<Switch> system-view
[Switch] bgp 64000
[Switch-bgp-default] confederation id 100
[Switch-bgp-default] confederation peer-as 65000
[Switch-bgp-default] confederation nonstandard
```

Related commands

confederation id

confederation peer-as

5.1.13. confederation peer-as

Use **confederation peer-as** to specify confederation peer sub-ASs.

Use **undo confederation peer-as** to remove the specified confederation peer sub-ASs.

Syntax

confederation peer-as *as-number-list*

undo confederation peer-as [*as-number-list*]

Default

No confederation peer sub-ASs are specified.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

as-number-list: Specifies a sub-AS number list. A maximum of 32 sub-ASs can be configured in one command line. The expression is *as-number-list* = *as-number* &<1-32>. The *as-number* argument specifies a sub-AS number in the range of 1 to 4294967295, and &<1-32> indicates that a maximum of 32 numbers can be specified.

Usage guidelines

Before this configuration, use the **confederation id** command to specify the confederation ID for the sub-ASs.

If the **undo confederation peer-as** command is executed without the *as-number-list* argument, all confederation peer sub-ASs are removed.

Examples

In BGP instance view, specify confederation peer sub-ASs 2000 and 2001.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] confederation id 10
[Switch-bgp-default] confederation peer-as 2000 2001
```

Related commands

5.1.14. dampening

Use **dampening** to enable BGP route dampening.

Use **undo dampening** to restore the default.

Syntax

dampening [*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

undo dampening

Default

Route dampening is disabled.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

half-life-reachable: Specifies a half-life for active routes, in the range of 1 to 45 minutes. By default, the value is 15 minutes.

half-life-unreachable: Specifies a half-life for suppressed routes, in the range of 1 to 45 minutes. By default, the value is 15 minutes.

reuse: Specifies a reuse threshold value for suppressed routes, in the range of 1 to 20000. A suppressed route whose penalty value decreases under the value is reused. By default, the reuse value is 750. The reuse threshold must be less than the suppression threshold.

suppress: Specifies a suppression threshold in the range of 1 to 20000. The route with a penalty value greater than the threshold is suppressed. The default value is 2000.

ceiling: Specifies a ceiling penalty value in the range of 1001 to 20000. The value must be greater than the *suppress* value. By default, the value is 16000.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

This command dampens only EBGP routes.

If an EBGP peer goes down after you configure this command, routes coming from the peer are dampened but not deleted.

Examples

In BGP IPv4 unicast address family view, configure BGP route dampening. Set the half-life for both active and suppressed routes to 10 minutes, the reuse threshold to 1000, the suppression threshold to 2000, and the ceiling penalty to 10000.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] dampening 10 10 1000 2000 10000
```

5.1.15. default local-preference

Use **default local-preference** to configure a default local preference.

Use **undo default local-preference** to restore the default.

Syntax

default local-preference *value*

undo default local-preference

Default

The default local preference is 100.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

value: Specifies a default local preference in the range of 0 to 4294967295. A larger value represents a higher preference.

Usage guidelines

You can also use the **apply local-preference** command in a routing policy to configure the local preference for BGP routes. If no routing policy is configured, all BGP routes use the local preference set by the **default local-preference** command. If a routing policy is configured, BGP routes matching the routing policy use the local preference set by the **apply local-preference** command. Other BGP routes use the local preference set by the **default local-preference** command.

Examples

In BGP IPv4 unicast address family view, set the default local preference to 180.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] default local-preference 180
```

Related commands

apply local-preference

route-policy

5.1.16. default med

Use **default med** to specify a default MED value.

Use **undo default med** to restore the default.

Syntax

default med *med-value*

undo default med

Default

The default MED value is 0.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

med-value: Specifies the default MED value in the range of 0 to 4294967295.

Usage guidelines

BGP selects a MED value in the following order:

1. MED set by the **apply cost** command.
2. MED set by the **med** keyword in the **import-route** command.
3. MED set by the **default med** command.
4. Original MED of a BGP route, or MED changed from the metric of a redistributed IGP route.

Examples

In BGP IPv4 unicast address family view, set the default MED to 25.

```
<Switch> system-view
```

```
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] default med 25
```

Table 5-2 Command output

Field	Description
BGP peer group	Name of the BGP peer group.
Remote AS	AS number of the peer group.
Type	Type of the peer groups: • **external**—EBGP peer group. • **internal**—IBGP peer group.
Maximum number of prefixes allowed	Maximum number of routes allowed to learn from the peer.
Threshold	Percentage of received routes from the peer to maximum routes allowed to learn from the peer. If the percentage is reached, the system generates a log message.
Configured hold time	Configured hold interval in seconds.
Keepalive time	Keepalive interval in seconds.
Minimum time between advertisements	Minimum route advertisement interval in seconds.
Peer preferred value	Preferred value specified for routes from the peer.
Site-of-Origin	SoO for the peer group.
Routing policy configured	Routing policy configured for the peer group. If you do not specify a routing policy, this field displays **No routing policy is configured**.
Members	Information about peers included in the peer group.
* - Dynamically created peer	An asterisk (*) before a peer address indicates that the peer is a dynamic peer.
Peer	IPv4 or IPv6 address of the peer.
AS	AS number of the peer.
MsgRcvd	Number of messages received.
MsgSent	Number of messages sent.
OutQ	Number of messages to be sent.
PrefRcv	For the IPv4 and IPv6 address families, this field displays the number of prefixes received from the peer.
Up/Down	Lasting time of the current BGP session state.
State	Current state of the BGP session between the local router and the peer.
IPsec profile name	IPsec profile applied to the IPv6 BGP peer group.

5.1.19. display bgp network

Use **display bgp network** to display information about routes advertised by the **network** command and shortcut routes configured by the **network short-cut** command.

Syntax

display bgp network { **ipv4** | **ipv6** } [**unicast**] [**vpn-instance** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4: Displays IPv4 address family information.

ipv6: Displays IPv6 address family information.

unicast: Displays BGP unicast address family information.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays routing information for the public network.

Examples

Display information about routes advertised by the **network** command and shortcut routes configured by the **network short-cut** command in the IPv4 unicast address family.

```
<Switch> display bgp network ipv4

  BGP local router ID: 192.168.1.135
  Local AS number: 100

  Network           Mask            Route-policy        Short-cut
  20.1.1.0          255.255.255.0                       No
  40.1.1.0          255.255.255.0   abc                 No
  30.1.1.0          255.255.255.0                       Yes
```

Display information about routes advertised by the **network** command and shortcut routes configured by the **network short-cut** command in the IPv6 unicast address family.

```
<Switch> display bgp network ipv6

  BGP local router ID: 192.168.1.135
  Local AS number: 100

  Network           PrefixLen       Route-policy        Short-cut
```

```
1::                 24                                      No
2::                 24                                      No
3::                 64                  policy1             No
2::                 24                                      Yes
```

Table 5-3 Command output

Field	Description
Network	Destination network address of the routes advertised by the **network** command and the shortcut routes.
Mask	Mask of the destination network address.
PrefixLen	Prefix length of the destination network address.
Route-policy	Routing policy that is applied to the route.
Short-cut	Whether the route is a shortcut route: • Yes. • No.

5.1.20. display bgp paths

Use **display bgp paths** to display BGP path attribute information.

Syntax

display bgp paths [*as-regular-expression*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

as-regular-expression: Displays information about BGP path attributes whose AS_PATH attribute matches the specified regular expression. The *as-regular-expression* argument is a string of 1 to 256 characters. If you do not specify this argument, the command displays information about all BGP path attributes.

Examples

Display information about all BGP path attributes.

```
<Switch> display bgp paths

  RefCount     MED          Path/Origin
  3            0            ?
  2            0            100i
  3            0            100i
  1            0            ?
```

```
1            0            ?
1            0            ?
```

Table 5-4 Command output

Field	Description
RefCount	Number of BGP routes with these path attributes.
MED	MULTI_EXIT_DISC attribute.
Path/Origin	AS_PATH and ORIGIN attributes of the route: • **AS_PATH attribute**—Records the ASs the route has passed, which avoids routing loops. • **ORIGIN attribute**—Identifies the origin of the route: ○ **i**—Originated in the AS. The origin of routes advertised with the **network** command is IGP. ○ **e**—Learned through EGP. ○ **?**—Unknown origin. The origin of routes redistributed from IGP protocols is INCOMPLETE.

5.1.21. display bgp peer

Use **display bgp peer** to display BGP peer or peer group information.

Syntax

display bgp peer ipv4 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*] **verbose**]

display bgp peer ipv6 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | { *ipv6-address* | **group-name** *group-name* } **log-info** | [*ipv6-address*] **verbose**]

display bgp peer ipv6 [**unicast**] [*ipv4-address mask-length* | *ipv4-address* **log-info** | [*ipv4-address*] **verbose**]

display bgp peer l2vpn evpn [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*] **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4: Displays IPv4 BGP peer or peer group information.

ipv6: Displays IPv6 BGP peer or peer group information.

evpn: Displays BGP EVPN peer or peer group information.

unicast: Displays BGP unicast peer or peer group information.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays BGP peer or peer group information for the public network.

ipv4-address mask-length: Specifies a subnet. The value range for the mask length is 0 to 32. If you specify a subnet, this command displays information about all dynamic peers in the subnet.

ipv4-address: Specifies a peer by its IPv4 address.

ipv6-address prefix-length: Specifies a subnet. The value range for the prefix length is 0 to 128. If you specify a subnet, this command displays information about all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address.

group-name *group-name*: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters.

log-info: Displays log information.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief BGP peer or peer group information.

Usage guidelines

If you do not specify any parameters, this command displays brief information about all BGP peers for the specified address family.

Examples

Display brief information about all BGP IPv4 unicast peers.

```
<Switch> display bgp peer ipv4

 BGP local router ID: 192.168.100.1
 Local AS number: 100
 Total number of peers: 1                 Peers in established state: 1

  * - Dynamically created peer
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  10.2.1.2               200       13       16    0       0 00:10:34 Established
```

Table 5-5 Command output

Field	Description
* - Dynamically created peer	An asterisk (*) before a peer address indicates that the peer is a dynamic peer.
VPN instance	Name of the VPN instance to which the peer belongs.

Field	Description
Peer	IPv4 or IPv6 address of the peer.
AS	AS number of the peer.
MsgRcvd	Number of messages received.
MsgSent	Number of messages sent.
OutQ	Number of messages to be sent.
PrefRcv	For the IPv4 and IPv6 address families, this field displays the number of prefixes that have been received from the peer and added into the local BGP routing table.
Up/Down	Lasting time of the current BGP session state.
State	Current state of the BGP session between the local router and the peer.

Display brief information about all dynamic peers in network 1.1.1.0/24.

```
<Switch> display bgp peer ipv4 1.1.1.0 24

 Type: EBGP link
 Dynamic address range: 1.1.1.0 24
 Configured: Active Hold Time: 3 sec     Keepalive Time: 1 sec
 Address family IPv4 Unicast: Configured

 Maximum allowed prefix number: 100
 Threshold: 75%
 Minimum time between advertisements is 100 seconds
 Optional capabilities:
  Multi-protocol extended capability has been enabled
  Route refresh capability has been enabled
 Nexthop self has been configured
 Keep-all-routes has been configured
 Send community has been configured
 Send extend community has been configured
 Default route originating has been configured
 Multi-hop ebgp has been enabled
 Peer preferred value: 100
 BFD: Enabled
 Site-of-Origin: 1:1
 Routing policy configured:
 No import as-path-acl list
 Export as-path-acl list is: 22
 No import prefix list
 Export prefix list is: p1
 No import route policy
 Export route policy is: p1
 No import filter-policy
 No export filter-policy
```

```
 Dynamic peers:
  1.1.1.3
```

Display brief information about all dynamic peers in network 1::/64.

```
<Switch> display bgp peer ipv6 1:: 64

 Type: IBGP link
 Dynamic address range: 1:: 64
 Configured: Active Hold Time: 180 sec   Keepalive Time: 60 sec
 Address family IPv6 Unicast: Configured

 Maximum allowed prefix number: 4294967295
 Threshold: 75%
 Minimum time between advertisements is 15 seconds
 Optional capabilities:
  Multi-protocol extended capability has been enabled
  Route refresh capability has been enabled
 Send community has been configured
 Peer preferred value: 0
 Site-of-Origin: Not specified
 Routing policy configured:
 No routing policy is configured

 Dynamic peers:
  1::1
```

Table 5-6 Command output

Field	Description
Type	BGP connection type between the local router and the dynamic peer: • **IBGP link**—IBGP connection. • **EBGP link**—EBGP connection.
Configured	Timers configured on the local router in seconds, including the hold time (Active Hold Time) and keepalive interval (Keepalive Time).
Address family IPv4 Unicast	IPv4 unicast address family capability.
Address family link-state	LS address family capability.
Address family IPv6 Unicast	IPv6 unicast address family capability.
Address family IPv4 Multicast	IPv4 multicast address family capability.
Address family IPv6 Multicast	IPv6 multicast address family capability.
Maximum allowed prefix number	Maximum number of routes allowed to learn from the peer.
Threshold	Percentage of received routes from the peer to maximum routes allowed to learn from the peer. If the percentage is reached, the system generates alarm messages.
Minimum time between advertisements	Minimum route advertisement interval in seconds.

Field	Description
Optional capabilities	Optional capabilities supported by the local end.
Peer Preferred Value	Preferred value specified for the routes from the peer.
BFD	Whether BFD is enabled to detect the link to the BGP peers.
IPsec profile name	IPsec profile applied to the IPv6 BGP peer. This field is available only for the IPv6 unicast and IPv6 multicast address families.
Routing policy configured	Routing policy configured for the peer. If you do not specify a routing policy, this field displays **No routing policy is configured**.
Dynamic peers	IP addresses of dynamic peers.

Display detailed information about BGP IPv4 unicast peer 10.2.1.2.

```
<Switch> display bgp peer ipv4 10.2.1.2 verbose

         Peer: 10.2.1.2          Local: 192.168.100.1
         Type: EBGP link
         BGP version 4, remote router ID 192.168.100.2
         BGP current state: Established, Up for 00h11m10s
         BGP current event: RecvKeepalive
         BGP last state: OpenConfirm
         Port:  Local - 179      Remote - 60672
         Configured: Active Hold Time: 180 sec   Keepalive Time: 60 sec
         Received  : Active Hold Time: 180 sec
         Negotiated: Active Hold Time: 180 sec   Keepalive Time: 60 sec
         Peer optional capabilities:
         Peer support BGP multi-protocol extended
         Peer support BGP route refresh capability
         Peer support BGP route AS4 capability
         Address family IPv4 Unicast: advertised and received

No routing policy is configured
```

Table 5-7 Command output

Field	Description
Peer	IPv4 or IPv6 address of the peer.
Local	Local router ID.
VPN instance	Name of the VPN instance to which the peer belongs.
Type	BGP connection type between the local router and the peer: • **IBGP link**—IBGP connection. • **EBGP link**—EBGP connection.
remote router ID	Router ID of the peer.
BGP current state	Current state of the BGP session between the local router and the peer.
Up for	Lasting time of the BGP session.
BGP current event	Current event of the BGP session between the local router and the peer.
BGP last state	Previous state of the BGP session.
Port	TCP port numbers of the local router and its peer.

Field	Description
Configured	Timers configured on the local router in seconds, including the hold time (Active Hold Time) and keepalive interval (Keepalive Time).
Received	Received timer (configured on the peer) in seconds, including the hold time (Active Hold Time).
Negotiated	Negotiated timers in seconds, including the hold time (Active Hold Time) and keepalive interval (Keepalive Time).
Peer optional capabilities	Optional capabilities supported by the peer.
Peer support BGP route AS4 capability	The peer supports 4-byte AS number.
Address family IPv4 Unicast	IPv4 unicast address family capability: routes of the address family can be advertised and received.
Address family LS	LS address family capability: routes of the address family can be advertised and received.
Address family IPv6 Unicast	IPv6 unicast address family capability: routes of the address family can be advertised and received.
Address family IPv4 Multicast	IPv4 multicast address family capability: routes of the address family can be advertised and received.
Address family IPv6 Multicast	IPv6 multicast address family capability: routes of the address family can be advertised and received.
InQ updates	Number of received updates to be processed.
OutQ updates	Number of updates to be sent to the peer.
NLRI statistics	Number of the reachable and unreachable routes received from and sent to the peer after the BGP session is established.
Message statistics	BGP message statistics.
Msg type	BGP message type.
Last rcvd time/Last sent time	Time when the most recent BGP message was received from or sent to the peer.
Current rcvd count/Current sent count	Number of BGP messages received from or sent to the peer on the current BGP session.
History rcvd count/History sent count	Number of BGP messages received from or sent to the peer since the BGP peer relationship was established.
Total	Total number of received and sent messages.
Maximum allowed prefix number	Maximum number of routes allowed to learn from the peer.
Threshold	Percentage of received routes from the peer to maximum routes allowed to learn from the peer. If the percentage is reached, the system generates alarm messages.
Minimum time between advertisements	Minimum route advertisement interval in seconds.
Optional capabilities	Optional capabilities supported by the local end.
Peer Preferred Value	Preferred value specified for the routes from the peer.

Field	Description
GTSM has been enabled	GTSM is supported.
the maximum number of hops	Maximum number of hops to the specified peer.
BFD	Whether BFD is enabled to detect the link to the BGP peer.
IPsec profile name	IPsec profile applied to the IPv6 BGP peer. This field is available only for the IPv6 unicast and IPv6 multicast address families.
Routing policy configured	Routing policy configured for the peer. If you do not specify a routing policy, this field displays **No routing policy is configured**.

Display log information for BGP IPv4 unicast peer 1.1.1.1.

```
<Switch> display bgp peer ipv4 1.1.1.1 log-info

 Peer : 1.1.1.1

     Date       Time     State Notification
                              Error/SubError

 06-Feb-2013 22:54:42 Down  Send notification with error 6/4
                            Cease/Administrative Reset
                            <administrative reset>
```

Table 5-8 Command output

Field	Description
Peer	IPv4 or IPv6 address of the peer.
Date	Date on which the Notification was sent or received.
Time	Time at which the Notification was sent or received.
State	BGP session state: • **Up**—The BGP session is in Established state. • **Down**—The BGP session is down.
Notification Error/SubError	Error code of the Notification, indicating the cause of why the BGP session was down. • **Error**—Refers to the error code, which identifies the type of the Notification. • **SubError**—Refers to the error subcode of the Notification, which identifies the specific information about the reported error.

5.1.22. display bgp routing-table dampened

Use **display bgp routing-table dampened** to display dampened BGP routes.

Syntax

display bgp routing-table dampened { **ipv4** | **ipv6** } [**unicast**] [**vpn-instance** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4: Displays dampened BGP IPv4 routes.

ipv6: Displays dampened BGP IPv6 routes.

unicast: Displays dampened BGP unicast routes.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays dampened BGP routes for the public network.

Examples

Display dampened BGP IPv4 unicast routes.

```
<Switch> display bgp routing-table dampened ipv4

 Total number of routes: 1

 BGP local router ID is 192.168.1.135
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
               Origin: i - IGP, e - EGP, ? - incomplete

     Network            From            Reuse                         Path/Ogn

  de 20.1.1.0/24        10.1.1.2        00:56:27                      100i
```

Display dampened BGP IPv6 unicast routes.

```
<Switch> display bgp routing-table dampened ipv6

 Total number of routes: 2

 BGP local router ID is 192.168.1.135
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
               Origin: i - IGP, e - EGP, ? - incomplete
```

```

Table 5-9 Command output

Field	Description
Status codes	Status codes: • *** – valid**—Valid route. • **> – best**—Optimal route. • **d – dampened**—Dampened route. • **h – history**—History route. • **s – suppressed**—Suppressed route. • **S – stale**—Stale route. • **i – internal**—Internal route. • **e – external**—External route. • **a – additional-path**—Add-Path optimal route.
Origin	Origin of the route: • **i – IGP**—Originated in the AS. The origin of routes advertised with the **network** command is IGP. • **e – EGP**—Learned through EGP. • **?– incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is INCOMPLETE.
Network	Destination network address.
From	IP address from which the route was received.
Reuse	Reuse time of the route.
Path/Ogn	AS_PATH and ORIGIN attributes of the route: • **AS_PATH attribute**—Records the ASs the route has passed, which avoids routing loops. • **ORIGIN attribute**—Identifies the origin of the route.

5.1.23. display bgp routing-table flap-info

Use **display bgp routing-table flap-info** to display BGP route flap statistics.

Syntax

display bgp routing-table flap-info ipv4 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [{ *mask-length* | *mask* } [**longest-match**]] | **as-path-acl** *as-path-acl-number*]

display bgp routing-table flap-info ipv6 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | **as-path-acl** *as-path-acl-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

ipv4: Displays BGP IPv4 route flap statistics.

ipv6: Displays BGP IPv6 route flap statistics.

unicast: Displays BGP unicast route flap statistics.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays BGP route flap statistics for the public network.

ipv4-address: Specifies a destination network address.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

longest-match: Specifies longest match mode, which selects the longest matching route through the following steps:

1. ANDs the specified network address with the mask of each route.
2. Matches a route if the AND result is the same as the network address of the route and the mask of the route is shorter than or equal to the specified mask.
3. Selects the route with the longest mask among the matching routes.

ipv6-address prefix-length: Displays route flap statistics for BGP IPv6 routes that match the specified network address, and match the prefix length in the range of 0 to 128.

as-path-acl *as-path-acl-number*: Displays route flap statistics for BGP routes that match the AS path list specified by its number in the range of 1 to 256.

Usage guidelines

If you specify only the *ipv4-address* argument, the system ANDs the network address with the mask of a route. If the result matches the network address of the route, the command displays flap statistics of the route.

If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument, and do not specify the **longest-match** keyword, the command displays flap statistics of the BGP IPv4 unicast or multicast route that matches both the specified destination network address and the mask (or mask length).

Examples

Display BGP IPv4 unicast route flap statistics.

```
<Switch> display bgp routing-table flap-info ipv4

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays BGP IPv4 unicast routing information for the default BGP instance.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays the BGP IPv4 unicast routing information for the public network.

ipv4-address: Specifies a destination network address.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

longest-match: Specifies longest match mode, which selects the longest matching route through the following steps:

1. ANDs the specified network address with the mask of each route.
2. Matches a route if the AND result is the same as the network address of the route and the mask of the route is shorter than or equal to the specified mask.
3. Selects the route with the longest mask among the matching routes.

as-path-acl *as-path-acl-number*: Displays BGP IPv4 unicast routes that match the AS path list specified by its number in the range of 1 to 256.

community-list: Displays BGP IPv4 unicast routes that match a community list.

ext-community: Displays extended community attribute information for BGP IPv4 unicast routes or displays BGP IPv4 unicast routes that match the extended community attribute criterion specified for route filtering.

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters.

whole-match: Displays routes exactly matching the specified community list. If you do not specify this keyword, the command displays routes whose COMMUNITY attributes include the specified community list.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

peer *ipv4-address*: Displays BGP IPv4 unicast routing information advertised to or received from the specified peer.

advertised-routes: Displays routing information advertised to the specified peer.

received-routes: Displays routing information received from the specified peer.

statistics: Displays routing statistics.

Usage guidelines

If you do not specify any parameters, this command displays brief information about all BGP IPv4 unicast routes.

If you specify only the *ipv4-address* argument, the system ANDs the network address with the mask of a route. If the result matches the network address of the route, the command displays information about the route.

If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument and do not specify the **longest-match** keyword, this command displays information about the BGP IPv4 unicast route that matches both the specified destination network address and the mask (or mask length).

This command displays BGP IPv4 unicast routing information regardless of whether the **unicast** keyword is specified.

Examples

Display brief information about all BGP IPv4 unicast routes.

```
<Switch> display bgp routing-table ipv4

Table 5-12 Command output

Field	Description
Paths	Number of routes: • **available**—Number of valid routes. • **best**—Number of optimal routes.
Original nexthop	Original next hop of the route. If the route was obtained from a BGP update message, the original next hop is the next hop IP address in the message.
OutLabel	This field is not supported in the current software version. Outgoing label of the route.
RxPathID	Add-Path ID of received routes.
TxPathID	Add-Path ID of advertised routes.
AS-path	AS_PATH attribute of the route, which records the ASs the route has passed and avoids routing loops.
Origin	Origin of the route: • **igp**—Originated in the AS. The origin of routes advertised with the **network** command is IGP. • **egp**—Learned through EGP. • **incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is INCOMPLETE.
Attribute value	BGP path attributes: • **MED**—MED value. • **localpref**–Local preference value. • **pref-val**—Preferred value. • **pre**—Route preference.

Field	Description
State	Current state of the route: • valid. • internal. • external. • local. • synchronize. • best.
From	IP address of the BGP peer that advertised the route.
Rely Nexthop	Next hop found by route recursion. If no next hop is found, this field displays **not resolved**.
IP precedence	IP precedence in the range of 0 to 7. **N/A** indicates that the route does not support this field.
QoS local ID	QoS local ID in the range of 1 to 4095. **N/A** indicates that the route does not support this field.
Traffic index	Traffic index in the range of 1 to 64. **N/A** indicates that the route does not support this field.

Display statistics for public BGP IPv4 unicast routes advertised to peer 10.2.1.2.

Predefined user roles

network-admin

network-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays the BGP IPv6 unicast routing information for the public network.

ipv6-address prefix-length: Specifies the destination network address and prefix length. The value range for the *prefix-length* argument is 0 to 128. If you do not specify this argument, the command displays brief information about all BGP IPv6 unicast routing information.

as-path-acl *as-path-acl-number*: Displays BGP IPv6 unicast routes that match the AS path list specified by its number in the range of 1 to 256.

community-list: Displays BGP IPv6 unicast routes that match a community list.

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters.

whole-match: Displays routes exactly matching the specified community list. If you do not specify this keyword, the command displays routes whose COMMUNITY attributes include the specified community list.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

peer: Displays BGP IPv6 unicast routing information advertised to or received from the specified peer.

ipv4-address: Specifies the peer IPv4 address.

ipv6-address: Specifies the peer IPv6 address.

advertised-routes: Displays routing information advertised to the specified peer.

received-routes: Displays routing information received from the specified peer.

statistics: Displays routing statistics.

Usage guidelines

This command displays BGP IPv6 unicast routing information regardless of whether the **unicast** keyword is specified.

Examples

Display brief information about all BGP IPv6 unicast routes.

```
<Switch> display bgp routing-table ipv6

 Total number of routes: 1

Table 5-15 Command output

Field	Description
Status codes	Status codes: • *** – valid**—Valid route. • **> – best**—Optimal route. • **d – dampened**—Dampened route. • **h – history**—History route. • **s – suppressed**—Suppressed route. • **S – stale**—Stale route. • **i – internal**—Internal route. • **e – external**—External route. • **a – additional-path**—Add-Path optimal route.
Origin	Origin of the route: • **i – IGP**—Originated in the AS. The origin of routes advertised with the **network** command is IGP. • **e – EGP**—Learned through EGP. • **?– incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is INCOMPLETE.
Network	Destination network address.
PrefixLen	Prefix length of the destination network address.
NextHop	Next hop IPv6 address.
LocPrf	Local preference value.
PrefVal	Preferred value of the route.
OutLabel	This field is not supported in the current software version. Outgoing label of the route.
MED	MULTI_EXIT_DISC attribute.
Path/Ogn	AS_PATH and ORIGIN attributes of the route:

Field	Description
	• **AS_PATH attribute**—Records the ASs the route has passed, which avoids routing loops. • **ORIGIN attribute**—Identifies the origin of the route.

Display detailed information about BGP IPv6 unicast routes destined to network 2::/64.

Table 5-16 Command output

Field	Description
Paths	Number of routes: • **available**—Number of valid routes. • **best**—Number of optimal routes.

Field	Description
Original nexthop	Original next hop of the route. If the route was obtained from a BGP update message, the original next hop is the next hop IP address in the message.
OutLabel	This field is not supported in the current software version. Outgoing label of the route.
RxPathID	Add-Path ID of received routes.
TxPathID	Add-Path ID of advertised routes.
AS-path	AS_PATH attribute of the route, which records the ASs the route has passed and avoids routing loops.
Origin	Origin of the route: • **igp**—Originated in the AS. The origin of routes advertised with the **network** command is IGP. • **egp**—Learned through EGP. • **incomplete**—Unknown origin. The origin of routes redistributed from IGP protocols is INCOMPLETE.
Attribute value	BGP path attributes: • **MED**—MED value. • **localpref**–Local preference value. • **pref-val**—Preferred value. • **pre**—Route preference.
State	Current state of the route: • valid. • internal. • external. • local. • best.
From	IP address of the BGP peer that advertised the route.
Relay Nexthop	Next hop found by route recursion. If no next hop is found, this field displays **not resolved**.
IP precedence	IP precedence in the range of 0 to 7. **N/A** indicates that the route does not support this field.
QoS local ID	QoS local ID in the range of 1 to 4095. **N/A** indicates that the route does not support this field.
Traffic index	Traffic index in the range of 1 to 64. **N/A** indicates that the route does not support this field.

5.1.26. ebgp-interface-sensitive

Use **ebgp-interface-sensitive** to enable immediate re-establishment of direct EBGP sessions.

Use **undo ebgp-interface-sensitive** to disable immediate re-establishment of direct EBGP sessions.

Syntax

ebgp-interface-sensitive

undo ebgp-interface-sensitive

Default

Immediate re-establishment of direct EBGP sessions is enabled.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

When a direct link to an EBGP peer fails, BGP tears down the session and re-establishes a session to the peer immediately. If the feature is not enabled, the router does not tear down the session until the hold time expires. However, disabling this feature can prevent routing flaps from affecting EBGP session state.

This command applies only to direct EBGP sessions.

Examples

Enable immediate re-establishment of direct EBGP sessions.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] ebgp-interface-sensitive
```

5.1.27. extcommunity-type tag

Use **extcommunity-type tag** to set the type value for the tag community attribute.

Use **undo extcommunity-type tag** to restore the default.

Syntax

extcommunity-type tag *tag-type-value*

undo extcommunity-type tag

Default

The type value for the tag community attribute is 83cf in hexadecimal notation.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

tag-type-value: Specifies a type value in the range of 0 to ffff, which is in hexadecimal notation.

Usage guidelines

The tag community attribute is an NEC-proprietary extended community attribute. It might be unrecognizable for devices from other vendors or have conflicts with other private extended community attributes. You can use this command to adjust the type value to a recognizable or non-conflicting one for the tag community attribute.

Examples

Set the type value to 0x5688 for the tag community attribute.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] extcommunity-type tag 5688。
```

Related commands

peer advertise tag

5.1.28. filter-policy export

Use **filter-policy export** to filter advertised BGP routes.

Use **undo filter-policy export** to remove the route filter.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol process-id*]

undo filter-policy export [*protocol process-id*]

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

filter-policy { *ipv6-acl-number* | **prefix-list** *ipv6-prefix-name* } **export** [*protocol process-id*]

undo filter-policy export [*protocol process-id*]

Default

Advertised BGP routes are not filtered.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999, to match routes by destination.

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999, to match routes by destination.

prefix-list *prefix-list-name*: Specifies an IPv4 prefix list by its name, a case-sensitive string of 1 to 63 characters, to match routes by destination.

prefix-list *ipv6-prefix-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to match routes by destination.

protocol: Filters routes redistributed from the routing protocol.

process-id: Specifies a routing protocol by its ID in the range of 1 to 65535. For IPv4 routes, this argument is available only when the protocol is **ospf**, or **rip**. For IPv6 routes, this argument is available only when the protocol is **ospfv3**, or **ripng**.

Usage guidelines

If you specify a protocol (such as **direct**), this command filters only routes redistributed from the specified protocol. If you do not specify a protocol, this command filters all advertised routes, including the following routes:

- Redistributed from IGP.
- Injected by the **network** command.
- Learned from BGP peers.

If you use a basic ACL (with a number from 2000 to 2999) configured with the **rule** [*rule-id*] { **deny** | **permit** } **source** *source-address source-wildcard* command, the command matches routes whose destination network addresses match the *source-address source-wildcard* argument. However, it does not match the masks of the destination addresses.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following steps:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

In BGP IPv4 unicast address family view, use IPv4 basic ACL 2000 to filter advertised BGP IPv4 routes.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] filter-policy 2000 export
```

Related commands

peer filter-policy

peer prefix-list

peer route-policy

5.1.29. filter-policy import

Use **filter-policy import** to filter received BGP routes.

Use **undo filter-policy import** to restore the default.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **import**

undo filter-policy import

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

filter-policy { *ipv6-acl-number* | **prefix-list** *ipv6-prefix-name* } **import**

undo filter-policy import

Default

Received BGP routes are not filtered.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 3999, to match routes by destination.

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999, to match routes by destination.

prefix-list *prefix-list-name*: Specifies an IPv4 prefix list by its name, a case-sensitive string of 1 to 63 characters, to match routes by destination.

prefix-list *ipv6-prefix-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to match routes by destination.

Usage guidelines

If you use a basic ACL (with a number from 2000 to 2999) configured with the **rule** [*rule-id*] { **deny** | **permit** } **source** *source-address source-wildcard* command, the

command matches routes whose destination network addresses match the *source-address source-wildcard* argument. However, it does not match the masks of the destination addresses.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following steps:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

In BGP IPv4 unicast address family view, use IPv4 basic ACL 2000 to filter received BGP routes.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] filter-policy 2000 import
```

5.1.30. graceful-restart

Use **graceful-restart** to enable BGP Graceful Restart (GR) capability.

Use **undo graceful-restart** to disable BGP GR capability.

Syntax

graceful-restart

undo graceful-restart

Default

BGP GR capability is disabled.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

GR ensures continuous forwarding when BGP restarts or an active/standby switchover occurs.

BGP peers exchange Open messages containing GR information. If both parties have GR capability, they establish a GR-capable session.

After you execute this command, the device re-establishes BGP sessions.

Examples

Enable GR capability for BGP process 100.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] graceful-restart
```

Related commands

graceful-restart timer restart

graceful-restart timer wait-for-rib

5.1.31. graceful-restart timer restart

Use **graceful-restart timer restart** to configure the GR timer.

Use **undo graceful-restart timer restart** to restore the default.

Syntax

graceful-restart timer restart *timer*

undo graceful-restart timer restart

Default

The GR timer is 150 seconds.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

timer: Specifies the GR timer in the range of 3 to 600 seconds.

Usage guidelines

The GR restarter sends the GR timer to the GR helper in an Open message. When the GR helper detects that an active/standby switchover or a BGP restart occurred on the GR restarter, the GR helper performs the following operations:

1. Marks all routes learned from the GR restarter as stale.
2. Starts the GR timer.
3. If no BGP session is established before the GR timer expires, the GR helper removes the stale routes.

Before you configure this command, enable the BGP GR capability.

To apply a new GR timer, you must re-establish BGP sessions.

Examples

Set the GR timer to 300 seconds.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] graceful-restart
[Switch-bgp-default] graceful-restart timer restart 300
```

Related commands

graceful-restart

graceful-restart timer wait-for-rib

5.1.32. graceful-restart timer wait-for-rib

Use **graceful-restart timer wait-for-rib** to configure the time to wait for the End-of-RIB marker.

Use **undo graceful-restart timer wait-for-rib** to restore the default.

Syntax

graceful-restart timer wait-for-rib *timer*

undo graceful-restart timer wait-for-rib

Default

The time to wait for the End-of-RIB marker is 600 seconds.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

timer: Specifies the time to wait for the End-of-RIB marker, in the range of 3 to 3600 seconds.

Usage guidelines

BGP uses this timer to control the time to receive updates from the peer. The timer is not advertised to the peer.

After the GR restarter and GR helper re-establish a BGP session, they start this timer. If they do not complete route exchange within the time period, the GR restarter does not receive new routes. It updates its routing table and forwarding table with learned BGP routes, and the GR helper removes the stale routes. Set a large value for the maximum time to wait for the End-of-RIB marker when a large number of routes exist.

This command controls the routing convergence speed. A smaller timer value means faster routing convergence but possibly results in incomplete routing information.

Before configuring this command, you must enable the BGP GR capability.

Examples

Set the time to wait for the End-of-RIB marker on the local end to 100 seconds.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] graceful-restart
[Switch-bgp-default] graceful-restart timer wait-for-rib 100
```

Related commands

graceful-restart

graceful-restart timer restart

5.1.33. group

Use **group** to create a peer group.

Use **undo group** to delete a peer group.

Syntax

group *group-name* [**external** | **internal**]

undo group *group-name*

Default

No peer groups exist.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a name for the peer group, a case-sensitive string of 1 to 47 characters.

external: Creates an EBGP peer group.

internal: Creates an IBGP peer group.

Usage guidelines

In a large-scale network, many peers can use the same route selection policy. You can configure a peer group and add these peers into this group. In this way, peers can share the same policy as the peer group. When the policy of the group is modified, the modification also applies to peers in it.

If you do not specify the **internal** or **external** keyword, this command creates an IBGP peer group.

If you perform configurations on a peer group and peers of the peer group, the most recent configuration takes effect.

After you create a peer group, you must use the **peer enable** command to enable BGP to exchange routing information with the specified peer group.

Examples

In BGP instance view, create EBGP peer group **test** with AS number 200, and add EBGP peers 10.1.1.1 and 10.1.2.1 into the group.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] group test external
[Switch-bgp-default] peer test as-number 200
[Switch-bgp-default] peer 10.1.1.1 group test
[Switch-bgp-default] peer 10.1.2.1 group test
```

Related commands

display bgp group

peer enable

5.1.34. import-route

Use **import-route** to enable BGP to redistribute routes from an IGP protocol.

Use **undo import-route** to disable route redistribution from an IGP protocol.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

import-route { **ospf** | **rip** } [{ *process-id* | **all-processes** } [**med** *med-value* | **route-policy** *route-policy-name*] *] [**inherit-tag**]

import-route { **direct** | **static** } [**med** *med-value* | **route-policy** *route-policy-name*]

undo import-route { **direct** | { **ospf** | **rip** } [*process-id* | **all-processes**] | **static** }

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

import-route { **ospfv3** | **ripng** } [{ *process-id* | **all-processes** } [**med** *med-value* | **route-policy** *route-policy-name*] *] [**inherit-tag**]

import-route { **direct** | **static** } [**med** *med-value* | **route-policy** *route-policy-name*]

undo import-route { **direct** | { **ospfv3** | **ripng** } [*process-id* | **all-processes**] | **static** }

Default

BGP does not redistribute IGP routes.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

direct: Redistributes direct routes.

ospf: Redistributes OSPF routes.

ospfv3: Redistributes OSPFv3 routes.

rip: Redistributes RIP routes.

ripng: Redistributes RIPng routes.

static: Redistributes static routes.

process-id: Specifies a process by its ID in the range of 1 to 65535. The default is 1. For IPv4 routes, it is available only when the protocol is **ospf**, or **rip**. For IPv6 routes, it is available only when the protocol is **ospfv3**, or **ripng**.

all-processes: Redistributes routes from all the processes of the specified IGP protocol.

med *med-value*: Specifies a MED value for redistributed routes, in the range of 0 to 4294967295. If you do not specify an MED, the metric of a redistributed route is used as its MED.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter redistributed routes or set route attributes for redistributed routes.

inherit-tag: Adds the tag community attribute to BGP routes generated from redistributed IGP routes, inheriting the original IGP route tags.

Usage guidelines

The **import-route** command cannot redistribute default IGP routes. To redistribute default IGP routes, use the **default-route imported** command together with the **import-route** command.

Only active routes can be redistributed. You can use the **display ip routing-table protocol** or **display ipv6 routing-table protocol** command to view route state information.

The ORIGIN attribute of routes redistributed by the **import-route** command is INCOMPLETE.

If you have specified the **all-processes** keyword to redistribute all routes of a routing protocol, this command no longer takes effect on any processes of the routing protocol.

The tag community attribute added to BGP routes depends on the configuration of the **apply tag** command under the following conditions:

- Both the **inherit-tag** and **route-policy** *route-policy-name* parameters are specified.
- The specified routing policy contains an **apply tag** clause.

Examples

In BGP IPv4 unicast address family view, redistribute routes from RIP process 1, and set the MED value for redistributed routes to 100.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] import-route rip 1 med 100
```

Related commands

display ip routing-table protocol

display ipv6 routing-table protocol

5.1.35. ip vpn-instance (BGP instance view)

Use **ip vpn-instance** to create a BGP-VPN instance and enter its view, or enter the view of an existing BGP-VPN instance.

Use **undo ip vpn-instance** to remove a BGP-VPN instance and all its configurations.

Syntax

ip vpn-instance *vpn-instance-name*

undo ip vpn-instance *vpn-instance-name*

Default

No BGP-VPN instances exist.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After you create a BGP peer in BGP-VPN instance view, the BGP routes learned from the peer are added into the routing table of the specified VPN instance.

This command and all commands in BGP-VPN instance view are typically executed on provider edge (PE) or Multi-VPN-Instance CE (MCE) devices. The commands add routes learned from different sites into different VPN instances.

Before you execute this command, you must perform the following tasks:

- Use the **ip vpn-instance** command to create the VPN instance in system view.
- Use the **route-distinguisher** command to configure a route distinguisher (RD) for the VPN instance.

Examples

Create a BGP-VPN instance and enter its view.

```
<Switch> system-view
[Switch] ip vpn-instance vpn1
[Switch-vpn-instance-vpn1] route-distinguisher 100:1
[Switch-vpn-instance-vpn1] quit
[Switch] bgp 100
[Switch-bgp-default] ip vpn-instance vpn1
[Switch-bgp-default-vpn1]
```

Related commands

ip vpn-instance (system view) (*MCE Command Reference*)

route-distinguisher (*MCE Command Reference*)

5.1.36. log-peer-change

Use **log-peer-change** to enable logging for BGP session state changes globally.

Use **undo log-peer-change** to disable logging for BGP session state changes globally.

Syntax

log-peer-change

undo log-peer-change

Default

Logging for BGP session state changes is enabled globally.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

After you execute both the **log-peer-change** and **peer log-change** commands, BGP logs session establishment and disconnection events for the peer or peer group. To display the log information, use the **display bgp peer ipv4 unicast log-info** command or the **display bgp peer ipv6 unicast log-info** command. The logs are sent to the information center of the device. The output rules of the logs (whether to output the logs and where to output) are determined by the information center configuration. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

If you disable logging for BGP session state changes globally or disable logging for a peer or peer group, BGP does not generate logs for session establishments and disconnections.

Examples

Enable logging for session state changes globally.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] log-peer-change
```

Related commands

display bgp peer

peer log-change

5.1.37. network

Use **network** to inject a network to the BGP routing table and configure BGP to advertise the network.

Use **undo network** to remove a local network.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

network *ipv4-address* [*mask-length* | *mask*] [**route-policy** *route-policy-name*]

undo network *ipv4-address* [*mask-length* | *mask*]

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

network *ipv6-address prefix-length* [**route-policy** *route-policy-name*]

undo network *ipv6-address prefix-length*

Default

BGP does not advertise local networks.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 network address. If you do not specify the *mask* or *mask-length* argument, natural mask is used.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a mask in dotted decimal notation.

ipv6-address: Specifies an IPv6 network address.

prefix-length: Specifies a prefix length in the range of 0 to 128.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter routes or set the route attributes.

Usage guidelines

The network to be injected must be available and active in the local IP routing table.

The ORIGIN attribute of the route injected with the **network** command is IGP.

When you execute the **undo network** command, you must specify the same mask or mask length/prefix length that you specified for the **network** command. Otherwise, the configuration cannot be removed.

Examples

In BGP IPv4 unicast address family view, inject local network 10.0.0.0/16 to the BGP routing table.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] network 10.0.0.0 255.255.0.0
```

5.1.38. non-stop-routing

MEMO:

non-stop-routing command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable BGP nonstop routing (NSR).

Use **undo non-stop-routing** to disable BGP NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

BGP NSR is disabled.

Views

BGP instance view

Predefined user roles

network-admin

Usage guidelines

BGP NSR ensures continuous routing by synchronizing BGP state and data information from the active BGP process to the standby BGP process. The standby BGP process can seamlessly take over all services when the active process fails.

Examples

Enable BGP NSR.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] non-stop-routing
```

5.1.39. network short-cut

Use **network short-cut** to increase the preference for a received EBGP route. This EBGP route is called a shortcut route.

Use **undo network short-cut** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

network *ipv4-address* [*mask-length* | *mask*] **short-cut**

undo network *ipv4-address* [*mask-length* | *mask*] **short-cut**

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

network *ipv6-address prefix-length* **short-cut**

undo network *ipv6-address prefix-length* **short-cut**

Default

A received EBGP route has a preference of 255.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies an IPv4 network address. If you do not specify the *mask* or *mask-length* argument, natural mask is used.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a mask for the network address, in dotted decimal notation.

ipv6-address: Specifies an IPv6 network address.

prefix-length: Specifies a prefix length in the range of 0 to 128.

Usage guidelines

Different routing protocols might find different routes to the same destination. However, not all of those routes are optimal. For route selection, routing protocols, direct routes, and static routes are assigned different preferences. The route with the highest preference is preferred.

By default, the preference of an EBGP route is lower than a local route. If a device has an EBGP route and a local route to reach the same destination, the device does not select the EBGP route. You can use the **network shortcut** command to configure the EBGP route to have the same preference as the local route so the EBGP route is more likely to become the optimal route.

You can use the **preference** command to modify the preferences for external and local BGP routes.

Examples

In BGP IPv4 unicast address family view, increase the preference of EBGP route 10.0.0.0/16.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] network 10.0.0.0 255.255.0.0 short-cut
```

Related commands

preference

5.1.40. peer additional-paths

Use **peer additional-paths** to configure the BGP additional path capabilities.

Use **undo peer additional-paths** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **additional-paths** { **receive** | **send** } *

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **additional-paths** { **receive** | **send** } *

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **additional-paths** { **receive** | **send** } *

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **additional-paths** { **receive** | **send** } *

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **additional-paths** { **receive** | **send** } *

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **additional-paths** { **receive** | **send** } *

Default

No BGP additional path capabilities are configured.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures the BGP additional path capabilities for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures the BGP additional path capabilities for all dynamic peers in the subnet.

receive: Enables the BGP additional path receiving capability.

send: Enables the BGP additional path sending capability.

Usage guidelines

You can enable the BGP additional path sending, receiving, or both sending and receiving capabilities on a BGP router. For two BGP peers to successfully negotiate the additional path capabilities, make sure one end has the sending capability and the other end has the receiving capability.

Examples

In BGP IPv4 unicast address family view, enable the BGP additional path receiving capability.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer 1.1.1.1 additional-paths receive
```

5.1.41. peer advertise additional-paths best

Use **peer advertise additional-paths best** to set the maximum number of Add-Path optimal routes that can be advertised to a peer or peer group.

Use **undo peer advertise additional-paths best** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise additional-paths best** *number*

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise additional-paths best**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise additional-paths best** *number*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise additional-paths best**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise additional-paths best** *number*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise additional-paths best**

Default

A maximum of one Add-Path optimal route can be advertised to a peer or peer group.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command sets the maximum number of Add-Path optimal routes that can be advertised to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command sets the maximum number of Add-Path optimal routes that can be advertised to all dynamic peers in the subnet.

number: Specifies the maximum number of Add-Path optimal routes that can be advertised to a peer or peer group, in the range of 2 to 32.

Usage guidelines

If the number of Add-Path optimal routes advertised to a peer or peer group exceeds the number of optimal routes, the number of optimal routes takes effect.

Examples

In BGP IPv4 unicast address family view, set the maximum number to 3 for Add-Path optimal routes that can be advertised to peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer 1.1.1.1 advertise additional-paths best 3
```

Related commands

additional-paths select-best

peer additional-paths

5.1.42. peer advertise-community

Use **peer advertise-community** to advertise the COMMUNITY attribute to a peer or peer group.

Use **undo peer advertise-community** to disable the COMMUNITY attribute advertisement to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise-community**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise-community**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-community**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-community**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-community**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-community**

Default

No COMMUNITY attribute is advertised to any peers or peer groups.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command advertises the COMMUNITY attribute to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command advertises the COMMUNITY attribute to all dynamic peers in the subnet.

Usage guidelines

The COMMUNITY attribute is a group of specific data carried in update messages. A route can carry one or more COMMUNITY attribute values (each is represented by a 4-byte integer). The receiving router processes the route (for example, determining whether to advertise the route and the scope for advertising the route) based on the COMMUNITY attribute values.

After you execute the **peer advertise-community** command, routing updates advertised to the peer carry the COMMUNITY attribute.

After you execute the **undo peer advertise-community** command, BGP, upon receiving a route with the COMMUNITY attribute, removes the COMMUNITY attribute before sending the route to the peer or peer group.

Examples

In BGP IPv4 unicast address family view, advertise the COMMUNITY attribute to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test advertise-community
```

Related commands

apply community

if-match community

ip community-list

5.1.43. peer advertise-ext-community

Use **peer advertise-ext-community** to advertise the extended community attribute to a peer or peer group.

Use **undo peer advertise-ext-community** to disable the extended community attribute advertisement to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise-ext-community**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise-ext-community**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

Default

No extended community attribute is advertised to any peers or peer groups.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command advertises the extended community attribute to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command advertises the extended community attribute to all dynamic peers in the subnet.

Usage guidelines

To meet increasing user demands, BGP defines a new attribute—extended community attribute. The extended community attribute has the following advantages over the COMMUNITY attribute:

- The extended community attribute has an 8-byte length.
- The extended community attribute supports various types. You can select an extended community attribute type as needed to implement route filtering and control. This simplifies configuration and management.

After you execute the **peer advertise-ext-community** command, route updates sent to the peer or peer group carry the extended community attribute.

After you execute the **undo peer advertise-ext-community** command, BGP, upon receiving a route with the extended community attribute, removes the extended community attribute before sending the route to the peer or peer group.

Examples

In BGP IPv4 unicast address family view, advertise the extended community attribute to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test advertise-ext-community
```

Related commands

apply extcommunity

if-match extcommunity

ip extcommunity-list

5.1.44. peer advertise tag

Use **peer advertise tag** to enable BGP to advertise the tag community attribute to a peer or peer group.

Use **undo peer advertise tag** to restore the default.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise tag**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise tag**

Default

BGP does not advertise the tag community attribute to a peer or peer group.

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, all dynamic peers in the subnet are specified.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, all dynamic peers in the subnet are specified.

Usage guidelines

Application scenarios

When routes are redistributed from a routing protocol into an IGP, the IGP can add a tag for them. This tag can be used for route filtering methods such as routing policies. Routing information is distributed across ASs after it is redistributed between IGPs and BGP. As a result, different route filtering methods might be applied to an IGP route when it exists in different ASs. To remove the impact of route location on the selection of route filtering methods, you can enable BGP to transmit the tag of IGP routes. After IGP routes are distributed to other ASs, IGP routes with the same tag will match the same route filtering method, regardless of their locations.

Operating mechanism

The tag community attribute is an NEC-proprietary extended community attribute, which is designed for transmitting IGP route tags.

NOTE:
For brief introduction, a BGP route carrying the tag community attribute is called tagged route. When BGP tags a route, it adds the tag community attribute to that route. When BGP untags a route, it removes the tag community attribute from that route.

The **peer advertise tag** command functions as follows:

- Before advertising a BGP route derived from a redistributed IGP route to the specified peer or peer group, BGP tags that route. The value of the tag community attribute depends on the configuration of the **import-route** command.
  - After receiving a tagged BGP route, BGP forwards that route to the specified peer or peer group without untagging.

If the **peer advertise tag** commands is not configured or the **undo peer advertise tag** command is configured, BGP untags BGP routes (if tagged) before advertising them to peers. In this situation, BGP does not support the following operations:

- Tags BGP routes before route advertisement.

- Advertises BGP routes without untagging.

Restrictions and guidelines

The tag community attribute might be unrecognizable for devices from other vendors or have conflicts with other private extended community attributes. You can use the **extcommunity-type tag** command to adjust the type value to a recognizable or non-conflicting one for the tag community attribute.

Examples

In BGP IPv4 unicast address family view, enable BGP to advertise the tag community attribute to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test advertise tag
```

Related commands

extcommunity-type tag

5.1.45. peer allow-as-loop

Use **peer allow-as-loop** to allow a local AS number to exist in the AS_PATH attribute of routes from a peer or peer group, and to set the number of times the local AS number can appear.

Use **undo peer allow-as-loop** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop** [*number*]

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **allow-as-loop** [*number*]

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **allow-as-loop**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **allow-as-loop** [*number*]

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **allow-as-loop**

Default

The local AS number is not allowed to exist in the AS_PATH attribute of routes from a peer or peer group.

Views

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP allows a local AS number to exist in the AS_PATH attribute of routes from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP allows a local AS number to exist in the AS_PATH attribute of routes from all dynamic peers in the subnet.

number: Specifies the number of times for which the local AS number can appear, in the range of 1 to 10. The default number is 1. If the number of times for which the local AS number appears in a route is more than the specified number, BGP considers that a routing loop occurs and discards the route.

Usage guidelines

By default, BGP does not receive routes that contain the local AS number in the AS_PATH attribute to avoid routing loops. However, in some network environments, the AS_PATH attribute of a route from a peer must be allowed to contain the local AS number. Otherwise, the route cannot be advertised correctly.

Examples

In BGP IPv4 unicast address family view, set the number of times the local AS number can appear in AS_PATH attribute of routes from peer group **test** to 2.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast

```

5.1.46. peer as-number (for a BGP peer group)

Use **peer as-number** to specify an AS number for a peer group.

Use **undo peer as-number** to delete the AS number of a peer group.

Syntax

peer *group-name* **as-number** *as-number*

undo peer *group-name* **as-number**

Default

No AS number is specified for a peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a name for a peer group, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

as-number: Specifies an AS number for a peer group, in the range of 1 to 4294967295.

Usage guidelines

This command applies only to a peer group with no peers in it.

When you specify an AS number for a peer group and want to add peers to it, make sure the AS number of the peers is the same as the peer group.

If you do not specify an AS number for a peer group, peers added to it can use their own AS numbers.

Examples

In BGP instance view, set the AS number for peer group **test** to 100.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test as-number 100
```

Related commands

peer group

5.1.47. peer as-number (for a BGP peer)

Use **peer as-number** to create a BGP peer and specify its AS number.

Use **undo peer** to delete a BGP peer.

Syntax

peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] }

Default

No BGP peers exist.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the IPv4 address of a peer.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables BGP to establish dynamic peer relationships with all devices in the subnet.

ipv6-address: Specifies the IPv6 address of a peer.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables BGP to establish dynamic peer relationships with all devices in the subnet.

as-number: Specifies an AS number for the peer, in the range of 1 to 4294967295. If the AS numbers of the peer and the local router are the same, the peer is an IBGP peer. If they are different, the peer is an EBGP peer.

Usage guidelines

You can also create a peer and add it to a peer group by using the **peer group** command.

To modify the AS number of a peer, do not execute the **peer as-number** command repeatedly. Instead, you must first delete the peer and configure it again.

After you create a peer, you must use the **peer enable** command to enable BGP to exchange routing information with the specified peer.

For a remote device to establish a peer relationship with the local device, you must specify the IP address of the local device on the remote device.

Examples

In BGP instance view, create BGP peer 1.1.1.1 and set its AS number to 100.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 as-number 100
```

Related commands

display bgp peer

peer enable

peer group

5.1.48. peer as-path-acl

Use **peer as-path-acl** to specify an AS path list to filter routes incoming from or outgoing to a peer or peer group.

Use **undo peer as-path-acl** to delete the AS path list specified to filter routes incoming from or outgoing to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **as-path-acl** as*-path-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **as-path-acl** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-path-acl** *as-path-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-path-acl** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-path-acl** *as-path-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-path-acl** { **export** | **import** }

Default

No AS path list is specified for filtering.

Views

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an AS path list to filter routes incoming from or outgoing to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an AS path list to filter routes incoming from or outgoing to all dynamic peers in the subnet.

as-path-acl-number: Specifies an AS path list by its number in the range of 1 to 256.

export: Filters outgoing routes.

import: Filters incoming routes.

Usage guidelines

The specified AS path list must have been created with the **ip as-path** command in system view. If you specify a nonexistent AS path list, all routes can pass the AS path list.

Examples

In BGP IPv4 unicast address family view, specify AS path list 1 to filter routes outgoing to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test as-path-acl 1 export
```

5.1.49. peer bfd

Use **peer bfd** to enable BFD for the link to a BGP peer or peer group.

Use **undo peer bfd** to remove the configuration.

Syntax

peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **bfd** [**multi-hop** | **single-hop**]

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **bfd**

Default

BFD is disabled for the link to a BGP peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables BFD for links to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables BFD for links to all dynamic peers in the subnet.

multi-hop: Enables multi-hop BFD.

single-hop: Enables single-hop BFD.

Usage guidelines

When you do not specify the **multi-hop** keyword or the **single-hop** keyword:

- If an IBGP peer or peer group is specified, this command enables multi-hop BFD for the IBGP peer or peer group.
- If a directly connected EBGP peer or peer group is specified and the **peer ebgp-max-hop** command is not configured, this command enables single-hop BFD for the EBGP peer or peer group. If the EBGP peer or peer group is not directly connected or the **peer ebgp-max-hop** command is configured, this command enables multi-hop BFD for the EBGP peer or peer group.

For more information about multi-hop and single-hop BFD, see *High Availability Configuration Guide*.

BFD helps speed up BGP routing convergence upon link failures. However, if you have enabled GR, use BFD with caution. BFD might detect a failure before the system performs GR, resulting in GR failure. If you have enabled both BFD and GR for BGP, do not disable BFD during a GR process to avoid GR failure.

To establish a BFD session to a BGP peer, you must configure the same BFD detection mode (multi-hop or single-hop) on the local router and the BGP peer.

Examples

In BGP instance view, enable BFD for the link to BGP peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test bfd
```

Related commands

display bfd session (*High Availability Command Reference*)

display bgp peer

5.1.50. peer capability-advertise conventional

Use **peer capability-advertise conventional** to disable the BGP multi-protocol extension, route refresh, and 4-byte AS number features for a peer or peer group.

Use **undo peer capability-advertise conventional** to enable the BGP multi-protocol extension, route refresh, and 4-byte AS number features for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise conventional**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise conventional**

Default

The BGP multi-protocol extension, route refresh, and 4-byte AS number features are enabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command disables BGP multi-protocol extension and route refresh for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command disables BGP multi-protocol extension and route refresh for all dynamic peers in the subnet.

Usage guidelines

The route refresh feature enables BGP to send and receive Route-refresh messages and implement BGP session soft-reset.

The multi-protocol extension feature enables BGP to advertise and receive routing information for various protocols (for example, IPv6 routing information).

The 4-byte AS number feature enables BGP to use 4-byte AS numbers in the range of 1 to 4294967295.

If both the **peer capability-advertise conventional** and **peer capability-advertise route-refresh** commands are executed, the most recent configuration takes effect.

Examples

In BGP instance view, disable the multi-protocol extension, route refresh, and 4-byte AS number features for peer 1.1.1.1.

```
<Switch> system-view
```

```
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 as-number 100
[Switch-bgp-default] peer 1.1.1.1 capability-advertise conventional
```

Related commands

display bgp peer

peer capability-advertise route-refresh

5.1.51. peer capability-advertise route-refresh

Use **peer capability-advertise route-refresh** to enable BGP route refresh for a peer or peer group.

Use **undo peer capability-advertise route-refresh** to disable BGP route refresh for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise route-refresh**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise route-refresh**

Default

BGP route refresh is enabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables BGP route refresh for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables BGP route refresh for all dynamic peers in the subnet.

Usage guidelines

The route refresh feature enables BGP to send and receive Route-refresh messages.

BGP uses the route refresh feature to implement BGP session soft-reset. After a policy is modified, the router advertises a Route-refresh message to the peers. The peers resend their routing information to the router. After receiving the routing information, the router filters the routing information by using the new policy. This method allows you to refresh the BGP routing table and apply the new route selection policy without tearing down BGP sessions.

BGP route refresh requires that both the local router and the peer support route refresh.

If both the **peer capability-advertise route-refresh** and **peer capability-advertise conventional** commands are executed, the most recent configuration takes effect.

Examples

In BGP instance view, enable BGP route refresh for peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 as-number 100
[Switch-bgp-default] peer 1.1.1.1 capability-advertise route-refresh
```

5.1.52. peer connect-interface

Use **peer connect-interface** to specify a source interface (IPv4 address/IPv6 address) for establishing TCP connections to a peer or peer group.

Use **undo peer connect-interface** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **connect-interface** *interface-type interface-number*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **connect-interface**

Default

BGP uses the primary IPv4 or IPv6 address of the output interface in the optimal route destined for the BGP peer or peer group as the source address.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source interface for establishing TCP connections to all dynamic peers in the network.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source interface for establishing TCP connections to all dynamic peers in the subnet.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The **peer connect-interface** command can change the source address for establishing TCP connections. If you execute both commands, the most recent configuration takes effect.

The **peer connect-interface** commands are applicable to the following scenarios:

- The peer's IPv4/IPv6 address does not belong to the interface directly connected to the local router. To ensure successful TCP connection establishment, use one of the following methods:
  - Specify the interface to which the IPv4/IPv6 address belongs as the source interface on the peer.
  - Specify the IPv4/IPv6 address of the interface directly connected to the local router as the source address on the peer.
- A BGP peer at an IPv6 link-local address must be directly connected to the local router. On the local router, you must use the **peer connect-interface** command to specify the interface directly connected to the BGP peer as the source interface of TCP connections.
- On a BGP router that has multiple links to a peer, the source interface for TCP connection changes because the primary source interface fails. To avoid this problem, specify a loopback interface as the source interface or specify the IP address of a loopback interface as the source address.

- You want to establish multiple BGP sessions to a router. In this case, BGP might fail to determine the source address for each TCP connection based on the optimal route to the peer. To prevent this problem, use one of the following methods:
  - If the BGP sessions use IP addresses of different interfaces, specify a source interface or source address for each session.
  - If the BGP sessions use different IP addresses of the same interface, specify a source address for each session.

The source interfaces on the local router and the peer must be reachable to each other.

To specify an indirectly connected interface on an EBGP peer as the source interface, use the **peer ebgp-max-hop** command. The command allows the establishment of an EBGP session to the indirectly connected peer.

If an interface has multiple IPv4 addresses, BGP uses the primary IPv4 address to establish TCP connections. If an interface has multiple IPv6 addresses, BGP selects a source IPv6 address.

You cannot specify a virtual template (VT) interface as the source interface for establishing TCP connections because a VT interface cannot process services.

Examples

In BGP instance view, specify loopback 0 as the source interface for TCP connections to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test connect-interface loopback 0
```

Related commands

peer ebgp-max-hop

5.1.53. peer default-route-advertise

Use **peer default-route-advertise** to advertise a default route to a peer or peer group.

Use **undo peer default-route-advertise** to disable default route advertisement to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **default-route-advertise** [**route-policy** *route-policy-name*]

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **default-route-advertise**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **default-route-advertise** [**route-policy** *route-policy-name*]

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **default-route-advertise**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **default-route-advertise** [**route-policy** *route-policy-name*]

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **default-route-advertise**

Default

No default route is advertised to any peers or peer groups.

Views

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a default route to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a default route to all dynamic peers in the subnet.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to modify the route attribute.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

This command enables the router to send a default route with the next hop being itself to the peer or peer group regardless of whether the default route exists in the routing table.

Examples

In BGP IPv4 unicast address family view, advertise a default route to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test default-route-advertise
```

5.1.54. peer description

Use **peer description** to configure a description for a peer or peer group.

Use **undo peer description** to remove the description for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **description** *text*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **description**

Default

No description information is configured for a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures a description for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures a description for all dynamic peers in the subnet.

text: Specifies a description for a peer or peer group, a case-sensitive string of 1 to 79 characters.

Examples

In BGP instance view, set the description for peer group **test** to **ISP1**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test description ISP1
```

5.1.55. peer ebgp-max-hop

Use **peer ebgp-max-hop** to enable BGP to establish an EBGP session to an indirectly connected peer or peer group and specify the maximum hop count.

Use **undo peer ebgp-max-hop** to disable BGP from establishing an EBGP session to an indirectly connected peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ebgp-max-hop** [*hop-count*]

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ebgp-max-hop**

Default

BGP does not establish an EBGP session to an indirectly connected peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP establishes EBGP sessions to all indirectly connected dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP establishes EBGP sessions to all indirectly connected dynamic peers in the subnet.

hop-count: Specifies the maximum number of hop counts, in the range of 1 to 255. The default is 64.

Usage guidelines

To become EBGP peers, two routers must be directly connected and use directly connected interfaces to establish an EBGP session. If they are not directly connected, use the **peer ebgp-max-hop** command to establish an EBGP session over multiple hops between two peers.

This command takes effect only on routes received after you execute this command. To apply this command to existing routes, use the **refresh bgp** command to soft-reset BGP sessions.

When the BGP GTSM feature is enabled, two peers can establish an EBGP session after passing GTSM check, regardless of whether the maximum number of hops is reached.

Examples

In BGP instance view, enable BGP to establish EBGP sessions to indirectly connected EBGP peer group **test**, and set the maximum hop count to 64 (default).

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test ebgp-max-hop
```

5.1.56. peer enable

Use **peer enable** to enable BGP to exchange routing information for an address family with a peer or peer group.

Use **undo peer enable** to disable BGP from exchanging routing information for an address family with a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

Default

BGP cannot exchange routing information with a peer or peer group.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP exchanges routing information for an address family with all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP exchanges routing information for an address family with all dynamic peers in the subnet.

Usage guidelines

Executing the **peer enable** command in different views enables BGP to exchange routing information for the corresponding address families with the specified peer.

- In BGP IPv4 unicast address family view, the command enables the capability to exchange IPv4 unicast routing information. It also adds the learned routes to the BGP routing table of the public network.
- In BGP-VPN IPv4 unicast address family view, the command enables the capability to exchange IPv4 unicast routing information. It also adds the learned routes to the BGP routing table of the specified VPN instance.

- In BGP IPv6 unicast address family view, the command enables the capability to exchange IPv6 unicast routing information. It also adds the learned routes to the IPv6 BGP routing table of the public network.
- In BGP-VPN IPv6 unicast address family view, the command enables the capability to exchange IPv6 unicast routing information. It also adds the learned routes to the IPv6 BGP routing table of the specified VPN instance.

The **undo peer enable** command disables BGP to exchange routing information for the corresponding address family with the peer.

Examples

In BGP IPv4 unicast address family view, enable BGP to exchange IPv4 unicast routing information with peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer 1.1.1.1 enable
```

Related commands

display bgp peer

5.1.57. peer fake-as

Use **peer fake-as** to advertise a fake AS number to a peer or peer group.

Use **undo peer fake-as** to remove the fake AS number advertised to a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **fake-as** *as-number*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **fake-as**

Default

No fake local AS number is advertised to a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a fake AS number to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a fake AS number to all dynamic peers in the subnet.

as-number: Specifies a fake AS number in the range of 1 to 4294967295.

Usage guidelines

After you move a BGP router from an AS to another AS (from AS 2 to AS 3 for example), you have to modify the AS number of the router on all its EBGP peers. To avoid such modifications, you can configure the router to advertise a fake AS number 2 to its EBGP peers so that the EBGP peers still think that Router A is in AS 2.

The **peer fake-as** command is applicable only to EBGP peers or peer groups.

If you execute the **peer fake-as** command on the local router, specify the local router's AS number on the peer as the fake local AS number specified in the command.

Examples

In BGP instance view, advertise a fake AS number of 200 to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test fake-as 200
```

5.1.58. peer filter-policy

Use **peer filter-policy** to filter routes advertised to or received from a peer or peer group by using an ACL.

Use **undo peer filter-policy** to remove the ACL specified to filter routes advertised to or received from a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** *ipv4-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** *ipv6-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** *ipv6-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** { **export** | **import** }

Default

No ACL-based filtering is configured.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command filters routes advertised to or received from all dynamic peers in the subnet by using an ACL.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command filters routes advertised to or received from all dynamic peers in the subnet by using an ACL.

ipv4-acl-number: Specifies an ACL by its number in the range of 2000 to 3999.

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999.

export: Filters routes advertised to the peer/peer group.

import: Filters routes received from the peer/peer group.

Usage guidelines

The specified ACL used by the **peer filter-policy** command must have been created with the **acl** command in system view. Otherwise, all routes can pass the ACL.

If you use a basic ACL (with a number from 2000 to 2999) configured with the **rule** [*rule-id*] { **deny** | **permit** } **source** *source-address source-wildcard* command, the command matches routes whose destination network addresses match the *source-address source-wildcard* argument without matching the masks of the destination addresses.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following steps:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

In BGP IPv4 unicast address family view, apply ACL 2000 to filter routes advertised to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test filter-policy 2000 export
```

Related commands

5.1.59. peer group

Use **peer group** to add a peer to a peer group.

Use **undo peer group** to delete a peer from a peer group.

Syntax

peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] }
group *group-name* [**as-number** *as-number*]

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] }
group *group-name*

Default

No peers exist in a peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies a peer by its IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command adds all dynamic peers in the subnet to a peer group.

ipv6-address: Specifies a peer by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command adds all dynamic peers in the subnet to a peer group.

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

as-number *as-number*: Specifies an AS for a peer by its number in the range of 1 to 4294967295.

Usage guidelines

You can add a peer to a peer group in the following ways:

- Use the **peer as-number** command to create a peer and specify its AS number, and then use the **peer group** command to add the peer to the peer group.
  - You can specify the **as-number** keyword for the **peer group** command. The AS number must be the same as the AS number specified in the **peer as-number** command.
  - If you have specified the AS number of the peer group with the **peer as-number** command, the peer to be added must have the same AS number as the peer group.
  - To add a peer to an IBGP peer group, the peer must be an IBGP peer.
- Use the **peer group** command to create a peer and add it to the peer group.

- If you have specified the AS number of the peer group with the **peer as-number** command, you do not need to specify the **as-number** keyword when you execute the **peer group** command. This is because the AS number of the peer is the same as the peer group. To specify the **as-number** keyword for the **peer group** command, make sure the AS number is the same as the peer group.
- If no AS number is specified for an EBGP peer group, specify the **as-number** keyword when you execute the **peer group** command.
- If no AS number is specified for an IBGP peer group, you do not need to specify the **as-number** keyword when you execute the **peer group** command. This is because the AS number of the IBGP peer group is the local AS number. To specify the **as-number** keyword for the **peer group** command, make sure the AS number is the same as the local AS number.

If you have specified the AS number of a peer group with the **peer as-number** command, only the peers with the same AS number can be added to the peer group. All peers in the group share the same AS number. If you have not specified the AS number for a peer group, peers added to it can use their own AS numbers.

After you add a peer to a peer group, you must use the **peer enable** command to enable BGP to exchange routing information with the peer group.

Examples

In BGP instance view, add peer 10.1.1.1 to EBGP peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] group test external
[Switch-bgp-default] peer 10.1.1.1 group test as-number 2004
```

Related commands

peer as-number

peer enable

5.1.60. peer ignore

Use **peer ignore** to disable BGP session establishment with a peer or peer group.

Use **undo peer ignore** to enable BGP session establishment with a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore**

Default

BGP can establish a session to a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP tears down sessions to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP tears down sessions to all dynamic peers in the subnet.

graceful *graceful-time*: Gracefully shuts down the session to a peer or peer group in the specified graceful shutdown period of time. The value range for the *graceful-time* argument is 60 to 65535 seconds. If you do not specify this option, the command immediately shuts down the session to the peer or peer group.

community { *community-number* | *aa:nn* }: Specifies the community attribute for advertised routes. The *community-number* argument represents the community sequence number in the range of 1 to 4294967295. The *aa:nn* argument represents the community number. Both *aa* and *nn* are in the range of 0 to 65535. If you do not specify this option, the command does not change the community attribute for advertised routes.

local-preference *preference*: Specifies the local preference for advertised routes, in the range of 0 to 4294967295. A larger value represents a higher preference. If you do not specify this option, the command does not change the local preference for advertised routes.

med *med*: Specifies the MED value for advertised routes, in the range of 0 to 4294967295. The smaller the MED value, the higher the route priority. If you do not specify this option, the command does not change the MED value for advertised routes.

Usage guidelines

This command enables you to temporarily tear down the BGP session to a peer or peer group. You can perform network upgrade and maintenance without needing to delete and reconfigure the peer or peer group. To recover the session, execute the **undo peer ignore** command.

If a session has been established to a peer, executing the **peer ignore** command for the peer tears down the session and clears all related routing information.

If sessions have been established to a peer group, executing the **peer ignore** command for the peer group disables the sessions to all peers in the group and clears all related routing information.

If you specify the **graceful** keyword in the **peer ignore** command, BGP performs the following tasks:

- Gracefully shuts down the session to the specified peer or peer group in the specified graceful shutdown period of time.
- Advertises all routes to the specified peer or peer group and changes the attribute for the advertised routes to the specified value.
- Advertises routes from the specified peer or peer group to other IBGP peers and peer groups and changes the attribute for the advertised routes to the specified value.

Examples

In BGP instance view, disable session establishment with peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 ignore
```

In BGP instance view, configure BGP to gracefully shut down the session to peer 1.1.1.1 in 60 seconds, advertise all routes to peer 1.1.1.1, and change the community attribute and local preference for the advertised routes to 1:1 and 200, respectively.

```
<Switch> system-view
[Switch] bgp 1
[Switch-bgp-default] peer 1.1.1.1 ignore graceful 60 community 1:1 local-preference 200
```

5.1.61. peer keep-all-routes

Use **peer keep-all-routes** to save all route updates from a peer or peer group, regardless of whether the routes have passed the configured routing policy.

Use **undo peer keep-all-routes** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **keep-all-routes**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **keep-all-routes**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **keep-all-routes**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **keep-all-routes**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **keep-all-routes**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **keep-all-routes**

Default

Route updates from a peer or peer group are not saved.

Views

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command saves all route updates from all dynamic peers in the subnet, regardless of whether the routes have passed the configured routing policy.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command saves all route updates from all dynamic peers in the subnet, regardless of whether the routes have passed the configured routing policy.

Usage guidelines

To implement BGP session soft-reset when the local router and a peer or peer group do not support the route refresh feature, use the **peer keep-all-routes** command. The command saves all route updates received from the peer or peer group. After modifying the route selection policy, filter all saved routes with the new policy to refresh the routing table. This method avoids tearing down BGP sessions.

Examples

In BGP IPv4 unicast address family view, save all route updates from peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
```

```
[Switch-bgp-default-ipv4] peer 1.1.1.1 keep-all-routes
```

Related commands

peer capability-advertise route-refresh

refresh bgp

5.1.62. peer log-change

Use **peer log-change** to enable logging for BGP session state changes for a peer or peer group.

Use **undo peer log-change** to disable logging for BGP session state changes for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **log-change**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **log-change**

Default

Logging for BGP session state changes is enabled for all peers or peer groups.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must already exist.

ipv4-address: Specifies the IPv4 address of a peer. The peer must already exist.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables the logging of BGP session state changes for all dynamic peers in the subnet.

ipv6-address: Specifies the IPv6 address of a peer. The peer must already exist.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables the logging of BGP session state changes for all dynamic peers in the subnet.

Usage guidelines

After you execute both the **log-peer-change** and **peer log-change** commands, BGP logs session establishment and disconnection events for the peer or peer group. To view the log information, use the **display bgp peer ipv4 unicast log-info** command or the **display bgp peer ipv6 unicast log-info** command. The logs are sent to the information center of the device. The output rules of the logs (whether to output the logs and where to output) are determined by the information center configuration. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

If you disable logging for BGP session state changes globally or disable logging for a peer or peer group, BGP does not generate logs for session establishments and disconnections.

Examples

In BGP instance view, enable logging for BGP session state changes for peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 as-number 200
[Switch-bgp-default] peer 1.1.1.1 log-change
```

Related commands

display bgp peer

log-peer-change

5.1.63. peer next-hop-local

Use **peer next-hop-local** to set the local router as the next hop for routes sent to a peer or peer group.

Use **undo peer next-hop-local** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

In BGP IPv6 unicast address family view/BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **next-hop-local**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **next-hop-local**

Default

BGP sets the local router as the next hop for all routes sent to an EBGP peer or peer group.

It does not set the local router as the next hop for EBGP routes sent to an IBGP peer or peer group for other address families.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command sets the local router as the next hop for routes sent to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command sets the local router as the next hop for routes sent to all dynamic peers in the subnet.

Usage guidelines

By default, BGP does not set the local router as the next hop for EBGP routes sent to an IBGP peer or peer group. To ensure that an IBGP peer can find the next hop, you can use this command to specify the router as the next hop for routes sent to the IBGP peer.

Examples

In BGP IPv4 unicast address family view, specify the router as the next hop for routes sent to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test next-hop-local
```

5.1.64. peer password

Use **peer password** to enable MD5 authentication for a BGP peer or peer group.

Use **undo peer password** to remove MD5 authentication for a BGP peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **password** { **cipher** | **simple** } *password*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **password**

Default

MD5 authentication is disabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables MD5 authentication for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables MD5 authentication for all dynamic peers in the subnet.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

password: Specifies the password. Its encrypted form is a case-sensitive string of 33 to 137 characters. Its plaintext form is a case-sensitive string of 1 to 80 characters.

Usage guidelines

You can enable MD5 authentication to enhance security using the following methods:

- Perform MD5 authentication when establishing TCP connections. Only the two parties that have the same password configured can establish TCP connections.
- Perform MD5 calculation on TCP segments to avoid modification to the encapsulated BGP packets.

Examples

In BGP instance view, perform MD5 authentication on the TCP connection between local router 10.1.100.1 and peer router 10.1.100.2. Set the authentication password to **aabbcc** in plaintext form.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 10.1.100.2 password simple aabbcc
```

5.1.65. peer preferred-value

Use **peer preferred-value** to set a preferred value for routes received from a peer or peer group.

Use **undo peer preferred-value** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value**

Default

The preferred value is 0 for routes received from a peer or peer group.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a preferred value for routes received from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a preferred value for routes received from all dynamic peers in the subnet.

value: Specifies a preferred value in the range of 0 to 65535.

Usage guidelines

If multiple routes that have the same destination are learned from different peers, you can specify different preferred values for the routes as needed to control BGP path selection. The one with the greatest preferred value is selected as the optimal route to the destination.

The preferred value is used for route selection on the local router and is not advertised to the peer. It has only local significance.

You can also use the **apply preferred-value** command in a routing policy to configure the preferred value for BGP routes. If both the **peer preferred-value** and **apply preferred-value** commands are configured, the **apply preferred-value** command applies. If the preferred value is not set in the routing policy or no routing policy is configured, the **peer preferred-value** command applies.

Examples

In BGP IPv4 unicast address family view, set the preferred value to 50 for routes from peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer 1.1.1.1 preferred-value 50
```

Related commands

apply preferred-value

route-policy

5.1.66. peer prefix-list

Use **peer prefix-list** to specify a prefix list to filter routes received from or advertised to a peer or peer group.

Use **undo peer prefix-list** to remove the prefix list specified to filter routes received from or advertised to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** *prefix-list-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv6-prefix-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv6-prefix-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** { **export** | **import** }

Default

No prefix list based filtering is configured.

Views

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command uses a prefix list to filter routes received from or advertised to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command uses a prefix list to filter routes received from or advertised to all dynamic peers in the subnet.

prefix-list-name: Specifies an IPv4 prefix list by its name, a case-sensitive string of 1 to 63 characters.

ipv6-prefix-name: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

export: Applies the filter to routes advertised to the specified peer/peer group.

import: Applies the filter to routes received from the specified peer/peer group.

Usage guidelines

The specified prefix list must have been created with the **ip prefix-list** or **ipv6 prefix-list** command in system view. If you specify a nonexistent IPv4/IPv6 prefix list, all routes can pass the prefix list.

Examples

In BGP IPv4 unicast address family view, use IPv4 prefix list **list1** to filter routes advertised to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test prefix-list list1 export
```

5.1.67. peer public-as-only

Use **peer public-as-only** to remove private AS numbers in BGP updates sent to an EBGP peer or peer group.

Use **undo peer public-as-only** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **public-as-only**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **public-as-only**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

Default

BGP updates sent to an EBGP peer or peer group can carry both public and private AS numbers.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a

subnet, this command removes private AS numbers in BGP updates sent to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command removes private AS numbers in BGP updates sent to all dynamic peers in the subnet.

Usage guidelines

Private AS numbers are typically used in test networks, and need not be transmitted in public networks. The range of private AS numbers is from 64512 to 65535.

After you execute the command, you can get the following results:

- If the AS_PATH attribute of a BGP update carries only private AS numbers, the device removes the AS numbers before sending the update to the EBGP peer or peer group.
- If the AS_PATH attribute carries both public and private AS numbers, the command does not take effect. The device sends the BGP update to the EBGP peer or peer group without removing the private AS numbers.
- If the AS_PATH attribute carries AS numbers of the peer or peer group, the command does not take effect. The device sends the BGP update to the peer or peer group without removing the private AS numbers.

This command is applicable only to EBGP peers and peer groups.

Examples

In BGP IPv4 unicast address family view, remove private AS numbers in BGP updates sent to EBGP peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test public-as-only
```

5.1.68. peer reflect-client

Use **peer reflect-client** to configure the device as a route reflector and specify a peer or peer group as a client.

Use **undo peer reflect-client** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

Default

Neither the route reflector nor the client is configured.

Views

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures the device as a route reflector and specifies all dynamic peers in the subnet as clients.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures the device as a route reflector and specifies all dynamic peers in the subnet as clients.

Usage guidelines

Using route reflectors can solve the issue brought by too many IBGP connections. In an AS, a router acts as a route reflector, and other routers act as clients connecting to the route reflector. The route reflector forwards the routing information received from a client to other clients. In this

way, all clients can receive routing information from one another without establishing BGP sessions.

Examples

In BGP IPv4 unicast address family view, configure the local device as a route reflector and specify IBGP peer group **test** as a client.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test reflect-client
```

Related commands

reflect between-clients

reflector cluster-id

5.1.69. peer route-limit

Use **peer route-limit** to set the maximum number of routes that can be received from a peer or peer group.

Use **undo peer route-limit** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **route-limit**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-limit**

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-limit**

Default

The number of routes that can be received from a peer or peer group is not limited.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies the maximum number of routes that can be received from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies the maximum number of routes that can be received from all dynamic peers in the subnet.

prefix-number: Specifies the number of routes that can be received from the peer or peer group. The value range for this argument is 1 to 4294967295. The router will tear down the session to the peer or peer group if the following conditions exist:

- The **alert-only**, **discard**, and **reconnect** keywords are not specified.
- The number of routes received from the peer or peer group reaches the *prefix-number*.

The router will not attempt to re-establish the session to a dynamic BGP peer until the router receives a connection request from the peer. For other peers, you can use the **reset bgp** command to re-establish the sessions.

alert-only: If the number of routes received from the peer or peer group reaches the *prefix-number*, the router generates a log message instead of tearing down the session to the peer or peer group. The router can continue to receive routes from the peer or peer group.

discard: If the number of routes received from the peer or peer group reaches the *prefix-number*, the router retains the session to the peer or peer group. However, it discards excess routes and generates a log message. After the number of routes received from the peer or peer group falls below the *prefix-number*, the router can continue to receive routes from the peer or peer group. To restore the discarded routes, use the **refresh bgp import** command to request the peer or peer group to resend the routes.

reconnect *reconnect-time*: Specifies a reconnect time. After the specified time is reached, the router re-establishes a session to the peer or peer group when the number of routes received from the peer or peer group reaches the *prefix-number*. The value range for the *reconnect-time* argument is 1 to 65535 seconds. This option is not available for dynamic BGP peers.

percentage-value: Specifies the threshold value for the router to generate a log message (the router generates a log message when the ratio of the number of received routes to the *prefix-number* exceeds the percentage value). The value range of this argument is 1 to 100, and the default is 75.

Examples

In BGP IPv4 unicast address family view, set the maximum number of routes that can be received from peer 1.1.1.1 to 10000. Configure the router to tear down the session to the peer if the number is exceeded.

```
<Switch> system-view
[Switch] bgp 109
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer 1.1.1.1 route-limit 10000
```

5.1.70. peer route-policy

Use **peer route-policy** to apply a routing policy to routes incoming from or outgoing to a peer or peer group.

Use **undo peer route-policy** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP EVPN address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** { **export** | **import** }

Default

No routing policy is applied to routes incoming from or outgoing to a peer or peer group.

Views

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command applies a routing policy to routes incoming from or outgoing to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command applies a routing policy to routes incoming from or outgoing to all dynamic peers in the subnet.

route-policy-name: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

export: Applies the routing policy to routes outgoing to the peer or peer group.

import: Applies the routing policy to routes incoming from the peer or peer group.

Usage guidelines

The specified routing policy must have been configured with the **route-policy** command in system view. If you specify a nonexistent routing policy, all routes can pass the routing policy.

The **if-match interface** command, if configured for the applied routing policy, does not take effect on routes.

Examples

In BGP IPv4 unicast address family view, apply routing policy **test-policy** to routes outgoing to peer group **test**.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] peer test route-policy test-policy export
```

Related commands

route-policy

5.1.71. peer route-update-interval

Use **peer route-update-interval** to specify an interval for sending the same update to a peer or peer group.

Use **undo peer route-update-interval** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-update-interval** *interval*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-update-interval**

Default

The interval for sending the same update to an IBGP peer is 15 seconds and the interval for sending the same update to an EBGP peer is 30 seconds.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an interval for sending the same update to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an interval for sending the same update to all dynamic peers in the subnet.

interval: Specifies a minimum interval for sending the same update message, in the range of 0 to 600 seconds.

Usage guidelines

A BGP router sends an update message to its peers when a route is changed. If the route changes frequently, the BGP router sends many updates for the route, resulting in routing flaps. By configuring the interval for sending the same update to a peer or peer group, you can avoid such routing flaps.

This command does not apply to withdrawn route updates. BGP sends withdrawal messages immediately for withdrawn routes.

Examples

In BGP instance view, set the interval for sending the same update to peer group **test** to 10 seconds.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test as-number 100
[Switch-bgp-default] peer test route-update-interval 10
```

5.1.72. peer source-address

Use **peer source-address** to specify a source IPv4 or IPv6 address for establishing TCP connections to a peer or peer group.

Use **undo peer source-address** to remove the configuration.

Syntax

peer *ipv4-address* [*mask-length*] **source-address** *source-ipv4-address*

peer *ipv6-address* [*prefix-length*] **source-address** *source-ipv6-address*

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **source-address**

peer *group-name* **source-address** { *source-ipv4-address* | *source-ipv6-address* } *

undo peer *group-name* **source-address** [*source-ipv4-address* | *source-ipv6-address*]

Default

BGP uses the primary IPv4 or IPv6 address of the output interface in the optimal route destined for the BGP peer or peer group as the source address for TCP connection establishment.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source IP address for establishing TCP connections to all dynamic peers in the subnet.

source-ipv4-address: Specifies a source IPv4 address.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source IPv6 address for establishing TCP connections to all dynamic peers in the subnet.

source-ipv6-address: Specifies a source IPv6 address.

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

Usage guidelines

The **peer connect-interface** command and the **peer source-address** command can both change the source address for establishing TCP connections. If you execute both commands, the most recent configuration takes effect.

The **peer source-address** and **peer connect-interface** commands are applicable to the following scenarios:

- The peer's IPv4/IPv6 address does not belong to the interface directly connected to the local router. To ensure successful TCP connection establishment, use one of the following methods:

- Specify the interface to which the IPv4/IPv6 address belongs as the source interface on the peer.
- Specify the IPv4/IPv6 address of the interface directly connected to the local router as the source address on the peer.

- A BGP peer at an IPv6 link-local address must be directly connected to the local router. On the local router, you must use the **peer connect-interface** command to specify the interface directly connected to the BGP peer as the source interface of TCP connections.
- On a BGP router that has multiple links to a peer, the source interface for TCP connection changes because the primary source interface fails. To avoid this problem, specify a loopback interface as the source interface or specify the IP address of a loopback interface as the source address.
- You want to establish multiple BGP sessions to a router. In this case, BGP might fail to determine the source address for each TCP connection based on the optimal route to the peer. To prevent this problem, use one of the following methods:
  - If the BGP sessions use IP addresses of different interfaces, specify a source interface or source address for each session.
  - If the BGP sessions use different IP addresses of the same interface, specify a source address for each session.

The source addresses on the local router and the peer must be reachable to each other.

To specify the address of an indirectly connected interface as the source address, use the **peer ebgp-max-hop** command. The command allows the establishment of an EBGP session to the indirectly connected peer.

You can specify both a source IPv4 address and a source IPv6 address for a peer group. BGP uses the source IPv4 address to establish TCP connections to IPv4 peers in the group. It also uses the source IPv6 address to establish TCP connections to IPv6 peers in the group.

Examples

In BGP instance view, specify source IPv4 address 1.1.1.1 for peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test source-address 1.1.1.1
```

Related commands

peer connect-interface

peer ebgp-max-hop

5.1.73. peer substitute-as

Use **peer substitute-as** to replace the AS number of a peer or peer group in the AS_PATH attribute with the local AS number.

Use **undo peer substitute-as** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **substitute-as**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **substitute-as**

Default

The AS number of a peer or peer group in the AS_PATH attribute is not replaced.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command replaces the AS number of all dynamic peers in the subnet in the AS_PATH attribute with the local AS number.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command replaces the AS number of all dynamic peers in the subnet in the AS_PATH attribute with the local AS number.

Usage guidelines

If different CEs use the same AS number, you must configure the relevant PE to replace the AS number of the CE as its own AS number. This ensures correct advertisement of private network routes.

Examples

In BGP instance view, substitute the local AS number for the AS number of peer 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer 1.1.1.1 substitute-as
```

5.1.74. peer timer

Use **peer timer** to set a keepalive interval and hold time for a peer or peer group.

Use **undo peer timer** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer keepalive** *keepalive* **hold** *holdtime*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer**

Default

The keepalive interval is 60 seconds, and the hold time is 180 seconds.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures a keepalive interval and hold time for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures a keepalive interval and hold time for all dynamic peers in the subnet.

keepalive *keepalive*: Sets a keepalive interval in the range of 0 to 21845 seconds.

hold *holdtime*: Sets a hold time in the range of 3 to 65535 seconds. The hold time must be at least three times the keepalive interval.

Usage guidelines

After establishing a BGP session, two routers send keepalive messages at the specified keepalive interval to each other to keep the session.

If a router receives no keepalive or update message from the peer within the hold time, it tears down the session.

The timers configured with this command are preferred to the timers configured with the **timer** command.

If the hold time settings on the local and peer routers are different, the smaller one is used.

If the hold time is set to 0, no keepalive message will be sent to the peer, and the peer session will never time out. If neither the hold time nor the keepalive interval is set to 0, the actual keepalive interval is the smaller one between one third of the hold time and the keepalive interval.

The timers configured with this command do not take effect until a session is re-established (for example, a session is reset).

Examples

In BGP instance view, set the keepalive interval and hold time for peer group **test** to 60 seconds and 180 seconds, respectively.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] peer test timer keepalive 60 hold 180
```

Related commands

display bgp peer

timer

5.1.75. preference

Use **preference** to configure preferences for BGP routes.

Use **undo preference** to restore the default.

Syntax

preference { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

undo preference

Default

The preferences of external, internal, and local BGP routes are 255, 255, and 130, respectively.

network-admin

Parameters

external-preference: Specifies a preference for EBGP routes, in the range of 1 to 255.

internal-preference: Specifies a preference for IBGP routes, in the range of 1 to 255.

local-preference: Specifies a preference for local routes, in the range of 1 to 255.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to set the route preference for matching routes. Routes not matching the routing policy use the default preference.

Usage guidelines

Different routing protocols might find different routes to the same destination. However, not all of those routes are optimal. For route selection, routing protocols, direct routes, and static routes are assigned different preferences. The route with the highest preference is preferred.

Configuring the preferences for BGP routes changes the possibility for the routes to become the optimal route.

To use a routing policy to set the preference, you must configure the preference with the **apply preference** command in the routing policy in advance. Otherwise, all matching routes use the default preference.

Examples

In BGP IPv4 unicast address family view, set preferences for EBGP, IBGP, and local routes to 20, 20, and 200, respectively.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] preference 20 20 200
```

5.1.76. reflect between-clients

Use **reflect between-clients** to enable route reflection between clients.

Use **undo reflect between-clients** to disable route reflection between clients.

Syntax

reflect between-clients

undo reflect between-clients

Default

Route reflection between clients is enabled.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Usage guidelines

When a route reflector is configured, and the clients of a route reflector are fully meshed, route reflection is unnecessary because it consumes more bandwidth resources. You can use the **undo reflect between-clients** command to disable route reflection instead of modifying network configuration or changing network topology.

After route reflection is disabled between clients, routes can still be reflected between a client and a non-client.

Examples

In BGP IPv4 unicast address family view, disable route reflection between clients.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] undo reflect between-clients
```

Related commands

peer reflect-client

reflector cluster-id

5.1.77. reflector cluster-id

Use **reflector cluster-id** to configure the cluster ID for a route reflector.

Use **undo reflector cluster-id** to restore the default.

Syntax

reflector cluster-id { *cluster-id* | *ipv4-address* }

undo reflector cluster-id

Default

A route reflector uses its router ID as the cluster ID.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

BGP EVPN address family view

Predefined user roles

network-admin

Parameters

cluster-id: Specifies the cluster ID in the format of an integer, in the range of 1 to 4294967295.

ipv4-address: Specifies the cluster ID in the format of an IPv4 address in dotted decimal notation.

Usage guidelines

The route reflector and clients form a cluster. Typically a cluster has one route reflector. The ID of the route reflector is the cluster ID.

You can configure more than one route reflector in a cluster to improve network reliability and prevent a single point of failure. Use this command to configure the same cluster ID for all route reflectors in the cluster to avoid routing loops.

Do not configure the router ID of a client as the cluster ID.

Examples

In BGP IPv4 unicast address family view, set the cluster ID on the local router (a reflector in the cluster) to 80.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] reflector cluster-id 80
```

Related commands

peer reflect-client

reflect between-clients

5.1.78. refresh bgp

Use **refresh bgp** to manually soft-reset BGP sessions.

Syntax

refresh bgp { *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]

refresh bgp { *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]

refresh bgp *ipv4-address* [*mask-length*] { **export** | **import** } **ipv6** [**unicast**]

refresh bgp { *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **l2vpn evpn**

Views

User view

Predefined user roles

network-admin

Parameters

ipv4-address: Soft-resets the BGP session to a peer specified by its IP address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command soft-resets BGP sessions to all dynamic peers in the subnet.

ipv6-address: Soft-resets the BGP session to a peer specified by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command soft-resets BGP sessions to all dynamic peers in the subnet.

all: Soft-resets all BGP sessions.

external: Soft-resets all EBGP sessions.

group *group-name*: Soft-resets the BGP sessions to the peers of the specified peer group. The *group-name* argument refers to the name of a peer group, a case-sensitive string of 1 to 47 characters.

internal: Soft-resets all IBGP sessions.

export: Performs outbound soft-reset (filters routes advertised to the specified peer or peer group by using the new configuration).

import: Performs inbound soft-reset (filters routes received from the specified peer or peer group by using the new configuration).

ipv4: Soft-resets BGP sessions for IPv4 address family.

ipv6: Soft-resets BGP sessions for IPv6 address family.

unicast: Soft-resets BGP sessions for unicast address family.

evpn: Soft-resets BGP sessions for EVPN address family.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command soft-resets BGP sessions for the specified address family on the public network.

Usage guidelines

A soft-reset operation enables the router to apply a new route selection policy without tearing down BGP connections.

To apply a new policy to outbound BGP sessions, execute this command with the **export** keyword. The router uses the new policy to filter routing information and sends the routing information that passes the filtering to the BGP peers.

To apply a new policy to inbound sessions, execute this command with the **import** keyword. The router advertises a route-refresh message to the peer and the peer resends its routing information to the router. After receiving the routing information, the router uses the new policy to filter the routing information.

This command requires that both the local router and the peer support route refresh.

If the **peer keep-all-routes** command is configured, the **refresh bgp import** command does not take effect.

Examples

Soft-reset all inbound BGP sessions for the IPv4 unicast address family.

```
<Switch> refresh bgp all import ipv4
```

Related commands

peer capability-advertise route-refresh

peer keep-all-routes

5.1.79. reset bgp

Use **reset bgp** to reset BGP sessions for the specified address family.

Syntax

reset bgp { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]

reset bgp { *as-number* | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } **ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]

reset bgp *ipv4-address* [*mask-length*] **ipv6** [**unicast**]

reset bgp { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **l2vpn evpn**

Views

User view

Predefined user roles

network-admin

Parameters

as-number: Resets BGP sessions to peers in the AS specified by its number in the range of 1 to 4294967295.

ipv4-address: Resets the BGP session to a peer specified by its IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command resets BGP sessions to all dynamic peers in the subnet.

ipv6-address: Resets the BGP session to a peer specified by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command resets BGP sessions to all dynamic peers in the subnet.

all: Resets all BGP sessions.

external: Resets all EBGP sessions.

group *group-name*: Resets the BGP sessions to the peers in the peer group specified by its name, a case-sensitive string of 1 to 47 characters.

internal: Resets all IBGP sessions.

ipv4: Resets BGP sessions for IPv4 address family.

ipv6: Resets BGP sessions for IPv6 address family.

unicast: Resets BGP sessions for unicast address family.

evpn: Resets BGP sessions for EVPN address family.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command resets BGP sessions for the specified address family on the public network.

Usage guidelines

A reset operation enables the router to apply a new route selection policy by re-establishing BGP sessions. This operation breaks down BGP sessions for a short period of time.

Examples

Reset all BGP sessions for the IPv4 unicast address family.

```
<Switch> reset bgp all ipv4
```

5.1.80. reset bgp all

Use **reset bgp all** to reset all BGP sessions for all address families.

Syntax

reset bgp all

Views

User view

Predefined user roles

network-admin

Usage guidelines

A reset operation enables the router to apply a new route selection policy by re-establishing BGP sessions. This operation breaks down BGP sessions for a short while.

Examples

Reset all BGP sessions.

```
<Switch> reset bgp all
```

5.1.81. reset bgp dampening

Use **reset bgp dampening** to clear BGP route dampening information and release suppressed BGP routes.

Syntax

reset bgp dampening ipv4 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [*mask-length* | *mask*]]

reset bgp dampening ipv6 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv4: Clears BGP IPv4 route dampening information and release suppressed BGP IPv4 routes.

ipv6: Clears BGP IPv6 route dampening information and release suppressed BGP IPv6 routes.

unicast: Clears BGP unicast route dampening information and release suppressed BGP unicast routes.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears BGP route dampening information for the public network, and releases suppressed BGP routes.

ipv4-address: Specifies an IPv4 destination network address. If you do not specify a network address, this command clears all BGP route dampening information, and releases all suppressed BGP routes.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

ipv6-address: Specifies an IPv6 destination network address. If you do not specify a network address, this command clears all BGP route dampening information, and releases all suppressed BGP routes.

prefix-length: Specifies a prefix length in the range of 0 to 128.

Usage guidelines

When you execute the **reset bgp dampening ipv4** command:

- If you specify only the *ipv4-address* argument, the system ANDs the network address with the mask of a route. If the result matches the network address of the route, the command clears dampening information for the route, and releases the suppressed route.
- If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument, this command does the following:
  - Clears dampening information for the route that matches both the specified destination network address and the mask (or mask length).
  - Releases the suppressed route.

Examples

Clear dampening information for the BGP IPv4 unicast route to network 20.1.0.0/16 and release the suppressed route.

```
<Switch> reset bgp dampening ipv4 20.1.0.0 255.255.0.0
```

Related commands

dampening

display bgp routing-table dampened

5.1.82. reset bgp flap-info

Use **reset bgp flap-info** to clear flap statistics for BGP routes.

Syntax

reset bgp flap-info ipv4 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [*mask-length* | *mask*] | **as-path-acl** *as-path-acl-number* | **peer** *ipv4-address*]

reset bgp flap-info ipv6 [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | **as-path-acl** *as-path-acl-number* | **peer** *ipv6-address*]

Views

User view

Predefined user roles

network-admin

Parameters

ipv4: Clears flap statistics for BGP IPv4 routes.

ipv6: Clears flap statistics for BGP IPv6 routes.

unicast: Clears flap statistics for BGP unicast routes.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears flap statistics for public BGP routes.

ipv4-address: Specifies an IPv4 destination network address.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

ipv6-address: Specifies an IPv6 destination network address.

prefix-length: Specifies a prefix length in the range of 0 to 128.

as-path-acl *as-path-acl-number*: Specifies an AS path list by its number in the range of 1 to 256, to filter BGP route flap statistics.

peer *ipv4-address* [*mask-length*]: Clears flap statistics for BGP routes learned from the specified IPv4 BGP peer. The *mask-length* argument specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command clears flap statistics for BGP routes learned from all dynamic peers in the subnet.

peer *ipv6-address*: Clears flap statistics for BGP routes learned from the specified IPv6 BGP peer. The *prefix-length* argument specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* arguments together to specify a subnet. If you specify a subnet, this command clears flap statistics for BGP routes learned from all dynamic peers in the subnet.

Usage guidelines

When you execute the **reset bgp flap-info ipv4** command:

- If you specify only the *ipv4-address* argument, the system ANDs the IPv4 network address with the mask of a route. If the result matches the IPv4 network address of the route, this command clears the flap statistics of the route.
- If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument, this command clears the flap statistics of the route that matches both the specified IPv4 destination network address and the mask (or mask length).

Examples

Clear flap statistics for the BGP IPv4 unicast route to network 20.1.0.0/16.

```
<Switch> reset bgp flap-info ipv4 20.1.0.0 16
```

Related commands

dampening

display bgp routing-table flap-info

5.1.83. router id

Use **router id** to configure a global router ID.

Use **undo router id** to restore the default.

Syntax

router id *router-id*

undo router id

Default

No global router ID is configured.

Views

System view

Predefined user roles

network-admin

Parameters

router-id: Specifies a router ID in IP address format.

Usage guidelines

Some routing protocols use a router ID to identify a device. You can configure a global router ID, which is used by routing protocols that have no router ID configured.

If no global router ID is configured, the highest loopback address, if any, is used as the router ID. If no loopback address is available, the highest physical interface IP address is used, regardless of the interface status. If no IP address is configured for any interface, the router ID is 0.0.0.0.

During an active/standby switchover, the standby main processing unit (MPU) checks the validity of the previous router ID backed up before switchover. If it is not valid, it selects a new router ID.

If the interface IP address that is selected as the router ID is removed or modified, a new router ID is selected. The following events will not trigger a router ID re-selection:

- The interface goes down.
- After a physical interface address is selected as the router ID, an IP address is configured for a loopback interface.
- A higher interface IP address is configured.

After a router ID is changed, use the **reset** command to make it effective.

Examples

Configure a global router ID as 1.1.1.1.

```
<Switch> system-view
[Switch] router id 1.1.1.1
```

Related commands

router-id (BGP instance view)

router-id (BGP-VPN instance view)

5.1.84. router-id (BGP instance view)

Use **router-id** to configure a router ID for a BGP instance.

Use **undo router-id** to restore the default.

Syntax

router-id *router-id*

undo router-id

Default

No router ID is configured for a BGP instance, and the BGP instance uses the global router ID configured by the **router id** command in system view.

Views

BGP instance view

Predefined user roles

network-admin

Parameters

router-id: Specifies a router ID for BGP, in IP address format.

Usage guidelines

To run BGP, a BGP instance must have a router ID, which is an unsigned 32-bit integer that uniquely identifies the router in the AS.

To modify a non-zero router ID for BGP, execute the **router-id** command in BGP instance view.

To improve availability, specify the IP address of a loopback interface as the router ID for BGP.

If you execute this command in the same BGP instance view multiple times, the most recent configuration takes effect.

You can configure the same router ID for different BGP instances.

Examples

In BGP instance view, set the router ID for BGP to 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] router-id 1.1.1.1
```

Related commands

router id

router-id (BGP-VPN instance view)

5.1.85. router-id (BGP-VPN instance view)

Use **router-id** to configure a router ID for a BGP VPN instance.

Use **undo router-id** to restore the default.

Syntax

router-id { *router-id* | **auto-select** }

undo router-id

Default

No router ID is configured for a BGP VPN instance, and the BGP VPN instance uses the router ID configured in BGP instance view. If no router ID is configured in BGP instance view, the BGP VPN instance uses the global router ID configured in system view.

Views

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

router-id: Specifies a router ID in IP address format.

auto-select: Automatically selects a router ID for the BGP VPN instance.

Usage guidelines

To run BGP, a VPN instance of a BGP instance must have a router ID, which is an unsigned 32-bit integer that uniquely identifies the BGP VPN router in the AS.

If the **auto-select** keyword is specified, the system selects a router ID for the BGP VPN instance in the following order:

1. The highest loopback address in the BGP VPN instance as the router ID.
2. The highest physical interface address in the BGP VPN instance as the router ID, regardless of the interface status.
3. 0.0.0.0 as the router ID.

If a non-zero router ID is selected for the BGP VPN instance, the router ID will not change when a more preferable router ID is available in the BGP VPN instance.

To improve availability, specify the IP address of a loopback interface as the router ID.

You can specify a different router ID for each VPN instance on a device.

If you execute this command in the same BGP-VPN instance view multiple times, the most recent configuration takes effect.

Examples

In BGP-VPN instance view, set the router ID to 1.1.1.1.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] ip vpn-instance vpn1
[Switch-bgp-default-vpn1] router-id 1.1.1.1
```

Related commands

router id

router-id (BGP instance view)

5.1.86. snmp-agent trap enable bgp

Use **snmp-agent trap enable bgp** to enable SNMP notifications for BGP.

Use **undo snmp-agent trap enable bgp** to disable SNMP notifications for BGP.

Syntax

snmp-agent trap enable bgp

undo snmp-agent trap enable bgp

Default

SNMP notifications for BGP are enabled.

Views

System view

Predefined user roles

network-admin

Usage guidelines

After you enable SNMP notifications for BGP, the device generates a notification when a BGP neighbor state change occurs. The notification includes the neighbor address, the error code and subcode of the most recent error, and the current neighbor state.

For BGP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Enable SNMP notifications for BGP.

```
<Switch> system-view
[Switch] snmp-agent trap enable bgp
```

5.1.87. summary automatic

Use **summary automatic** to configure automatic route summarization for redistributed IGP subnet routes.

Use **undo summary automatic** to restore the default.

Syntax

summary automatic

undo summary automatic

Default

Automatic route summarization is not performed for redistributed IGP subnet routes.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

Predefined user roles

network-admin

Usage guidelines

After the **summary automatic** command is configured, BGP summarizes IGP subnets redistributed by the **import-route** command.

Automatic summary routes can be manually summarized, but cannot be added to the IP routing table.

Examples

In BGP IPv4 unicast address family view, configure automatic route summarization for redistributed IGP subnet routes.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] address-family ipv4 unicast
[Switch-bgp-default-ipv4] summary automatic
```

Related commands

aggregate

import-route

5.1.88. timer

Use **timer** to configure a BGP keepalive interval and hold time.

Use **undo timer** to restore the default.

Syntax

timer keepalive *keepalive* **hold** *holdtime*

undo timer

Default

The BGP keepalive interval and the hold time are 60 seconds and 180 seconds, respectively.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

Parameters

keepalive *keepalive*: Configures a keepalive interval in the range of 0 to 21845 seconds.

hold *holdtime*: Configures a hold time in seconds, whose value is 0 or in the range of 3 to 65535. The hold time must be at least three times the keepalive interval.

Usage guidelines

After establishing a BGP session, two routers send keepalive messages at the specified keepalive interval to each other to keep the session.

If a router receives no keepalive or update message from the peer within the hold time, it tears down the session.

Use the **timer** command to configure the keepalive interval and hold time for all BGP peers. Use the **peer timer** command to configure the keepalive interval and hold time for a peer or peer

group. If both commands are configured, the intervals configured by the **peer timer** command have higher priority.

If the hold time settings on the local and peer routers are different, the smaller one is used.

If the hold time is set to 0, no keepalive message will be sent to the peer, and the peer session will never time out. If neither the hold time nor the keepalive interval is set to 0, the actual keepalive interval is the smaller one between one third of the hold time and the keepalive interval.

The **timer** command affects only new BGP sessions.

After the **timer** command is executed, no peer session is closed at once. The configured hold time is used for negotiation in session re-establishment (for example, when you reset the BGP session).

Examples

In BGP instance view, set the keepalive interval and hold time to 60 seconds and 180 seconds, respectively.

```
<Switch> system-view
[Switch] bgp 100
[Switch-bgp-default] timer keepalive 60 hold 180
```

6.1. Policy-based routing commands

6.1.1. apply next-hop

Use **apply next-hop** to set next hops.

Use **undo apply next-hop** to remove next hops.

Syntax

apply next-hop [**vpn-instance** *vpn-instance-name*] { *ip-address* [**direct**] [**track** *track-entry-number*] }&<1-2>

undo apply next-hop [[**vpn-instance** *vpn-instance-name*] *ip-address*&<1-2>]

Default

No next hop is set.

Views

Policy node view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

ip-address: Specifies the IP address of the next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option, the next hop belongs to the public network.

direct: Specifies that the next hop must be directly connected to take effect.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-2>: Indicates that the argument before it can be entered up to two times.

Usage guidelines

You can specify multiple next hops for backup in one command line or by executing this command multiple times.

With a next hop specified, the **undo apply next-hop** command removes the next hop.

Without any next hop specified, the **undo apply next-hop** command removes all next hops.

Examples

Set a directly-connected next hop of 1.1.1.1.

```
<Switch> system-view
[Switch] policy-based-route aa permit node 11
[Switch-pbr-aa-11] apply next-hop 1.1.1.1 direct
```

6.1.2. display ip policy-based-route

Use **display ip policy-based-route** to display PBR policy information.

Syntax

display ip policy-based-route [**policy** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command displays information for all PBR policies.

Examples

Display all policy information.

```
<Switch> display ip policy-based-route
Policy name: aaa
  node 1 permit:
    if-match acl 2000
    apply next-hop 1.1.1.1
```

Table 6-1 Command output

Field	Description
node 1 permit	The match mode of Node 1 is **permit**.
if-match acl	Compares packets with the ACL.
apply next-hop	Specifies a next hop for permitted packets.

Related commands

policy-based-route

6.1.3. display ip policy-based-route interface

Use **display ip policy-based-route interface** to display interface PBR configuration and statistics.

Syntax

display ip policy-based-route interface *interface-type interface-number* [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information on the master device.

Examples

Display PBR configuration and statistics on VLAN-interface 2.

```
<Switch> display ip policy-based-route interface vlan-interface 2
Policy based routing information for interface Vlan-interface2:
Policy name: aaa
  node 0 deny:
  Matched: 0
  node 1 permit:

Table 6-2 Command output

Field	Description
Policy based routing information for interface *XXXX*(failed)	PBR configuration and statistics on the interface. **NOTE:** If you specify a slot number, this field displays **failed** in brackets for a policy that failed to be issued to the driver. The failure means that all node configurations in the PBR policy failed to be issued.
node 0 deny(not support) node 2 permit(no resource)	Match mode of the node, **permit** or **deny**. **NOTE:** If you specify a slot number, this field displays the cause in brackets for a node that does not take effect: • **not support**—The device does not support the match criteria configured on the node. • **no resource**—The node does not have sufficient resources (for example, ACLs).
if-match acl	Compares packets with the ACL.
apply next-hop	Specifies a next hop for permitted packets.
Matched: 0 (no statistics resource)	Number of successful matches on the node. **NOTE:** If you specify a slot number but the device does not have sufficient resources to collect statistics on the slot, this field displays **no statistics resource** in brackets.
Total matched	Total number of successful matches on all nodes.

Related commands

reset ip policy-based-route statistics

6.1.4. display ip policy-based-route setup

Use **display ip policy-based-route setup** to display PBR configuration.

Syntax

display ip policy-based-route setup

Views

Any view

Predefined user roles

network-admin

network-operator

Examples

Display PBR configuration.

```
<Switch> display ip policy-based-route setup
Policy name              Type     Interface
pr01                     Forward  Vlan-interface2
aaa                      Local    N/A
```

Table 6-3 Command output

Field	Description
Type	Type of the PBR: • **Forward**—Interface PBR. • **Local**—Local PBR.
Interface	Interface where the policy is applied.

Related commands

ip policy-based-route

6.1.5. if-match acl

Use **if-match acl** to set an ACL match criterion.

Use **undo if-match acl** to restore the default.

Syntax

if-match acl { *acl-number* | **name** *acl-name* }

undo if-match acl

Default

No ACL match criterion is set.

Views

Policy node view

Predefined user roles

network-admin

Parameters

acl-number: Specifies an ACL by its number in the range of 2000 to 2999 for a basic ACL, and in the range of 3000 to 3999 for an advanced ACL.

name *acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters starting with letter *a* to *z* or *A* to *Z*. The ACL name cannot be **all**. For the command to take effect, make sure the specified ACL is a basic or advanced ACL.

Examples

Configure Node 11 of policy **aa** to permit the packets matching ACL 2011.

```
<Switch> system-view
[Switch] policy-based-route aa permit node 11
[Switch-pbr-aa-11] if-match acl 2011
```

Configure Node 11 of policy **aa** to permit the packets matching ACL **aaa**.

```
<Switch> system-view
[Switch] policy-based-route aa permit node 11
[Switch-pbr-aa-11] if-match acl name aaa
```

6.1.6. ip local policy-based-route

Use **ip local policy-based-route** to specify a policy for local PBR.

Use **undo ip local policy-based-route** to restore the default.

Syntax

ip local policy-based-route *policy-name*

undo ip local policy-based-route

Default

No policy is referenced for local PBR.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Usage guidelines

Local PBR guides the forwarding of locally generated packets, such as ICMP packets generated by using the **ping** command.

Local PBR might affect local services, such as ping and Telnet. When you use local PBR, make sure you fully understand its impact on local services of the device.

You can specify only one policy for local PBR and must make sure the specified policy already exists.

Before you apply a new policy, you must first remove the current policy.

Examples

Configure local PBR based on policy **aaa**.

```
<Switch> system-view
[Switch] ip local policy-based-route aaa
```

Related commands

display ip policy-based-route setup

policy-based-route

6.1.7. ip policy-based-route

Use **ip policy-based-route** to specify a policy for interface PBR on an interface.

Use **undo ip policy-based-route** to restore the default.

Syntax

ip policy-based-route *policy-name*

undo ip policy-based-route

Default

No policy is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Examples

Apply policy **aaa** to VLAN-interface 2.

```
<Switch> system-view
[Switch] interface vlan-interface 2
[Switch-Vlan-interface2] ip policy-based-route aaa
```

Related commands

display ip policy-based-route setup

policy-based-route

6.1.8. policy-based-route

Use **policy-based-route** to create a policy node and enter its view, or enter the view of an existing policy node.

Use **undo policy-based-route** to delete a policy or policy node.

Syntax

policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

undo policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

Default

No policy nodes exist.

Views

System view

Predefined user roles

network-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters.

deny: Specifies the match mode for the policy node as **deny**.

permit: Specifies the match mode for the policy node as **permit** (default mode).

node *node-number*: Specifies a policy node by its number in the range of 0 to 255. A smaller number has a higher priority.

Usage guidelines

A policy that has been applied to an interface or locally cannot be deleted. To delete it, you must first cancel the application.

- If a policy node is specified, the **undo policy-based-route** command deletes the specified policy node.
- If a match mode is specified, the command deletes all nodes configured with the match mode.
- If no policy node or match mode is specified, the command deletes the whole policy.

Examples

Create permit-mode of Node 10 for policy **policy1** and enter its view.

```
<Switch> system-view
[Switch] policy-based-route policy1 permit node 10
[Switch-pbr-policy1-10]
```

Related commands

display ip policy-based-route

6.1.9. reset ip policy-based-route statistics

Use **reset ip policy-based-route statistics** to clear PBR statistics.

Syntax

reset ip policy-based-route statistics [**policy** *policy-name*]

Views

User view

Predefined user roles

network-admin

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command clears PBR statistics for all policies.

Examples

Clear all PBR statistics.

```
<Switch> reset ip policy-based-route statistics
```

Related commands

display ip policy-based-route interface

7.1. IPv6 static routing commands

7.1.1. delete ipv6 static-routes all

Use **delete ipv6 static-routes all** to delete all IPv6 static routes.

Syntax

delete ipv6 [**vpn-instance** *vpn-instance-name*] **static-routes all**

Views

System view

Predefined user roles

network-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the command deletes all IPv6 static routes for the public network.

Usage guidelines

When you use this command, the system will prompt you to confirm the operation before deleting all the IPv6 static routes.

Examples

Delete all IPv6 static routes.

```
<Switch> system-view
[Switch] delete ipv6 static-routes all
This will erase all IPv6 static routes and their configurations, you must reconfigure
all static routes.
Are you sure?[Y/N]:y
```

Related commands

ipv6 route-static

7.1.2. ipv6 route-static

Use **ipv6 route-static** to configure an IPv6 static route.

Use **undo ipv6 route-static** to remove an IPv6 static route.

Syntax

ipv6 route-static *ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] [**bfd** { **control-packet** | **echo-packet** } | **permanent**] | [**vpn-instance** *d-vpn-instance-name*] *next-hop-address* [**bfd control-packet bfd-source** *ip-address* | **permanent**] } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] [**bfd** { **control-packet** | **echo-packet** } | **permanent**] | *next-hop-address* [**public**] [**bfd control-packet bfd-source** *ip-address* | **permanent**] | **vpn-instance** *d-vpn-instance-name next-hop-address* [**bfd control-packet bfd-source** *ipv6-address* | **permanent**] } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

undo ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* [*interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address*] [**preference** *preference*]

Default

No IPv6 static route is configured.

Views

System view

Predefined user roles

network-admin

Parameters

ipv6-address prefix-length: Specifies the IPv6 address and prefix length.

interface-type interface-number: Specifies an output interface by its type and number. If the output interface is an NBMA interface or broadcast interface and not a point-to-point (P2P) interface, the next hop address must be specified.

next-hop-address: Specifies the next hop IPv6 address.

bfd: Enables BFD to detect reachability of the static route's next hop.

control-packet: Specifies the BFD control mode.

bfd-source *ip-address*: Specifies the source IPv6 address of BFD packets.

echo-packet: Specifies the BFD echo mode.

permanent: Specifies the IPv6 route as a permanent IPv6 static route. If the output interface is down, the permanent IPv6 static route is still active.

public: Indicates the next hop is on the public network.

vpn-instance *d-vpn-instance-name*: Specifies a destination VPN instance by its name, a case-sensitive string of 1 to 31 characters. If a destination VPN is specified, packets will search for the output interface based on the specified next hop (IPv6 address) for the static route.

preference *preference*: Specifies a preference for IPv6 static routes, in the range of 1 to 255. The default is 60.

tag *tag-value*: Sets a tag for marking the static route, in the range of 1 to 4294967295. The default is 0. Tags of routes are used for route control in routing policies. For more information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

description *text*: Configures a description for the IPv6 static route, which consists of 1 to 60 characters, including special characters such as the space, but excluding the question mark (?).

vpn-instance *s-vpn-instance-name*: Specifies a source VPN instance by its name, a case-sensitive string of 1 to 31 characters. Each VPN has its own routing table, and the configured static route is installed in the routing tables of the specified VPNs.

Usage guidelines

An IPv6 static route that has the destination address configured as **::/0** (a prefix length of 0) is the default IPv6 route. If the destination address of an IPv6 packet does not match any entry in the routing table, this default route is used to forward the packet.

Follow these guidelines to configure the output interface, next hop address, or both for a static route:

- If the output interface is a broadcast interface or an NBMA interface, the next hop address must be specified.
- If the output interface is a P2P interface, you can specify only the output interface. You do not need to change the configuration of the route even if the peer address is changed.

Follow these guidelines when you configure BFD for IPv6 static routes:

- If you specify the source IPv6 address of BFD packets, you must specify the IPv6 address as the next hop IPv6 address on the peer device.

Follow these guidelines when you configure a static route:

- Enabling BFD for a flapping route could worsen the route flapping situation. Therefore, use it with caution. For more information about BFD, see *High Availability Configuration Guide*.
- The next hop IPv6 address of echo packets must be a global unicast address.
- Do not specify the **permanent** keyword together with the **bfd** keyword.

Examples

Configure an IPv6 static route, with the destination address 1:1:2::/64 and next hop 1:1:3::1.

```
<Switch> system-view
[Switch] ipv6 route-static 1:1:2:: 64 1:1:3::1
```

Related commands

display ipv6 routing-table protocol

7.1.3. ipv6 route-static default-preference

Use **ipv6 route-static default-preference** to set a default preference for IPv6 static routes.

Use **undo ipv6 route-static default-preference** to restore the default.

Syntax

ipv6 route-static default-preference *default-preference*

undo ipv6 route-static default-preference

Default

The default preference of IPv6 static routes is 60.

Views

System view

Predefined user roles

network-admin

Parameters

default-preference: Specifies a default preference for IPv6 static routes, in the range of 1 to 255.

Usage guidelines

If no preference is specified for an IPv6 static route, the default preference applies.

When the default preference is reconfigured, it applies only to newly added IPv6 static routes.

Examples

Set a default preference of 120 for IPv6 static routes.

```
<Switch> system-view
[Switch] ipv6 route-static default-preference 120
```

8. RIPng commands

8.1. RIPng commands

8.1.1. checkzero

Use **checkzero** to enable zero field check on RIPng packets.

Use **undo checkzero** to disable zero field check.

Syntax

checkzero

undo checkzero

Default

Zero field check is enabled.

Views

RIPng view

Predefined user roles

network-admin

Usage guidelines

Some fields in RIPng packet headers must be zero. These fields are called zero fields. You can enable zero field check on incoming RIPng packets. If a zero field of a packet contains a non-zero value, RIPng discards the packet.

Examples

Disable zero field check on RIPng packets for RIPng 100.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100] undo checkzero
```

8.1.2. default cost

Use **default cost** to configure a default metric for redistributed routes.

Use **undo default cost** to restore the default.

Syntax

default cost *cost-value*

undo default cost

Default

The default metric of redistributed routes is 0.

Views

RIPng view

Predefined user roles

network-admin

Parameters

cost-value: Specifies a default metric for redistributed routes, in the range of 0 to 16.

Usage guidelines

When you use the **import-route** command to redistribute routes from another routing protocol without specifying a metric, the metric specified by the **default cost** command applies.

Examples

Configure a default metric of 2 for redistributed routes.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100] default cost 2
```

Related commands

import-route

8.1.3. display ripng

Use **display ripng** to display state and configuration information for a RIPng process.

Syntax

display ripng [*process-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about all RIPng processes.

Examples

Display state and configuration information for all configured RIPng processes.

```
<Switch> display ripng
  Public VPN-instance name:
```

```
RIPng process: 1
       Preference: 100
           Routing policy: abc
       Fast-reroute:
           Routing policy: abc
       Checkzero: Enabled
       Default cost: 0
       Maximum number of load balanced routes: 6
       Update time   :   30 secs  Timeout time         :  180 secs
       Suppress time :  120 secs  Garbage-collect time :  120 secs
       Update output delay:   20(ms)  Output count:    3
       Graceful-restart interval:   60 secs
       Triggered Interval : 5 50 200
       Number of periodic updates sent: 256
       Number of trigger updates sent: 1
```

Table 8-1 Command output

Field	Description
Public VPN-instance name	Public network where the RIPng process runs.
Private VPN-instance name	VPN where the RIPng process runs.
RIPng process	RIPng process ID.
Preference	RIPng preference.
Checkzero	Indicates whether zero field check for RIPng packet headers is enabled: **Enabled** or **Disabled**.
Default Cost	Default metric of redistributed routes.
Fast-reroute	RIPng FRR.
Maximum number of balanced paths	Maximum number of load-balanced routes.
Update time	RIPng update interval, in seconds.
Timeout time	RIPng timeout interval, in seconds.
Suppress time	RIPng suppress interval, in seconds.
Garbage-Collect time	RIPng garbage collection interval, in seconds.
Update output delay	RIPng packet sending interval, in milliseconds.
Output count	Maximum number of RIPng packets that can be sent at an interval.
Graceful-restart interval	GR interval in seconds.
Triggered Interval	Triggered update sending interval.

8.1.4. display ripng database

Use **display ripng database** to display all active routes in the advertising database for a RIPng process.

Syntax

display ripng *process-id* **database** [*ipv6-address prefix-length*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

ipv6-address prefix-length: Specifies an IPv6 address. The *ipv6-address* argument specifies an IPv6 address. The *prefix-length* argument specifies a prefix length in the range of 0 to 128.

Examples

Display active routes for RIPng process 1.

```
<Switch> display ripng 1 database
   1::/64,
        cost 0, RIPng-interface
   10::/32,
        cost 0, imported
   2::2/128,
       via FE80::20C:29FF:FE7A:E3E4, cost 1
```

Table 8-2 Command output

Field	Description
cost	Route metric value.
imported	Indicates the route is redistributed from another routing protocol.
RIPng-interface	Route learned from the interface.
via	Next hop IPv6 address.

8.1.5. display ripng interface

Use **display ripng interface** to display interface information for a RIPng process.

Syntax

display ripng *process-id* **interface** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify this argument, the command displays information about all interfaces for the RIPng process.

Examples

Display interface information for RIPng process 1.

```
<Switch> display ripng 1 interface
Total: 1

 Interface: Vlan-interface100
         Link-local address: FE80::20C:29FF:FEC8:B4DD
         Split-horizon: On                Poison-reverse: Off
         MetricIn: 0                      MetricOut: 1
         Default route: Off
         Primary path detection mode: BFD echo
         Summary address:
                1::/16
```

Table 8-3 Command output

Field	Description
Total	Number of interfaces running RIPng.
Interface	Name of an interface running RIPng.
Link Local Address	Link-local address of an interface running RIPng.
Split-horizon	Indicates whether split horizon is enabled: • **On**—Enabled. • **Off**—Disabled.
Poison-reverse	Indicates whether poison reverse is enabled: • **On**—Enabled. • **Off**—Disabled.
MetricIn/MetricOut	Additional metric to incoming and outgoing routes.
Default route	• **Only**—The interface advertises only a default route. • **Originate**—The interface advertises a default

Field	Description
	route and other RIPng routes. • **Off**—In this state, the interface does not advertise a default route. • **In garbage-collection status**—In this state, the interface advertises a default route with a metric of 16.
Default route cost	Cost of the default route.
Primary path detection mode	**BFD echo** indicates that BFD single-hop echo detection is used to detect primary link failures.

8.1.6. display ripng route

Use **display ripng route** to display all RIPng routes for a RIPng process.

Syntax

display ripng *process-id* **route** [*ipv6-address prefix-length* [**verbose**] | **peer** *ipv6-address* | **statistics**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

ipv6-address prefix-length: Specifies an IPv6 address. The *ipv6-address* argument specifies an IPv6 address. The *prefix-length* argument specifies a prefix length in the range of 0 to 128.

verbose: Displays all routing information for the specified destination IPv6 address. If you do not specify this keyword, the command displays only optimal RIPng routes with the specified destination IPv6 address.

peer *ipv6-address*: Specifies a neighbor by its IPv6 address.

statistics: Displays routing information statistics, including total number of routes and the number of routes learned from each neighbor.

Examples

Display routing information for RIPng process 1.

```
<Switch> display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
```

```
Peer FE80::20C:29FF:FED4:7171 on Vlan-interface100
Destination 4::4/128,
    via FE80::20C:29FF:FED4:7171, cost 1, tag 0, AOF, 5 secs
Local route
Destination 3::3/128,
    via ::, cost 0, tag 0, DOF
Destination 6::/64,
    via ::, cost 0, tag 0, DOF
```

Display information about routes with the specified prefix for RIPng process 1.

```
<Switch> display ripng 1 route 3::3 128 verbose
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::4283:59FF:FE97:205 on Vlan-interface100
 Destination 3::3/128,
     via FE80::4283:59FF:FE97:205, cost 1, tag 0, AOF, 28 secs
```

Table 8-4 Command output

Field	Description
A–Aging	The route is in aging state.
S–Suppressed	The route is in suppressed state.
G–Garbage-collect	The route is in Garbage-collect state.
D–Direct	The route is a direct route.
Local route	The route is a locally generated direct route.
O - Optimal	The route is an optimal route.
F - Flush to RIB	The route has been flushed to the RIB.
Peer	Neighbor connected to the interface.
Destination	IPv6 destination address.
via	Next hop IPv6 address.
cost	Routing metric value.
tag	Route tag.
secs	Time a route entry has stayed in the current state.

Display routing information statistics for RIPng process 1.

```
<Switch> display ripng 1 route statistics
Peer                                    Optimal/Aging    Garbage
 FE80::20C:29FF:FED4:7171                1/2              0
 Local                                   2/0              0
 total                                   3/2              0
```

Table 8-5 Command output

Field	Description
Peer	IPv6 address of the neighbor.
Optimal	Number of optimal routes.
Aging	Number of routes in aging state.
Garbage	Number of routes in Garbage-collection state.
Local	Total number of locally generated direct route.
total	Total number of routes learned from RIPng neighbors.

8.1.7. filter-policy export

Use **filter-policy export** to configure RIPng to filter redistributed routes.

Use **undo filter-policy export** to remove the filtering.

Syntax

filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

undo filter-policy export [*protocol* [*process-id*]]

Default

RIPng does not filter redistributed routes.

Views

RIPng view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999 to filter redistributed routes.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a string of 1 to 63 characters, to filter redistributed routes.

protocol: Filters routes redistributed from a routing protocol.

process-id: Specifies the process ID of the specified routing protocol, in the range of 1 to 65535. This argument is available only when the routing protocol is **ripng**, or **ospfv3**. The default is 1.

Usage guidelines

If the *protocol* argument is specified, RIPng filters only routes redistributed from the specified routing protocol. Otherwise, RIPng filters all redistributed routes.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL in one of the following ways:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* command.
- To deny/permit a route with the specified destination and prefix, use the **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* **destination** *dest dest-prefix* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the prefix of the route. For the prefix configuration to take effect, specify a contiguous prefix.

Examples

Use IPv6 prefix list to filter redistributed RIPng updates.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc index 10 permit 100:1:: 32
[Switch] ripng 100
[Switch-ripng-100] filter-policy prefix-list abc export
```

Configure advanced IPv6 ACL 3000 to permit only route 2001::1/128 to pass. Use advanced IPv6 ACL 3000 to filter redistributed routes.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule 10 permit ipv6 source 2001::1 128 destination
ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff 128
[Switch-acl-ipv6-adv-3000] rule 100 deny ipv6
[Switch-acl-ipv6-adv-3000] quit
[Switch] ripng 100
[Switch-ripng-100] filter-policy 3000 export
```

8.1.8. filter-policy import

Use **filter-policy import** to configure RIPng to filter received routes.

Use **undo filter-policy import** to restore the default.

Syntax

filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **import**

undo filter-policy import

Default

RIPng does not filter received routes.

Views

RIPng view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999 to filter received routes.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a string of 1 to 63 characters, to filter received routes.

Usage guidelines

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL in one of the following ways:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* command.
- To deny/permit a route with the specified destination and prefix, use the **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* **destination** *dest dest-prefix* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the prefix of the route. For the configuration to take effect, specify a contiguous prefix.

Examples

Use the IPv6 prefix list **abc** to filter received RIPng updates.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc index 10 permit 100:1:: 32
[Switch] ripng 100
[Switch-ripng-100] filter-policy prefix-list abc import
```

Configure advanced IPv6 ACL 3000 to permit only route 2001::1/128 to pass. Use advanced IPv6 ACL 3000 to filter received routes.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule 10 permit ipv6 source 2001::1 128 destination
ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff 128
[Switch-acl-ipv6-adv-3000] rule 100 deny ipv6
[Switch-acl-ipv6-adv-3000] quit
[Switch] ripng 100
[Switch-ripng-100] filter-policy 3000 import
```

8.1.9. graceful-restart

Use **graceful-restart** to enable Graceful Restart (GR) for RIPng.

Use **undo graceful-restart** to disable RIPng GR.

Syntax

graceful-restart

undo graceful-restart

Default

RIPng GR is disabled.

Views

RIPng view

Predefined user roles

network-admin

Examples

Enable GR for RIPng process 1.

```
<Switch> system-view
[Switch] ripng 1
[Switch-ripng-1] graceful-restart
```

8.1.10. import-route

Use **import-route** to redistribute routes from another routing protocol.

Use **undo import-route** to remove routes redistributed from another routing protocol.

Syntax

import-route bgp4+ [*as-number*] [**allow-ibgp**] [**cost** *cost-value* | **route-policy** *route-policy-name*] *

undo import-route bgp4+

import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

undo import-route { **direct** | **static** }

import-route { **ospfv3** | **ripng** } [*process-id*] [**cost** *cost-value* | **route-policy** *route-policy-name*] *

undo import-route { **ospfv3** | **ripng** } [*process-id*]

Default

RIPng does not redistribute routes from another routing protocol.

Views

RIPng view

Predefined user roles

network-admin

Parameters

bgp4+: Redistributes BGP4+ routes.

direct: Redistributes direct routes.

ospfv3: Redistributes OSPFv3 routes.

ripng: Redistributes RIPng routes.

static: Redistributes static routes.

as-number: Specifies an AS by its number in the range of 1 to 4294967295. If you do not specify the *as-number* argument, this command redistributes all IPv6 EBGP routes. As a best practice, specify the AS number to avoid redistributing excessive IPv6 EBGP routes.

process-id: Specifies an OSPFv3, or RIPng process by its ID in the range of 1 to 65535. The default is 1.

allow-ibgp: Allows redistribution of IBGP routes. The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command additionally redistributes IBGP routes and might cause routing loops. Therefore, use it with caution.

cost *cost-value*: Specifies a metric for redistributed routes, in the range of 0 to 16. The default metric is 0.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

This command redistributes only active routes. To view route state information, use the **display ipv6 routing-table protocol** command.

Examples

Redistribute routes from OSPFv3 process 7 into RIPng and set the metric for redistributed routes to 7.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100] import-route ospfv3 7 cost 7
```

8.1.11. maximum load-balancing

Use **maximum load-balancing** to set the maximum number of equal-cost multi-path (ECMP) routes for load balancing.

Use **undo maximum load-balancing** to restore the default.

Syntax

maximum load-balancing *number*

undo maximum load-balancing

Default

8

Views

RIPng view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of ECMP routes in the range of 1 to 8. When this argument takes a value of 1, RIPng does not perform load balancing.

Examples

Set the maximum number of ECMP routes to 2.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100] maximum load-balancing 2
```

Related commands

max-ecmp-num

8.1.12. non-stop-routing

> **MEMO:**
>
> **non-stop-routing** command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable RIPng NSR.

Use **undo non-stop-routing** to disable RIPng NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

RIPng NSR is disabled.

Views

RIPng view

Predefined user roles

network-admin

Usage guidelines

RIPng NSR enabled for a RIPng process takes effect only on that process. If multiple RIPng processes exist, enable RIPng NSR for each process as a best practice.

RIPng NSR and RIPng GR are mutually exclusive. Do not configure the **non-stop-routing** command and the **graceful-restart** command at the same time.

Examples

Enable NSR for RIPng process 1.

```
<Switch> system-view
[Switch] ripng 1
[Switch-ripng-1] non-stop-routing
```

8.1.13. preference

Use **preference** to set the preference for RIPng routes.

Use **undo preference** to restore the default.

Syntax

preference { *preference* | **route-policy** *route-policy-name* } *

undo preference

Default

The preference of RIPng routes is 100.

Views

RIPng view

Predefined user roles

network-admin

Parameters

preference: Specifies the preference for RIPng routes, in the range of 1 to 255. The smaller the value, the higher the preference.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can specify a routing policy to set a preference for the matching RIPng routes.

- The preference set by the routing policy applies to all matching RIPng routes. The preference of other routes is set by the **preference** command.
- If no preference is set by the routing policy, the preference of all RIPng routes is set by the **preference** command.

Examples

Set the preference for RIPng routes to 120.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100] preference 120
```

8.1.14. reset ripng process

Use **reset ripng process** to restart a RIPng process.

Syntax

reset ripng *process-id* **process**

Views

User view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

Usage guidelines

After executing the command, you are prompted to confirm the operation.

Examples

Restart RIPng process 100.

```
<Switch> reset ripng 100 process
Reset RIPng process? [Y/N]:y
```

8.1.15. reset ripng statistics

Use **reset ripng statistics** to clear statistics for a RIPng process.

Syntax

reset ripng *process-id* **statistics**

Views

User view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

Examples

Clear statistics for RIPng process 100.

```
<Switch> reset ripng 100 statistics
```

8.1.16. ripng

Use **ripng** to enable RIPng and enter RIPng view.

Use **undo ripng** to disable RIPng.

Syntax

ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

undo ripng [*process-id*]

Default

RIPng is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535. The default value is 1.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, the RIPng process runs on the public network.

Usage guidelines

Before you configure global RIPng parameters, you must create a RIPng process. This restriction does not apply to configuring interface RIPng parameters.

If you disable a RIPng process, the configured RIPng parameters become invalid.

Examples

Create RIPng process 100 and enter its view.

```
<Switch> system-view
[Switch] ripng 100
[Switch-ripng-100]
```

8.1.17. ripng default-route

Use **ripng default-route** to configure a RIPng interface to advertise a default route with a specified metric.

Use **undo ripng default-route** to disable a RIPng interface from sending a default route.

Syntax

ripng default-route { **only** | **originate** } [**cost** *cost-value*] *

undo ripng default-route

Default

A RIPng process does not advertise a default route.

Views

Interface view

Predefined user roles

network-admin

Parameters

only: Advertises only an IPv6 default route (::/0).

originate: Advertises an IPv6 default route (::/0) and other routes.

cost-value: Specifies a cost for the default route, in the range of 1 to 15. The default is 1.

Usage guidelines

This command enables the interface to advertise a RIPng default route in a route update regardless of whether the default route exists in the local IPv6 routing table.

A RIPng interface configured to advertise a default route does not receive any default routes from its neighbors.

Examples

Configure RIPng on VLAN-interface 100 to advertise only a default route.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng default-route only
```

Configure RIPng on VLAN-interface 101 to advertise a default route and other routes.

```
<Switch> system-view
[Switch] interface vlan-interface 101
[Switch-Vlan-interface101] ripng default-route originate
```

8.1.18. ripng enable

Use **ripng enable** to enable RIPng on an interface.

Use **undo ripng enable** to disable RIPng on an interface.

Syntax

ripng *process-id* **enable**

undo ripng enable

Default

RIPng is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

process-id: Specifies a RIPng process by its ID in the range of 1 to 65535.

Examples

Enable RIPng 100 on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng 100 enable
```

8.1.19. ripng metricin

Use **ripng metricin** to configure an interface to add a metric to inbound RIPng routes.

Use **undo ripng metricin** to restore the default.

Syntax

ripng metricin *value*

undo ripng metricin

Default

The additional metric of an inbound route is 0.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Adds an additional metric to inbound routes, in the range of 0 to 16.

Examples

Configure VLAN-interface 100 to add a metric of 12 to inbound RIPng routes.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng metricin 12
```

8.1.20. ripng metricout

Use **ripng metricout** to configure an interface to add a metric to outbound RIPng routes.

Use **undo ripng metricout** to restore the default.

Syntax

ripng metricout *value*

undo ripng metricout

Default

The additional metric of outbound routes is 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

value: Adds an additional metric to outbound routes, in the range of 1 to 16.

Examples

Configure RIPng on VLAN-interface 100 to add a metric of 12 to outbound routes.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng metricout 12
```

8.1.21. ripng poison-reverse

Use **ripng poison-reverse** to enable poison reverse.

Use **undo ripng poison-reverse** to disable poison reverse.

Syntax

ripng poison-reverse

undo ripng poison-reverse

Default

Poison reverse is disabled.

Views

Interface view

Predefined user roles

network-admin

Examples

Enable poison reverse for RIPng update messages on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng poison-reverse
```

8.1.22. ripng split-horizon

Use **ripng split-horizon** to enable split horizon.

Use **undo ripng split-horizon** to disable split horizon.

Syntax

ripng split-horizon

undo ripng split-horizon

Default

Split horizon is enabled.

Views

Interface view

Predefined user roles

network-admin

Usage guidelines

Split horizon prevents routing loops. If you want to disable this feature, make sure the operation is indispensable.

If both poison reverse and split horizon are enabled, only poison reverse takes effect.

Examples

Enable split horizon on VLAN-interface 100.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ripng split-horizon
```

8.1.23. ripng summary-address

Use **ripng summary-address** to configure a summary network to be advertised through an interface.

Use **undo ripng summary-address** to remove a summary network.

Syntax

ripng summary-address *ipv6-address prefix-length*

undo ripng summary-address *ipv6-address prefix-length*

Default

No summary network is configured to be advertised through an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the destination IPv6 address of the summary route.

prefix-length: Specifies the prefix length of the destination IPv6 address of the summary route, in the range of 0 to 128. It indicates the number of consecutive 1s of the prefix, which defines the network ID.

Usage guidelines

Networks on the summary network will not be advertised. The cost of the summary route is the lowest cost among summarized routes.

Examples

Assign an IPv6 address with the 64-bit prefix to VLAN-interface 100 and configure a summary with the 35-bit prefix.

```
<Switch> system-view
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] ipv6 address 2001:200::3EFF:FE11:6770/64
[Switch-Vlan-interface100] ripng summary-address 2001:200:: 35
```

8.1.24. timers

Use **timers** to set RIPng timers.

Use **undo timers** to restore the default.

Syntax

timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *

undo timers { **garbage-collect** | **suppress** | **timeout** | **update** } *

Default

The garbage-collect timer is 120 seconds, the suppress timer is 120 seconds, the timeout timer is 180 seconds, and the update timer is 30 seconds.

Views

RIPng view

Predefines user roles

network-admin

Parameters

garbage-collect-value: Sets the garbage-collect timer in the range of 1 to 86400 seconds.

suppress-value: Sets the suppress timer in the range of 0 to 86400 seconds.

timeout-value: Sets the timeout timer in the range of 1 to 86400 seconds.

update-value: Sets the update timer in the range of 1 to 86400 seconds.

Usage guidelines

RIPng has the following timers:

- **Update timer**—Interval between update messages.
- **Timeout timer**—Route aging time. If no update for a route is received before the timer expires, RIPng sets the metric of the route to 16.
- **Suppress timer**—How long a RIPng route stays in suppressed state. When the metric of a route becomes 16, the route enters the suppressed state. If RIPng receives an update for the route from the same neighbor and the route in the update has a metric less than 16, RIPng uses the route to replace the suppressed route.
- **Garbage-collect timer**—Interval from when the metric of a route becomes 16 to when it is deleted from the routing table. During the garbage-collect timer length, RIPng advertises the route with a metric of 16. If no update is announced for that route before the garbage-collect timer expires, RIPng deletes the route from the routing table.

As a best practice, do not change the default values of these timers.

The timer lengths must be kept consistent on all routers in the network.

Examples

Set the update, timeout, suppress, and garbage-collect timers to 5 seconds, 15 seconds, 15 seconds, and 30 seconds.

```
<Switch> system-view
[Switch] ripng 1
[Switch-ripng-1] timers update 5 timeout 15 suppress 15 garbage-collect 30
```

9. OSPFv3 commands

9.1. OSPFv3 commands

9.1.1. abr-summary (OSPFv3 area view)

Use **abr-summary** to configure route summarization on an ABR.

Use **undo abr-summary** to remove the configuration.

Syntax

abr-summary *ipv6-address prefix-length* [**not-advertise**] [**cost** *cost-value*]

undo abr-summary *ipv6-address prefix-length*

Default

Route summarization is not configured on an ABR.

Views

OSPFv3 area view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the destination IPv6 address of the summary route.

prefix-length: Specifies the prefix length of the destination IPv6 address, in the range of 0 to 128. This argument specifies the number of consecutive 1s of the prefix, which defines the network ID.

not-advertise: Specifies not to advertise the summary IPv6 route. If you do not specify this keyword, the command advertises the IPv6 summary route.

cost *cost-value*: Specifies the cost of the summary route, in the range of 1 to 16777215. The default cost is the largest cost value among routes that are summarized.

Usage guidelines

This command applies only to an ABR to summarize multiple contiguous networks into one network.

To enable ABR to advertise specific routes that have been summarized, use the **undo abr-summary** command.

Examples

Summarize networks 2000:1:1:1::/64 and 2000:1:1:2::/64 in Area 1 into 2000:1:1::/48.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 1
[Switch-ospfv3-1-area-0.0.0.1] abr-summary 2000:1:1:: 48
```

9.1.2. area

Use **area** to create an OSPFv3 area and enter OSPFv3 area view.

Use **undo area** to remove an OSPFv3 area.

Syntax

area *area-id*

undo area *area-id*

Default

No OSPFv3 areas exist.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

area-id: Specifies an area by its ID, an IPv4 address or a decimal integer in the range of 0 to 4294967295 that is translated into the IPv4 address format.

Examples

Create OSPFv3 Area 0 and enter its view.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 0
[Switch-ospfv3-1-area-0.0.0.0]
```

9.1.3. bandwidth-reference (OSPFv3 view)

Use **bandwidth-reference** to set a reference bandwidth value for link cost calculation.

Use **undo bandwidth-reference** to restore the default.

Syntax

bandwidth-reference *value*

undo bandwidth-reference

Default

The reference bandwidth value is 100 Mbps for link cost calculation.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

value: Specifies the reference bandwidth value for link cost calculation, in the range of 1 to 4294967 Mbps.

Usage guidelines

You can configure an OSPFv3 cost for an interface with one of the following methods:

- Configure the cost value in interface view.
- Configure a bandwidth reference value. OSPFv3 computes the cost automatically based on the bandwidth reference value by using the following formula: Interface OSPFv3 cost = Bandwidth reference value / Interface bandwidth.
  - If the calculated cost is greater than 65535, the value of 65535 is used.
  - If the calculated cost is smaller than 1, the value of 1 is used.

If no cost value is configured for an interface, OSPFv3 computes the interface cost value automatically.

Examples

Set the reference bandwidth value to 1000 Mbps.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] bandwidth-reference 1000
```

9.1.4. default-cost (OSPFv3 area view)

Use **default-cost** to set a cost for the default route advertised to the stub area or NSSA area.

Use **undo default-cost** to restore the default.

Syntax

default-cost *cost*

undo default-cost

Default

The cost is 1.

Views

OSPFv3 area view

Predefined user roles

network-admin

Parameters

value: Specifies a cost for the default route advertised to the stub area or NSSA area, in the range of 0 to 16777214.

Usage guidelines

This command takes effect only on the ABR of a stub area or the ABR or ASBR of an NSSA area.

Examples

Configure Area 1 as a stub area, and set the cost of the default route advertised to the stub area to 60.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 1
[Switch-ospfv3-1-area-0.0.0.1] stub
[Switch-ospfv3-1-area-0.0.0.1] default-cost 60
```

Related commands

stub (OSPFv3 area view)

9.1.5. default-route-advertise (OSPFv3 view)

Use **default-route-advertise** to redistribute a default route into the OSPFv3 routing domain.

Use **undo default-route-advertise** to restore the default.

Syntax

default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

undo default-route-advertise

Default

No default route is redistributed into the OSPFv3 routing domain.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

always: Redistributes a default route in an AS-external-LSA into the OSPFv3 routing domain regardless of whether a default route exists in the routing table. If you do not specify this keyword, the router redistributes a default route in an AS-external-LSA into the OSPFv3 routing domain only when the default route exists in the routing table.

permit-calculate-other: Enables OSPFv3 to calculate default routes received from other routers. If you do not specify this keyword, OSPFv3 does not calculate default routes from other routers. If the router does not redistribute any default route in an AS-external-LSA into the OSPFv3 routing domain, the router calculates default routes from other routers. It calculates these routes regardless of whether this keyword is specified.

cost *cost-value*: Specifies a cost for the default route, in the range of 0 to 16777214. The default is 1.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters. When the routing policy is matched and one of the following conditions is met, the command redistributes a default route in an AS-external-LSA into the OSPFv3 routing domain:

- A default route exists in the routing table.
- The **always** keyword is specified.

The routing policy modifies values in the AS-external-LSA.

tag *tag*: Specifies a tag for the default route, in the range of 0 to 4294967295. If you do not specify this option, the tag specified to 1.

type *type*: Specifies a type for the AS-external-LSA, 1 or 2. The default is 2.

Usage guidelines

This command redistributes a default route in an AS-external-LSA, which cannot be redistributed with the **import-route** command. If the local routing table has no default route, you must provide the **always** keyword for the command.

Examples

Redistribute a default route into the OSPFv3 routing domain. (The default route does not exist in the local router.)

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] default-route-advertise always
```

Related commands

import-route (OSPFv3 view)

9.1.6. display ospfv3

Use **display ospfv3** to display OSPFv3 process information.

Syntax

display ospfv3 [*process-id*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about all OSPFv3 processes.

verbose: Displays detailed OSPFv3 process information. If you do not specify this keyword, the command displays brief OSPFv3 process information.

Examples

Display detailed information about all OSPFv3 processes.

```
<Switch> display ospfv3 verbose

Table 9-1 Command output

Field	Description
OSPFv3 Process 1 with Router ID 1.1.1.1	OSPFv3 process is 1, and router ID is 1.1.1.1.
Router type	Router type: • ABR. • ASBR. • NSSA. • Null.
Route tag	Tag of the routes redistributed into the OSPFv3 process.
Route tag check	Whether the check is enabled for the route tag in OSPFv3 LSAs of the OSPFv3 process.
Multi-VPN-Instance	Whether the OSPFv3 process supports PE or multiple VPN instances: • **Multi-VPN-Instance: Disabled**—The process does not support multiple VPN instances. • **Multi-VPN-Instance: Enabled**—The process supports multiple VPN instances. • **PE Router, Multi-VPN-Instance: Enabled**—The local device is a PE.
DN-bit check	Whether the check is enabled for the DN bit in OSPFv3 LSAs of the OSPFv3 process.
DN-bit set	Whether the DN bit is set for OSPFv3 LSAs in the OSPFv3 process.
Condition	Time when the router acts as a stub router: • Always.

Field	Description
	• On startup while BGP is converging for *xxx* seconds, where *xxx* is specified by the user. • On startup for *xxx* seconds, where *xxx* is specified by the user.
State	State of the stub router: • Active. • Inactive.
SPF-schedule-interval	Interval for SPF calculations.
Transmit pacing	LSU advertisement rate: • **Interval**—Specifies the interval for sending LSUs. • **Count**—Specifies the maximum number of LSUs sent at each interval.
Default ASE parameters	Default parameters of redistributed routes. **Tag** represents the route tag of the redistributed routes.
Route preference	Internal route preference.
ASE route preference	AS-external route preference.
FRR backup mode	FRR backup mode: • **LFA**—Uses the LFA algorithm to calculate a backup next hop for all routes. **LFA ABR-only** indicates that only the next hop of the route to the ABR can be used as the backup next hop. • **route-policy** *route-policy-name*—Specifies a backup next hop by using a routing policy.
LSA originated count	Number of originated LSAs.
LSA received count	Number of received LSAs.
Area count	Total number of areas.
Stub area count	Number of stub areas.
NSSA area count	Number of NSSA areas.
ExChange/Loading neighbors	Neighbors in ExChange/Loading state.
Calculation trigger type	Route calculation trigger type: • **Full**—Calculation of all routes is triggered. • **Area topology change**—Topology change in an area. • **Intra router change**—Incremental intra-area route change. • **ASBR change**—Incremental ASBR route change. • **Full IP prefix**—Calculation of all IP prefixes is triggered. • **Full intra AS**—Calculation of all intra-AS prefixes is triggered. • **Inc intra AS**—Calculation of incremental intra-AS prefixes is triggered. • **Full inter AS**—Calculation of all AS-external prefixes is triggered. • **Inc inter AS**—Calculation of incremental AS-external prefixes is triggered.

Field	Description
	• **Nexthop calculation**—Calculation of next hops is triggered. • **N/A**—Route calculation is not triggered.
Current calculation type	Current route calculation type: • SPF calculation. • **Intra router calculation**—Intra-area route calculation. • **ASBR calculation**—Inter-area ASBR route calculation. • **Inc intra router**—Incremental intra-area route calculation. • **Inc ASBR calculation**—Incremental inter-area ASBR route calculation. • **Full intra AS**—Calculation of all intra-AS prefixes. • **Inc intra AS**—Calculation of incremental intra-AS prefixes. • **Full inter AS**—Calculation of all AS-external prefixes. • **Inc inter AS**—Calculation of incremental AS-external prefixes. • **N/A**—Route calculation is not triggered.
Current calculation phase	Current route calculation phase: • **Calculation area topology**—Calculating area topology. • **Calculation router**—Calculating routes on routers. • **Calculation intra AS**—Calculating intra-AS routes. • **Calculation ASBR**—Calculating routes on ASBRs. • **Calculation inter AS**—Calculating AS-external routes. • **Calculation end**—Ending phase of calculation. • **N/A**—Route calculation is not triggered.
Redistribute timer	Route redistribution timer status: on or off.
Redistribute schedule type	Route redistribution scheduling type: • **RIB**—Redistribute routes through the RIB table. • **Self**—Redistribute routes through the routing table. • **N/A**—Route redistribution is not triggered.
Redistribute route count	Number of redistributed routes.
Process reset state	Process reset state: • **N/A**—The process is not reset. • **Under reset**—The process is in the reset progress. • **Under RIB smooth**—The process is synchronizing RIB routes.
Current reset type	Current process reset type:

Field	Description
	• **N/A**—The process is not reset. • **GR quit**—Normal reset when GR quits abnormally. • **Delete**—Delete OSPFv3 process. • **Undo router-id**—Delete router ID. • **Set router-id**—Set router ID.
Next reset type	Next process reset type: • **N/A**—The process is not reset. • **GR quit**—Normal reset when GR quits abnormally. • **Delete**—Delete OSPFv3 process. • **Undo router-id**—Delete router ID. • **Set router-id**—Set router ID.
Reset prepare message replied	Modules that reply reset prepare messages: • **P**—Neighbor maintenance module. • **S**—LSDB synchronization module. • **C**—Route calculation module. • **R**—Route redistribution module.
Reset process message replied	Modules that reply reset process messages: • **P**—Neighbor maintenance module. • **S**—LSDB synchronization module. • **C**—Route calculation module. • **R**—Route redistribution module.
Reset phase of module	Reset phase of each module: • LSDB synchronization (S) module: ○ **N/A**—Not reset. ○ **Delete ASE**—Delete all ASE LSAs. ○ **Delete area LSA**—Delete LSAs from an area. ○ **Delete area IF**—Delete interfaces from an area. • Route calculation (C) module: ○ **N/A**—Not reset. ○ **Delete topology**—Delete area topology. ○ **Delete router**—Delete routes of routers. ○ **Delete intra AS**—Delete intra-AS routes ○ **Delete inter AS**—Delete AS-external routes. ○ **Delete ASBR**—Delete ASBR routes. • Route redistribution (R) module: ○ **N/A**—Not reset. ○ **Delete import**—Delete redistributed routes.
IPsec profile name	IPsec profile applied to the interface.
Keychain authentication: Enabled (test)	Keychain authentication is enabled for the area, and the keychain **test** is used.
Created by Vlink	The area is created through virtual link.
7/5 translator state	State of the translator that translates Type-7 LSAs to Type-5 LSAs:

Field	Description
	• **Enabled**—The translator is specified through commands. • **Elected**—The translator is designated through election. • **Disabled**—The device is not a translator.
7/5 translate stability timer interval	Stability interval (in seconds) for Type-7 LSA-to-Type-5 LSA translation.

9.1.7. display ospfv3 abr-asbr

Use **display ospfv3 abr-asbr** to display information about the routes to OSPFv3 ABR and ASBR.

Syntax

display ospfv3 [*process-id*] **abr-asbr**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about all the routes to the OSPFv3 ABR and ASBR.

Examples

Display information about all the routes to the OSPFv3 ABR and ASBR.

```
<Switch> display ospfv3 abr-asbr

                OSPFv3 Process 1 with Router ID 1.1.1.1

 Destination : 1.1.1.2                                  Rtr Type : ABR
 Area        : 0.0.0.0                                  Path Type: Intra
 Interface   : Vlan102                                BkInterface: Vlan101
 NextHop     : FE80:1:1::1
 BkNexthop   : FE80:1:2::2
 Cost        : 1

 Destination : 1.1.1.3                                  Rtr Type : ASBR
 Area        : 0.0.0.0                                  Path Type: Intra
 Interface   : Vlan103                                BkInterface: Vlan104
 BkNexthop   : FE80:1:2::4
```

```
NextHop      : FE80:2:1::1
Cost         : 1
```

Table 9-2 Command output

Field	Description
OSPFv3 Process 1 with Router ID 1.1.1.1	OSPFv3 process is 1, and router ID is 1.1.1.1.
Destination	Router ID of an ABR or ASBR.
Rtr Type	Router type: ABR or ASBR.
Area	Area ID of the next hop.
Path Type	Type of the route to the ABR or ASBR: • **Intra**—Intra-area route. • **Inter**—Inter-area route.
Interface	Output interface.
BkInterface	Backup output interface.
NextHop	Next hop address.
BkNexthop	Backup next hop address.
Cost	Cost from the router to the ABR or ASBR.

9.1.8. display ospfv3 abr-summary

Use **display ospfv3 abr-summary** to display ABR summary route information.

Syntax

display ospfv3 [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about ABR summary routes for all OSPFv3 processes.

area *area-id*: Specifies an OSPFv3 area by its ID. The area ID is an IP address or a decimal integer in the range of 0 to 4294967295 that is translated into the IP address format. If you do not specify this option, the command displays information about ABR summary routes for all OSPFv3 areas.

ipv6-address prefix-length: Specifies an IPv6 address. The *ipv6-address* argument specifies an IPv6 prefix. The *prefix-length* argument specifies a prefix length in the range of 0 to 128. If you do not specify this argument, the command displays information about all summary routes on the ABR.

verbose: Displays detailed ABR summary route information. If you do not specify this keyword, the command displays brief ABR summary route information.

Examples

Display brief ABR summary route information in OSPFv3 process 1.

```
<Switch> display ospfv3 1 abr-summary

            OSPFv3 Process 1 with Router ID 2.2.2.2

                    Area: 1.1.1.1
 Total summary addresses: 1

 Prefix       : 1000:4::/32
 Status       : Advertise
 NULL0        : Active
 Cost         : 1 (Configured)
 Routes count: 2
```

Table 9-3 Command output

Field	Description
Area	Area to which the summary routes belong.
Total summary addresses	Total number of summary routes.
Prefix	Prefix of the summary route.
Status	Advertisement status of the summary route.
NULL0	Null 0 route.
Cost	Cost of the summary route.
Routes count	Number of summarized routes.

Display detailed ABR summary route information in OSPFv3 process 1.

```
<Switch> display ospfv3 1 abr-summary verbose

            OSPFv3 Process 1 with Router ID 2.2.2.2

                      Area: 1.1.1.1
Total summary addresses: 1

 Cost         : 1 (Configured)
```

```
Routes count: 2
  Destination                                     Metric
  1000:4:10:3::/96                                1
  1000:4:11:3::/96                                1
```

Table 9-4 Command output

Field	Description
Destination	Destination address of a summarized route.
Metric	Metric of a summarized route.

9.1.9. display ospfv3 asbr-summary

Use **display ospfv3 asbr-summary** to display ASBR summary route information.

Syntax

display ospfv3 [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays information about ASBR summary routes for all OSPFv3 processes.

ipv6-address prefix-length: Specifies an IPv6 address. The *ipv6-address* argument specifies an IPv6 prefix. The *prefix-length* argument specifies a prefix length in the range of 0 to 128. If you do not specify this argument, the command displays information about all ASBR summary routes.

verbose: Displays detailed ASBR summary route information. If you do not specify this keyword, the command displays brief ASBR summary route information.

Examples

Display brief ASBR summary route information in OSPFv3 process 1.

```
<Switch> display ospfv3 1 asbr-summary

                OSPFv3 Process 1 with Router ID 2.2.2.2

 Total summary addresses: 1
```

```
Prefix      : 1000:4::/32
Status      : Advertise

 Nssa-only   : (Not configured)
 Routes count: 2
  Destination                              Protocol Process Type Metric
```

```
1000:4:10:3::/96                        Static   0       2     1
1000:4:11:3::/96                        Static   0       2     1
```

Table 9-6 Command output

Field	Description
Destination	Prefix and prefix length of the summarized route.
Protocol	Routing protocol from which the route was redistributed.
Process	Process of the routing protocol from which the route was redistributed.
Type	Type of the summarized route.
Metric	Metric of the summarized route.

9.1.10. display ospfv3 graceful-restart

Use **display ospfv3 graceful-restart** to display GR information.

Syntax

display ospfv3 [*process-id*] **graceful-restart** [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays GR information for all processes.

verbose: Displays detailed GR information. If you do not specify this keyword, the command displays brief GR information.

Examples

Display brief GR information for all OSPFv3 processes (GR restarter).

```
<Switch> display ospfv3 graceful-restart

                OSPFv3 Process 1 with Router ID 3.3.3.3

 Graceful-restart capability      : Enable
 Graceful-restart support         : Planned and un-planned, Partial
 Helper capability                : Enable
 Helper support                   : Planned and un-planned
 Current GR state                 : Normal
```

```
Graceful-restart period         : 120 seconds
Number of neighbors under helper: 0
Number of restarting neighbors  : 0
Last exit reason:
  Restarter: None
  Helper   : None
```

Table 9-7 Command output

Field	Description
OSPFv3 Process 1 with Router ID 3.3.3.3	The GR status of OSPFv3 process 1 with router ID 3.3.3.3 is displayed.
Graceful-restart capability	Whether OSPFv3 GR is enabled: • Enabled. • Disabled.
Graceful-restart support	GR modes that the process supports (displayed only when GR is enabled): • **Planned and un-planned**—Supports both planned and unplanned GR. • **Planned only**—Supports only planned GR. • **Partial**—Supports partial GR. • **Global**—Supports global GR.
Helper capability	Whether OSPFv3 GR helper is enabled: • Enabled. • Disabled.
Helper support	Policies and GR modes that the GR helper supports (displayed only when GR helper is enabled): • **Strict LSA check**—The GR helper supports strict LSA checking. • **Planned and un-planned**—The GR helper supports both planned and unplanned GR. • **Planned only**—The GR helper supports only planned GR.
Current GR state	GR status: • **Normal**—GR is not in progress or has completed. • **Under GR**—GR is in progress. • **Under Helper**—The process is acting as GR helper.
Graceful-restart period	GR restart interval.
Number of neighbors under helper	Number of neighbors in GR helper status.
Number of restarting neighbors	Number of neighbors in GR restarter status.
Last exit reason	Last exit reason: • **Restarter**—Reason that the restarter exited most recently: ○ None. ○ **Completed**—GR is completed. ○ **Interval timer is fired**—The GR timer expires.

Field	Description
	○ **Interface state change**—An interface state change occurs. ○ **Received 1-way hello**—The device receives 1-way hello packets from the neighbor. ○ **Reset neighbor**—The neighbor is reset. ○ **DR or BDR change**—The DR or BDR changes. • **Helper**—Reason that the helper exited most recently: ○ None. ○ **Completed**—GR is completed. ○ **Received 1-way hello**—The device receives 1-way hello packets from the neighbor. ○ **Grace Period timer is fired**—The GR timer expires. ○ **Lsa check failed**—An LSA change on the GR helper is detected. ○ **Reset neighbor**—The neighbor is reset. ○ **Received MAXAGE gracelsa but neighbor is not full**—The device receives Grace-LSAs that reached the maximum age, but the neighbor is not in Full state.

Display detailed GR information for all OSPFv3 processes (GR restarter).

```
<Switch> display ospfv3 graceful-restart verbose

               OSPFv3 Process 1 with Router ID 3.3.3.3

 Graceful-restart capability     : Enable
 Graceful-restart support        : Planned and un-planned, Partial

Area: 0.0.0.5
Area flag: NSSANoSummaryNoImportRoute
7/5 translator state: Disabled
7/5 translate stability timer interval: 0
Area up interface count: 0
```

Table 9-8 Command output

Field	Description
Area	Area ID.
Area flag	Type of the area: • Normal. • Transit. • Stub. • **StubNoSummary**—Totally stub area. • NSSA.

Field	Description
	• **NSSANoSummary**—Totally NSSA area. • **NSSANoSummaryNoImportRoute**—Totally NSSA area with the **no-import-route** keyword configured.
7/5 translator state	State of the translator that translates Type-7 LSAs to Type-5 LSAs: • **Enabled**—The translator is specified through commands. • **Elected**—The translator is designated through election. • **Disabled**—The device is not a translator.
7/5 translate stability timer interval	Stability interval (in seconds) for Type-7 LSA-to-Type-5 LSA translation.
Area up interface count	Number of up interfaces in the area.
Interface	Interface in the area, or the output interface of the virtual link.
Restarter state	Restarter state on the interface.
State	Interface state.
Type	Interface network type.
Neighbor count of this interface	Number of neighbors on the interface.
Neighbor	Neighbor router ID.
GR state	Neighbor GR state: • **Normal**—GR is not in progress or has completed. • **Under GR**—GR is in process. • **Under Helper**—The process is acting as GR helper.
Last helper exit reason	Reason that the helper exited most recently.
Virtual-link Neighbor-ID	Router ID of the virtual link's neighbor.
Neighbor-State	Neighbor or virtual link state: Down, Init, 2-Way, ExStart, Exchange, Loading, and Full.
Local IPv6 address	Local IPv6 address of the neighbor relationship.
Remote IPv6 address	Peer IPv6 address of the neighbor relationship.
Transit area	Transit area ID.

9.1.11. display ospfv3 interface

Use **display ospfv3 interface** to display OSPFv3 interface information.

Syntax

display ospfv3 [*process-id*] **interface** [*interface-type interface-number* | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535.

interface-type interface-number: Specifies an interface by its type and number.

verbose: Displays detailed information about all OSPFv3 interfaces.

Usage guidelines

If you do not specify a process, this command displays brief OSPFv3 interface information for all processes.

If you do not specify the *interface-type interface-number* argument or the **verbose** keyword, this command displays brief information about all OSPFv3 interfaces.

Examples

Display OSPFv3 information about VLAN-interface 1.

```
<Switch> display ospfv3 interface vlan-interface 1

               OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
----------------------------------------------------------------------------
 Vlan-interface1 is up, line protocol is up
  Interface ID 65697        Instance ID 0
  IPv6 prefixes
    fe80::200:12ff:fe34:1  (Link-Local address)
    2001::1
  Cost: 1       State: BDR       Type: Broadcast    MTU: 1500
  Priority: 1
  Designated router: 2.2.2.2
  Backup designated router: 1.1.1.1
  Timers: Hello 10, Dead 40, Poll 40, Retransmit 5, Transmit delay 1
  FRR backup: Enabled
  Neighbor count is 1, Adjacent neighbor count is 1
  Primary path detection mode: BFD echo
  IPsec profile name: profile001
  Keychain authentication: Enabled (test), inherited
  Exchanging/Loading neighbors: 0
  Wait timer: Off,  LsAck timer: Off
  Prefix-suppression is enabled
```

Table 9-9 Command output

Field	Description
Area	Area ID that the interface belongs to.
Interface ID	Interface ID.
Instance ID	Instance ID.
IPv6 prefixes	IPv6 prefix.
Cost	Cost value of the interface.
State	Interface state: • **DOWN**—No protocol traffic can be sent or received on the interface. • **Waiting**—The interface starts sending and receiving Hello packets. The router is trying to determine the identity of the (Backup) designated router for the network. • **P-2-P**—The interface will send Hello packets at the hello interval, and try to establish an adjacency with the neighbor. • **DR**—The router is the designated router on the network. • **BDR**—The router is the backup designated router on the network. • **DROther**—The router is a DR Other router on the attached network.
Type	Network type of the interface: PTP (P2P), PTMP (P2MP), Broadcast, or NBMA.
MTU	MTU value of the interface.
Priority	DR priority of the interface.
Designated router	DR on this link.
Backup designated router	BDR on this link.
Timers	Time intervals in seconds configured on the interface: • **Hello**—Hello interval. • **Dead**—Dead interval. • **Poll**—Polling interval on an NBMA network. • **Retransmit**—LSA retransmission interval.
Transmit Delay	LSA transmission delay on the interface, in seconds.
FRR backup	Whether LFA calculation is enabled on an interface: • **Enabled**. • **Disabled**.
Neighbor count	Number of neighbors on the interface.
Primary path detection mode	Primary link detection mode: • **BFD ctrl**—BFD control packet mode. • **BFD echo**—BFD echo packet mode.
Adjacent neighbor count	Number of adjacencies on the interface.
IPsec profile name	IPsec profile applied to the interface.

Field	Description
Keychain authentication: Enabled (test), inherited	Keychain authentication is enabled for the interface, and the keychain **test** is used. The **inherited** attribute indicates that the interface is using the authentication mode specified for the area to which the interface belongs.

9.1.12. display ospfv3 lsdb

Use **display ospfv3 lsdb** to display OSPFv3 LSDB information.

Syntax

display ospfv3 [*process-id*] **lsdb** [{ **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **link** | **network** | **router** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays LSDB information for all processes.

external: Displays AS external LSAs (Type-5 LSAs).

grace: Displays Grace-LSAs (Type-11 LSAs).

inter-prefix: Displays Inter-area-prefix LSAs (Type-3 LSAs).

inter-router: Displays Inter-area-router LSAs (Type-4 LSAs).

intra-prefix: Displays Intra-area-prefix LSAs (Type-9 LSAs).

link: Displays Link-LSAs (Type-8 LSAs).

network: Displays Network-LSAs (Type-2 LSAs).

router: Displays Router-LSAs (Type-1 LSAs).

unknown: Displays unknown LSAs.

type: Specifies an LSA type, a hexadecimal string of 0 to ffff. If you do not specify this argument, the command displays all unknown LSAs.

link-state-id: Specifies a link state ID in IPv4 address format.

originate-router *router-id*: Specifies an advertising router by its ID.

self-originate: Displays locally originated LSAs.

statistics: Displays LSA statistics.

total: Displays the total number of LSAs in the LSDB.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

Examples

Display OSPFv3 LSDB information.

```
<Switch> display ospfv3 lsdb

                OSPFv3 Process 1 with Router ID 1.1.1.1

Table 9-13 Command output

Field	Description
SendCnt	Number of interfaces to send the LSA.
RxmtCnt	Number of LSAs in the link state retransmission list.
Status	LSA status: • Normal. • Delayed. • **Maxage routed**—The LSA has reached its maximum age. • Self originated. • **Stale**—A self-originated LSAis received during the GR process.

9.1.13. display ospfv3 nexthop

Use **display ospfv3 nexthop** to display OSPFv3 next hop information.

Syntax

display ospfv3 [*process-id*] **nexthop**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays next hop information for all OSPFv3 processes.

Examples

Display next hop information for OSPFv3 process 1.

```
<Switch> display ospfv3 1 nexthop

                OSPFv3 Process 1 with Router ID 1.1.1.1

 Nexthop : FE80::20C:29FF:FED7:F308              Interface: Vlan102
 RefCount: 4                                     Status   : Valid
 NbrID   : 1.1.1.1                               NbrIntID : 21

 Nexthop : FE80::20C:29FF:FED7:F312              Interface: Vlan103
 RefCount: 3                                     Status   : Valid
 NbrID   : 1.1.1.1                               NbrIntID : 38
```

Table 9-14 Command output

Field	Description
Nexthop	Next hop address.
Interface	Output interface.
RefCount	Reference count (routes that use the next hop).
Status	Next hop status: valid or invalid.
NbrId	Neighbor router ID.
NbrIntID	Neighbor interface ID.

9.1.14. display ospfv3 peer

Use **display ospfv3 peer** to display information about OSPFv3 neighbors.

Syntax

display ospfv3 [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify a process, this command displays neighbor information for all processes.

area *area-id*: Specifies an area by its ID, an IPv4 address or a decimal integer in the range of 0 to 4294967295 that is translated into the IPv4 address format. If you do not specify an area, this command displays neighbor information for all areas.

interface-type interface-number: Specifies an interface by its type and number.

verbose: Displays detailed neighbor information.

peer-router-id: Specifies a neighbor.

statistics: Displays OSPFv3 neighbor statistics.

Usage guidelines

If you do not specify an interface and a neighbor, this command displays neighbor information for all interfaces.

Examples

Display neighbor information for OSPFv3 process 1.

```
<Switch> display ospfv3 1 peer vlan-interface 1

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.1
----------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   Init/ -           00:00:36  0      Vlan1
```

Table 9-15 Command output

Field	Description
Router ID	Neighbor router ID.
Pri	Neighboring router priority.
State	Neighbor state.
Dead-Time	Dead time remained.
Inst ID	Instance ID.
Interface	Interface connected to the neighbor.

Display detailed neighbor information for OSPFv3 process 1.

```
<Switch> display ospfv3 1 peer vlan-interface 1 verbose

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area 0.0.0.1 interface Vlan1's neighbors
 Router ID: 2.2.2.2          Address: fe80::200:5eff:fe00:100
   State: ExStart  Mode: None  Priority: 1
   DR: 2.2.2.2  BDR: None   MTU: 1500
   Options is 0x000413 (AT|-|-|-|-|R|-|x|E|V6)
   Dead timer due in 00:00:33
```

```
Neighbor is up for 00:24:19
Authentication sequence: (high) 0, (low) 59755
Neighbor state change count: 205
Database Summary List 0
Link State Request List 0
Link State Retransmission List 0
Neighbor interface ID: 8037
GR state: Normal
Grace period: 0           Grace period timer: Off
DD Rxmt Timer: Off        LS Rxmt Timer: On
```

Table 9-16 Command output

Field	Description
Router ID	Neighbor router ID.
Address	Link-local address of the interface.
State	Neighbor state.
Mode	Neighbor mode for LSDB synchronization.
Priority	Neighboring router priority.
DR	DR on the interface's network segment.
BDR	BDR on the interface's network segment.
MTU	Interface MTU.
Options	LSA options: • **AT**—Whether the Authentication Trailer option is carried in packets. • **DC**—The originating router supports OSPFv3 over on-demand circuits. • **R**—Whether the originating router is an active router. • **N**—Whether the originating router supports NSSA LSAs. • **x**—Reserved. • **E**—Whether the originating router can receive AS External LSAs. • **V6**—Whether the originating router takes part in IPv6 route calculation.
Dead timer due in 33 sec	This dead timer will expire in 33 seconds.
Neighbor is up for 00:24:19	The neighbor has been up for 00:24:19.
Authentication sequence: (high) 0, (low) 59755	Authentication sequence number carried in the received packets. The high 32-bit value is 0, and the low 32-bit value is 59755.
Neighbor state change count	Count of neighbor state changes.
Database Summary List	Number of LSAs sent in DD packet.
Link State Request List	Number of LSAs in the link state request list.
Link State Retransmission List	Number of LSAs in the link state retransmission list.
Neighbor interface ID	Interface ID of the neighbor.

Field	Description
GR state	GR state: • **Normal**—GR is not in progress. • **Doing GR**—Acting as the GR restarter. • Complete GR. • **Helper**—Acting as the GR helper.
Grace period	Grace-LSA sending interval.
Grace period timer	Grace-LSA sending interval timer.
DD Rxmt Timer	DD packet retransmission timer.
LS Rxmt Timer	LSU retransmission timer.

Display OSPFv3 neighbor statistics.

```
<Switch> display ospfv3 peer statistics

                OSPFv3 Process 1 with Router ID 1.1.1.1
----------------------------------------------------------------------------
 Area ID          Down Attempt Init 2-Way ExStart Exchange Loading Full Total
 0.0.0.0          0    0       0    0      0       0        0       1    1
 Total            0    0       0    0      0       0        0       1    1
```

Table 9-17 Command output

Field	Description
Area ID	Area ID.
Down	In this state, neighbor initial state, the router has not received any information from a neighboring router for a period of time.
Attempt	This state is available only in an NBMA network. In this state, the OSPFv3 router has not received any information from a neighbor for a period. The router can send Hello packets at a longer interval to keep the neighbor relationship.
Init	In this state, the device received a Hello packet from the neighbor but the packet contains no router ID of the neighbor. Mutual communication is not setup.
2-Way	Mutual communication between the router and its neighbor is available. DR/BDR election is finished under this state (or higher).
ExStart	In this state, the router decides on the initial DD sequence number and active/standby relationship of the two parties.
Exchange	In this state, the router exchanges DD packets with the neighbor.
Loading	In this state, the router sends LSRs to request the neighbor for needed LSAs.
Full	LSDB synchronization has been accomplished between neighbors.
Total	Total number of neighbors under the same state.

9.1.15. display ospfv3 request-queue

Use **display ospfv3 request-queue** to display OSPFv3 request list information.

Syntax

display ospfv3 [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify an OSPFv3 process, this command displays OSPFv3 request list information for all OSPFv3 processes.

area *area-id*: Specifies an area by its ID, an IPv4 address or a decimal integer in the range of 0 to 4294967295 that is translated into the IPv4 address format. If you do not specify an OSPFv3 area, this command displays OSPFv3 request list information for all areas.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays OSPFv3 request list information for all interfaces.

neighbor-id: Specifies a neighbor's router ID. If you do not specify a neighbor, this command displays OSPFv3 request list information for all OSPFv3 neighbors.

Examples

Display OSPFv3 request list information.

```
<Switch> display ospfv3 request-queue

                OSPFv3 Process 1 with Router ID 1.1.1.1

                    Area: 0.0.0.0
                    Interface Vlan-interface100
----------------------------------------------------------------------------
                    Nbr-ID 1.3.3.3 Request List
 Type     LinkState ID     AdvRouter        SeqNum       Age   CkSum
 0x4005   0.0.34.127       1.3.3.3          0x80000001   0027  0x274d
 0x4005   0.0.34.128       1.3.3.3          0x80000001   0027  0x2d45
 0x4005   0.0.34.129       1.3.3.3          0x80000001   0027  0x333d
 0x4005   0.0.34.130       1.3.3.3          0x80000001   0027  0x3935
```

Table 9-18 Command output

Field	Description
Area	Area ID.
Interface	Interface type and sequence number.
Nbr-ID	Neighbor ID.
Request list	Request list information.
Type	LSA type.
LinkState ID	Link state ID.
AdvRouter	Advertising router.
SeqNum	LSA sequence number.
Age	LSA age.
CkSum	Checksum.

9.1.16. display ospfv3 retrans-queue

Use **display ospfv3 retrans-queue** to display retransmission list information.

Syntax

display ospfv3 [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify an OSPFv3 process, this command displays retransmission list information for all OSPFv3 processes.

area *area-id*: Specifies an area by its ID, an IPv4 address or a decimal integer in the range of 0 to 4294967295 that is translated into the IPv4 address format. If you do not specify an OSPFv3 area, this command displays retransmission list information for all OSPFv3 areas.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays retransmission list information for all interfaces.

neighbor-id: Specifies a neighbor's router ID. If you do not specify a neighbor, this command displays retransmission list information for all neighbors.

Examples

Display OSPFv3 retransmission list information.

```
<Switch> display ospfv3 retrans-queue

                OSPFv3 Process 1 with Router ID 1.1.1.1

                    Area: 0.0.0.0
                    Interface Vlan-interface100
----------------------------------------------------------------------------
                    Nbr-ID 1.2.2.2 Retransmit List
 Type     LinkState ID     AdvRouter        SeqNum       Age    CkSum
 0x2009   0.0.0.0         1.3.3.3          0x80000001   3600   0x49fb
```

Table 9-19 Command output

Field	Description
Area	Area ID.
Interface	Interface type and sequence number.
Nbr-ID	Neighbor ID.
Retransmit List	Retransmission list information.
Type	LSA type.
LinkState ID	Link state ID.
AdvRouter	Advertising router.
SeqNum	LSA sequence number.
Age	LSA age.
CkSum	Checksum.

9.1.17. display ospfv3 routing

Use **display ospfv3 routing** to display OSPFv3 route information.

Syntax

display ospfv3 [*process-id*] **routing** [*ipv6-address prefix-length*]

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the OSPFv3 route information for all processes.

ipv6-address prefix-length: Specifies an IPv6 address. The *ipv6-address* argument specifies an IPv6 prefix. The *prefix-length* argument specifies a prefix length in the range of 0 to 128.

Examples

Display OSPFv3 routing information.

```
<Switch> display ospfv3 routing

                OSPFv3 Process 1 with Router ID 9.9.9.9
--------------------------------------------------------------------------
 I  - Intra area route,  E1 - Type 1 external route,  N1 - Type 1 NSSA route
 IA - Inter area route,  E2 - Type 2 external route,  N2 - Type 2 NSSA route
 *  - Selected route

*Destination: 3::3/128
  Type       : I                                  Area       : 0.0.0.1
  AdvRouter  : 1.1.1.1                            Preference : 0

Table 9-20 Command output

Field	Description
Destination	Destination network segment.
Type	Route type.
Area	Area ID.

Field	Description
AdvRouter	Advertising router.
Preference	OSPFv3 route preference.
NibID	Next hop ID.
Cost	Route cost value.
Interface	Output interface.
BkInterface	Backup output interface.
Nexthop	Primary next hop IP address.
BkNexthop	Backup next hop IP address.
Nexthop	Next hop address.
Interface	Output interface.
AdvRouter	Advertising router.
Area	Area ID.
Tag	Tag of external routes.
Preference	Route preference.
Total	Total number of routes.
Intra area	Number of intra-area routes.
Inter area	Number of inter-area routes.
ASE	Number of Type-5 external routes.
NSSA	Number of Type-7 external routes.

9.1.18. display ospfv3 statistics

Use **display ospfv3 statistics** to display OSPFv3 statistics.

Syntax

display ospfv3 [*process-id*] **statistics**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays OSPFv3 statistics for all processes.

Examples

Display OSPFv3 statistics.

```
<Switch> display ospfv3 statistics

              OSPFv3 Process 1 with Router ID 1.1.1.1
                  Packet Statistics
------------------------------------------------------------
 Type                          Recv              Send
 Hello                         1746              1284
 DB Description                505               941
 Ls Req                        252               136

 ASE                                            0
 NSSA                                           0
```

Table 9-21 Command output

Field	Description
Packet Statistics	Statistics about inbound and outbound packets.
Hello	Hello packet.
DB Description	DB description packet.
Ls Req	Link state request packet.
Ls Upd	Link state update packet.
Ls Ack	Link state acknowledgment packet.

Field	Description
Local Originated LSAs Statistics	Statistics about generated LSAs.
Router-LSA	Number of Type-1 LSAs.
Network-LSA	Number of Type-2 LSAs.
Inter-Area-Prefix-LSA	Number of Type-3 LSAs.
Inter-Area-Router-LSA	Number of Type-4 LSAs.
AS-external-LSA	Number of Type-5 LSAs.
NSSA-LSA	Number of Type-7 LSAs.
Link-LSA	Number of Type-8 LSAs.
Intra-Area-Prefix-LSA	Number of Type-9 LSAs.
Grace-LSA	Number of Type-11 LSAs.
Unknown-LSA	Number of Unknown-LSAs.
Total	Total number.
Routes Statistics	Number of routes.
Intra Area	Intra-area routes.
Inter Area	Inter-area routes.
ASE	Type-5 external routes.
NSSA	Type-7 external routes.

9.1.19. display ospfv3 vlink

Use **display ospfv3 vlink** to display OSPFv3 virtual link information.

Syntax

display ospfv3 [*process-id*] **vlink**

Views

Any view

Predefined user roles

network-admin

network-operator

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. If you do not specify this argument, the command displays the OSPFv3 virtual link information for all OSPFv3 processes.

Examples

Display OSPFv3 virtual link information.

```
<Switch> display ospfv3 vlink
```

```
                OSPFv3 Process 1 with Router ID 1.1.1.1

Virtual-link Neighbor-id: 12.2.2.2, Neighbor-state: Full
Interface: 2348 (Vlan-interface12), Instance-ID: 0
Local  IPv6 address: 3:3333::12
Remote IPv6 address: 2:2222::12
Cost: 1  State: P-2-P  Type: Virtual
Transit area: 0.0.0.1
Timers: Hello 10, Dead 40, Retransmit 5, Transmit Delay 1
IPsec profile name: profile001
Keychain authentication: Enabled (test), inherited
```

Table 9-22 Command output

Field	Description
Virtual-link Neighbor-ID	ID of the neighbor on the virtual link.
Neighbor-State	Neighbor state: Down, Init, 2-Way, ExStart, Exchange, Loading, or Full.
Interface	Number and name of the local interface on the virtual link.
Cost	Interface route cost.
State	Interface state.
Type	Virtual link.
Transit Area	Transit area ID. This field is displayed when a virtual link is present on the interface.
Timers	Values of OSPFv3 timers (in seconds): **Hello**, **Dead**, and **Retransmit**.
Transmit Delay	LSA transmission delay on the interface, in seconds.
IPsec profile name	IPsec profile applied to the virtual link.
Keychain authentication: Enabled (test), inherited	Keychain authentication is enabled for the virtual link, and the keychain **test** is used. The **inherited** attribute indicates that the virtual link is using the authentication mode specified for the backbone area.

9.1.20. filter (OSPFv3 area view)

Use **filter** to configure inbound/outbound Inter-Area-Prefix-LSA filtering on an ABR.

Use **undo filter** to remove the configuration.

Syntax

filter { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

undo filter { **export** | **import** }

Default

Inter-Area-Prefix-LSAs are not filtered.

Views

OSPFv3 area view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999 to filter inbound/outbound Inter-Area-Prefix-LSAs.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter inbound/outbound Inter-Area-Prefix-LSAs.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter inbound/outbound Inter-Area-Prefix-LSAs.

export: Filters Inter-Area-Prefix-LSAs advertised to other areas.

import: Filters Inter-Area-Prefix-LSAs advertised into the local area.

Usage guidelines

This command applies only to an ABR.

Examples

Use IPv6 prefix list **my-prefix-list** to filter inbound Inter-Area-Prefix-LSAs. Use IPv6 basic ACL 2000 to filter outbound Inter-Area-Prefix-LSAs in OSPFv3 Area 1.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] area 1
[Switch-ospfv3-1-area-0.0.0.1] filter prefix-list my-prefix-list import
[Switch-ospfv3-1-area-0.0.0.1] filter 2000 export
```

9.1.21. filter-policy export (OSPFv3 view)

Use **filter-policy export** to configure OSPFv3 to filter redistributed routes.

Use **undo filter-policy export** to remove the configuration.

Syntax

filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

undo filter-policy export [*protocol* [*process-id*]]

Default

Redistributed routes are not filtered.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999 to filter redistributed routes by destination address.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter redistributed routes by destination address.

protocol: Filters routes redistributed from the specified routing protocol. If you do not specify this argument, the command filters all redistributed routes.

process-id: Specifies a process by its ID in the range of 1 to 65535. This argument is available only when the *protocol* argument is **ripng**, or **ospfv3**.

Usage guidelines

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL in one of the following ways:

- To deny/permit a route with the specified destination, use **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix*.
- To deny/permit a route with the specified destination and prefix, use **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* **destination** *dest dest-prefix*.

The **source** keyword specifies the destination address of a route, and the **destination** keyword specifies the prefix of the route. For the configuration to take effect, specify a contiguous prefix.

Using the **filter-policy export** command filters only routes redistributed by the **import-route** command. If the **import-route** command is not configured to redistribute routes from other protocols and other OSPFv3 processes, the **filter-policy export** command does not take effect.

Examples

Use IPv6 prefix list **abc** to filter redistributed routes.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc permit 2002:1:: 64
[Switch] ospfv3
[Switch-ospfv3-1] filter-policy prefix-list abc export
```

Configure IPv6 advanced ACL 3000 to permit only route 2001::1/128. Use ACL 3000 to filter redistributed routes.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
```

```
[Switch-acl-ipv6-adv-3000] rule 10 permit ipv6 source 2001::1 128 destination
ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff 128
[Switch-acl-ipv6-adv-3000] rule 100 deny ipv6
[Switch-acl-ipv6-adv-3000] quit
[Switch] ospfv3
[Switch-ospfv3-1] filter-policy 3000 export
```

9.1.22. filter-policy import (OSPFv3 view)

Use **filter-policy import** to configure OSPFv3 to filter routes calculated using received LSAs.

Use **undo filter-policy import** to remove the configuration.

Syntax

filter-policy { *ipv6-acl-number* [**gateway** *prefix-list-name*] | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

undo filter-policy import

Default

Routes calculated using received LSAs are not filtered.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999 to filter routes by destination.

gateway *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter routes by next hop. If you do not specify this option, the command does not filter routes by next hop.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters, to filter routes by destination.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to filter received routes.

Usage guidelines

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL in one of the following ways:

- To deny/permit a route with the specified destination, use **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix*.
- To deny/permit a route with the specified destination and prefix, use **rule** [*rule-id*] { **deny** | **permit** } **ipv6 source** *sour sour-prefix* **destination** *dest dest-prefix*.

The **source** keyword specifies the destination address of a route, and the **destination** keyword specifies the prefix of the route. For the configuration to take effect, specify a contiguous prefix.

Using the **filter-policy import** command filters only routes computed by OSPFv3. Routes that fail to pass the filter are not added to the routing table.

Examples

Use IPv6 prefix list **abc** to filter received routes.

```
<Switch> system-view
[Switch] ipv6 prefix-list abc permit 2002:1:: 64
[Switch] ospfv3
[Switch-ospfv3-1] filter-policy prefix-list abc import
```

Configure IPv6 advanced ACL 3000 to permit only route 2001::1/128 to pass. Use ACL 3000 to filter received routes.

```
<Switch> system-view
[Switch] acl ipv6 advanced 3000
[Switch-acl-ipv6-adv-3000] rule 10 permit ipv6 source 2001::1 128 destination
ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff 128
[Switch-acl-ipv6-adv-3000] rule 100 deny ipv6
[Switch-acl-ipv6-adv-3000] quit
[Switch] ospfv3
[Switch-ospfv3-1] filter-policy 3000 import
```

9.1.23. graceful-restart enable

Use **graceful-restart enable** to enable the GR capability for OSPFv3.

Use **undo graceful-restart enable** to disable the GR capability for OSPFv3.

Syntax

graceful-restart enable

undo graceful-restart enable

Default

The GR capability for OSPFv3 is disabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

GR includes planned GR and unplanned GR.

- **Planned GR**—Manually restarts OSPFv3 or performs an active/standby switchover. Before OSPFv3 restart or active/standby switchover, the GR restarter sends Grace-LSAs to GR helpers.
- **Unplanned GR**—OSPFv3 restarts or an active/standby switchover occurs because of device failure. Before OSPFv3 restart or active/standby switchover, the GR restarter does not send Grace-LSAs to GR helpers.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

Examples

Enable the GR capability for OSPFv3 process 1.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] graceful-restart enable
```

Related commands

graceful-restart helper enable

9.1.24. graceful-restart helper enable

Use **graceful-restart helper enable** to enable the GR helper capability for OSPFv3.

Use **undo graceful-restart helper enable** to disable the GR helper capability for OSPFv3.

Syntax

graceful-restart helper enable

undo graceful-restart helper enable

Default

The GR helper capability for OSPFv3 is enabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

Upon receiving the Grace-LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Examples

Enable the GR helper capability for OSPFv3 process 1.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] graceful-restart helper enable
```

Related commands

graceful-restart enable

9.1.25. graceful-restart helper strict-lsa-checking

Use **graceful-restart helper strict-lsa-checking** to enable strict LSA checking for the GR helper.

Use **undo graceful-restart helper strict-lsa-checking** to disable strict LSA checking for the GR helper.

Syntax

graceful-restart helper strict-lsa-checking

undo graceful-restart helper strict-lsa-checking

Default

Strict LSA checking for the GR helper is disabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

With GR helper enabled, when an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Examples

Enable strict LSA checking for the GR helper in OSPFv3 process 1.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] graceful-restart helper strict-lsa-checking
```

Related commands

graceful-restart helper enable

9.1.26. graceful-restart interval

Use **graceful-restart interval** to set the GR restart interval.

Use **undo graceful-restart interval** to restore the default.

Syntax

graceful-restart interval *interval*

undo graceful-restart interval

Default

The GR restart interval is 120 seconds.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

interval: Specifies GR restart interval in the range of 40 to 1800 seconds.

Usage guidelines

For GR restart to succeed, the value of the GR restart interval cannot be smaller than the maximum OSPFv3 neighbor dead time of all the OSPFv3 interfaces.

Examples

Set the GR restart interval for OSPFv3 process 1 to 100 seconds.

```
<Switch> system-view
[Switch] ospfv3 1
[Switch-ospfv3-1] graceful-restart interval 100
```

Related commands

ospfv3 timer dead

9.1.27. import-route (OSPFv3 view)

Use **import-route** to redistribute routes.

Use **undo import-route** to disable route redistribution.

Syntax

import-route bgp4+ [**allow-ibgp**] [**cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *

undo import-route bgp4+

import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *

undo import-route { **direct** | **static** }

import-route { **ospfv3** | **ripng** } [*process-id* | **all-processes**]

undo import-route { **ospfv3** | **ripng** } [*process-id* | **all-processes**]

Default

OSPFv3 route redistribution is disabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

bgp4+: Redistributes IPv6 BGP routes.

direct: Redistributes direct routes.

static: Redistributes static routes.

ospfv3: Redistributes OSPFv3 routes.

ripng: Redistributes RIPng routes.

process-id: Specifies the process ID of a routing protocol, in the range of 1 to 65536. The default is 1.

all-processes: Redistributes routes from all the processes of the specified routing protocol.

allow-ibgp: Redistributes IBGP routes.

cost *cost-value*: Specifies a cost for redistributed routes, in the range of 1 to 16777214. The default is 1.

route-policy *route-policy-name*: Specifies a routing policy to filter redistributed routes. The *route-policy-name* argument is a case-sensitive string of 1 to 63 characters.

type *type*: Specifies the type for redistributed routes, 1 or 2. The default is 2.

Usage guidelines

An external route is a route to a destination outside the OSPFv3 AS. External routes include the following types:

- **Type-1 external routes**—Have high credibility. The cost of Type-1 external routes is comparable with the cost of OSPFv3 internal routes. The cost of a Type-1 external route equals the cost from the router to the ASBR plus the cost from the ASBR to the external route's destination.

- **Type-2 external routes**—Have low credibility. OSPFv3 considers the cost from the ASBR to a Type-2 external route is much bigger than the cost from the ASBR to an OSPFv3 internal router. The cost of a Type-2 external route equals the cost from the ASBR to the Type-2 external route's destination.

The **import-route** command cannot redistribute default routes.

The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command redistributes both EBGP and IBGP routes, and might cause routing loops. Therefore, use it with caution.

Examples

Configure OSPFv3 process 1 to redistribute routes from RIPng and specify the type as type 2 and cost as 50.

```
<Switch> system-view
[Switch] ospfv3
[Switch-ospfv3-1] import-route ripng 10 type 2 cost 50
```

Configure OSPFv3 process 100 to redistribute the routes discovered by OSPFv3 process 160.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] import-route ospfv3 160
```

Related commands

default-route-advertise (OSPFv3 view)

9.1.28. log-peer-change

Use **log-peer-change** to enable logging for neighbor state changes.

Use **undo log-peer-change** to disable logging for neighbor state changes.

Syntax

log-peer-change

undo log-peer-change

Default

Logging for neighbor state changes is enabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

This feature enables the device to deliver logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether

and where to output logs). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Disable logging for neighbor state changes for OSPFv3 process 100.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] undo log-peer-change
```

9.1.29. lsa-generation-interval

Use **lsa-generation-interval** to set the OSPFv3 LSA generation interval.

Use **undo lsa-generation-interval** to restore the default.

Syntax

lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo lsa-generation-interval

Default

The maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

maximum-interval: Specifies the maximum OSPFv3 LSA generation interval in the range of 1 to 60 seconds.

minimum-interval: Specifies the minimum OSPFv3 LSA generation interval in the range of 10 to 60000 milliseconds. The default is 0, which indicates that the minimum interval can be any value.

incremental-interval: Specifies the OSPFv3 LSA generation incremental interval in the range of 10 to 60000 milliseconds.

Usage guidelines

When network changes are infrequent, LSAs are generated at the minimum interval. If network changes become frequent, the LSA generation interval is incremented by the incremental interval × 2^{n-2} for each generation until the maximum interval is reached. The value *n* is the number of generation times.

The minimum interval and the incremental interval cannot be greater than the maximum interval.

Examples

Set the maximum LSA generation interval to 2 seconds, minimum interval to 100 milliseconds, and incremental interval to 100 milliseconds.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] lsa-generation-interval 2 100 100
```

Related commands

lsa-arrival-interval

9.1.30. maximum load-balancing (OSPFv3 view)

Use **maximum load-balancing** to set the maximum number of equal-cost multi-path (ECMP) routes.

Use **undo maximum load-balancing** to restore the default.

Syntax

maximum load-balancing *number*

undo maximum load-balancing

Default

8

Views

OSPFv3 view

Predefined user roles

network-admin

Parameters

number: Specifies the maximum number of ECMP routes in the range of 1 to 8. When the maximum number is 1, OSPFv3 does not perform load balancing.

Examples

Set the maximum number of ECMP routes to 2.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] maximum load-balancing 2
```

9.1.31. non-stop-routing

MEMO:

non-stop-routing command is supported from later software, including Version 7.2.16.

Use **non-stop-routing** to enable OSPFv3 NSR.

Use **undo non-stop-routing** to disable OSPFv3 NSR.

Syntax

non-stop-routing

undo non-stop-routing

Default

OSPFv3 NSR is disabled.

Views

OSPFv3 view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

OSPFv3 NSR and OSPFv3 GR are mutually exclusive. Do not configure the **non-stop-routing** command and the **graceful-restart enable** command at the same time.

Examples

Enable NSR for OSPFv3 process 100.

```
<Switch> system-view
[Switch] ospfv3 100
[Switch-ospfv3-100] non-stop-routing
```

9.1.32. ospfv3

Use **ospfv3** to enable an OSPFv3 process and enter OSPFv3 view.

Use **undo ospfv3** to disable an OSPFv3 process.

Syntax

ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

undo ospfv3 [*process-id*]

Default

No OSPFv3 process is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535. The default process ID is 1.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the OSPFv3 process runs on the public network.

Usage guidelines

Specify a router ID for the OSPFv3 process. Otherwise, the OSPFv3 process cannot generate LSAs.

Examples

Enable OSPFv3 process 120 and set the router ID to 1.1.1.1.

```
<Switch> system-view
[Switch] ospfv3 120
[Switch-ospfv3-120] router-id 1.1.1.1
```

9.1.33. ospfv3 area

Use **ospfv3 area** to enable an OSPFv3 process on an interface and specify an area for the interface.

Use **undo ospfv3 area** to disable an OSPFv3 process on an interface.

Syntax

ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

undo ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

Default

No OSPFv3 processes are enabled on an interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

process-id: Specifies an OSPFv3 process by its ID in the range of 1 to 65535.

area-id: Specifies an area by its ID, an IPv4 address or a decimal integer in the range of 0 to 4294967295 that is translated into the IPv4 address format.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Examples

Configure VLAN-interface 10 to run instance 1 of OSPFv3 process 1 in Area 1.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 1 area 1 instance 1
```

9.1.34. ospfv3 bfd enable

Use **ospfv3 bfd enable** to enable BFD on an OSPFv3 interface.

Use **undo ospfv3 bfd enable** to disable BFD on an OSPFv3 interface.

Syntax

ospfv3 bfd enable [**instance** *instance-id*]

undo ospfv3 bfd enable [**instance** *instance-id*]

Default

BFD is disabled on an OSPFv3 interface.

Views

Interface view

Predefined user roles

network-admin

Parameters

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

BFD provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3.

OSPFv3 uses BFD to implement bidirectional control detection.

Examples

Enable BFD on VLAN-interface 11 in instance 1.

```
<Switch> system-view
[Switch] interface vlan-interface 11
[Switch-Vlan-interface11] ospfv3 bfd enable instance 1
```

9.1.35. ospfv3 cost

Use **ospfv3 cost** to set an OSPFv3 cost for an interface in an instance.

Use **undo ospfv3 cost** to remove the configuration.

Syntax

ospfv3 cost *cost-value* [**instance** *instance-id*]

undo ospfv3 cost [**instance** *instance-id*]

Default

The cost is 1 for a VLAN interface, is 0 for a loopback interface, and is computed according to the interface bandwidth for other interfaces.

Views

Interface view

Predefined user roles

network-admin

Parameters

cost-value: Specifies an OSPFv3 cost in the range of 0 to 65535 for a loopback interface, and in the range of 1 to 65535 for other interfaces.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Examples

Set the OSPFv3 cost to 33 for VLAN-interface 10 in instance 1.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 cost 33 instance 1
```

9.1.36. ospfv3 dr-priority

Use **ospfv3 dr-priority** to set the router priority for an interface in an instance.

Use **undo ospfv3 dr-priority** to remove the configuration.

Syntax

ospfv3 dr-priority *priority* [**instance** *instance-id*]

undo ospfv3 dr-priority [**instance** *instance-id*]

Default

An interface has a router ID of 1.

Views

Interface view

Predefined user roles

network-admin

Parameters

priority: Specifies a router priority in the range of 0 to 255.

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

An interface's router priority determines its privilege in DR/BDR selection.

Examples

Set the router priority for VLAN-interface 10 in instance 1 to 8.

```
<Switch> system-view
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 dr-priority 8 instance 1
```

9.1.37. ospfv3 mtu-ignore

Use **ospfv3 mtu-ignore** to configure an interface to ignore MTU check during DD packet exchange.

Use **undo ospfv3 mtu-ignore** to remove the configuration.

Syntax

ospfv3 mtu-ignore [**instance** *instance-id*]

undo ospfv3 mtu-ignore [**instance** *instance-id*]

Default

An interface performs MTU check during DD packet exchange.

Views

Interface view

Predefined user roles

network-admin

Parameters

instance *instance-id*: Specifies an instance by its ID in the range of 0 to 255. The default is 0.

Usage guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Examples

Configure VLAN-interface 10 that belongs to instance 1 to ignore MTU check during DD packet exchange.

```
<Switch> system-view
```

```
[Switch] interface vlan-interface 10
[Switch-Vlan-interface10] ospfv3 mtu-ignore instance 1
```

9.1.38. ospfv3 network-type

Use **ospfv3 network-type** to specify the network type for an OSPFv3 interface.

Use **undo ospfv3 network-type** to remove the configuration.

Syntax

ospfv3 network-type { **broadcast** | **nbma** | **p2mp** [**unicast**] | **p2p** } [**instance** *instance-id*]

undo ospfv3 network-type [**instance** *instance-id*]

Default

The network type of an OSPFv3 interface is broadcast.

Views

Interface view

Predefined user roles

network-admin

Parameters

broadcast: Specifies the network type as broadcast.
